73 P. LEPTOPE'TALA (Lehm. ind. sem. hort. hamb. 1830. 8. pug. 3. p. 32.) stems ascending, pilose, nearly leafless; leaves quinate; leaflets oval, serrated, densely clothed with white tomentum beneath; stipulas ovate, entire; petals obcordate, veiny, shorter than the calyx. ♃. H. Native of mountains between the town of Mexico and Tolucco. Root brown, woody. Corolla small, yellow.

Slender-petalled Cinquefoil. Pl. ¼ foot.

74 P. WALLICHIA'NA (Del. in Wall. cat. no. 1023. Lehm. pug. 3. p. 30.) stems erect, bluntly angled; leaves quinate,

pilose on both surfaces; leaflets stalked, obovate, bluntly serrated at the apex; flowers panicled, crowded; calycine segments lanceolate, outer ones usually bifid; petals emarginate, a little longer than the calyx. ♃. H. Native of Nipaul. Corolla yellow.

Wallich's Cinquefoil. Pl. ½ foot.

75 P. VIRGA'TA (Lehm. pot. 75. no. 27.) stem erect, twiggy; leaves with 7-9 leaflets; leaflets lanceolate, pinnatifid, glabrous above, and clothed with white tomentum beneath; stipulas lanceolate, entire; corolla small; petals obovate, quite entire, twice the length of the calyx. ♃. H. Native country unknown. Flowers yellow, panicled at the tops of the branches.

Twiggy Cinquefoil. Fl. June, July. Clt. 1820. Pl. 1½ foot.

76 P. CANE'SCENS (Bess. fl. galic. no. 607. 1. p. 330.) stem erect, many-flowered; leaves quinate; leaflets oblong-cuneiform, deeply serrated, clothed with adpressed pili above, and canescent from tomentum beneath; stipulas ovate-lanceolate, entire or toothed; petals obcordate, length of calyx. ♃. H. Native of Europe, Caucasus, and Siberia. P. Hungárica, Schlecht. P. parviflòra, Gaud. P. ornithópoda, Tausch. hort. can. 1. fasc. 1. t. 10. ex Tratt. ros. 4. p. 54.?—Jacq. fl. aust. 4. t. 383. Flowers yellow.

Var. β, inclinàta (Ser. in D. C. prod. 2. p. 578.) stems inclinate, weak; leaves clothed with hoary tomentum beneath, smoothish above. ♃. H. P. inclinàta, Vill. dauph. 3. p. 567. t. 45. Horn. hort. hafn. 2. p. 477. P. adscéndens, Waldst. et Kit. ex Lehm. pot. 92. P. intermèdia, Schult. obs. bot. p. 95. P. récta, Lapeyr. abr. 288. P. assúrgens, Vill. fl. dauph. 3. p. 567. P. hírta, Hænke.

Canescent Cinquefoil. Fl. June, July. Clt. 1817. Pl. 1 to 1½ foot.

77 P. STIPULA'RIS (Lin. spec. 712. but not of Lapeyr.) stems erect, weak; lower leaves with 7 leaflets, upper ones ternate; leaflets linear-oblong, tridentate, nearly glabrous; stipulas large, dilated; petals obovate, hardly emarginate, longer than the calyx; receptacle glabrous. ♃. H. Native of Siberia.—Gmel. sib. 3. t. 37. f. 2. Flowers small, yellow, panicled.

Large-stipuled Cinquefoil. Fl. June, July. Clt. 1727. Pl. ½ to 1 foot.

78 P. HI'RTA (Lin. spec. 712. Lehm. pot. t. 8.) stem pilose, erect, few-flowered; leaves with 5-7 leaflets; leaflets pilose, cuneiform, cut at the apex; stipulas lanceolate, entire; petals obcordate, longer than the calyx. ♃. H. Native of the Pyrenees, south of France, Piedmont, Silesia, Siberia, &c. P. crysopétala, Bess. in litt. P. angustifòlia, D. C. fl. fr. 5. p. 540. Flowers yellow.

Var. β, rùbens (Ser. in D. C. prod. 2. p. 578.) stem red, decumbent, viscid. ♃. H. P. hírta β viscòsa, Pers. P. pilòsa, Vill. dauph. 3. p. 570. Willd. spec. 2. p. 1100. P. Sibírica, Patrin.

Hairy Cinquefoil. Fl. May, Sept. Clt. 1725. Pl. ½ to 1 ft.

79 P. PEDA'TA (Poir. suppl. 4. p. 540. Nestl. pot. 447.) stem ascending, reddish; leaves pedate, with 5-7 leaflets; leaflets lanceolate, serrated, pilose on the margins and beneath. ♃. H. Native of Liguria and Piedmont, on hills. Lodd. bot. cab. 579. P. rùbens, All. fl. pedem. 2. no. 1486. but not of Vill. P. pilòsa, D. C. fl. fr. 6. p. 540. exclusive of the synonymes, Willd. spec. 2. p. 1100. P. hírta α, rùbens, Ser. in D. C. prod. 2. p. 578. Flowers large, golden yellow.

Pedate-leaved Cinquefoil. Fl. June, July. Clt. 1819. Pl. ascending 1 foot.

80 P. ASTRACA'NICA (Jacq. icon. rar. 1. t. 92.) stem ascending, pilose, dichotomous; radical leaves quinate; leaflets oblong, bluntly serrated; cauline leaves toothless, tripartite, pubescently pilose; stipulas large; petals obcordate, longer than the calyx. ♃. H. Native of Caucasus and about Constantinople. P. corymbòsa, Mœnch. Flowers terminal and axillary.

Astracan Cinquefoil. Fl. Ju. July. Clt. 1787. Pl. 1 to 1½ ft.

81 P. TAU'RICA (Schlecht. in berol. mag. ann. 7. p. 291. Lehm. pot. 90. t. 9.) stem erect, pilose, many-flowered; leaves quinate; leaflets obovate, cuneated at the base, serrated in front, clothed with adpressed silky pili; stipulas lanceolate, entire; petals obcordate, a little longer than the calyx. ♃. H. Native of Tauria, on the higher mountains, and at Sarepta in arid places. Flowers large, pale yellow, sub-panicled.

Taurian Cinquefoil. Fl. June, July. Clt. 1820. Pl. 1 foot.

82 P. RE'CTA (Lin. spec. 711.) stem erect, pilose; leaves with 5-7 leaflets; leaflets oblong, deeply serrated, beset with spreading pili; lower stipulas lanceolate, entire, upper ones broader and jagged; petals obcordate, exceeding the calyx. ♃. H. Native of Tauria, Caucasus, Austria, Germany, Italy, Switzerland, France, and the Pyrenees. Nestl. pot. 42. t. 6. All. fl. pedem. 71. f. 1. Sav. hort. rom. 5. t. 49. Flowers pale yellow, disposed in terminal corymbs.

Upright Cinquefoil. Fl. Ju. Aug. Clt. 1648. Pl. 1 to 1½ ft.

83 P. OBSCU'RA (Willd. spec. 2. p. 1100.) stem erect, pilose, reddish; leaves with 5-7 leaflets; leaflets oval-oblong, deeply toothed, beset with adpressed pili; stipulas ovate-lanceolate, for the most part cut; petals obcordate, hardly longer than the calyx. ♃. H. Native of Siberia, Tauria, Caucasus, and Italy. Nocca in Balb. fl. tic. 240. t. 10. P. récta β obscùra, Poir. suppl. 5. p. 589. P. récta, Vill. dauph. 3. p. 569. Flowers golden yellow, corymbose.

Obscure Cinquefoil. Fl. Ju. July. Clt. 1800. Pl. 1 to 2 ft.

84 P. LACINIÒSA (Waldst. et Kit. in litt. ex Nestl. pot. 45. Lehm. pot. 86. t. 9.) stem pilose, erect, reddish; leaves with 5-7 leaflets; leaflets oblong, laciniately pinnatifid, pilose; stipulas deeply jagged; petals obcordate, much longer than the calyx. ♃. H. Native of Hungary. P. cardiopétala, Bess. in litt. Flowers yellow, disposed in corymbose panicles.

Jagged-leaved Cinquefoil. Fl. June, July. Clt. 1816. Pl. 1 to 1½ foot.

85 P. DIVARICA'TA (Poir. suppl. 4. p. 540.) stem erect; leaves with 5-7 leaflets; leaflets oblong, tapering a long way at the base, deeply serrated, smoothish; stipulas pinnatifid; petals obcordate, about equal in length to the calyx. ♃. H. Native of Corsica. D. C. fl. fr. 6. p. 541. Stems dichotomously corymbose at the apex, with the branches divaricate. Corolla yellow.

Divaricate-branched Cinquefoil. Fl. Ju. July. Pl. 1 to 1½ ft.

86 P. VALDE'RIA (Lin. spec. 714.) stem erect, hoary as well as the whole plant; leaves with 5-7 leaflets; leaflets obovate, serrated, clothed with silky tomentum, hoary beneath; stipulas lanceolate, entire, rarely denticulated; petals obovate-oblong, hardly emarginate, shorter than the calyx. ♃. H. Native of Piedmont, Valder, &c. in stony places. All. pedem. t. 24. f. 1. Flowers pale sulphur-coloured.

Valder Cinquefoil. Fl. May, June. Clt. 1825. Pl. ¼ to ½ ft.

* * *Flowers white or red.*

87 P. LUPINOÌDES (Willd. spec. 2. p. 1107. Nestl. pot. 60. Lehm. pot. 126.) stem erect, pilose; leaves with 5-7 leaflets; leaflets obovate, roundish, obtuse, connivently serrated at the apex, densely clothed with silky villi; stipulas large, entire; petals obcordate, shorter than the calyx. ♃. H. Native of the higher alps of Dauphiny and the Pyrenees. Lodd. bot. cab. 654. P. nivàlis, Lapeyr. abr. p. 290. act. toul. 1. p. 210. t. 16. P. lupinoìdes β nivàlis, Pers. ench. 2. p. 55. P. Valdèria, Vill. dauph. 3. p. 572. P. lanàta, Lam. fl. fr. 3. p. 646. P. integrifòlia, Lapeyr. abr. 291. Corolla white. Flowers 3-6, terminal.

Lupine-like Cinquefoil. Fl. July. Clt. 1739. Pl. ¼ to ½ ft.

88 P. CLUSIA'NA (Jacq. austr. 2. t. 116. Sims, bot. mag. 1327.) stems ascending, few-flowered, purplish, pubescent; radical leaves quinate, cauline ones ternate; leaflets oval-cuneiform, pubescent, tridentate at the apex, with the teeth connivent; stipulas ovate-lanceolate, entire; petals roundish, hardly longer than the calyx. ♃. H. Native of Austria, Styria, Carniola, Tyrol, and Salisburg, on rocks and among stones. P. caulés-cens β Clusiàna, Poir. suppl. 5. p. 595. P. caulèscens, Scop. fl. carn. ed. 2. vol. 1. p. 361. Corymbs terminal. Corolla large, white.

Clusius's Cinquefoil. Fl. June, Aug. Clt. 1806. Pl. ½ foot.

89 P. CAULE'SCENS (Lin. spec. 713.) downy; stem erect, weak, many-flowered, pilose; radical leaves quinate, cauline ones ternate; leaflets obovate, connivently serrated at the apex, with pilose margins; stipulas entire; petals obovate-cuneiform, hardly emarginate, longer than the calyx. ♃. H. Native of the south of Europe, on the higher Alps. Jacq. aust. 3. p. 11. t. 220. Sturm, deutsch. fl. fasc. 1. with a figure. P. álba var. Lam. fl. fr. 3. p. 118. Peduncles crowded at the tops of the stems. Corolla white.

Caulescent Cinquefoil. Fl. May, July. Clt. 1759. Pl. ½ ft.

90 P. GLAU'CA (Moris, elench. sard. p. 18.) plant very clammy; stems ascending; radical leaves quinate, cauline ones ternate or simple; leaflets obovate-cuneiform, pubescent on both surfaces, bluntly and unequally many-toothed at the apex. ♃. H. Native of Sardinia. Habit of P. caulèscens, Lin. but differs from it in the teeth of the leaflets being more close.

Glaucous Cinquefoil. Pl. ½ foot.

91 P. A'LBA (Lin. spec. 713.) stems procumbent, weak, few-flowered; lower leaves quinate, upper ones ternate; leaflets oblong, connivently serrated at the apex, smoothish above, but clothed with silky canescent down beneath; stipulas lanceolate, entire; petals obcordate, longer than the calyx. ♃. H. Native of middle and south Europe and Caucasus. In Wales in mountainous woods according to Mr. Haviland, but not observed by any other person. Smith, engl. bot. 1384. Jacq. austr. 2. t. 115. P. nítida, Scop. carn. ed. 2. vol. 1. p. 362. P. Clusiàna, Gesh. cat. scep. no. 272. P. cordàta, Braune, fl. salisb. 2. p. 80. Fragària álba, Crantz. Pedicels axillary and terminal. Flowers white.

White-flowered Cinquefoil. Fl. Feb. Aug. Wales. Pl. prostrate.

92 P. ALCHEMILLOÌDES (Lapeyr. act. toul. 1. p. 212. t. 17.) stems erectish, many-flowered; leaves with 5 or 7 leaflets; leaflets oblong-lanceolate, tridentate at the apex, the teeth connivent, glabrous above, but with silky-silvery down beneath; stipulas of radical leaves subulate, of cauline ones ovate-lanceolate; outer calycine segments lanceolate; petals ovate-oblong, emarginate, a little longer than the calyx. ♃. H. Native of the Pyrenees, among rocks. P. Pyrenàica, Schlecht. Flowers white.

Alchemilla-like Cinquefoil. Fl. July, Aug. Clt. 1823. Pl. 1 ft.

93 P. COMAROÌDES (Humb. et Bonpl. ex Nestl. pot. 62. t. 4. f. 3. and Kunth, nov. gen. amer. 6. p. 217.) stems firm, erectish; radical leaves quinate, cauline ones ternate; leaflets elliptic, usually 5-toothed at the apex, smoothish above, but clothed with silky hoary down beneath; stipulas entire; petals obcordate, much longer than the calyx. ♃. H. Native of Mexico, on mount Jorullo at the height of 1600 feet. P. rùbra, Schlecht. in berl. mag. nat. 291. Corolla dark purple.

Comarum-like Cinquefoil. Fl. Sept. Pl. ¾ foot.

94 P. COLORA'TA (Lehm. sem. hort. hamb. 1821. p. 8.) stems erect, purple; lower leaves quinate, with obovate-lanceolate leaflets; upper leaves ternate, with lanceolate leaflets; leaflets serrated, and beset with silky incumbent pili; stipulas ovate, quite entire, sheathing; petals obcordate, veiny, longer than the calyx. ♃. H. Native of Nipaul. P. Nepalénsis, Hook. exot. fl. t. 88. P. formòsa, D.Don, prod. fl. nep. p. 232. Flowers beautiful purple.

Coloured Cinquefoil. Fl. Ju. July. Clt. 1822. Pl. 1 to 1½ ft.

95 P. RUSSELLIA'NA (Sweet, fl. gard. t. 279.) villous; stems branched, diffuse; radical leaves petiolate, ternate, quaternate or quinate; leaflets ovate or obovate, obtuse, deeply serrated, feather-nerved, rather silky beneath; stipulas adnate, ovate-lanceolate, acuminated; calycine segments lanceolate, acute; petals large, obcordate. ♃. H. A hybrid between *P. formòsa* and *P. atropurpùrea.* Petals bright scarlet, with a darker base.

Russell's Cinquefoil. Fl. June, Aug. Hybrid. Pl. 1½ foot.

96 P. HOPWOODIA'NA (Sweet, fl. gard. 2. ser. t. 61.) stems ascending, clothed with villi; lower leaves with 5-6 leaflets, upper ones ternate; leaflets oblong-cuneiform, coarsely toothed, hairy on both surfaces; calycine segments ovate, acuminated; petals obcordate, imbricated, longer than the calyx. ♃. H. A hybrid between *R. formòsa,* impregnated by the pollen of *P. récta.* Petals beautifully variegated, marked with a spot of deep rose colour at the base, and from it to the centre of a pale straw colour, edged with bright rose colour. Lindl. bot. reg. t. 1383.

Hopwood's Cinquefoil. Fl. June, Jul. Hybrid. Pl. 1½ ft.

97 P. MACKAYA'NA (Sweet, fl. gard. 2. ser. t. 42.) villous; stems ascending, branched; leaves flaccid, radical ones quinate; leaflets oblong-cuneated, coarsely and bluntly toothed; cauline leaves ternate, few-toothed; stipulas ovate, acute, quite entire; petals obcordate, undulated, a little longer than the calyx. ♃. H. A hybrid, produced from *P. formòsa* impregnated by the pollen of *P. opàca.* Petals pale yellow tinged with red, and light red at the base.

Mackay's Cinquefoil. Fl. June, Oct. Hybrid. Pl. 1½ ft.

§ 3. *Leaves pinnately digitate.*

98 P. DIVERSIFÒLIA (Lehm. pug. 2. p. 9. Hook, fl. bor. amer. 190.) stems ascending; radical leaves pinnate, with usually 3 pairs of leaflets, and quinate; cauline leaves with 2 pairs of leaflets, digitate or ternate; leaflets cuneiform, coarsely and deeply toothed above, and clothed with silky pili at the apex; stipulas ovate-lanceolate, quite entire; petals obcordate, longer than the calyx. ♃. H. Native of North America, in the alpine prairies, as well as of the higher summits of the Rocky Mountains between lat. 52° and 56°. Corolla yellow.

Diverse-leaved Cinquefoil. Pl. ¼ to 1 foot.

99 P. PULCHE'RRIMA (Lehm. pug. 2. p. 10. Hook, fl. bor. amer. p. 190.) stems ascending, villous; leaves impari-pinnate; leaflets crowded, elliptic, equally serrated, beset with adpressed pili above and clothed with white tomentum beneath; stipulas ovate, acute, quite entire, woolly; petals entire, longer than the calyx. ♃. H. Native of North America, in the prairies as well as on the dry banks of the Rocky Mountains, between lat. 52° and 56°. Corolla golden yellow.

Very fair Cinquefoil. Pl. ½ foot.

100 P. RUBRICAU'LIS (Lehm. pug. 2. p. 11. Hook, fl. bor. amer. p. 191.) stem ascending; radical leaves pinnate, with 2 pairs of leaflets, cauline ones ternate; leaflets approximate, oblong, pinnatifidly serrated, glabrous above and tomentose beneath; stipulas quite entire; petals obcordate, exceeding the calyx a little; receptacle smoothish. ♃. H. Native of North America, about Bear Lake, in lat. 66°. Flowers golden yellow, disposed in a dichotomous panicle.

Red-stemmed Cinquefoil. Pl. 1 foot.

101 P. PULCHE'LLA (R. Br. chl. melv. p. 193.) stems procumbent; usually 1-flowered; leaves pinnate, with 2 pairs of leaflets, clothed with silky tomentum beneath; leaflets 2-3-lobed or linear, entire, with revolute edges, the terminal or odd one pinnatifid; stipulas ovate, sheathing; styles glandular and dilated at the base; petals obovate, emarginate, length of calyx. ♃. H.

Native of the islands of the Arctic sea; shores of the mainland between the Coppermine and Mackenzie rivers. Corolla yellow.

Pretty Cinquefoil. Pl. procumbent.

102 P. Ruthe'nica (Willd. spec. 1079.) stem erect, diffuse, pilose; radical leaves quinately-pinnate, cauline leaves ternate; leaflets hairy, obovate, unequally and deeply serrated; stipulas oblong-lanceolate, outer side toothed; petals shorter than the calyx. ♃. H. Native of Siberia. Flowers small, yellow, panicled on the tops of the branches pedicels hairy, primary ones solitary in the forks of the stem.

Russian Cinquefoil. Fl. May, June. Clt. 1799. Pl. 1 to 2 ft.

103 P. diffu'sa (Willd. enum 555.) stem diffuse, beset with spreading pili; radical leaves quinately pinnate, cauline ones ternate; leaflets lanceolate, unequally and coarsely serrated, beset with spreading pili on both surfaces; primary pedicels solitary; petals retuse, shorter than the calyx. ♃. H. Native country unknown. Flowers small, yellow, panicled at the tops of the branches.

Diffuse Cinquefoil. Fl. May, July. Clt. 1817. Pl. 1 foot.

104 P. Dombe'yi (Nestl. pot. p. 38. t. 5. f. 2.) stems decumbent, pilose; leaves quinately pinnate, upper ones ternate; leaflets obovate, cuneiform, hardly pilose, serrated at the apex; stipulas lanceolate, acute, entire; petals a little longer than the calyx; receptacle hairy; carpels glabrous. ♃. H. Native of Chili. Corolla yellow.

Dombey's Cinquefoil. Pl. decumbent.

§ 4. *Leaves pinnate. Flowers yellow.*

105 P. bifu'rca (Lin. spec. 711.) roots creeping; stems ascending; leaflets about equal in size, bifid or entire, outer ones confluent; stipulas oblong, entire, or a little cut; flowers subcorymbose; pedicels pilose; petals obovate, entire, longer than the calyx. ♃. H. Native of Iberia, Siberia, and Silesia.—Gmel. itin. 1. t. 37. f. 1. Corolla pale yellow.

Var. β, subsericea (Ser. mss. in D.C. prod. 2. p. 580.) stems, leaves, and calyxes smaller, and clothed with rather silky down. ♃. H. Native about Astracan.

Var. γ, monstròsa (Fisch. gor. in litt. Led. fl. alt. 2. p. 246.) branches much crowded, short. ♃. H. Native of Dahuria and Altaia, in sterile salt places.

Forked-leaved Cinquefoil. Fl. May, Ju. Clt. 1773. Pl. ½ ft.

106 P. astragalifòlia (Led. fl. ross. alt. ill. t. 328. fl. alt. 2. p. 246.) plant clothed with silky villi; stems prostrate, nearly leafless; radical leaves pinnate, usually with 6 pairs of leaflets; leaflets oblong, quite entire, or 2-3-parted, upper ones rather confluent, terminal or odd one trifid; cauline leaves small, simple, entire, or wanting; stipulas oblong, entire, or cut a little; petals nearly orbicular, twice the length of the calyx. ♃. H. Native of Altaia, in sterile deserts on the right bank of the river Tschuja. Flowers pale yellow, 2-4, terminal.

Milk-vetch-leaved Cinquefoil. Fl. June. Pl. prostrate.

107 P. Japónica (Blum. bijdr. 1105.) stolons decumbent; radical leaves pinnate, usually with 3 pairs of leaflets, beset with strigose villi; cauline leaves ternate; leaflets obovate, sharply serrated, outer ones largest and approximate; stipulas trifid at the apex. ♃. H. Native of Japan.

Japan Cinquefoil. Pl. creeping.

108 P. geoi'des (Bieb. fl. taur. 1. p. 404.) plant hairy; stems erect; leaves pinnate; leaflets roundish, a little lobed, hairy, outer ones the largest; stipulas multifid; panicle somewhat dichotomous; calycine segments obtuse, denticulated at the apex; petals obovate, entire, about equal in length to the calyx. ♃. H. Native of Tauria, among rocks towards the top of Mount Tschaturdag. Lehm. pot. t. 2. P. fragarioìdes, Habl. 147. but not of Lin. Corolla yellow, about the size of those of *Gèum urbànum.*

Geum-like Cinquefoil. Fl. Ju. Jul. Clt. 1820. Pl. 1 to 1½ ft.

109 P. fragarioi'des (Lin. spec. 710.) stem erect, dichotomous, with creeping stolons issuing from the base; radical leaves pinnate, cauline ones ternate; leaflets oval, sharply serrated, silky-pilose, outer ones larger and more confluent; stipulas serrated; petals obovate-cuneiform, a little longer than the calyx. ♃. H. Native of Siberia. Lehm. pot. t. 4. Gmel. fl. sib. 3. t. 34. f. 2. P. poterioìdes, Schlecht. berol. mag. ann. 7. p. 286. Plant pilose. Flowers yellow, in corymbose panicles.

Strawberry-like Cinquefoil. Fl. May, Ju. Clt. 1773. Pl. ½ ft.

110 P. pimpinelloi'des (Lin. spec. 711.) stem erect, pilose; leaves pinnate; leaflets about equal, roundish, dentately serrated, pilose; stipulas cut; petals obcordate, a little longer than the calyx. ♃. H. Native of America, among stones. Nestl. pot. 32. t. 2. f. 1. Buxb. cent. 1. t. 48. Flowers yellow, disposed in dichotomous panicles.

Pimpernel-like Cinquefoil. Fl. Ju. Aug. Clt. 1758. Pl. 1 ft.

111 P. cicutariæfòlia (Willd. spec. 2. p. 1098.) stem erect, beset with adpressed pili; leaves pinnate; leaflets cuneiform, deeply toothed, with a few hairs on both surfaces; stipulas nearly entire; flowers in corymbose panicles; petals obovate, about equal in length to the calyx; receptacle glabrous. ♃. H. Native of Galatia. Nestl. pot. t. 2. f. 2. Flowers yellow, about the size of those of *P. argéntea.* Leaves resembling those of *Eròdium cicutàrium.*

Cicutarium-leaved Cinquefoil. Fl. June, Aug. Clt. 1818. Pl. ½ to 1 foot.

112 P. supi'na (Lin. spec. 711.) stems decumbent, dichotomous; leaves pinnate; leaflets oblong, deeply serrated; stipulas ovate, entire; pedicels axillary, solitary; petals obovate, length of calyx. ♃. H. Native of Europe and Siberia, also of North America, in the plains of the Saskatchawan. Jacq. fl. aust. 5. t. 406.—Gmel. itin. vol. 1. t. 27. f. 1. P. prostràta, Haenke. Corolla small, yellow.

Supine Cinquefoil. Fl. June, Aug. Clt. 1696. Pl. prostr.

113 P. effu'sa (Dougl. mss. Hook. fl. bor. amer. p. 187.) plant clothed with hoary tomentum; stems ascending, weak; leaves interruptedly pinnate; leaflets oblong, deeply serrated; flowers in dichotomous panicles; stipulas lanceolate, acuminated, entire; petals obcordate, equal in length to the sepals, which are acuminated. ♃. H. Native of the north-west coast of America, on the elevated grounds of the Assinaboyne, and the higher parts of the Red river. Receptacle villous. Corolla golden yellow.

Effuse Cinquefoil. Pl. ascending.

114 P. Pennsylva'nica (Lin. mant. 76.) stem erect, rather pilose; leaves interruptedly pinnate, clothed with hoary tomentum; larger leaflets oblong, truncate, deeply serrated, smaller ones quite entire, about the size of the segments of the larger ones; stipulas lanceolate, usually entire, but sometimes with a few teeth; petals obcordate, a little longer than the calyx. ♃. H. Native of the south of Europe, North America, and Siberia, plentiful. Jacq. hort. vind. 2. t. 189. P. híspida, Poir. suppl. 4. p. 538. Willd. enum. 553. Panicle branched. Flowers yellow.

Var. β, strigòsa (Lehm. pot. p. 55.) leaflets somewhat pectinately pinnatifid; segments with revolute margins; stipulas jagged. ♃. H. Common in North America and Siberia. P. pectinàta, Fisch. in litt. P. absinthifòlia, Dougl.

Pennsylvanian Cinquefoil. Fl. June, Aug. Clt. 1725. Pl. 1 to 2 feet.

115 P. Missou'rica (Horn. ex Lindl. bot. reg. 1412.) stem erect; leaves pinnate, with usually 3 pairs of leaflets, hoary and silky above, and clothed with white down beneath; leaflets oblong, pinnatifid, with the segments lanceolate-linear and acute;

stipulas foliaceous, cut; flowers corymbose; petals emarginate, longer than the woolly calyx. ♃. H. Native of North America, on the plains of the Missouri. P. argùta, Spreng. syst. 2. p. 534. but not of Pursh. Flowers yellow.

Missouri Cinquefoil. Fl. June, Aug. Clt. 1827. Pl. 1½ foot.

116 P. ARGU'TA (Pursh, fl. amer. sept. 2. p. 736.) stem erect, pubescent, clammy at the apex; leaves pinnate; leaflets roundish-ovate, oblique at the base, doubly and deeply toothed; stipulas almost entire; calyxes acute, shorter than the petals, which are obovate and entire. ♃. H. Native of North America, in the woody country as far as lat. 65°. north, and westward to the Rocky Mountains, and at Fort Vancouver on the Columbia. Hook. fl. bor. amer. p. 186. t. 63. Lindl. in bot. reg. t. 1379. P. confertiflòra, Torrey, fl. unit. st. 1. p. 499. P. oblíqua, and P. ferrugínea, Dougl. P. sylvéstris, Bigel. fl. bost. 2. p. 206. Gèum agrimonioìdes, Pursh, fl. amer. sept. 1. p. 351. Plant pubescent all over. Flowers pale yellow. Panicle crowded, dichotomous.

Sharp-serrated-leaved Cinquefoil. Fl. June, Jul. Clt. 1826. Pl. 1 to 3 feet.

117 P. HIPPIA'NA (Lehm. pug. 2. p. 7. Hook. fl. bor. amer p. 188. t. 64.) stem erect; leaves pinnate; leaflets lanceolate, oblong, deeply and connivently serrated, silky above, and clothed with hoary shining tomentum beneath; stipulas lanceolate, acuminated, quite entire; panicle somewhat dichotomous, loose; petals obcordate, exceeding the calyx. ♃. H. Native of North America, on the plains of the Saskatchawan and prairies of the Rocky Mountains. P. leucophýlla, Torrey, ann. lyc. 2. p. 197. but not of Pall. itin. 3. p. 194. P. dealbàta, Dougl. mss. Flowers yellow.

Hippio's Cinquefoil. Fl. June, July. Pl. 1 to 2 feet.

118 P. BIPINNATI'FIDA (Dougl. mss. Hook. fl. bor. amer. p. 188.) stem erect; leaves pinnate; leaflets obovate, pectinately pinnatifid, clothed with silky silvery down above, and with white tomentum beneath; stipulas rhomboid, cut; flowers corymbose, crowded; petals obovate, entire, longer than the calyx. ♃. H. Native of North America, in Louisiana and plains of the Saskatchawan and Red rivers. P. argùta, Lehm. pot. p. 62. but not of Pursh. Flowers yellow.

Bipinnatifid-leaved Cinquefoil. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

119 P. DRUMMÓNDI (Lehm. pug. 2. p. 9. Hook, fl. bor. amer. p. 189. t. 65.) stem herbaceous; radical leaves irregularly and subverticillately pinnate, cauline ones with 2 pairs of leaflets; leaflets obovate, truncate, cuneated at the base, profoundly serrated, ciliated, smoothish; stipulas ovate, entire; petals obcordate, veiny, twice the length of the calyx. ♃. H. Native of North America, in alpine woods on the Rocky Mountains, north of the Smoking River, in lat. 56°. Panicle terminal. Petals golden yellow.

Drummond's Cinquefoil. Fl. Ju. Jul. Clt. 1826. Pl. 1 to 2 ft.

120 P. VISCÒSA (Donn, hort. cantab. ed. 7. and Lehm. pot. p. 57.) stems erect, and are as well as the leaves clothed with clammy pubescence; leaves greenish on both surfaces, pinnate; leaflets oblong, sharply and deeply serrated, superior ones decurrent, lower ones small; stipulas almost entire; petals obovate, emarginate, hardly longer than the calyx; receptacle pilose. ♃. H. Native of Dahuria and Siberia, on rocks at the rivers Tscharysch and Buchtorm, and in fields at the river Irtysch. Led. fl. ross. alt. ill. t. 343. P. híspida, Nestl. pot. t. 36. but not of Willd. P. longifòlia and P. nudicaúlis, Schlecht. berl. mag. p. 287. P. Pennsylvánica, Horn. hort. hafn. 2. p. 476. P. pubéscens, Mœnch. meth. p. 658. P. dentàta, Vittm. Flowers yellow, crowded at the tops of the branches into a few-flowered panicle.

Clammy Cinquefoil. Fl. Ju. Aug. Clt. 1797. Pl. 1 to 1½ ft.

121 P. AGRIMONIOI'DES (Bieb. fl. taur. 1. p. 403.) stems ascending, beset with spreading villi; leaves interruptedly pinnate; leaflets numerous, obovate-oblong, obtuse, deeply and bluntly toothed or almost pinnatifid, pubescent above, and clothed with hoary villi beneath; stipulas nearly entire, ovate-lanceolate; petals longer than the calyx; receptacle villous. ♃. H. Native of Armenia, and Siberia in dry grassy places at the river Irtysch. Led. fl. ross. alt. ill. t. 327.—Gmel. sib. 3. t. 38. Flowers yellow, disposed in a terminal panicle.

Agrimony-leaved Cinquefoil. Fl. May, June. Clt. 1817. Pl. ½ to ¾ foot.

122 P. STRIGÒSA (Pall. ex Tratt. no. 31. exclusive of the American plant. Led. fl. alt. 2. p. 237.) stem erect, straight, pubescent; leaves pinnate; leaflets oblong, cuneated at the base, deeply and pectinately toothed, with revolute margins, clothed with hoary pubescence above and with woolly tomentum beneath; stipulas half pinnate; flowers panicled; petals obovate, hardly exceeding the calyx. ♃. H. Native of Altaia, at the river Tscharysch and Tschuja.—Gmel. sib. 3. p. 181. no. 29. t. 34. f. 1. Flowers yellow.

Strigose Cinquefoil. Fl. June, July. Pl. 1 foot.

123 P. FILIPE'NDULA (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 59.) stem erect, pilose; leaves interruptedly pinnate, beset with spreading pili, pale green on both surfaces; leaflets lanceolate, pinnatifidly serrated, smaller ones quite entire, outer ones confluent; stipulas toothed; panicle crowded, somewhat trichotomous; petals obcordate, exceeding the calyx; receptacle villous. ♃. H. Native of Dahuria. Corolla yellow.

Dropwort-like Cinquefoil. Fl. June, July. Clt. 1823. Pl. 1 to 2 feet.

124 P. TANACETIFÒLIA (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. p. 60.) stems ascending, pilose; leaves pinnate, very hairy; leaflets lanceolate, pinnatifidly serrated, upper ones opposite, with the terminal one stalked; stipulas jagged; panicle terminal, corymbose; petals obcordate, twice the length of the calyx; receptacle villous. ♃. H. Native of Siberia. Corolla pale yellow.

Tansy-leaved Cinquefoil. Pl. ½ to 1 foot.

125 P. SANGUISÓRBA (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 61. t. 5.) stem erect, 1-2-flowered, glabrous, purplish; leaves pinnate, quite glabrous; leaflets obovate, bluntly serrated; stipulas cut; petals obcordate, hardly the length of the calyx; receptacle glabrous. ♃. H. Native of Siberia. Corolla cream-coloured.

Burnet-like Cinquefoil. Fl. Ju. Jul. Clt. 1826. Pl. ½ to 1 ft.

126 P. MICROPE'TALA (D. Don, prod. fl. nep. 231.) stems almost simple, slender; lower leaves pinnate, upper ones ternate; leaflets 7-9, obovate-oblong, serrate-toothed, outer ones much the largest, all clothed with white tomentum beneath; stipulas oblong, obtuse, scarious, quite entire; pedicels opposite the leaves, usually solitary; petals oval, quite entire, one half shorter than the calyx. ♃. H. Native of Gosaingsthan. Corolla small, yellow. Outer calycine segments bifid or bipartite. Cómarum flàvum, Hamilt. Roxb. hort. beng. p. 36. P. albiflòrum, Wall. cat. no. 1018.

Small-petalled Cinquefoil. Pl. ½ foot.

127 P. LESCHENAULTIA'NA (D. C. prod. 2. p. 584.) plant thickly beset with yellow hairs; stems ascending, few-flowered; radical leaves pinnate, cauline ones ternate, on short petioles; leaflets obovate-roundish, obtuse, crenate-toothed, outer ones the largest, silky above and clothed with white tomentum beneath; stipulas dilated, almost quite entire; petals obcordate, longer than the calyx. ♃. H. Native of the East Indies, on the Neelghiry Mountains, where it is called *Gahè-gueda*, according to Leschenault. Corolla yellow.

Leschenault's Cinquefoil. Pl. ½ foot.

128 P. LEUCONÒTA (D. Don, prod. fl. nep. p. 230.) stems erect, almost simple; leaves pinnate, with many pairs of leaflets; leaflets oblong, obtuse, deeply serrated, green above, but clothed with silvery white down beneath; stipulas ovate, deeply serrated; flowers small, sub-umbellate, involucrated; calycine segments nearly equal; petals obovate, quite entire, exceeding the calyx. ♃. H. Native of Gosaingsthan. Corolla yellow.

White-backed-leaved Cinquefoil. Pl. ½ foot.

129 P. POLYPHY'LLA (Wall. cat. no. 1026. Lehm. pug. 2. p. 14.) stem erect; leaves interruptedly pinnate, with many pairs of leaflets; leaflets quite glabrous, lined with veins, the large ones oblong and bluntly crenate-toothed; stipulas sheathing, oval, crenate-toothed; outer calycine segments large, 3-lobed, with the lateral lobes small; petals obovate-orbicular, longer than the calyx. ♃. H. Native of Gosaingsthan. Panicle terminal, corymbose. Corolla golden yellow.

Var. β, barbàta (Wall. cat. 1030.) stem very pilose; calyxes more foliaceous.

Many-leafletted Cinquefoil. Pl. 1 to 1½ foot.

130 P. PEDUNCULA'RIS (D. Don, prod. fl. nep. p. 230.) stem slender, erect, simple, few-flowered, leafless at the apex; leaves radical, pinnate, length of stem; leaflets oblong, contiguous, sharply and deeply serrated, rather silky above and silvery beneath; outer calycine segments longest, usually 2-3-cleft; petals nearly orbicular, entire, twice the length of the calyx. ♃. H. Native of Gosaingsthan. P. velutìna, Wall. cat. 1016. but not of Lehm. Corolla yellow. Habit of *P. anserìna*.

Peduncular Cinquefoil. Pl. ½ foot.

131 P. COMMUTA'TA (Lehm. pug. 2. p. 16.) stems ascending, 1-2-flowered, almost leafless; leaves pinnate, with many pairs of leaflets, green above, but clothed with silky villi beneath; leaflets oblong, deeply serrated or somewhat pinnatifid; flowers small, outer calycine segments oblong, obtuse, the rest ovate, acute. ♃. H. Native of Kamaon. P. microphýlla δ, latifòlia, Wall. cat. no. 1010. Corolla small, yellow.

Changed Cinquefoil. Pl. ¼ to ½ foot.

132 P. MICROPHY'LLA (D. Don, prod. fl. nep. p. 231. Wall. cat. no. 1010. Lehm. pug. 2. p. 17.) plant humble, tufted, clothed with silky villi; stems erect, 1-flowered, almost leafless, peduncle-formed, length of leaves; leaves pinnate, with many pairs of leaflets; leaflets crowded, deeply and digitately pinnatifid; segments linear, bluntish; petals obovate, quite entire, twice the length of the calyx. ♃. H. Native of Gosaingsthan. Flowers golden yellow.

Var. β, glabriúscula (Wall. l. c.) plant a little larger, and less silky, villous.

Var. γ, depréssa (Wall. l. c.) plant more densely tufted; stems shorter.

Small-leaved Cinquefoil. Pl. 2 to 3 inches.

133 P. CHINE'NSIS (Ser. in D. C. prod. 2. p. 581.) canescent; stem erect, paniculately corymbose at the apex, many-flowered; leaves interruptedly pinnate, larger leaflets oblong, pectinately-pinnatifid, glabrous above, and clothed with hoary tomentum beneath, with the nerves rather prominent; segments parallel, spreading, linear, with revolute edges; stipulas ovate, upper ones cut; flowers small; outer calycine segments minute. ♃. H. Native of China, in the province of Pichiley. Corolla yellow.

China Cinquefoil. Pl. 1½ foot.

134 P. GERARDIA'NA (Lindl. in Wall. cat. no. 1023. Lehm. pug. 2. p. 23.) plant woolly; stem erect, slender; leaves pinnate; leaflets 5-7, green above, and densely clothed with villi beneath, outer ones much the largest, obovate, bluntly serrate-toothed; stipulas broad, lanceolate, quite entire; flowers terminal, sub-corymbose; petals obovate-cuneiform, somewhat 2-lobed, longer than the calyx. ♃. H. Native of Sirmore. Corolla yellow.

Gerard's Cinquefoil. Pl. ½ to 1 foot.

135 P. NIVA'LIS (Torrey, ann. lyc. 2. p. 32. t. 3. f. 1.) plant nearly glabrous; stems erect, leafless, 1-flowered; leaves pinnate, with numerous, contiguous, somewhat imbricated, ovate, rather ciliated 2-3-lobed leaflets, upper ones confluent; lobes acute, spreading; petals nearly orbicular, quite entire, a little longer than the calyx. ♃. H. Native of North America, among the Rocky Mountains. Corolla yellow.

Snow Cinquefoil. Pl. ¼ foot.

136 P. MOORCRÓFTII (Wall. cat. 1014. Lehm. pug. 3. p. 29.) stem erect, simple, few-flowered; leaves pinnate, with 3-4 pairs of leaflets, pilose above, and glabrous beneath; leaflets obovate-oblong, almost quite entire, terminal one trifid; stipulas ovate-lanceolate, quite entire, ciliated; inner calycine segments ovate-roundish, obtuse; petals obovate, quite entire, longer than the calyx. ♃. H. Native of Ladak. Corolla yellow.

Moorcroft's Cinquefoil. Pl. ¼ to ½ foot.

137 P. ANSERÌNA (Lin. spec. 710.) roots and stems creeping; leaves interruptedly pinnate; leaflets oval, sharply serrated, silky; pedicels axillary, solitary, length of leaves; stipulas multifid; petals obovate, longer than the calyx. ♃. H. Native of Europe, Siberia, and America, in meadows and by road sides; plentiful in Britain. Smith, engl. bot. 861. Sturm, deutsch. fl. with a figure. Fl. dan. t. 544. Curt. lond. t. 31. Corolla large, yellow. The roots are astringent, with a sweetish taste, and were formerly used for tanning leather.

Var. β, geminiflòra (Ser. in D. C. prod. 2. p. 582.) flowers twin.—Moris. hist. sect. 2. t. 20. f. 4. P. anserina β, Nestl. pot. 35. Lehm. pot. 72.

Var. γ, cóncolor (Ser. l. c.) leaves silky on both surfaces.

Var. δ, Grœnlándica (Tratt. ros. 4. p. 13.) leaves smaller, with fewer pairs of leaflets; leaflets ovate-roundish, pinnatifidly serrated, glabrous above; stolons very long. ♃. H. Native of Greenland.

Goose Cinquefoil, Silver-weed, or Goose Tansey. Fl. May, Sept. Britain. Pl. creeping.

138 P. SIEMERSIA'NA (Lehm. sem. hort. hamb. 1821. p. 8. pug. 2. p. 31.) stems erect; leaves interruptedly pinnate, with many pairs of silky-silvery leaflets; larger leaflets obovate, sharply serrated, lined above, and nerved beneath; stipulas deeply toothed; petals obovate, a little longer than the calyx. ♃. H. Native of Nipaul. P. spléndens, Wall. mss. D. Don, prod. fl. nep. p. 230. Sweet, fl. gard. t. 191. P. fúlgens, Wall. mss. P. lineàta, Trev. Reichb. hort. bot. 1. p. 7. t. 8. P. naspàta, Hamilt. mss. Flowers yellow, disposed in dichotomous corymbs.

Siemers's Cinquefoil. Fl. May, July. Clt. 1822. Pl. 1 foot.

139 P. CA'NDICANS (Humb. et Bonpl. ex Nestl. pot. p. 34. t. 3. f. 2. and H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems ascending, few-flowered; leaves interruptedly pinnate; leaflets unequal, profoundly pinnatifid, clothed with white silky down on both surfaces; stipulas cut and entire; petals spatulate, obcordate, a little longer than the calyx. ♃. H. Native of Mexico, on the mountains. Flowers yellow, 2-4 at the tops of the stems, and lateral near the tops of the stems, on long pedicels. Receptacle villous.

Var. β, nàna (Humb. et Bonpl. ex Nestl. pot. t. 34. f. 2.) P. Humboldtiàna, Tratt. ros. 4. p. 41. Stem and leaves smaller. Lehm. pot. 67.

White-leaved Cinquefoil. Fl. May, July. Clt. 1820. Pl. ½ to 1 foot.

140 P. VERTICILLA'TA (Steph. in Willd. spec. 2. p. 1096.) stems ascending; leaves pinnate; leaflets narrow-linear, clothed with white tomentum beneath, with revolute margins; lateral ones distant, opposite, twin, subverticillate, terminal one trifid; stipulas cut; petals obovate, entire, a little longer than the

calyx. ♃. H. Native of Siberia. Flowers yellow, crowded at the tops of the branches.

Verticillate-leaved Cinquefoil. Pl. $\frac{1}{4}$ foot.

141 P. LINEARI′LOBA (Moc. et Sesse, fl. mex. icon. t. 298. D. C. prod. 2. p. 582.) root thick, turnip-formed; stems prostrate, 1-2-flowered; leaves silky; radical ones bipinnate, cauline ones 1-lobed; leaflets linear-obovate; stipulas lanceolate, narrow; calycine segments ovate; petals obcordate, length of the calyx. ♃. H. Native of Mexico. Flowers yellow. Allied to *P. anserìna*.

Linear-lobed-leaved Cinquefoil. Pl. prostrate.

142 P. APPROXIMA′TA (Bunge in Led. fl. ross. alt. ill. t. 325. fl. alt. 2. p. 241.) stems erect or ascending at the base, and are, as well as the petioles, clothed with white villi; radical and lower cauline leaves with 7 leaflets, upper ones with 5 leaflets or ternate, all pubescent and green above, but clothed with hoary tomentum beneath, pectinately pinnatifid; stipulas ovate-lanceolate, entire, rarely furnished with a large tooth at the base; petals emarginate, longer than the calyx; receptacle villous. ♃. H. Native of Altaia, in dry grassy places at the river Irtysch. Panicle dichotomous, with the pedicels solitary in the forks. Corolla yellow.

Approximate Cinquefoil. Fl. June, July. Pl. $\frac{1}{2}$ foot.

143 P. CONFE′RTA (Bunge in Led. fl. ross. alt. ill. t. 333.) root many-stemmed; stems ascending, and are, as well as the petioles, beset with long spreading villi; leaves pinnate; leaflets 7-11, oblong-lanceolate, distant, pectinately pinnatifid, with revolute margins, green and pubescent above, and clothed with hoary villi beneath; stipulas broad-ovate, a little cut; panicle terminal, crowded; petals obovate, rather retuse, about equal in length to the calyx; receptacle villous. ♃. H. Native of Altaia, at the river Kerlyk. Corolla yellow.

Crowded Cinquefoil. Fl. June, July. Pl. $\frac{1}{2}$ foot.

144 P. SOONGA′RICA (Bunge in Led. fl. ross. alt. ill. t. 332. fl. alt. 2. p. 244.) stem loose, ascending at the base, puberulous; petioles clothed with white villi; leaves pinnate; radical ones with 3-4 pairs of leaflets, those under the flower lanceolate and entire, the rest of the cauline ones with 2 pairs of leaflets; leaflets cinereous beneath, superior ones deeply pinnate-parted, lower ones smaller, lowest ones almost entire; lower stipulas pinnately jagged; flowers in loose dichotomous panicles; petals obovate, somewhat emarginate, exceeding the calyx; receptacle villous. ♃. H. Native of Altaia, on the mountains of Arkul and Dolen Kara in the Soongarian desert. Corolla yellow.

Soongarian Cinquefoil. Fl. May. Pl. $\frac{1}{2}$ to 1 foot.

145 P. EGE′DII (Wormsk. in fl. dan. 9. p. 5. t. 1578.) stem short, rather branched; leaves pinnate, quite glabrous; leaflets oval, pinnatifid; segments lanceolate, acute; pedicels axillary, solitary, longer than the leaves; stipulas quite entire; petals obovate, longer than the calyx. ♃. H. Native of Greenland, near Holsteinborg. Corolla large, yellow.

Eged's Cinquefoil. Pl. 1 to 2 inches.

146 P. SERI′CEA (Lin. spec. 70.) stems hoary, pubescent; leaves pinnate; leaflets ovate or obovate-oblong, deeply pinnate parted, clothed with silky tomentum on both surfaces; segments linear, obtuse, with revolute margins; stipulas lanceolate, entire or a little cut; flowers in dichotomous panicles; petals obcordate, twice the length of the calyx; receptacle villous. ♃. H. Native of Siberia, on rocks at the rivers Tschuja, Koksun, and Tscharysch. Lehm. pot. t. 6. Led. fl. ross. alt. ill. t. 334. Corolla yellow.

Var. β, glabràta (Hook. fl. bor. amer. p. 189.) leaves hardly silky at the apex. ♃. H. Native of North America, on the Rocky Mountains between lat. 52° and 56°.

Silky Cinquefoil. Fl. May, Ju. Clt. 1780. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

147 P. DASYPHY′LLA (Bunge in Led. fl. ross. alt. ill. t. 331. fl. alt. 2. p. 243.) stems ascending, rather villous; leaves pinnate; leaflets oblong, pinnate-parted; segments oblong-linear, bluntish, green and pubescent above, but clothed with hoary-silky villi beneath; stipulas ovate-lanceolate, entire; panicle terminal, few-flowered; petals obovate, entire, longer than the calyx; receptacle rather villous. ♃. H. Native of Altaia, on rocks at the rivers Korgon, Tscharysch, Koksun, and Tschuja, in the Soongarian desert. Corolla yellow.

Thick-leaved Cinquefoil. Fl. May. Pl. $\frac{1}{2}$ foot.

148 P. MULTI′FIDA (Lin. spec. 710.) stems ascending, pubescent; leaves pinnate, with few pairs of leaflets; leaflets pinnate-parted; segments linear, green and pubescent above, and clothed with hoary tomentum beneath; stipulas linear-lanceolate, acuminated, entire; flowers corymbose; petals emarginate, about equal in length to the calyx; receptacle pilose. ♃. H. Native of Switzerland, Siberia, Altaia, and Dahuria, in subalpine places, and in rather humid meadows. Ser. mus. helv. 1. p. 56 and 79. t. 8. P. verticillàris, Willd.?—Amm. ruth. p. 88. t. 113. f. 13. Flowers yellow.

Var. β, angustifòlia (Lehm. pot. p. 64.) leaflets more profoundly pinnate-parted, the segments much longer, and more distant.

Multifid-leaved Cinquefoil. Fl. May, June. Clt. 1759. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

149 P. CORIANDRIFÒLIA (D. Don, prod. fl. nep. p. 232.) plant tufted, nearly glabrous; stems simple, few-flowered, nearly leafless; radical leaves very numerous, pinnate; leaflets profoundly pinnate-parted; segments linear, ending each in a tuft of long white hairs, tipped with obtuse glands; stipulas lanceolate, acute, and entire; petals 2-lobed, twice the length of the calyx. ♃. F. Native of Gosaingsthan. P. meifòlia, Wall. cat. no. 1011. Corolla yellow.

Coriander-leaved Cinquefoil. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

150 P. DISSE′CTA (Pursh, fl. sept. 1. p. 355.) plant nearly glabrous; stems erect, loose; radical leaves pinnate; lower leaflets lanceolate, quite entire, upper ones cuneiform, pinnatifid; cauline leaves digitately-pinnate, the lateral leaflets the smallest; stipulas large, entire or denticulated; flowers pedunculate at the tops of the stems; petals obovate, hardly longer than the calyx. ♃. H. Native of Hudson's Bay. Flowers pale yellow, corymbose.

Dissected-leaved Cinquefoil. Pl. $\frac{1}{2}$ foot.

§ 5. *Leaves pinnate. Flowers white.*

151 P. RUPE′STRIS (Lin. spec. 711.) stems erect, dichotomous, reddish brown; radical leaves pinnate, cauline ones ternate; leaflets roundish, cuneated at the base, serrate-toothed; stipulas undivided; petals obovate, longer than the calyx. ♃. H. Native of Europe and Siberia, in mountainous regions. In Wales on the sides of a hill called Craig Wreidhin or rather Breddin, Montgomeryshire, but a doubtful native. Jacq. austr. 2. p. 91. t. 114. Ser. mus. helv. 1. p. 65. t. 6. f. 2. Smith, engl. bot. 2058. Krok. fl. sil. 2. t. 9. P. rùbens, Mœnch. meth. p. 657. P. fragarioìdes, Poir. suppl. 5. p. 586. Outer calycine segments usually bifid according to Ledebour, but linear and shorter than the inner ones according to Lehman. According to Smith the petals are obcordate in the British plant, if so it is a distinct species. Corolla white.

Rock Cinquefoil. Fl. May, Sept. England. Pl. 1 to $1\frac{1}{2}$ foot.

§ 6. *Shrubby species.*

152 P. FRUTICÒSA (Lin. spec. 709.) shrubby; leaves pinnate; leaflets oblong-lanceolate, quite entire, hairy; flowers subcorymbose; stipulas lanceolate, scarious, pilose above; petals obovate-roundish, longer than the calyx. ♄. H. Native of Poland, Germany, Dahuria, Piedmont, and the Pyrenees. In

England in mountainous thickets, but rare; about Greta-Bridge, Mickleforce, Egglestone Abbey, and several other places in Teesdale. Smith, engl. bot. t. 88. Nestl. pot. 30. t. 1. P. prostràta, Lapeyr. abr. p. 67. Upper leaves sessile, ternate. Leaves glabrous above, but when young beset with incumbent pili beneath, and canescent. Flowers yellow.

Shrubby Cinquefoil. Fl. Ju. Aug. England. Sh. 2 to 4 feet.

153 P. FLORIBU'NDA (Poir. suppl. 4. p. 54. Pursh, fl. amer. sept. 1. p. 355.) shrubby; leaves pinnate, pilose, grey; leaflets lanceolate, quite entire; flowers corymbose; stipulas lanceolate, scarious; petals obovate-roundish, longer than the calyx. ♄. H. Native of North America, throughout Canada from Lake Huron to the plains of the Saskatchawan and Bear Lake rivers under the Arctic circle, and from Newfoundland to the valleys of the Rocky Mountains on both sides, Kotzebue's Sound, and Behring's Straits. Wats. dend. brit. 70. P. fruticòsa β, Nestl. pot. p. 30. P. tenuifòlia, Schlecht. in berol. mag. ann. 7. p. 285. Upper leaves ternate, sessile? Flowers yellow.

Bundle-flowered Cinquefoil. Fl. June, Oct. Clt. 1811. Sh. 2 to 4 feet.

154 P. PARVIFÒLIA (Fisch. in litt. Lehm. pug. 3. p. 6.) shrubby, branched; leaves ternate, pilose on both surfaces; lateral leaflets deeply bipartite, rarely bifid or entire, terminal one tripartite, with the segments divaricate, linear, with revolute margins; stipulas lanceolate, acuminated, membranous, scarious, pilose above, purplish; flowers 2-3, terminal; petals obovate-cuneiform, entire, much longer than the calyx. ♄. H. Native of the Soongarian desert. Flowers yellow. Receptacle woolly.

Small-leaved Cinquefoil. Shrub 2 to 4 feet.

155 P. DAHU'RICA (Nestl. pot. 31. t. 1.) shrubby, nearly glabrous; lower branches horizontal, upper ones erect; leaves impari-pinnate, with 5 leaflets; leaflets oblong, quite entire, with revolute margins, superior ones confluent; flowers in terminal corymbose panicles; stipulas connate in one, pilose, scarious; outer calycine segments oval, inner ones the largest, ovate, and coloured; petals obovate, entire, longer than the calyx. ♄. H. Native of Dahuria, near Nertschinsk. P. fruticòsa β, Lehm. pot. 32. P. glàbra, Lodd. bot. cab. t. 914. Led. fl. ross. alt. ill. t. 173. Flowers white.

Dahurian Cinquefoil. Fl. June, Aug. Clt. 1818. Shrub 2 to 4 feet.

156 P. SALESÒVII (Poir. suppl. 4. p. 538. Lehm. pot. p. 35. t. 1.) shrubby; leaves pinnate, with 3-4 pairs of oblong sharply serrated leaflets, clothed with white tomentum beneath; stipulas ovate, acuminated, entire; flowers crowded at the tops of the branches; petals obovate, entire, longer than the calyx; outer calycine segments narrow. ♄. H. Native of Siberia. Corolla white.

Salesove's Cinquefoil. Fl. June, Jul. Clt. 1823. Sh. 1 to 2 ft.

157 P. ARBU'SCULA (D. Don, prod. fl. nep. p. 256. Wall. pl. asiat. rar. 3. t. 228.) shrubby, much branched; leaves pinnate; leaflets 5, oval, obtuse, villous above, and naked beneath, when young silky on both surfaces; peduncles elongated, 1-flowered, terminal, solitary, villous; stipulas brown, lanceolate, obtuse, membranous; calycine segments dissimilar, outer ones roundish, obtuse, deeply bipartite; petals orbicular, entire, longer than the calyx. ♄. H. Native of Gosaingsthan. P. Nepalénsis, D. Don, prod. fl. nep. p. 229. but not of Hook. Stems rooting. Flowers yellow.

Little-tree Cinquefoil. Shrub creeping.

158 P. RI'GIDA (Wall. cat. 1009. Lehm. pug. 3. p. 3.) shrubby, much branched; leaves ternate; leaflets oblong, entire, silky above, and glabrous beneath, with revolute margins; flowers terminal, usually solitary; stipulas broad, lanceolate, entire, membranous, sheathing; outer calycine segments usually deeply bipartite; petals orbicular, deeply emarginate, twice the length of the calyx. ♄. H. Native of Gosaingsthan and Kamaon. Flowers yellow.

Stiff Cinquefoil. Shrub 2 to 3 feet.

159 P. LIGNÒSA (Willd. herb. ex Spreng. syst. append. p. 344.) shrubby; branches twisted, compressed; leaves quinately digitate; leaflets cuneated, truncate, 3-toothed at the apex; peduncles solitary. ♄. H. Native of Hyrcania.

Woody Cinquefoil. Shrub.

† *Species not sufficiently known.*

160 P. LAGASCA'NA (Ser. in D. C. prod. 2. p. 586.) tomentose; leaves quinately pinnate; leaflets cuneiform, cut; floral ones ternate, with the leaflets sessile and trifid; petals equal in length to the calyx; receptacle hairy. ♃. H. Native country unknown. P. incìsa, Lag. gen. et spec. p. 16. but not of Desf.

Lagasca's Cinquefoil. Pl. $\frac{3}{4}$ foot.

161 P. CORYMBÒSA (Pour. act. toul. 3. p. 325.) stem shrubby, ascending; leaves quinate and ternate, villous. ♄. H. Native country unknown.

Corymbose-flowered Cinquefoil. Shrub.

162 P. BITHY'NICA (Horn. hort. hafn. suppl. 55.) stem much branched; radical leaves quinate; leaflets roundish-obovate; cauline leaves ternate; petals shorter than the calyx. ♄. H. Native of Bithynia.

Bithynian Cinquefoil. Pl. $\frac{3}{4}$ foot.

Cult. All the species of *Potentilla* are of easy cultivation, and some of them are handsome when in flower. They will grow in any common garden soil, and are easily increased by dividing the plants, or by seed. The shrubby kinds are very proper for the front of shrubberies, and they propagate freely by cuttings planted in the autumn in a sheltered situation.

XIII. TORMENTI'LLA (from *tormentum*, pain; in reference to its supposed efficacy in tooth ache, as well as from being supposed to cure diseases of the bowels). Lin. gen. no. 256. Smith, engl. fl. 2. p. 423.

LIN. SYST. *Icosándria, Polýgynia.* Calyx 8-parted, the 4 outer segments accessory and narrowest. Petals 4, inversely heart-shaped. Stamens 16 or more, not half so long as the corolla. Styles lateral, deciduous. Carpels or akenia seated on a small depressed hairy receptacle.—Herbaceous plants, with weak terete stems, digitate leaves, and solitary lateral pedicels, bearing small yellow flowers.

1 T. ERE'CTA (Lin. spec. 716.) stem ascending, branched, dichotomous; leaves ternate; cauline ones sessile; leaflets oblong, acute, deeply serrated; stipulas cut; pedicels solitary in the forks of the stem, and lateral; petals obcordate. ♃. H. Native of Europe, in barren pastures, heaths, and bushy places; plentiful in Britain. Oed. fl. dan. 589. T. officinàlis, Smith, fl. brit. 552. engl. bot. t. 863. Curt. lond. fasc. 5. t. 35. Potentílla Tormentílla, Sibth. 162. Nestl. pot. 65. Potentílla tetrapétala, Hall. jun. in Ser. mus. 1. p. 57. The flowers are sometimes to be met with having 5 petals, and a double blossomed variety was found by the late Miss Jones, of Hafod, in Cardiganshire. The roots are so astringent as to be used in the Western Isles of Scotland and in the Orkneys for tanning leather; for which purpose they are superior even to oak bark. They are at first boiled in water, and the leather is then steeped in the cold liquor. They are also used for dyeing a red colour. The root has an austere styptic taste, with a slight kind of aromatic flavour, and it is one of the most agreeable and efficacious of our indigenous aromatic astringents, and may be employed with good effect in all cases where medicines of this class are proper. It is sometimes given in powder, but usually in decoction.

Erect Tormentil. Fl. June, July. Britain. Pl. $\frac{1}{2}$ foot or pr.

2 T. RE'PTANS (Lin. spec. 716.) stems procumbent, hardly

branched; leaflets 3-5, obovate, deeply toothed, hairy, as well as the petioles; stipulas lanceolate, entire; pedicels lateral, 1-flowered, long, and slender; petals obcordate. ♃. H. Native of Europe, about hedges and the borders of fields. In Britain in several parts of Oxfordshire, and at Braintree, Essex; at Lakenham, near Norwich; in Hertfordshire and Surrey; at Bright House, near Halifax, Yorkshire; in barren grounds of Scotland. Smith, engl. bot. 864. Potentílla procúmbens, Sibth. Potentílla nemoràlis, Nestl. pot. 65. Plot's tormentil, Pet. herb. brit. t. 41. f. 10. Flowers sometimes with 5 petals.

Creeping Tormentil. Fl. June, July. Britain. Pl. pros.

3 T. HUMIFU'SA; floriferous stems short and filiform, procumbent; leaflets 5, cuneate-oblong, obtuse, deeply toothed, clothed with white tomentum beneath. ♃. H. Native of North America, in the plains of the Missouri. Potentílla humifùsa, Nutt. gen. amer. 1. p. 130.

Trailing Tormentil. Pl. trailing.

Cult. Plants of the easiest culture and propagation; however they are not worth growing except in botanical gardens, to fill up the arrangements.

XIV. CO'MARUM (from *κομαρος*, *comaros*, the arbutus; similar in fruit). Lin. gen. no. 638. Smith, engl. fl. 2. p. 433.

LIN. GEN. *Icosándria, Monogýnia.* Calyx 10-parted, the 5 outer segments accessory and small. Petals 5, lanceolate, shorter than the calyx, attached to the rim of the calyx along with the stamens. Styles lateral. Carpels or akenia numerous, seated on a large, dry, spongy, hairy, hemispherical receptacle.—An herbaceous creeping plant, with broad pinnate and ternate leaves, and terminal panicles of purple flowers.

1 C. PALU'STRE (Lin. spec. 718.) ♃. H. Native of Europe, Siberia, and North America, in marshes; plentiful in Britain. Smith, engl. bot. 173. Schkuhr, handb. t. 138. f. 1. Fl. dan. 637. Potentílla Cómarum, Scop. fl. carn. ed. 2. vol. 1. p. 359. Potentílla palústris, Lehm. pot. 32. Potentílla rùbra, Hall. fil. in Ser. mus. helv. 1. p. 5, 6. Root creeping. Stems ascending. Leaves pinnate. Leaflets broad, acutely serrated, green above, but glaucescent beneath. Flowers pedicellate, axillary, and terminal, dark purple; petals lanceolate, acuminated, much shorter than the calyx. The roots dye wool of a dirty red-colour, and have astringency enough with other plants of the same class to tan leather. In Scotland the fruit are called *cow-berries*.

Marsh Cinquefoil. Fl. June, July. Britain. Pl. 1 to 1½ foot.

Cult. This plant will grow in any kind of moist soil, and is increased by dividing at the root.

XV. HORKE'LIA (in honour of John Horkel, professor of physiology at Berlin). Cham. et Schlecht. in Linnæa. vol. 2. p. 27. Hook. fl. bor. amer. p. 196.

LIN. SYST. *Decándria, Polygýnia.* Calyx campanulate, semi-10-cleft, outer segments accessory. Petals 5, small. Stamens 10, inserted by 2 series in the sides of the calyx. Ovaries numerous, seated on a dry, conical, villous, receptacle. Styles simple, articulated with the ovaries, almost terminal. Akenia inclosed in the calyx.—Erect herbs, with pinnate leaves, and crowded terminal insignificant flowers.

1 H. CONGE'STA (Dougl. mss. Hook. bot. mag. 2880.) radical leaves pinnate; leaflets cuneate-oblong, cut at the apex; outer calycine segments quite entire; petals longer than the calyx. ♃. H. Native of California, at Cape Mendocino, and on the low hills of the Umtqua river in lat. 41° to 42°. Corolla white.

Crowded-flowered Horkelia. Fl. Aug. Clt. 1826. Pl. 1 to 2 ft.

2 H. CALIFÓRNICA (Cham. et Schlecht. in Linnæa. 2. p. 27.) erect, clothed with viscid pili; leaves pinnate and pinnatifid; flowers panicled; petals shorter than the calyx. ♃. H. Native of California. Sibbáldia Califórnica, Spreng. syst. app. p. 341. Corolla white.

Californian Horkelia. Pl. 1 to 2 feet.

Cult. The species of *Horkèlia* will grow in any common garden soil, and are readily increased by dividing at the root.

XVI. SIBBA'LDIA (in honour of Robert Sibbald, professor of physic at Edinburgh, author of Scotia Illustrata, 1684, &c.) Lin. gen. 393. Lam. ill. t. 221. D. C. prod. 2. p. 586.

LIN. SYST. *Penta-Decándria, Penta-Decagýnia.* Calyx flattish, 10-cleft, the 5 outer segments accessory. Petals 5, linear-spatulate. Stamens 5-10. Styles 5-10, lateral. Carpels or akenia 5-10, seated on an almost naked receptacle.—Evergreen, dwarf, glandless herbs, with trifoliate leaves, and glomerate or corymbose heads of yellow or white flowers.

1 S. PROCU'MBENS (Lin. spec. 406.) leaves trifoliate; leaflets equal, cuneated, and coarsely toothed at the apex, rather pilose; flowers corymbose; petals shorter than the calyx. ♃. H. Native of Europe, Siberia, and North America, on high mountains. Plentiful on the summits of the highland mountains of Scotland, in micaceous soil. Smith, engl. bot. t. 897. Fl. dan. 32. Petals small, yellow.

Procumbent Sibbaldia. Fl. July. Scotland. Pl. 1 to 3 inches.

2 S. ADPRE'SSA (Bunge in Led. fl. ross. alt. ill. t. 276. fl. alt. 1. p. 429.) leaves ternate; lateral leaflets oblong-lanceolate, quite entire, intermediate one cuneated, tripartite, with the lateral segments entire, and the middle one tridentate at the apex, silky beneath; flowers with 10 stamens and 10 styles; petals equal in length to the calyx. ♃. H. Native of Altaia, on high dry fields at the rivers Kan and Tschuja. Petals white.

Adpressed Sibbaldia. Pl. ¼ foot.

3 S. PARVIFLÒRA (Willd. act. soc. berol. vol. 2.) leaves trifoliate; leaflets beset with strigose pili on both surfaces; flowers in glomerate heads; petals obovate, one-half shorter than the calyx. ♃. H. Native of Cappadocia. Fragària orientàlis flore luteo, Tourn. cor. 21. Petals yellow.

Small-flowered Sibbaldia. Fl. July, Aug. Pl. ¼ foot.

Cult. *Sibbáldia* is a genus of small alpine plants. They do best in small pots in a mixture of peat, loam, and sand, and are increased by dividing.

XVII. CHAMÆRHO'DOS (from *χαμαι*, *chamai*, on the ground, and *ῥοδος*, *rhodos*, a rose, dwarf-rose). Bunge in Led. fl. ross. alt. ill. t. 257. fl. alt. 1. p. 429. Hook. fl. bor. amer. p. 196. —Sibbáldia species of Lin. D. C. and others.

LIN. SYST. *Pentándria, Penta-Decagýnia.* Calyx campanulate, 5-cleft. Petals 5, obovate. Stamens 5. Styles lateral, rarely 5, usually 10 or more. Carpels 5-10 or more, seated on a villous receptacle.—Small plants, with dissected leaves, beset with glandular pili. Corolla white or purple.

1 C. ERE'CTA (Bunge in Led. fl. alt. 1. p. 431.) herbaceous, pubescent; stems elongated, racemosely panicled; radical leaves biternately multifid, upper cauline ones 3-5-cleft; segments linear-filiform; flowers pentandrous; styles 5-20; petals exceeding the calyx. ♂. F. Native of Siberia, and Altaia, in pine woods, and of North America about Carlton House, on the Saskatchawan, as also among the Rocky Mountains.—Amm. ruth. p. 58. t. 25. Lam. ill. t. 221. f. 2. Sibbáldia erécta, Lin. spec. p. 406. Corolla purple.

Erect Chamærhodos. Fl. June, Aug. Clt. 1806. Pl. 1 ft.

2 C. GRANDIFLÒRA (Bunge, fl. alt. 1. p. 431.) stems numerous, erect, leafy; leaves divided into numerous linear segments, pubescent; petals twice the length of the calyx. ♃. H. Native of Dahuria, on granite rocks near Ouda, and at the river Selenga. Sibbáldia grandiflòra, Pall. in Willd. rel. ex Schultes, syst. 6. p. 770. Corolla red, larger than that of *C. erécta.*

Great-flowered Chamærhodos. Pl. 1 foot.

3 C. SABULÒSA (Led. fl. ross. alt. ill. t. 257. fl. alt. 1. p. 432.) plant suffruticose, clothed with clammy villi, tufted; stems as-

cending, dichotomously and corymbosely panicled at the apex; leaves triternate; segments obovate-oblong, obtuse; flowers with 5 stamens, and usually with 10 styles; petals equal in length to the calyx. ♃. H. Native of Siberia, in sandy islands in the river Tschuja. Petals white.

Sand Chamærhodos. Fl. June. Pl. procumbent.

4 C. POLY'GYNA; stem straight, beset with glandular hairs, panicled; leaves multifid; segments linear; flowers polygynous, disposed in glomerate heads; petals about equal in length to the calyx. ♃. H. Native of Siberia. Sibbáldia polýgyna, Willd. rel. ex Schultes, syst. 6. p. 770. Petals rose-coloured.

Polygynous Chamærhodos. Fl. Jul. Aug. Clt. 1824. Pl. $\frac{1}{2}$ ft.

5 C. ALTA'ICA (Bunge, fl. alt. 1. p. 429.) plant suffruticose, tufted, prostrate; leaves palmate or 3-parted, middle segment trifid, lateral ones bifid or trifurcate; sepals linear; flowers usually solitary, with 5 stamens and 10 styles; petals more than twice the length of the calyx. ⊙. H. Native of Altaia, at the rivers Kan and Kerlyk, in schistous saltish soil. Sibbáldia Altàica, Lin. suppl. 191. Flowers large, red.

Altaian Chamærhodos. Fl. June, July. Pl. prostrate.

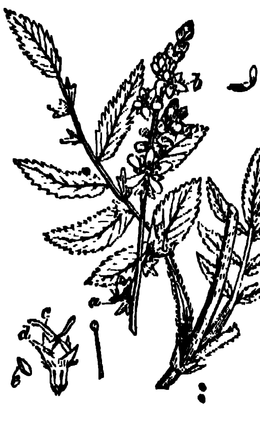
Cult. The species of *Chamærhòdos* are very difficult to preserve through the winter, as they are very liable to be carried off by the damp. They should be grown in pots in a mixture of sand, peat, and loam, and should be placed on a dry shelf in a cold frame in winter, at which time they should be but sparingly watered, if at all. They are only to be increased by seed.

XVIII. AGRIMO'NIA (a corruption of *Argemone*, a name given by the Greeks to a plant which was supposed to cure cataract of the eye, from αργος, *argos*, white, the cataract of the eye being white). Tourn. inst. t. 155. Nestl. pot. 16. D. C. prod. 2 p. 587.

LIN. SYST. *Dodecándria, Digýnia.* Calyx tubular, foveolate on the sides, with 5 small acute marginal segments (f. 73. *d.*), the tube subsequently hardened, and closed over the seeds, furnished on the outside by a circle of hooked bristles, forming an involucre. Petals 5 (f. 73. *b.*). Stamens 7-20, from the rim of the calyx along with the petals. Carpels 2, in the bottom of the calyx. Styles 2, lateral (f. 73. *c.*). Seeds pendulous.—Astringent aromatic herbs, with interruptedly pinnate leaves, each accompanied by a pair of stipulas united to the petioles. Flowers small, numerous, spiked, yellow. Bracteas trifid (f. 73. *a.*).

1 A. EUPATÒRIA (Lin. spec. 643.) hairy or smoothish; leaves interruptedly pinnate; leaflets elliptic-oblong, coarsely serrated, odd one stalked; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, encircled by a whorl of hooked prickles above; spikes of flowers elongated. ♃. H. Native of Europe, in bushy places by road sides, and about the borders of fields; plentiful in some parts of Britain. Smith, engl. bot. 1335. Curt. lond. fasc. 5. t. 32. Woodv. med. bot. suppl. 258. Fl. dan. t. 588. The herb is slightly bitter, aromatic, astringent, evincing a tonic property, for which it has always been noted, and which has procured it a place in several British herb teas. In decoction it was formerly used as an astringent for a gargle, and in diarrhœa and leucorrhœa. Kalm informs us, that the Canadians use the infusion of the root with great success in burning fevers, and Dr. Hill says it is an effectual cure for jaundice, sweetened with honey, in the quantity of half a pint three times a day. The plant will dye wool of a nankeen colour. It is also recommended for dressing leather.

FIG. 73.



Eupator's Agrimony. Fl. June, July. Britain. Pl. 1 to 2 ft.

2 A. NEPALE'NSIS (D. Don, prod. fl. nep. p. 229.) leaves interruptedly pinnate; leaflets ovate, serrated, odd one stalked, very villous on both surfaces, as well as the stems; racemes erect, slender; bracteas trifid, shorter than the calyx; calycine segments lanceolate, acute, keeled. ♃. H. Native of Gosaingsthan.

Nipaul Agrimony. Fl. June, July. Clt. 1820. Pl. 1 to 2 ft.

3 A. DAHU'RICA (Willd. herb. ex Stev. in litt. D. C. prod. 2. p. 587.) glabrous; leaves interruptedly pinnate; the rest unknown. ♃. H. Native of Dahuria. Very like *A. Eupatòria*, but differs in the leaves being narrower and more acute, and in the flowers being more remote.

Dahurian Agrimony. Fl. June, July. Clt. 1811. Pl. 1 to 2 ft.

4 A. ODORA'TA (Cam. epit. 7. D. C. prod. 2. p. 587.) hairy; leaves interruptedly pinnate; leaflets oblong, lanceolate, deeply crenate-toothed; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, pilose, with the foveolæ obovate, and drawn out even to the base, and with the bristles ascending and short. ♃. H. Native of Italy. A. Eupatòria, Desf. cat. 176. ex D. C. fl. fr. 4. p. 451.—Mill. fig. t. 15. Spikes several.

Sweet-scented Agrimony. Fl. July, Aug. Clt. 1640. Pl. 2 to 3 feet.

5 A. PILÒSA (Led. ind. hort. dorp. suppl. 1823. p. 1. fl. alt. 2. p. 205.) pilose; leaves interruptedly pinnate; leaflets cuneate-rhomboid, smoothish above, but pilose at the nerves beneath, serrated, the smaller ones almost quite entire; bristles of fruit erectly connivent; the foveolæ drawn out beyond the middle. ♃. H. Native of Altaia, frequent in meadows and by way sides. Rchb. icon. pl. rar. 3. p. 49. t. 252. f. 414. Stems usually simple, bearing only one spike, rarely branched.

Pilose Agrimony. Fl. June, July. Clt. 1819. Pl. 1 to 2 ft.

6 A. PARVIFLÒRA (Ait. hort. kew. ed. 1. vol. 2. p. 130.) smoothish; leaves interruptedly pinnate; leaflets numerous, lanceolate, deeply serrated; spikes slender; petals one-half longer than the calyx; fruit distant; tube of calyx turbinate; foveolæ drawn out even to the base; bristles ascending. ♃. H. Native of North America, from Pennsylvania to Carolina, and throughout Canada. Fibres of the root tuberous, as in *Spiræ'a filipéndula.*

Small-flowered Agrimony. Fl. June, July. Clt. 1766. Pl. 1 to 2 feet.

7 A. SUAVE'OLENS (Pursh, fl. amer. sept. 1. p. 336.) plant very hairy; leaves interruptedly pinnate; leaflets lanceolate, sharply serrated; spikes of flowers twiggy and clammy; flowers almost sessile; petals twice the length of the calyx; fruit obconical, with divaricate bristles. ♃. H. Native from Virginia to Carolina.

Sweet-scented Agrimony. Fl. July, Aug. Clt. 1810. Pl. 1 to 2 feet.

8 A. BLU'MEI; leaves interruptedly pinnate, velvety, pubescent; the terminal leaflet sessile; racemes elongated, spicately racemose, clothed with clammy pubescence. ♃. H. Native of Java and Japan, on the mountains. A. suavèolens, Blum. bijdr. 1113. but not of Pursh.

Blume's Agrimony. Pl. 1 to 2 feet.

9 A. STRIA'TA (Michx. fl. bor. amer. 1. p. 887.) leaves interruptedly pinnate; spikes twiggy; fruit reflexed, turbinate, sulcately striated. ♃. H. Native of Canada. Flowers white. This species is hardly known.

Striated-calyxed Agrimony. Fl. July, Aug. Clt. 1812. Pl. 1 to 2 feet.

10 A. **re'pens** (Lin. spec. 875.) hairy; leaves pinnate; leaflets oblong, terminal one sessile; spikes nearly sessile; petals 3 times the length of the calyx; bracteas length of flowers; stipulas length of the internodes of the stem, and almost covering it; roots creeping; fruit hispid. ♃. H. Native of Armenia. Like *A. Eupatòria*, but the stems are thicker, the spikes more dense, the flowers sessile, and the fruit larger.

Creeping-rooted Agrimony. Fl. Jul. Aug. Clt. 1737. Pl. 2 ft.

Cult. Plants of easy culture. They will grow in any common soil, and are readily increased by dividing at the root.

XIX. **AREMO'NIA** (altered from *Agrimonia*). Neck. elem. no. 768. Agrimonioides, Tourn. inst. t. 155. Amònia, Nestl. pot. 17. Spallanzània, Poll. giorn. fis. pav. 1816. p. 187. with a figure.

Lin. syst. *Peta-Decándria, Digýnia.* Involucrum calyciform, 10-12-cleft. Tube of calyx oblong, with a 5-cleft bractless limb. Petals 5. Stamens 5-10. Carpels 2. Styles terminal. Akenia usually solitary from abortion, inclosed in the globose tube of the calyx, thin, membranous. Seed pendulous.—An evergreen herb, with interruptedly impari-pinnate leaves; leaflets dentately serrated, lower ones small, outer ones large. Flowers small, yellow, in fascicles or few-flowered corymbs.

1 A. **agrimonioìdes** (D. C. prod. 2. p. 588.) ♃. H. Native of Italy and Carniola, in humid places. Agrimònia agrimonioìdes, Lin. spec. 643. Col. ecphr. t. 144. Mor. oxon. sect. 5. t. 34. f. 9. Stem leaves ternate.

Agrimonia-like Aremonia. Fl. June, July. Clt. 1739. Pl. ½ to ¾ foot.

Cult. See *Agrimònia* for culture and propagation.

XX. **BRAYE'RA** (in honour of Dr. Brayer, the discoverer of the plant). Kunth, in Brayer, not. 8vo. 1824. Paris, dict. class. hist. nat. 2. p. 501. with a figure, D. C. prod. 2. p. 588.

Lin. syst. *Dodecándria, Digýnia.* Calyx permanent, with a turbinate tube, which is silky on the outside; limb 10-parted, outer segments accessory, large, and oblong; the 5 inner ones spatulate and shorter; throat pervious. Petals 5, scale-formed, small, linear, deciduous. Stamens 15-20, nearly equal, shorter than the petals. Carpels 2, free, in the bottom of the calyx, 1-2-ovulate. Styles exserted, crowned by subpeltate crenately lobed stigmas. Seed solitary, pendulous.—A tree. Peduncles branched, and clothed with soft hairs, flexuous, and bracteate; flowers 4 together; bracteas roundish-elliptic. Leaves unknown.

1 B. **anthelmi'ntica** (Kunth, l. c.) ♄. F. Native of Abyssinia, where it is called *cotz* or *cabotz*. The flowers of this tree are the most powerful anthelmintic known. Upon the authority of Dr. Brayer 2 or 3 doses of the infusion are sufficient to cure the most obstinate case of tænia.

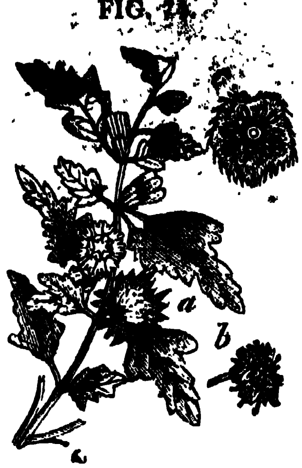
Anthelmintic Brayera. Tree.

Cult. The tree will possibly thrive well in a mixture of loam and peat, and cuttings will most probably root in sand under a hand-glass.

Tribe II.

NEURA'DEÆ. Calyx 5-cleft (f. 74. *a.*), with a short tube, adhering to the ovaries; lobes cut, valvate in æstivation. Petals 5 (f. 74. *b.*), inserted in the bottom of the calycine lobes. Stamens 10. Styles 10. Carpels 10, connected into a 10-celled capsule (f. 74. *c.*), which is depressed at the apex, and girded by the echinated calyx. Seeds solitary in the cells, bony, obliquely pendulous. Embryo curved, with an oblique radicle and oblong cotyledons.—Decumbent, fruticose, tomentose herbs, with sinuately pinnatifid leaves, and small solitary axillary flowers. Seeds germinating in the capsule.

FIG. 74.



XXI. **NEURA'DA** (νευρον, *neuron*, a nerve; in reference to the plaited nerved leaves). Juss. in Lin. gen. 587. Gærtn. fruct. 1. p. 162. t. 32. D. C. prod. 2. p. 548.

Lin. syst. *Decándria, Polygýnia.* Character the same as that of the tribe.

1 N. **procu'mbens** (Lin. spec. 631.) ⊙. H. Native of Egypt, Arabia, and Numidia. Forst. descrip. p. 90. Lam. ill. t. 393. (f. 74.)

Procumbent Neurada. Pl. tr.

Cult. The seeds of this plant only require to be sown in a warm dry sheltered situation in the open ground.

Tribe III.

RO'SEÆ (so named in consequence of the section comprising *roses*). D. C. prod. 2. p. 596.—Rósæ, Juss. gen. p. 353. Calyx with the tube contracted at the mouth (f. 75. *g.*), and with a 5-parted limb (f. 75. *b.* f. 76. *d.*); the segments somewhat spirally imbricated at the apex in æstivation, and usually pinnately divided (f. 75. *b. c.* f. 76. *d.*). Petals 5 (f. 75. *e.* f. 76. *e.*). Stamens numerous. Carpels numerous, bony, inserted on the inside of the tube of the calyx, which at length becomes baccate (f. 75. *f.* f. 76. *b.*), and incloses them; they are dry and indehiscent, bearing each a style on the inner side. Styles exserted from the constricted part of the calycine tube (f. 75. *g.*), sometimes distinct, sometimes connected into a columnar style. Seeds solitary, exalbuminous, inverted. Embryo straight, with flattish cotyledons.—Shrubs, usually with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole (f. 75. *a.*).

XXII. **RO'SA** (from *rhos*, red, Celtic; in reference to the colour of the flowers of most of the species of the rose). Tourn. inst. 1. p. 636. t. 408. Lin. gen. 631. Lam. ill. t. 440. Lindl. mon. 8vo. 1820. Pronv. nom. ros. 1818. mon. ross. 1824.—Rhodóphora, Neck. elem. 784.

Lin. syst. *Icosándria, Polygýnia.* The character the same as that of the tribe.

Sect. I. Simplicifòlia (Lindl.). Leaves simple, exstipulate. Fruit bristly.

1 R. **berberifòlia** (Pall. nov. act. petr. 10. p. 379. t. 10. f. 5.) leaves simple, serrated; prickles decurrent; sepals entire. ♄. H. Native of Persia, near Amadan, and in fields at the bottom of Mount Elwend, and in the desert of Soongaria. R. simplicifòlia, Salisb. hort. allert. 359. par. lond. 101. with a figure. Led. fl. ross. atl. ill. 370. Lówea conspícua, Lindl. bot. reg. 1261. Petals yellow, marked with purple at the base.

Var. α, glàbra (Ser. in D. C. prod. 2. p. 602.) stipulas connate, leaf-formed, glabrous; prickles substipular, twin. ♄. H. Native of the Soongarian desert, in salt places beyond the river Irtysch.—Red. et Thor. ros. 1. p. 27.

Var. β, velutìna (Ser. mss. in D. C. prod. 2. p. 602.) stem, prickles, and leaves velvety; leaflets spatulate-lanceolate; prickles substipular, twin. ♄. H. Native of Persia.

Barberry-leaved Rose. Fl. Ju. Jul. Clt. 1790. Sh. 1 to 2 ft.

Sect. II. Feròces (from *ferox*, fierce, in reference to the branches being thickly beset with prickles). Lindl. mon. p. 3. Branches clothed with permanent tomentum. Fruit naked. The plants contained in this section are a strictly natural group. They are low shrubs, losing their leaves early in autumn, and are then remarkable for their hoary branches, bristles and numerous prickles. Their fruit is perfectly smooth, which character separates them from the next section, in which the fruit is downy. Sepals usually toothed.

2 R. FE'ROX (Lawr. ros. t. 42.) prickles of the same shape, and much crowded. ♄. H. Native of Caucasus. Lindl. in bot. reg. t. 440. R. Kamtschática, Red. ros. 1. p. 47. t. 12. R. Kamschática β, ferox, Ser. in D. C. prod. 2. p. 607. R. echinàta, Dupont. Flowers large, red. Fruit globose, scarlet.

Var. β, *nìtens* (Lindl. bot. reg. 824.) leaves shining, pale green, glabrous on both surfaces; flowers pale crimson. R. Kamtschática γ, nìtens, Ser. in D. C. prod. 2. p. 607.

Fierce Rose. Fl. July, Aug. Clt. 1796. Shrub 3 to 4 ft.

3 R. RUGÒSA (Thunb. fl. jap. 213.) arms crowded, nearly equal; peduncles beset with curved prickles. ♄. H. Native of Japan. *Ramanas* of the Japanese. Lindl. ros. p. 5. t. 19.

Wrinkled Rose. Shrub 3 to 4 feet.

4 R. KAMTSCHA'TICA (Vent. cels. t. 67.) prickles infra-stipular, falcate, large; leaves opaque. ♄. H. Native of Kamtschatka, in dry rocky places. Lindl. in bot. reg. t. 419. Flowers solitary, deep red. Fruit spherical, scarlet, less than that of *R. ferox.*

Kamtschatka Rose. Fl. June, Jul. Clt. 1791. Sh. 3 to 4 ft.

SECT. III. BRACTEA'TÆ (from *bracteatus*, propped or covered with plates; flowers furnished with bracteas). Branches and fruit clothed with permanent tomentum. This section is readily distinguished from the last by the woolliness of the fruit. Leaves dense, usually shining, and prickles are placed under the stipulas in pairs. Sepals simple or nearly so.

5 R. INVOLUCRA'TA (Roxb. Lindl. ros. p. 8.) leaflets elliptic-lanceolate, tomentose beneath; bracteas contiguous, pectinate. ♄. H. Native of Nipaul and China. Lindl. bot. reg. 709. R. palústris, Hamilt. mss. R. Lindleyàna, Tratt. ros. 2. p. 190. Flowers white, nearly solitary, surrounded by 3 or 4 approximate leaves.

Involucrated Rose. Fl. Ju. Jul. Clt. 1818. Sh. 3 to 4 ft.

6 R. MICROPHY'LLA (Roxb. Lindl. ros. p. 9.) leaflets ovate, small; bracteas appressed, pectinate; fruit prickly. ♄. H. Native of China. *Hai-tong-hong* of the Chinese. Flowers small, double, of a delicate blush colour.

Small-leaved Rose. Fl. Aug. Oct. Shrub 2 to 3 feet.

7 R. BRACTEA'TA (Wendl. obs. p. 50.) leaflets oblong, obtuse, quite glabrous; bracteas appressed, pectinated. ♄. H. Native of China. Red. ros. p. 35. t. 6. Vent. cels. t. 28. Ròsa lùcida, Lawr. ros. t. 84. Ròsa Macártnea, Dum. Cour. bot. cult. Flowers showy, pure white, solitary, nearly sessile. Fruit spherical, orange red.

Var. β, *scabriúscula* (Lindl. ros. 10.) branches setigerous; prickles smaller, straightish. ♄. H. Native of China. R. bracteàta, Mœnch, meth. suppl. 290. Jacq. fragm. 30. t. 34. f. 2. Sims, in bot. mag. 1377.

Bracteated or Macartney's Rose. Fl. June, Oct. Clt. 1795. Shrub 2 to 3 feet.

8 R. LYE'LLII (Lindl. ros. p. 12. t. 1.) leaflets oblong-lanceolate, glabrous; bracteas distant, entire; flowers cymose. ♄. H. Native of Nipaul. Plant densely villous. Flowers probably white.

Lyell's Rose. Shrub 3 to 4 feet.

SECT. IV. CINNAMÒMEÆ (plants agreeing in character with *R. cinnamòmea*). Lindl. ros. 13. Plants setigerous or unarmed, bracteate. Leaflets lanceolate, glandless. Disk thin, never thickened. This section is distinguished by its long, lanceolate leaflets, without glands, upright shoots, and compact habit; red flowers never solitary except by abortion, and always supported by bracteas; an inconspicuous disk but little thickened; round, small, red fruit, losing their long narrow sepals, and small, smooth, shining pericarps. The shoots are usually setigerous next the ground, but rarely so towards the apex, except in one or two instances. *R. alpìna* and *R. aciculàris* of the following division sometimes have bractea, but their sepals never fall off till the fruit is decayed. Sepals simple, entire, or nearly so, unless when mentioned otherwise.

9 R. NÍTIDA (Willd. enum. 544.) dwarf; prickles crowded, very slender; leaflets shining, narrow-lanceolate, flat. ♄. H. Native of Newfoundland. Lindl. ros. 19. t. 2. R. rubrispìna, Bosc. dict. d. agr. 246.? R. blánda, Pursh, fl. amer. sept. 1. p. 344. R. Redùtea rubéscens, Red. ros. 1. p. 103. t. 36. Shrub beset with straight red spines. Flowers deep red. Fruit depressed, spherical, bright scarlet.

Shining-leaved Rose. Fl. June, Aug. Clt. 1807. Sh. 2 ft.

10 R. RA'PA (Bosc. dict. d'agr. ex. Desf. cat. hort. par. 273.) taller, diffuse; branches unarmed; leaflets oblong, undulated, shining; fruit hemispherical. ♄. H. Native of North America, in the warmer states. Red. ros. 1. p. 7. t. 2. R. túrgida, Pers. ench. 2. p. 49. R. fraxinifòlia, Dum. Cours. bot. cult. Petals always multiplied, smaller than those of *R. lùcida*, bright red. Fruit deep red. Sepals compound.

Turnip Rose. Fl. June, Aug. Shrub 3 to 4 feet.

11 R. LU'CIDA (Ehrh. beitr. 4. p. 22.) compact; prickles of the branches stipular; leaflets oblong, imbricated, flat, shining; fruit globose, depressed. ♄. H. Native of North America, from New York to Carolina; near Boston, in bogs, and on the edges of marshes, and of Newfoundland. R. rùbra lùcida, Ross. ros. t. 7. and t. 25. f. 1. R. lùcida, Jacq. fragm. 71. t. 107. f. 3. Red. ros. 1. p. 45. t. 11.—Dill. elth. 325. t. 245. f. 316. Flowers red, overtopped by the leaves and young branches. Fruit bright red.

Lucid Rose. Fl. June, Aug. Clt. 1724. Sh. 4 to 6 feet.

12 R. LINDLE'YI (Spreng. syst. 2. p. 647.) diffuse; branches twiggy, almost unarmed; leaflets oblong, undulated, opaque, glaucescent. ♄. H. Native of North America. R. láxa, Lindl. ros. 18. t. 3. R. Carolina ε, Ait. hort. kew. ed. 2. vol. 3. p. 260. R. Carolina, pimpinellifòlia, Andrews. ros. with a figure. A spreading shrub, with reddish brown branches. Flowers rose-coloured, growing usually in pairs.

Lindley's Carolina Rose. Fl. July, Aug. Clt. ? Sh. 3 to 4 ft.

13 R. LA'XA (Retz. ex Spreng. syst. 2. p. 548.) cauline prickles recurved; flowers corymbose; bracteas glandularly serrated; petioles unarmed, villous; leaflets oblong, equally serrated, pubescent beneath. ♄. H. Native of Siberia. Flowers red. Fruit oblong, glabrous.

Loose Rose. Shrub 3 to 4 feet.

14 R. KOSINGIA'NA (Bess. ex Spreng. syst. append. 2. p. 548.) prickles almost stipular, recurved; leaflets with cuspidate serratures, glabrous on both surfaces, pale beneath; peduncles and calyxes hispid; fruit oblong, glabrous. ♄. H. Native of Podolia, at Tyra.

Kosingian Rose. Shrub 4 to 6 feet.

15 R. FRUTETÒRUM (Bess. ex Spreng. syst. 2. p. 548.) prickles almost stipular, strong, reflexed; petioles unarmed, and are as well as the under surface of the leaves villous; leaflets elliptic; peduncles very short, glabrous; fruit globose, glabrous. ♄. H. Native of Volhynia.

Bush Rose. Fl. June, July. Clt. 1818. Shrub 5 to 6 feet.

16 R. PARVIFLÒRA (Ehrh. beitr. 4. p. 21.) dwarf; stipulas linear; prickles acicular; leaflets lanceolate, smoothish, sharply serrated; calyxes clammy. ♄. H. Native of North America, on the declivities of hills in the state of New York and Carolina. Du Roi, harbk. 2. p. 354. Smith, insect. georg. 1. p. 49. t. 25.? R. hùmilis, Marsh. arb. 136. R. Caroliniàna, Michx. fl. bor.

amer. 1. p. 295. R. Carolìna γ and δ, Ait. hort. kew. ed. 2. vol. 3. p. 260. Pennsylvanian Rose, Lawr. ros. t. 3. and t. 66. A very low weak plant. Flowers pale blush, usually growing by pairs.

Var. β, flòre-pleno; flowers double, pale blush, unexpanded. A neat little rose. Red. ros. 2. p. 73. with a figure.

Small-flowered Pennsylvanian Rose. Fl. June, Aug. Clt. 1724. Shrub 2 feet.

17 R. Woódsii (Lindl. ros. p. 21.) stipulas and sepals connivent; leaflets oblong, obtuse, glabrous. ♄. H. Native of North America, near the Missouri and north of the Saskatchawan and as far as the Bear Lake. Lindl. bot. reg. t. 976. R. lùtea nìgra, Pronv. nom. p. 24. A low shrub, with dull dark branches. Flowers pink. Fruit ovate, naked. There is a plant which was gathered about Cumberland House Fort, which Mr. Borrer takes to be a variety of the present species, having the leaves downy beneath.

Woods's Rose. Fl. Mar. June. Clt.? Shrub 2 to 3 feet.

18 R. Caroli'na (Lin. spec. 703.) stipulas convolute; leaflets lanceolate; sepals spreading. ♄. H. Native of New England, Virginia, and Canada as far as the Saskatchawan. Red. ros. 1. p. 81. t. 28. Lindl. ros. p. 23. t. 4. R. Virginiàna, Du Roi, harbk. 2. p. 353. Rössig, ros. t. 13. R. palústris, Marsh. arbr. 135. R. corymbòsa, Ehrh. beitr. 4. p. 21. R. Pennsylvánica, Michx. fl. bor. amer. 1. p. 296. R. Caroliniàna, Bigel, fl. bost. 121. R. Hudsoniàna, Red. ros. 1. p. 95. t. 35. Branches green or reddish brown. Cymes one or many-flowered. Flowers crimson. Petals concave or flat, crumpled. Fruit round, scarlet, hispid. Sometimes the ends of the shoots have no prickles.

Var. β, Flórida (Lindl. ros. t. 23.) leaves without pubescence, thinner. R. Flórida, Donn, cant. ed. 8. p. 169. R. enneaphýlla, Rafin.

Carolina Rose. Fl. June, Jul. Clt. 1726. Shrub 2 to 8 ft.

19 R. bla'nda (Ait. hort. kew. 2. p. 202.) taller; prickles deciduous; leaflets oblong, flat; petioles pilose. ♄. H. Native of North America, on the west coast, Hudson's Bay, Canada as far north as Bear Lake. R. fraxinifòlia *α*, blánda, Ser. in D. C. prod. 2. p. 606. Flowers solitary, large, pale red.

Bland Rose. Shrub 2 to 6 feet.

20 R. fraxinifòlia (Börk. holz. 301. Ker. bot. reg. 458.) taller, unarmed; branches straight, glaucescent; leaflets opaque, undulated, glabrous. ♄. H. Native of Newfoundland, and on the north-west coast of America. R. Virginiàna, Mill. dict. no. 10. R. blánda *α*, Sol. mss. Jacq. fragm. 70. t. 105. R. corymbòsa, Bosc. dict. d'agr. ex Desf. cat. hort. par. p. 272.? R. alpìna β, Ait. hort. kew. ed. 2. vol. 3. p. 265. R. alpìna læ'vis, Red. ros. 1. p. 57. t. 19. Lawr. ros. t. 75. Branches dark purple, with a pale blue bloom. Flowers small, red, in few-flowered cymes. Fruit naked, small, round, or ovate, of a dull pale red colour.

Var. β, variegàta (Ser. in D. C. prod. 2. p. 607.) flowers rose-coloured, variegated with purple. R. alpìna flòre variegàto, Red. ros. p. 55. with a figure.

Var. γ, L'Heritieriàna (Ser. l. c.) flowers corymbose, semi-double; prickles scattered, recurved. R. L'Heritieriàna, Red. ros. 3. p. 21. with a figure.

Ash-leaved Rose. Fl. May, June. Clt.? Shrub 4 to 6 ft.

21 R. cinnamòmea (Besl. hort. eyst. vern. ord. 6. p. 5. Lin. spec. 703.) tall, cinereous; branches straight; prickles stipular, straightish; stipulas dilated, undulated; leaflets oblong, obtuse, wrinkled, tomentose beneath. ♄. H. Native of Denmark, Belgium, Portugal, Germany, Switzerland, France, Bohemia, and Caucasus. Lindl. ros. p. 28. t. 5. Red. ros. 1. p. 105. t. 37. and p. 133. t. 51. R. fœcundíssima, Munch. hausv. 5. p. 279. Fl. dan. t. 1214. R. majàlis, Herm. diss. 8. Flowers solitary or 2-3 together, pale or bright red. Fruit round, naked, crimson. The double-flowering variety is much more common than the single.

Var. β, fluviàlis (Lindl. ros. p. 28.) leaflets ovate, acute. ♄. H. Native of Denmark and Switzerland.

Cinnamon Rose. Fl. May, June. Clt.? Shrub 5 to 6 feet.

22 R. Dicksonia'na (Lindl. hort. trans. 7. p. 224. syn. brit. fl. p. 99.) branches flexuous, setigerous, armed with a few slender, scattered prickles; leaflets folded together, unequal, with coarse double serratures; stipulas, petioles, and sepals glandular, the latter unequal; fruit naked. ♄. H. Native of Ireland. Flowers white.

Dickson's Rose. Fl. June, July. Ireland. Sh. 5 to 6 feet.

23 R. Tau'rica (Bieb. fl. taur. 1. p. 394.) taller, cinereous; prickles scattered, weak; branches straight, unarmed towards the apex; leaflets oblong, wrinkled, villous beneath; sepals compound; styles stretched out, glabrous. ♄. H. Native of Tauria, in bushy places. Habit of *R. cinnamòmea.* Flowers red.

Taurian Rose. Fl. June, Jul. Clt. 181[illegible]. Shrub 5 to 6 ft.

24 R. Dahu'rica (Pall. fl. ross. 61. Lindl. ros. p. 32.) tall, much branched; branches slender, coloured; prickles stipular, spreading, a little recurved; stipulas linear; leaflets oblong, wrinkled, tomentose beneath, deeply serrated. ♄. H. Native of Dahuria and Mongol Tartary, in birch woods. Flowers red. Fruit ovate, red.

Dahurian Rose. Fl. May, June. Clt. 1824. Sh. 4 to 6 ft.

25 R. Soonga'rica (Bung. in Led. fl. alt. 2. p. 226.) tall; branches brown; prickles stipular, strong, reflexed; stipulas ovate, lanceolate, glandularly serrated; leaflets glabrous, oval-oblong, simply serrated; fruit globose, glabrous. ♄. H. Native of the Soongarian desert, on the mountains of Arkaul and Dolenkara, at the river Irtysch. Peduncles corymbose, beset with glandular bristles. Petioles prickly. Flowers white; petals length of calyx. Prickles of the sterile branches straight.

Soongarian Rose. Fl. May. Shrub 5 to 6 feet.

26 R. Gmeli'ni (Bunge in Led. fl. alt. 2. p. 228.) branches dark brown, sterile branches very prickly, floriferous ones almost unarmed; prickles setaceous, unequal; sepals ovate, acuminated, undivided, beset with glandular bristles; petioles clothed with glandular down; leaflets 5-7, obovate-oblong, simply serrated, pubescent, and glandless beneath; peduncles hispid; fruit ovate, glabrous. ♄. H. Native of Siberia, common. R. canìna, Sievers in Pall. nord. beytr. 7. Rosa non spinosa, fructu turbinato, Gmel. fl. sib. 3. p. 177. no. 15. Petals deep red, shorter than the sepals.

Gmelin's Rose. Shrub 3 to 4 feet.

27 R. arista'ta (Lapeyr. fl. pyr. t. 105.) upper leaves usually with 2 pairs of leaflets, and with the petiole ending in a spine. ♄. H. Native of the Pyrenees. Stem with a few prickles. Flowers solitary, purple. Perhaps a monstrosity of *R. cinnamòmea.*

Armed-petioled Rose. Shrub 4 to 6 feet.

28 R. maja'lis (Retz, obs. bot. 3. p. 33.) dwarf, grey; branches straight, coloured; prickles scattered, nearly equal; stipulas linear; leaflets oblong, flat, glaucous, and tomentose beneath. ♄. H. Native of Sweden, Lapland, and Britain, near Pontefract, Yorkshire. R. mùtica, Fl. dan. 688. R. spinosíssima, Gorter. ingr. 78. R. collíncola, Ehrh. beitr. 2. p. 70. R. cinnamòmea, Smith, engl. bot. 2388. Flowers usually solitary, pale red. Fruit orange red, spherical, naked.

Var. β, canéscens (Lindl. ros. p. 34.) leaves white from tomentum. ♄. H. Native of Sweden.

Hog Rose. Fl. May, June. Britain. Shrub 3 to 4 feet.

29 R. macrophy'lla (Lindl. ros. p. 35. t. 6.) unarmed; leaves very long; leaflets 5-11, lanceolate; petioles with a few glands, and are, as well as the leaflets, woolly beneath; sepals narrow, longer than the petals, which are apiculated. ♄. H.

Native of Gosaingsthan. Flowers red. Peduncles villous, and furnished with a few unequal setæ, as well as the fruit.

Long-leaved Rose. Shrub 5 to 6 feet.

Sect. V. Pimpinellifòliæ (from *pimpinella*, pimpernel, and *folium*, a leaf; resemblance in leaves to those of *pimpernel*). Lindl. ros. p. 36. Plants bearing crowded, nearly equal prickles, or unarmed. Bractless, rarely bracteate. Leaflets ovate or oblong. Sepals connivent, permanent. Disk almost wanting. This section is essentially different from the last in habit, but in artificial characters they approach very nearly. It, however, may be distinguished by the greater number of leaflets, which vary from 7 to 13, and even to 15, instead of from 5 to 7. The flowers are also universally without bracteas, except in the *R. alpìna*, *R. Sabìni*, *R. Doniàna*, and perhaps *R. marginàta*. These having connivent permanent sepals, cannot be confounded with the preceding division, nor on account of their disk with the following. There is no instance of stipular prickles in the present tribe. The sepals are entire or nearly so, unless when mentioned otherwise.

30 R. alpìna (Lin. spec. 703.) unarmed; fruit elongated, pendulous; peduncles hispid. ♄. H. Native of the alps of Austria, hills in the south of France, Silesia, Bohemia, Dauphiny, Switzerland, &c. Jacq. fl. austr. 3. p. 43. t. 279. Lindl. bot. reg. 424. R. rupéstris, Crantz, austr. 85. R. Monspeliàca, Gouan. monsp. 255. R. inérmis, Mill. dict. no. 6. R. hýbrida, Vill. dauph. 3. p. 554. R. lagenària, Vill. l. c. p. 563. R. biflòra, Krok. fl. sil. 2. p. 157. Flowers erect, blush-coloured, solitary. Fruit orange red, oblong or obovate, with a long neck, generally pendulous.

Var. β, *Pyrenàica* (Lindl. ros. p. 37.) tube of calyx and peduncles hispid. R. Pyrenàica, Gouan. ill. 31. t. 19. R. alpìna, Jacq. hort. schœnbr. 4. p. 416. R. híspida, Krok. siles. 2. p. 152. R. turbinàta, Vill. dauph. 3. p. 550. R. alpìna δ, D. C. fl. fr. 6. p. 536. R. híspida and R. alpìna coronàta, Desv. journ. bot. 1813. p. 119?

Var. γ, *pendulìna* (Lindl. ros. p. 37.) leaflets numerous, and are as well as the stems coloured. ♄. H. R. pendulìna, Lin. herb. Ait. hort. kew. ed. 1. vol. 2. p. 208. Lawr. ros. t. 91. R. alpìna pendulìna, Red. ros. 1. p. 57. t. 17. R. alpìna ι, latifòlia, Ser. in D. C. prod. 2. p. 612.

Var. δ, *pimpinellifòlia* (Lindl. ros. p. 37.) smaller in every part than the other varieties. ♄. H. R. pimpinellifòlia, Vill. dauph. 3. p. 553. R. glandulòsa, Bell. in act. taur. 1790. p. 230. R. pygmæ'a, Bieb. fl. taur. 1. p. 397. R. Pyrenàica β, Smith in Rees' cycl.

Var. ε, *lagenària* (Ser. in D. C. prod. 2. p. 611.) stem and branches glabrous; peduncles hispid; neck of calyx tapering: leaflets lanceolate or oblong, doubly and sharply serrated. ♄. H. Native of the Alps and Pyrenees.

Var. ζ, *sorbinélla* (Ser. in D. C. prod. 2. p. 611.) peduncles short, hispid; calyx smooth; leaflets oblong-lanceolate, distant, acutely and doubly serrated. ♄. H. Native of the Alps of Bern.

Var. κ, *hispidélla* (Ser. l. c.) branches armed with slender, more or less numerous, recurved prickles; peduncles and calyxes smoothish; leaflets elliptic. R. alpìna β, D. C. fl. fr. 4. p. 440. R. alpìna coronàta, Desv. journ. bot. 1813. p. 119.

Var. ϑ, *læ'vis* (Ser. mel. 1. p. 52. ros. exsic. no. 49. but not of Desv. nor Red.) stem, peduncles, and calyxes quite glabrous; fruit oblong. ♄. H. Native of the Alps of Switzerland and Jura. R. sanguisórba majòris, &c. Dill. hort. elth. p. 325. t. 245. f. 317. R. alpìna glàbra, Desv. journ. bot. 1813. p. 119. R. alpìna læ'vis, Desv. l. c. R. alpìna vulgàris, Red. ros. 2. p. 111. with a figure.

Var. ι, *pyrifórmis* (Ser. l. c.) stem, peduncles, and calyxes glabrous; fruit short, pear-shaped. ♄. H. Native on mount Belpberg, about Bern.

Var. κ, *setòsa* (Ser. l. c.) stem smooth; peduncles and calyxes beset with numerous, yellow, long bristles; leaflets distant, elliptic or obovate, sharply and doubly serrated; fruit pear-shaped. ♄. H. Native of Switzerland about Bern, and of the Pyrenees. R. alpìna hircìna, Desv. journ. bot. 1813. p. 119.

Var. λ, *globòsa* (Desv. journ. bot. 1813. p. 119.) stem and branches smooth; peduncles and calyxes hispid; fruit nearly globose. R. alpìna ξ, D. C. fl. fr. 5. p. 536. R. canina ambígua, Desv. journ. bot. 1813. p. 119. There is a variety of this with dark purple petioles and branches.

Var. μ, *hellebórina* (Ser. l. c.) leaflets large, approximate, sharply and broadly toothed, the 3 terminal ones resembling those of *Helléborus lívidus;* germens and pedicels smooth. ♄. H. Native of Russia.

Var. ν, *pilósula* (Ser. l. c.) leaflets obovate, obtuse; petioles hispid; peduncles pilose. ♄. H. Native about Basle.

Var. ζ, *turbinàta* (Desv. journ. bot. 1818. t. 119.) stem and branches almost unarmed; leaflets ovate, glaucescent beneath; peduncles hispid; sepals dilated at the apex; flowers double red. R. inérmis, Delaun. bon. jard. 1808. p. 717. Red. ros. 2. p. 93. with a figure. R. alpìna flore pleno, Godefroy, cat. 1819. no. 58. R. turbinàta, Vill. dauph. 3. p. 550. but not of Ait. R. alpìna múltiplex, Ser. mel. 1. p. 13. in a note. R. míxta, Tratt. ros. 1. p. 136.

Alpine Rose. Fl. June, July. Clt. 1683. Shrub 5 to 8 ft.

31 R. Candolleà'na; prickles crowded, equal; fruit elongated, pendulous. ♄. H. Native of Germany and Siberia. R. rubélla, Lindl. ros. p. 40. R. péndula, Roth. fl. germ. 2. p. 561. R. alpìna, Pall. fl. ros. 61. R. polyphýlla, Willd. enum. suppl. 37. R. alpìna θ, rubélla, Ser. in D. C. prod. 2. p. 612. R. Candolleàna péndula, Red. ros. 2. p. 45. with a figure. R. Candolleàna élegans, Thor. ros. cand. p. 7. Flowers solitary, deep red. Fruit elongated, scarlet.

Var. β, *melanocárpa* (Lindl. ros. p. 40.) fruit shorter, blackish-brown.

De Candolle's Rose. Shrub 3 to 4 feet.

32 R. rubé'lla (Smith, engl. bot. 2521.) prickles slender, straight, crowded; fruit globose; leaflets glabrous; peduncles bristly. ♄. H. Native of England, in Northumberland, on the sandy sea-coast. Flowers either blush coloured or white, blotched with pink. Fruit bright scarlet.

Reddish Rose. Fl. July. England. Shrub 2 to 3 feet.

33 R. strí'cta (Muhl. cat. 50. Lindl. ros. p. 42. t. 7.) much branched; branches unarmed; fruit elongated, pendulous. ♄. H. Native of North America, in New England and Pennsylvania. R. Virginiàna, Herm. diss. 19. R. pendulìna, Lin. spec. 705. R. Carolìna ζ, Ait. hort. kew. ed. 2. vol. 3. p. 260. Lawr. ros. t. 36.—Dill. hort. elth. 325. t. 245. f. 317. Flowers bright red. Fruit speckled with little pale spots before maturity. Leaves glaucous.

Var. β, *pubéscens;* leaves pubescent beneath. ♄. H. Native of North America, on the Saskatchawan.

Straight Rose. Fl. June. Clt.? Shrub 3 to 4 feet.

34 R. suà'vis (Willd. enum. suppl. p. 37. Link. enum. 2. p. 57.) stem hispid; leaves glabrous, glaucescent beneath; peduncles and petioles clothed with glandular bristles. ♄. H. Native country unknown. Petals deep purple, deeply 2-lobed. Fruit oblong, glabrous.

Sweet Rose. Fl. June, July. Clt. 1818. Shrub 3 to 4 feet.

35 R. aciculà'ris (Lindl. ros. p. 44. t. 8.) tall; prickles acicular, unequal; leaflets glaucous, wrinkled, rather convex; fruit sub-ampullaceous, drooping. ♄. H. Native of Siberia. Flowers solitary, pale blush, fragrant. Fruit obovate, naked, of a yellowish orange colour. R. alpìna ε, aculeàta, Ser. in D. C. prod. 2. p. 611.

Acicular-prickled Rose. Fl. May, Ju. Clt. 1805. Sh. 6 to 8 ft.

36 R. LUTE'SCENS (Pursh, fl. amer. sept. vol. 2. p. 735. Lindl. ros. p. 47. t. 9.) prickles of branches crowded, unequal, slender, reflexed; of the branchlets small and nearly equal; leaflets flat, glabrous, simply serrated. ♄. H. Native of North America and Siberia. R. híspida, Curt. bot. mag. 1570. Flowers pale yellow. Fruit large, ovate, black.

Yellow American Rose. Fl. May, Ju. Clt. 1780. Sh. 4 to 6 ft.

37 R. SULPHU'REA (Ait. hort. kew. 2. p. 201. Lindl. ros. t. 77.) stipulas linear, divaricate, dilated at the apex; leaflets glaucous, flattish; tube hemispherical. ♄. H. Native of the Levant. Ker. bot. reg. t. 46. Red. ros. 1. p. 29. t. 3. R. hemisphérica, Herm. diss. 18. R. glaucophýlla, Ehrh. beitr. 2. p. 69. Ròsa lùtea flòre pleno. Rai. hist. 1475. no. 31. R. lùtea, Brot. fl. lus. 1. p. 337. Stem prickles unequal, scattered. Flowers large, of a fine transparent yellow, always double.

Sulphur-coloured-flowered Rose. Fl. July. Clt. 1629. Sh. 4 to 6 feet.

38 R. FLA'VA (Wicks ex Spreng. syst. 2. p. 550.) fruit globose, and is as well as the peduncles hispid; prickles of the branches much crowded, somewhat setaceous; petioles prickly; leaflets pubescent beneath. ♄. H. Native of Siberia. Flowers yellow.

Yellow Siberian Rose. Shrub 4 to 6 feet.

39 R. VIMI'NEA (Lindl. ros. p. 49.) branches twiggy; prickles setaceous, much crowded, straight, spreading, unequal; leaflets membranous, flat, glabrous, simply serrated. ♄. H. Native of Siberia? R. hórrida, Lindl. ex Spreng. syst. 2. p. 549. Flowers very large.

Twiggy Rose. Shrub 3 to 4 feet.

40 R. SPINOSI'SSIMA (Lin. fl. suec. 442. spec. 491.) prickles unequal; leaflets flat, glabrous, simply serrated. ♄. H. Native of Europe; plentiful in Britain. A dwarf, compact bush, with creeping roots. Flowers small, solitary, white or blush coloured. Fruit ovate, or nearly round, black or dark purple.

Var. a, pùmila (Lindl. ros. p. 50.) prickles horizontal; fruit ovate; * peduncles glandular or bristly. ♄. H. Native throughout Europe and of Caucasus, on hills near the sea. R. spinosíssima, Lin. R. cinnamòmea, Herm. diss. 7. R. chamærhòdon, Vill. dauph. 3. p. 555. R. pimpinellifòlia δ, Red. ros. 1. p. 119. t. 44. * * Peduncles naked. R. spinosíssima, Fl. dan. t. 398. Bull. par. t. 277. Lawr. ros. t. 18. and t. 48. Smith, engl. bot. t. 187. R. pimpinellifòlia, Lin. syst. ed. 10. p. 1062. spec. 703. Rossig. ros. t. 9. and t. 25. f. 2. Jacq. fragm. 71. t. 107. f. 1. Red. ros. 1. p. 83. t. 29. and p. 85. t. 30. R. Scótica, Mill. dict. no. 5. R. collìna, Schrank. fl. no. 774. R. pimpinellifòlia, var. α, vulgàris, Ser. in D. C. prod. 2. p. 608. R. spinosíssima, var. pusílla, Woodv. in Lin. trans. 12. p. 179.

Var. β, *revérsa* (Lindl. ros. p. 51.) dwarf; prickles slender; lower ones deflexed; fruit ovate. ♄. H. R. spinosíssima, Jacq. fragm. 79. t. 124. R. nàna, Andrews, ros. R. revérsa, Lindl. bot. reg. t. 431. Flowers of a whitish yellow colour.

Var. γ, *R. polycárpa* (Lindl. l. c.) dwarf; fruit depressed, and are as well as the peduncles bristly. ♄. H. Native of Ireland.

Var. δ, *pilòsa* (Lindl. l. c.) leaflets acute, pilose beneath. ♄. H. Native of Ireland.

Var. ε, *turbinàta* (Lindl. l. c.) dwarf; fruit turbinate. ♄. H. Native of Ireland.

Var. ζ, *Pallásii* (Lindl. l. c.) taller; prickles nearly equal, much crowded. ♄. H. R. pimpinellifòlia, Pall. fl. ross. 62. t. 75. Red. ros. 1. p. 84. R. Altàica, Willd. enum. 543. R. Sibírica, Tratt. ros. 2. p. 230. R. pimpinellifòlia θ, Altàica, Red. ros. 1. p. 84. Flowers white. Grows in elevated plains and exposed precipices, from the northern part of the Altaian mountains, extending through Siberia. Its more robust habit, and its approach to equal size in its prickles are its principal characters.

Var. η, *Róssica* (Lindl. l. c.) taller; prickles long and very slender. ♄. H. Native of Russia.

Var. θ, *argéntea* (Ser. in D. C. prod. 2. p. 608.) branches and stems hispid from prickles, intermixed with minute bristles; peduncles and calyxes purple, hispid; leaflets ovate, clothed with white tomentum beneath; flowers white, semi-double. ♄. H. R. híspida argéntea, Red. ros. 3. p. 81. Curt. bot. mag. 1570.

Var. ι, *echinélla* (Ser. l. c.) teeth of leaflets very numerous; peduncles and calyxes hispid.

Var. κ, *flavéscens* (Ser. l. c.) peduncles and fruit smooth; flowers pale yellow. R. Candolleàna flavéscens, Red. ros. 2. p. 46.

Var. λ, *microcárpa* (Ser. l. c.) flowers and leaves smaller; fruit smaller, and are as well as the peduncles hispid or smooth; stem prickly. ♄. H. Native of Podolia. R. melanocárpa, Bess. enum. pl. Volh. 18. 61 and 62.

Var. μ, *inérmis* (Ser. l. c. D. C. fl. fr. 4. p. 438.) stems and branches unarmed. var. 1. Flowers white. Red. ros. 1. p. 84. var. 2. Flowers pale red. Red. ros. 3. p. 23.

Var. ν, *marmoràta* (Ser. l. c.) flowers small, more or less variegated or blotched; leaflets small, roundish; stems and branches more or less prickly. ♄. H. Lois. in Duham. ed. nov. ex Red. ros. 1. p. 84. R. pimpinellifòlia θ, Red. ros. 1. p. 84.

Var. ο, *Islándica* (Lindl. ros. p. 57.) taller; prickles large, falcate. ♄. H. Common in Ireland. R. Hibérnica, Hook. mss.

Very-spiny or Scotch Rose. Fl. May, June. Britain. Sh. 1 to 2 feet.

41 R. Hibe′rnica (Smith, engl. bot. 2196.) prickles unequal, slightly hooked, smaller ones bristle-formed; leaflets ovate, acute, simply serrated, with the ribs hairy beneath; sepals pinnate; fruit nearly globular, smooth as well as the peduncles. ♄. H. Native of Ireland, in the counties of Derry and Down, in thickets. Flowers rather small, light blush coloured. Fruit orange-coloured.

Irish Rose. Fl. June, Nov. Ireland. Shrub 4 to 6 feet.

42 R. oxyaca′ntha (Bieb. fl. taur. 3. p. 338.) stem very prickly; prickles setaceous, reversed; petioles prickly and glandular; leaflets sharply and simply serrated, glabrous; sepals undivided; peduncles clothed with glandular bristles, when in fruit reflexed; fruit nearly globose, glabrous. ♄. H. Native of Siberia. Flowers red.

Sharp-spined Rose. Fl. Ju. Jul. Clt. 1820. Sh. 2 to 4 ft.

43 R. sanguisorbifòlia (Donn, hort. cant. ed. 8. p. 169.) tall; prickles nearly equal; leaflets 9-11, oblong, glabrous, simply serrated; fruit globose, depressed, dark. ♄. H. Native country unknown. R. spinosíssima, var. ι, sanguisorbifòlia, Lindl. ros. t. 51. R. spinos. ι, macrophýlla, Ser. in D. C. prod. 2. p. 609. Flowers white. This plant is easily distinguished from the last in the greater number of leaflets, and in the globose depressed fruit.

Burnet-leaved Rose. Fl. May, June. Clt.? Sh. 3 to 5 feet.

44 R. grandiflòra (Lindl. ros. p. 55. and bot. reg. 888.) branches without bristles; prickles nearly equal, distant; leaflets flat, glabrous, simply serrated. ♄. H. Native of Siberia. R. pimpinellifòlia, Bieb. fl. taur. 2. p. 394. Flowers white. Fruit dark.

Great-flowered Rose. Fl. May, Ju. Clt. 1818. Sh. 4 to 6 ft.

45 R. Califo′rnica (Schlecht. et Cham. in Linnæa. 2. p. 35.) branches glabrous; prickles stipular, twin, a little recurved, the rest of the shrub unarmed; leaflets 5-7, ovate, obtuse, sharply serrated, pubescent above and tomentose beneath; stipulas with a few glands on the margins; corymbs terminal; peduncles pilose; sepals ovate, acuminated, dilated, and spatulate at the apex, pubescent outside and tomentose inside, white, and densely ciliated on the edges. ♄. H. Native of California. Petals rose-coloured, size of those of *R. pimpinellifòlia.*

California Rose. Shrub.

46 R. Nankine′nsis (Lour. coch. 324.) dwarf, much branched; prickles crowded; leaflets acuminated, ciliately serrated; sepals prickly; petals apiculate. ♄. G. Native of China, about Canton and Nankin. Flowers pale red, small, double.

Nankin Rose. Shrub 1 foot.

47 R. myriaca′ntha (D. C. fl. fr. 4. p. 439. Lindl. ros. p. 55. t. 10.) prickles unequal, largest ones dagger-formed; leaflets glandular, glabrous, orbicular. ♄. H. Native of Dauphiny and near Montpelier. P. parvifòlia, Pall. ross. 62.? R. provinciàlis, Bieb. fl. taur. 1. p. 396.? R. spinosíssima, var. η, myriacántha, Ser. in D. C. prod. 2. p. 608. Flowers white.

Myriad-spined Rose. Fl. May, Ju. Clt. 1820. Sh. 1 to 2 ft.

48 R. involu′ta (Smith, engl. bot. 2068.) prickles very unequal, and very much crowded; leaflets doubly serrated, pubescent; petals convolute; fruit prickly. ♄. H. Native of the western parts of Scotland; in several parts of the Hebrides; in the Isle of Arran (G. Don); and in Glen Lyon. R. nivàlis, Donn, hort. cant. ed. 8. p. 170. Petals pale red, concave.

Involute-petalled Rose. Fl. June. Scotland. Sh. 2 to 3 ft.

49 R. reve′rsa (Waldst. et Kit. hung. 3. p. 293. t. 264.) prickles setaceous, nearly equal, reflexed; leaves doubly serrated, pubescent; fruit hispid. ♄. H. Native of Hungary, on the mountains of Matra, in stony places. Flowers solitary, white, tinged with pink. Fruit ovate; dark purple.

Reversed Rose. Fl. June, July. Clt. 1816. Sh. 2 to 5 ft.

50 R. margina′ta (Wallr. ann. bot. 68. Lindl. ros. p. 58.) dwarf; branches twisted, when young pruinose; leaflets ovate-cordate, triply serrated, quite glabrous; sepals muricated. ♄. H. Native of Germany, in fields about Bennstadt. Petals blush-coloured, with yellow claws. Fruit ovate-globose, purplish. Prickles numerous, straight. Peduncles and calyxes bristly, with glands.

Marginate Rose. Shrub 1 to 2 feet.

51 R. Sabi′ni (Woods. in Lin. trans. 12. p. 188.) peduncles, branches, fruit, and calyx bristly; prickles scattered, straightish; leaflets doubly-serrated, nearly smooth, with hairy ribs; sepals

pinnate. ♄. H. Native of Scotland, near Dunkeld; in England in Cumberland, Northumberland, and Yorkshire. Borr. in engl. bot. suppl. 2594. Flower-stalks rather aggregate. Petals fine red. Fruit ovate, bright scarlet.

Sabine's Rose. Fl. July. Britain. Shrub 5 to 8 feet.

52 R. Donia'na (Woods. in Lin. trans. 12. p. 185.) peduncles bractless, bristly as well as the globular fruit and calyx; stem bristly and prickly, like the downy petioles; leaflets elliptical, doubly and sharply serrated, hairy on both sides; petals spreading. ♄. H. Native of the Highlands of Scotland, particularly on the mountains of Clova, Angusshire. Borr. in engl. bot. suppl. 2601. R. Sabìni β, Lindl. ros. p. 59. Flowers pink, expanded. Segments of the calyx simple.

Don's Rose. Fl. June, July. Scotland. Shrub 2 to 4 feet.

53 R. Wilsòni (Borr. in Hook. brit. fl. p. 228. engl. bot. suppl. 2722.) prickles crowded, unequal, straight, intermixed with setæ; leaflets simply serrated, hairy, their disks glandless; sepals simple; fruit nearly globular. ♄. H. Native of England, near Bangor Ferry. Flowers beautiful dark pink.

*Wilson's*Rose. Fl. June, July. Shrub 2 to 4 feet.

54 R. gra'cilis (Woods. in Lin. trans. 12. p. 186.) peduncles usually in pairs, bristly, often bracteate; branches, fruit, and calyx bristly; larger prickles curved, usually twin; leaflets doubly serrated, hairy on both sides. ♄. H. Native of the north of England, in thickets. R. villòsa, Smith, engl. bot. 583. excluding the synonym and the fruit. Petals slightly concave, of a pale pink. Fruit globular. Segments of the calyx simple.

Slender Rose. Fl. July. Britain. Shrub 8 to 10 feet.

55 R. reclina'ta (Red. ros. 3. p. 79. with a figure) stem nearly unarmed, but very prickly in the single-flowered variety; leaflets 3-7, lanceolate-oblong; flower bud reclinate before expansion; sepals nearly entire; fruit nearly globose, and are as well as the peduncles glabrous. ♄. H. Native of? Perhaps a hybrid between *R. alpìna* and *R. I'ndica*, ex Red. l. c. Flowers lurid purple.

Var. β, *múltiplex* (Red. l. c. p. 79. with a figure,) flowers nearly double, inclinate, somewhat panicled; leaflets 3-5, ovate, rather cordate; stem rather prickly. ♄. H.

Reclinate-flowered Rose. Shrub.

† *Species belonging to section Pimpinellifòliæ, but are not sufficiently known.*

56 R. live'scens (Bess. suppl. cat. hort. crem. et enum. p. 20. 61. and 67.) prickles stipular, spreading; leaflets oblong, serrated, of a livid glaucous colour, party coloured beneath, and are glabrous as well as the petioles; sepals glandular, exceeding the petals; peduncles twin, glabrous; fruit oblong, smooth. ♄. H. Native of Volhynia. R. Guttensteingénsis, Jacq. f. 110. R. Damascèna, var. livéscens, Ser. in D. C. prod. 2. p. 604.

Livescent-leaved Rose. Shrub 4 to 5 feet.

57 R. pa'llens (Retz, ex Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets oval, quite glabrous; sepals nearly equal; fruit hemispherical, and are smooth as well as the peduncles. ♄. H. Native of Sweden.

Pale Rose. Shrub 4 to 5 feet.

58 R. hemisphe'rica (Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets small, roundish, and are as well as the petioles quite glabrous; peduncles bristly; fruit hemispherical, short, glabrous. ♄. H. Native country unknown.

Hemispheric-fruited Rose. Shrub.

59 R. Mosque'nsis (Spreng. syst. append. 200.) prickles stipular, straight; leaflets oblong, serrated, pubescent as well as the petioles, which are unarmed; fruit globose, glabrous, as well as the peduncles. ♄. H. Native about Moscow, in fields.

Moscow Rose. Shrub 4 to 5 feet.

60 R. Gorinke'nsis (Fisch. ex Spreng. syst. append. p. 200.) branches shining, nearly unarmed; petioles and leaves pubescent beneath; fruit nearly globose, and are as well as the peduncles quite glabrous. ♄. H. Native about Moscow, in fields.

Gorinki Rose. Shrub 4 to 6 feet.

61 R. ochroleu'ca (Swartz, ex Spreng. syst. append. p. 200.) This species differs from *R. spinosissima* in the prickles being straight, and in the petioles being nearly unarmed. ♄. H. Native country unknown. Flowers cream-coloured.

Cream-coloured-flowered Rose. Shrub 2 to 4 feet.

62 R. coru'scans (Waitz. ex Link. enum. 3. p. 57.) stem bristly and very prickly; petioles pubescent; leaflets oblong-lanceolate, acuminated, serrated, glabrous; peduncles naked; tube of calyx globose and naked, the segments with tomentose edges. ♄. H. Native country unknown. Flowers pink.

Glittering Rose. Fl. June, July. Clt.? Shrub 4 to 5 feet.

63 R. Kentucke'nsis (Rafin. ros. amer. in ann. sc. phys. 5. p. 213.) stems weak, and are as well as the petioles glabrous; prickles recurved; branches flexuous; leaflets ovate-elliptic, attenuated at the base and apex, serrated, pale and pubescent beneath; calyx hispid and villous; fruit globose, glabrous. ♄. H. Native of North America, in Kentucky. Leaflets 3-5. Fruit dark purple. Prickles bay-coloured.

Kentucky Rose. Shrub 2 to 3 feet.

64 R. trifolia'ta (Rafin. l. c. p. 213.) quite glabrous; prickles recurved; leaflets 3, acute, serrated, glabrous; flowers subcorymbose; fruit globose, glabrous. ♄. H. Native of North America, in Kentucky. Flowers large, rose-coloured. Anthers copper-coloured.

Trifoliate Rose. Shrub 4 to 5 feet.

65 R. e'legans (Rafin. l. c. p. 214.) branches and petioles prickly; leaflets 5-7, elliptic, subcordate, serrated, glabrous, the same colour on both surfaces; flowers 1-3, terminal; fruit globose, hispid. ♄. H. Native of North America, on the banks of Hudson's river. Flowers large, rose-coloured, fragrant. Stipulas hispid.

Elegant Rose. Shrub 4 to 5 feet.

66 R. globòsa (Rafin. l. c. p. 215.) branches glabrous; prickles twin, straight, short; petioles pubescent, prickly; leaflets 3-5, ovate, serrated, villous beneath; flowers panicled; fruit globose, large, glabrous. ♄. H. Native of North America.

Globose-fruited Rose. Shrub.

67 R. cu'rsor (Rafin. l. c. p. 215.) branches flagelliform, glabrous; prickles recurved; petioles, nerves, peduncles, and calyxes glandular; leaflets 3-5, oblong, acuminated, serrated, pale and villous beneath; flowers numerous, corymbose; peduncles jointed, bracteolate; fruit globose, glabrous, small. ♄. H. Native of North America, in Kentucky. Stems running even to the tops of trees. Stipulas narrow. Flowers large, scentless. Fruit pear-shaped.

Runner Rose. Shrub cl.

68 R. obova'ta (Rafin. l. c. 5. p. 217.) stem glabrous; prickles stipular, straight; petioles prickly, pubescent; leaflets 7, obovate, acute, entire, pubescent beneath; flowers solitary; fruit globose, depressed; peduncles glabrous. ♄. H. Native of New York. Flowers large, rose purple, very fragrant. Branches beset with glandular dots.

Obovate-leafletted Rose. Shrub.

69 R. serrula'ta (Rafin. l. c. p. 218.) stem and petioles prickly and hispid; stipular prickles straight; stipulas ciliated; leaflets 5-7, obovate, doubly serrated, pale; flowers usually solitary: sepals serrulated; fruit globose, hispid. ♄. H. Native of North America. Flowers middle-sized, rose-coloured, sweet-scented. Petals almost entire.

Var. β, *rotundifòlia* (Rafin. l. c.) prickles slender, straight, numerous; leaflets oval-roundish. Native of Kentucky.

Serrulated-calyxed Rose. Shrub 3 to 6 feet.

70 R. Rafine'squii (Ser. in D. C. prod. 2. p. 611.) plant almost unarmed and glabrous; petioles hispid; leaflets 3-7, oval-oblong, acuminated, serrated, glabrous; flowers usually solitary; fruit turbinate, glabrous; sepals undivided. ♄. H. Native of North America. R. nivea, Rafin. l. c. p. 218. but not of D. C. Flowers white, rather sweet scented.

Rafinesque's Rose. Shrub 3 to 6 feet.

71 R. fusílla (Rafin. l. c. p. 218.) stems procumbent, glabrous, twisted; prickles stipular, straight; petioles pubescent; leaflets 3-5, obovate-oblong, serrated, shining, paler beneath and pubescent: flowers solitary; peduncles hispid; stigmas tomentose, umbilicate; fruit globose, depressed, smooth, scarlet. ♄. H. Native of North America, in Kentucky.

Small Rose. Shrub procumbent.

Sect. VI. Centifòliæ (from *centum*, a hundred, and *folium*, a leaf; because of the species contained in this section agreeing in character with the *hundred-leaved rose*). Lindl. ros. p. 60. Shrubs bearing bristles and prickles of two forms. Peduncles bracteate. Leaflets oblong or ovate, wrinkled. Disk thickened, closing the throat. Sepals compound. This division comprises the portion which has most particularly interested the lovers of flowers. It is probable that the earliest of which there are any records as being cultivated belonged to some portion of it; but to which particular species those of Cyrene or Mount Pangæus are to be referred, is now too late to enquire. The attar of roses, which is an important article of commerce, is either obtained from them indiscriminately, as in the manufactory at Florence, conducted by a convent of friars, or from some particular kind, as in India. It appears, from specimens brought from Chizapore by Colonel Hardwicke, that *R. Damascèna* is there exclusively used for obtaining the essential oil. The Persians also make use of a sort which Kœmpfer calls *R. Shirazénsis*, from its growing about Schiraz, in preference to others; this may be either *R. Damascèna* or *R. centifòlia.* It is, however, well known that attar of roses from different countries is of various degrees of goodness, that from Turkey being usually the best. It is therefore probable that *R. moschàta* may be sometimes used either alone or mixed with other kinds, especially at Mogodor, where considerable quantities are procured, but of inferior quality. To the three or four first species of the section nearly all the fine double roses of the gardens are referrible. The species contained in the present section are all setigerous, by which they are distinguished from the following divisions; their thickened disk and divided sepals separate them from the preceding. To the section of *Rubiginòsæ* the glanduliferous sorts approach; but the difference of their glands, the size of their flowers, and their dissimilar habit, prevent their being confounded.

72 R. Damasce'na (Mill. dict. no. 15.) prickles unequal, larger ones falcate; sepals reflexed; fruit elongated. ♄. H. Native of Syria. Redout. ros. 1. p. 137. t. 53. R. Bélgica, Mill. dict. no. 17. R. Calendàrum, Mœnch. hausv. ex Bork. holz. 330. Rossig. ros. t. 8. and t. 33. R. bífera, Poir. suppl. 6. p. 276. Red. ros. 1. p. 107. t. 38. and p. 121. t. 45. Flowers large, white, or red, single or double. The present species may be distinguished from *R. centifòlia* in the greater size of the prickles, green bark, elongated fruit, and long reflexed sepals. The petals of this species, and all the varieties of *R. centifòlia*, as well as those of other species, are employed indiscriminately for the purpose of making rose water. The following are the garden varieties of the *Damask rose.*

Agathe, rouge.
argéntea.
Auguste, belle.

Damascus or Damask Rose. Fl. June, July. Clt. 1573. Shrub 2 to 4 feet.

73 R. Centifòlia (Lin. spec. 704.) prickles unequal, larger ones falcate; leaflets ciliated with glands; flowers drooping; calyxes clammy; fruit oblong. ♄. H. Native of Eastern Caucasus, in groves. Bull. par. 275. Rossig. ros. t. 1. Red. ros. 1. p. 25. t. 1. p. 37. t. 7. p. 77. t. 26. p. 79. t. 27. p. 111. t. 40. R. provinciàlis, Mill. dict. no. 18. R. polyánthos, Rossig. ros. t. 35. R. caryophýllea, Poir. suppl. 6. p. 276. R. unguiculàta, Desf. cat. 175. R. vàrians, Pohl, boh. 2. p. 171. Flowers white or red, single, but most commonly double. This species is distinguished from *R. Damascèna* in the sepals not being reflexed, the flowers full, double, and the petals very large, whence the name of *Cabbage-rose*. Its fruit is either oblong or roundish, but never elongated. From *R. Gállia* it is distinguished by the flowers being drooping and by the larger size of the prickles, with a more robust habit. The following are the garden varieties of the *hundred-leaved* or *cabbage-rose*.

Aunay, belle d'.
Auròra.
Belgic, red.
Blandford, or Kingston.
blush, royal.
Bourbon.
bright crumpled.
cabbage, blush.

surpassante.
syren.
Trianon, belle de.
Versailles.
Vilmorin.

Var. β, *muscòsa* (Lindl. ros. p. 64.) calyx and peduncles mossy. ♄. H. R. muscòsa, Mill. dict. no. 22. Lawr. ros. t. 14. Rossig. ros. t. 6. Ker. bot. reg. t. 53. and t. 102. Red. ros. 1. p. 39. t. 8. p. 41. t. 9. p. 87. t. 31.—Mill. fig. t. 221. f. 1. R. provinciàlis β, Smith, in Rees' cycl. The *Moss rose* is either white or red and always very double. The following are the names of the varieties:

moss, blush.
moss, common.
moss, dark.
moss, prolific.
moss, single.
moss, striped.
moss, white.

Var. γ, *Pompònia* (Lindl. ros. p. 64.) smaller in every part than the other varieties. ♄. H. R. centifòlia minor, Rossig. ros. t. 20. and t. 37. R. Divionénsis, Rossig. ros. t. 24. R. Pompònia, D. C. fl. fr. 4. p. 443. Red. ros. 1. p. 65. t. 21. R. Burgundìaca, Pers. ench. 2. p. 48. R. provinciàlis γ, Smith, in Rees' cycl. R. centifòlia τ, Red. ros. 1. p. 113. t. 41. Flowers double, white, or red. The following are the names of the garden varieties of the *Pompone rose.*

De Meaux.
dwarf Bagshot.
mossy de Meaux.
mignonne charmante.
pompone.
pompone, proliferous.
provins, dwarf.
provins, small.
Rheims, de.
St. Francis.

Var. δ, *bipinnàta* (Lindl. ros. p. 65.) leaves bipinnate. ♄. H. R. centifòlia bipinnàta, Pers. ench. 1. p. 48. Red. ros. 2. p. 11. t. 4. Celery-leaved rose of the French.

Hundred-leaved, Cabbage, Pompone, Provins, and Moss Roses. Fl. June, July. Clt. 1596. Shrub 3 to 6 feet.

74 R. Ga'llica (Lin. spec. 704.) prickles nearly equal, the same shape, weak; leaflets stiff, elliptic; flowers erect; sepals ovate; fruit nearly globose. ♄. H. Native of middle Europe and Caucasus, in hedges. Mill. fig. t. 221. f. 2. Rossig. ros. tt. 17. 22. 25. figures 6. 26. 28. 31. 36. 38. 39. Red. ros. vol. 1. p. 73. t. 25. p. 135. t. 52. vol. 2. p. 17. t. 7. p. 19. t. 8. and 10. R. centifòlia, Mill. dict. no. 41. R. sylvática, Gater. mont. p. 94. R. rùbra, Lam. fl. fr. 3. p. 130. R. holoserícea, Rossig. ros. t. 16. R. Damascèna, rùbra-purpùrea, Rossig. ros. t. 18. R. Bélgica, Brot. fl. lus. 1. p. 338. R. blánda, Brot. l. c. Flowers from red to crimson, double or semidouble. The flowers of the *officinal rose* have not the fragrance of the *Dutch hundred-leaved rose*, but the beautiful colour of the petals, and their pleasant astringency, have rendered them officinal. It must, however, be remarked, that their odour is increased by drying, while that of the *damask rose* is almost destroyed. They are kept dried for making gargles. The following are the names of the garden varieties of the French or officinal rose.

Var. β, *pùmila* (Lindl. ros. p. 68.) flowers single; roots creeping. ♄. H. Native of Austria, Piedmont, Tauria, Caucasus, Iberia, and about Geneva. R. pùmila, Lin. suppl. 262. Jacq. austr. 2. p. 59. t. 198. R. rèpens, Munch. hausv. 5. p. 281. R. híspida, Munch. l. c. R. Austrìaca, Crantz. austr. 86. R. Olýmpica, Donn, hort. cant. ed. 8. p. 170. Flowers single, red.

Var. γ, *arvìna* (Lindl. ros. p. 69.) leaves naked on both surfaces. ♄. H. Native of Silesia. R. arvìna, Krok. siles. 2. p. 150.

Var. δ, *inapérta* (Ser. mel. 1. p. 86.) branches and peduncles hispid from prickles; calyx campanulate, glandular; flowers double from abortion, white and red. Called *vilmorin rose.*

Var. ε, *Agàtha* (Red. et Thor. ros. 3. p. 35. with a figure,) leaflets small or large; sepals more or less pinnate; flowers small, very double, outer petals spreading, but the inner ones are concave. Called *Agatha rose.*

Var. ζ, *inérmis* (Ser. in D. C. prod. 2. p. 604.) glabrous; branches smooth; peduncles hardly glandular; tube of calyx bell-shaped; flowers double, purple; sepals shortly and simply pinnate.

French or Officinal Rose. Fl. June, July. Sh. 2 to 3 feet.

75 R. PYGMÆ'A (Bieb. fl. taur. 1. p. 397. suppl. p. 342. cent. pl. ross. 1. t. 2.) stems unarmed; branches and petioles hispid from prickles; leaflets ovate, acute, glandularly biserrated, smoothish above, and glaucescent beneath; sepals entire; fruit rather obovate. ♄. H. Native of Tauria. Flowers red. Perhaps a variety of *R. Gállica.*

Pygmy Rose. Fl. June, July. Shrub 2 feet.

76 R. PARVIFÒLIA (Ehrh. beitr. 6. p. 97.) dwarf; prickles nearly equal; leaflets stiff, ovate, acute, sharply serrated; sepals ovate, nearly simple. ♄. H. Native on mountains in the neighbourhood of Dijon. Ker. bot. reg. t. 452. R. Burgundìaca, Rossig, ros. t. 4. R. Reménsis, Desf. cat. 175. R. Gállica var. κ parvifòlia, Ser. in D. C. prod. 2. p. 664. Shrub compact, bluish grey. Flowers solitary, overtopped by the young shoots, purple, very double. Red. ros. 3. p. 107. with figures.

Small-leaved or Burgundy Rose. Fl. June, July. Shrub 1 to 2 feet.

77 R. PULCHE'LLA (Willd. enum. p. 545.) ovaries roundish-obovate; peduncles and calyxes beset with glandular bristles; petioles clothed with glandular pubescence, unarmed; cauline prickles scattered. ♄. H. Native country unknown. Allied to *R. turbinàta,* but the stems are much smaller; flowers also smaller, and the form of the ovaries is different. Perhaps this is the *rose de Meaux* of the gardens, or some variety of *R. Gállica.*

Neat Rose. Fl. June, July. Clt. 1824. Shrub 2 feet.

78 R. ADENOPHY'LLA (Willd. enum. 546.) ovaries ovate, and are, as well as the calyxes and peduncles, clothed with glandular bristles; petioles beset with glandular pubescence, unarmed; leaves simply serrated, glaucous beneath, with glandular margins; prickles of the branches scattered. ♄. H. Native country unknown. Flowers large, single, red; petals emarginate. Allied to *R. turbinàta* and *R. pulchélla.*

Gland-leaved Rose. Fl. June, July. Shrub 2 feet.

79 R. ORBESSA'NEA (Red. ros. 2. p. 21. with a figure.) This appears to be some garden production, and possibly a variety of *R. Gállica,* but its fruit is that of *R. turbinàta.* Flowers red, double. ♄. H. Native country unknown.

Orbessan Rose. Fl. June, July. Shrub 2 to 4 feet.

80 R. VERECU'NDA (Waitz in Tratt. ros. vol. 1.) prickles crowded, straight; petioles villous, prickly; leaflets sweet-scented, ovate-oblong, acute, simply serrated, hoary-green, hairy above, and villous beneath, and on the margins; stipulas quite entire; branches setigerous and prickly; fruit oblong, and is, as well as the peduncles, clothed with glandular villi; flowers sub-cymose; styles exserted. ♄. H. Native country unknown. Perhaps a variety of *R. Damascéna.*

Reddish Rose. Shrub 3 to 6 feet.

81 R. LE'PIDA (Waitz in Tratt. ros. vol. 1.) prickles straight, crowded, unequal; branches prickly, glanduliferous, as well as the petioles, peduncles, and base of fruit; leaflets ovate, acute, simply serrated, hairy on both surfaces, with ciliated margins. ♄. H. Native country unknown. R. Francísca, Hortul. Perhaps a variety of *R. Damascèna.*

Lepid Rose. Fl. June, July. Shrub.

SECT. VII. VILLÒSÆ (from *villosus*, villous; shrubs villous). Lindl. ros. p. 72. Surculi straight. Prickles straightish. Leaflets ovate or oblong, with diverging serratures. Sepals connivent, permanent. Disk thickened, closing the throat. This division borders equally close upon those of *Caninæ* and *Rubiginòsæ*. From both it is distinguished by its root shoots being erect and stout. The most absolute marks of difference, however, between this and Sect. *Caninæ*, exist in the prickles of the present section being straight, and the serratures of the leaves diverging. If, as is sometimes the case, the prickles of this tribe are falcate, the serratures become more diverging. The permanent sepals are another character by which this tribe may be known from Sect. *Caninæ*. The section *Rubiginòsæ* cannot be [illegible] with the present section on account of their unequal, hooked [illegible] glandular leaves. Roughness of fruit and permanence of sepals are common to both.

82 R. TURBINÀTA (Ait. hort. kew. 2. p. 206.) tube of calyx turbinate; sepals undivided; leaves villous beneath. ♄. H. Native of Germany, probably spontaneous. Lawr. ros. 63. Jacq. schœnbr. 4. t. 415. Jacq. fragm. 71. t. 107. f. 2. Red. ros. 1. p. 127. t. 48. R. campanulàta, Ehrh. beitr. 6. p. 97. R. Francofortiàna, Mœnch. hausv. 5. p. 24. R. Francfurténsis, Rossig. ros. t. 11. Habit of *R. Damascèna*. Flowers large, red, very double.

Turbinate-calyxed or Franckfort Rose. Fl. June, July. Clt. 1629. Shrub 4 to 6 feet.

83 R. VILLÒSA (Lin. spec. 704.) leaflets rounded, bluntish, downy all over; fruit globose, rather depressed, partly bristly; sepals slightly compound. ♄. H. Native of Europe, in hedges; in Britain, in bushy rather mountainous situations, in Wales, Scotland, and the north of England. R. móllis, Smith, engl. bot. t. 2459. R. tomentòsa β, Lindl. ros. p. 77. R. heterophýlla, Woods. in Lin. trans. 12. p. 195. R. pulchélla, Woods. l. c. p. 196. R. pomífera, Herm. diss. 16. Flowers red or pink. This is a very variable plant. Branches without bristles.

Var. β, *resinòsa* (Lindl. ros. p. 77.) dwarf, grey; leaflets narrow; flowers very red. ♄. H. Native of Ireland.

Villous Rose. Fl. July. Britain. Shrub 5 to 6 feet.

84 R. SYLVÉSTRIS (Lindl. syn. brit. fl. p. 101.) stem erect, coloured, flexuous; prickles hooked; leaflets oblong, acute, hoary on both sides; sepals diverging, deciduous before the fruit is ripe; fruit elliptic, bristly. ♄. H. Native of Oxfordshire, in hedges. R. tomentòsa sylvéstris, Woods.

Wild Rose. Fl. June, July. England. Shrub 6 to 8 feet.

85 R. BOREYKIÀNA (Bess. ex Spreng. syst. 2. p. 652.) prickles of branches scattered, recurved; petioles prickly; leaflets doubly serrated, pubescent beneath, glandular on the margins, but not beneath; peduncles corymbose, covered with glandular bristles; fruit oblong, glabrous. ♄. H. Native of the north of Podolia.

Boreykian Rose. Shrub 6 to 8 feet.

86 R. TOMENTÒSA (Smith, fl. brit. 539. engl. bot. 990.) leaflets ovate, acute, more or less downy; fruit elliptical, hispid; sepals pinnate; prickles slightly curved. ♄. H. Native of Europe, in hedges and thickets; plentiful in Britain. Red. ros. 2. p. 39. t. 17. R. villòsa, Ehrh. arb. 45. Du Roi, harbk. 2. p. 341. Fl. dan. 1458. R. mollíssima, Börk. holz. p. 307. R. dùbia, Wibel. wirth. p. 263. R. villòsa β, Huds. 219. Petals red, white at the base.

Var. β, *scabriúscula* (Smith, engl. bot. 1896.) leaves greener, nearly smooth except the ribs, which are hairy. ♄. H. Native near Newcastle. R. fœ̀tida, Batard, suppl. 29. Red. ros. 1. p. 131. t. 150.

Tomentose Rose. Fl. June, July. Britain. Shrub 6 feet.

87 R. SHERRÀRDI (Davies, Welsh. bot. 49.) prickles conical, hooked, compressed; leaflets elliptical, acute, downy on both surfaces; sepals pinnate; fruit globular, abrupt, rather bristly. ♄. H. Native near Kingston-upon-Thames, near Tonbridge Wells, and Down in Kent; in Cambridgeshire and Anglesea.

R. subglobòsa, Smith, engl. fl. 2. p. 384. R. tomentòsa, var. ε and η, Woods. in Lin. trans. 12. p. 201. Peduncles from 1-8, the more numerous the shorter, beset with glandular bristles. Fruit large, globular.

Sherard's Rose. Fl. June, July. Britain. Shrub 6 feet.

88 R. HI'SPIDA (Poir. encyc. bot. no. 15.) ovaries globose, and are as well as the peduncles hispid from prickles; leaflets ovate, white from tomentum beneath; stem prickles scattered; flowers solitary. ♄. H. Native of Europe. R. villòsa β, pomífera, Desv, journ. bot. 1813. p. 117.

Hispid Rose. Shrub 5 to 6 feet.

89 R. A'LBA (Lin. spec. 705.) leaflets oblong, glaucous, nakedish above, simply serrated; prickles straightish or falcate, slender or strong, without setæ; sepals pinnate, reflexed; fruit unarmed. ♄. H. Native of Piedmont, Cochin-china, Denmark, France, and Saxony. Lawr. ross. tt. 23. 25. 32. 37. Oed. fl. dan. 1215. Red. ros. 1. p. 97. t. 34. and p. 117. t. 43. R. usitatíssima, Gat. montaub. 94. Flowers large, either white or of the most delicate blush colour, with a grateful fragrance. Fruit oblong, scarlet, or blood-coloured. The following garden varieties belong to this species:

agate.
belle Aurore.
blanche à cœur vert.
blanche de Belgique.
blush, double white.
bouquet blanc.

thornless, double.
triangulàris.
white, double.
white, semidouble.

White Rose. Fl. June, July. Clt. 1597. Shrub 4 to 7 feet.

90 R. MÓLLIS (Led. ex Spreng. syst. 2. p. 551.) ovaries ovate, glaucous, and are prickly as well as the peduncles; branches glabrous, unarmed, pubescent as well as the petioles; leaflets obtuse, doubly serrated, villous on both surfaces. ♄. H. Native of Caucasus. R. Ledeboùrii, Spreng. syst. 2. p. 551.

Soft Rose. Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

91 R. TEREBINTHA'CEA (Bess. ex Spreng. syst. 2. p. 551.) prickles of the branches straight and compressed; petioles pubescent; leaflets tomentose beneath; peduncles corymbose, bristly; sepals lanceolate, emarginate; fruit oblong, tapering to both ends, bristly. ♄. H. Native of Podolia, at Tyra.

Turpentine Rose. Shrub 4 to 6 feet.

SECT. VIII. RUBIGINÒSÆ (from *rubiginosus*, rusted; the leaves of the species are usually clothed with rust-coloured glands beneath). Lindl. ros. p. 84. Prickles unequal, sometimes bristle-formed, rarely wanting. Leaflets ovate or oblong, glandular, with diverging serratures. Sepals permanent (f. 75. *d.*). Disk thickened. Sirculi arched. The numerous glands on the lower surface of the leaves will be sufficient to prevent any thing else being referred to this section. But *R. tomentòsa* has sometimes glandular leaves, but in such cases the inequality of the prickles of *Rubiginòsæ*, and their red fruit, will alone distinguish them.

92 R. LU'TEA (Dodon. pempt. 187. Mill. dict. no. 11.) prickles straight; leaflets deep green; sepals nearly entire, setigerous; petals flat, concave. ♄. H. Native of Germany and south of France. Lawr. ros. t. 12. Curt. bot. mag. 363. R. eglantèria, Lin. spec. 703. Red. ros. 1. p. 69. t. 23.. R. fœ'tida, Herm. diss. 18. R. chlorophýlla, Ehrh. beitr. 2. p. 69. R. cèrea, Rossig. ros. t. 2. Flowers deep yellow, large, cup-shaped, solitary. Fruit unknown.

Var. β, *subrùbra* (Red. ros. 3. p. 73. with a figure) peduncles rather hispid and glandular; leaves and petioles glabrous; stem prickly at the base; prickles unequal, scattered; petals of a lurid red above and yellowish beneath; stigmas yellow.

Var. γ, *punícea* (Lindl. ros. p. 84.) petals scarlet above and yellow beneath. ♄. H. Native of Austria. R. punícea, Mill. dict. no. 12. Rossig. ros. t. 5. R. cinnamòmea, Roth. fl. germ. 1. p. 217. R. lùtea bícolor, Jacq. vind. 1. t. 1. Lawr. ros. t. 6. Sims, bot. mag. t. 1077. R. eglantèria punícea, Red. ros. 1. p. 71. t. 24. R. eglantèria bícolor, D. C. fl. fr. 4. p. 437.

Yellow Eglantine Rose. Fl. June. Clt. 1596. Sh. 3 to 4 ft.

93 R. RUBIGINÒSA (Lin. mant. 2. p. 564.) prickles hooked, compressed, with smaller straighter ones interspersed; leaflets elliptical, doubly serrated, hairy, clothed beneath with rust-coloured glands; sepals pinnate, and are bristly as well as the peduncles; fruit obovate, bristly towards the base. ♄. H. Native throughout Europe, and of Caucasus. In Britain, in bushy places, on a dry, gravelly, or chalky soil. Smith, engl. bot. t. 991. Curt. fl. lond. t. 116. Jacq. austr. t. 50. Lawr. ros. tt. 41. 61. 65. 72. and 74. Schkuhr, handb. t. 134. R. suavifòlia, Lightf. scot. 1. p. 261. Fl. dan. 870. R. eglantèria, Mill. dict. no. 4. Lin. spec. ed. 1. p. 491.? R. agréstis, Savi. fl. pis. p. 475. R. rubiginòsa parviflòra, Rau, enum. 135. Leaves sweet-scented when bruised. Flowers pink. Fruit scarlet, obovate, or elliptic.

Var. β, *Vaillantiàna* (Red. ros. 3. p. 95. with a figure,) fruit ovate and hispid as well as the peduncles; prickles of the branches somewhat horizontal; leaflets nearly glabrous above; flowers white.

Var. γ, *rotundifòlia* (Lindl. ros. 88.) branches flagelliform; prickles straightish, slender; leaflets roundish, small, tube of calyx nearly globose, glabrous. ♄. H. Native of Germany. R. rubiginòsa rotundifòlia, Rau, enum. p. 136. Flowers solitary.

Var. δ, *aculeatissima* (Dup. gym. ros. p. 13. ex Red. et Thor. ros. 2. p. 97.) flowers usually solitary; fruit ovate, and are as well as the peduncles beset with glandular bristles; leaflets ovate-roundish; prickles straightish, very numerous. Cultivated in gardens.

Var. ε, *nemoràlis* (Red. et Thor. ros. 2. p. 23. with a figure) flowers usually solitary, small; fruit ovate, and is as well as the peduncles beset with glandular bristles; leaflets large, thin; prickles straightish, few. ♄. H. Native of France. R. nemoròsa, Lebert et Lejeune, fl. spa. 2. p. 311.

Var. ζ, *umbellàta* (Lindl. ros. 87.) flowers several, in a fascicle; fruit globose, almost smooth; peduncles hispid; branches very prickly; leaflets ovate-roundish, glabrous, glandular beneath; prickles hooked. ♄. H. R. umbellàta, Leers, fl. herb. 119. add. p. 286. Gmel. fl. bad. 2. p. 425. D. C. fl. fr. 5. p. 532. Rau, enum. 134. R. tenuiglandulòsa, Mer. fl. par. 189. R. rubiginòsa eglantèria cymòsa, Woods, in Lin. trans. R. sempervìrens, Roth, fl. germ. 1. p. 218.

Var. η, *pùbera* (Ser. in D. C. prod. 2. p. 616.) flowers usually solitary; fruit ovate, smooth; peduncles beset with glandular bristles; leaflets roundish, glandular beneath, and are as well as the petioles puberulous. ♄. H. Native of Switzerland, about Aarberg.

Var. θ, *grandiflòra* (Lindl. ros. 88.) leaflets nearly naked; petioles villous; flowers large; fruit purple, and are as well as the peduncles glabrous. ♄. H. Native of Germany. R. grandiflòra, Wallr. ann. bot. 66.

Var, ι, *màjor* (Ser. exsic. no. 4. mel. 1. p. 45.) stems erect; flowers solitary or corymbose, numerous; fruit ovate, and are as well as the peduncle clothed with glandular bristles; leaflets broad, sparingly glandular beneath; petiole and middle nerve villous; flowers semidouble.

Var. ι, *spinulifòlia* (Ser. in D. C. prod. 2. p. 616.) prickles large, straight, or somewhat deflexed; leaflets oval, spinulose beneath; tube of calyx ovate, and is as well as the peduncles more or less hispid. ♄. H. Native about Fribourg and Verviers. R. spinulifòlia, Dem. ess. p. 8. R. spinulifòlia, Dematratiàna, Thor. ros. t. 1. Red. et Thor. ros. 3. p. 8.

Var. λ, *flexuòsa* (Lindl. ros. 88.) branches very flexuous; leaflets nearly orbicular; bracteas deciduous; flowers usually solitary; styles smooth. ♄. H. Native of Germany and Switzerland. R. Reynièri, Hall. fil. in Rœm. arch. 6. 1. st. 2. p. 7. R. flexuòsa, Rau, enum. p. 127. R. montàna, D. C. suppl. 532.?

Var. μ, *parvifòlia* (Lindl. ros. 145.) dwarf; branches setigerous; leaflets roundish. ♄. H. Native of Tauria, and France. Willd. enum. 546. R. micrántha, D. C. fl. fr. 5. p. 539. but not of Smith. Flowers pale rose-coloured.

Rusty Rose, Sweet Briar, or Eglantine. Fl. June, July. Britain. Shrub 4 to 6 feet.

94 R. SUAVE`OLENS (Pursh. fl. amer. sept. vol. 1. p. 346.) prickles scattered, straight; petioles beset with glandular bristles; leaflets ovate, serrated, sparingly glandular beneath; flowers usually solitary; peduncles bracteate; fruit ovate. ♄. H. Native of North America. R. rubiginòsa and eglantèria of the Americans. Rafin. ros. amer. in ann. phys. 5. p. 518. Leaves sweet-scented when bruised. Flowers pink. Sepals entire.

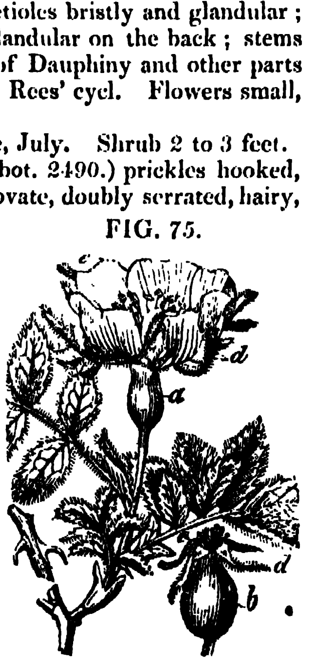
American *Sweet* Briar or Eglantine. Fl. June, July. Clt. 1100. Shrub 5 to 6 feet.

95 R. MONTA`NA (Vill. dauph. 3. p. 547.) prickles solitary, hooked; leaflets roundish, abrupt, doubly serrated, smooth, hardly glandular; peduncles and petioles bristly and glandular; sepals partly pinnate, bristly and glandular on the back; stems strong, reddish. ♄. H. Native of Dauphiny and other parts of the south of Europe. Smith in Rees' cycl. Flowers small, generally white.

Mountain Sweet Briar. Fl. June, July. Shrub 2 to 3 feet.

96 R. MICRA'NTHA (Smith, engl. bot. 2490.) prickles hooked, scattered, nearly uniform; leaflets ovate, doubly serrated, hairy, glandular beneath; sepals pinnate; fruit elliptic, rather bristly, contracted at the summit; stems straggling. ♄. H. Native of Britain, in hedges and thickets, chiefly in the south of England. R. rubiginòsa β, micrántha, Lindl. ros. p. 87. with erroneous synonyms. Leaves sweet-scented. Flowers small, pale red.

FIG. 75.



Small-flowered Sweet Briar. Fl. June, July. Britain. Sh. 4 to 5 ft.

97 R. SE`PIUM (Thuil. fl. par. 252. Borr. in engl. bot. suppl. t. 2653.) prickles slender; branches flexuous; leaflets shining, acute at both ends; flowers usually solitary; fruit polished; sepals pinnate, with very narrow segments. ♄. H. Native of Europe, in hedges; in England near Bridport, Warwickshire. Flowers small, pink. R. Helvética and R. myrtifòlia, Hall. R. canìna β, D. C. fl. fr. ed. 3. no. 3617. R. agréstis, Savi. fl. pis. 1. p. 474. R. biserràta. R. macrocárpa and R. stipulàris, Mer. fl. par. 190. ex Desv. (f. 75.)

Hedge Briar. Fl. June, July. Britain. Shrub 4 to 6 feet.

98 R. PULVERULE'NTA (Bieb. fl. taur. 1. p. 399.) branches glandular; leaflets pruinose on both surfaces; prickles recurved, dilated at the base; fruit ovate, and are as well as the peduncles hispid. ♄. H. Native of Caucasus, on hills about Narza. Flowers solitary, pale red, almost sessile. Leaves grey, with glands on both surfaces.

Var. β, *eriocárpa* (Ser. in D. C. prod. 2. p. 617.) leaflets oval, doubly serrated; fruit smooth. R. pulverulénta, Lyell. in Lindl. ros. p. 93.

Powdery Briar. Fl. June, July. Clt. 1817. Shrub 5 to 6 feet.

99 R. UNCINE'LLA (Bess. ex Spreng. syst. 2. p. 552.) prickles of the branches scattered, recurved; petioles rather prickly; leaflets pubescent beneath, doubly serrated, glandular on both surfaces; fruit oblong, and are as well as the peduncles glabrous. ♄. H. Native of Volhynia and Tauria.

Small-hooked Briar. Shrub 5 to 6 feet.

100 R. CARYOPHYLLA`CEA (Bess. enum. p. 19.) prickles of branches equal, recurved, scattered; petioles nearly unarmed; leaflets doubly serrated, glandular on both surfaces, and hoary beneath; fruit oblong, glabrous as well as the peduncles. ♄. H. Native of Podolia, Volhynia, and Iberia. R. rubiginòsæ var. μ caryophyllàcea, Ser. in D. C. prod. 2. p. 617.

Clove-scented Briar. Shrub 5 to 6 feet.

101 R. IBE'RICA (Stev. in Bieb. fl. taur. suppl. 343.) cauline prickles scattered, hooked, dilated at the base; petioles glandular and prickly; leaflets broad ovate, glandularly biserrated, and beset with glands on both surfaces; fruit ovate, smooth, or with a few bristles as well as the peduncles. ♄. H. Native of Eastern Iberia, about the town of Krzchinval. Very nearly allied to *R. pulverulénta* according to Bieberstein.

Iberian Rose. Fl. June, July. Clt. 1820. Shrub 4 to 6 ft.

102 R. INODO`RA (Fries. nov. fl. suec. 9.) stem very prickly; leaflets oblong, clammy and glandular beneath; fruit oblong, and are as well as the peduncles glabrous. ♄. H. Native of the north of Holland. Leaves scentless. Sepals reflexed, pinnate. Fruit oblong-ovate, purple. Said to be the same as *R. Borrèri*, no. 122.

Scentless Briar. Shrub 4 to 5 feet.

103 R. CUSPIDA`TA (Bieb. fl. taur. 1. p. 396.) prickles strong, hooked, dilated at the base, scattered; leaflets ovate-lanceolate, acute, villous on both surfaces, glandular beneath; flowers corymbose; sepals pinnate, ending in a narrow serrated point; fruit ovate, and are as well as the peduncles hispid. ♄. H. Native of Tauria, about Kisljar. Flowers white. Fruit dark purple.

Cuspidate-sepalled Briar. Shrub 5 to 6 feet.

104 R. GLUTINÒSA (Smith, fl. græc. prod. 1. p. 348. fl. græc. t. 482.) branches pilose; prickles numerous, falcate; leaflets roundish, coarsely serrated, hoary, glandular and viscid on both surfaces; fruit and peduncles beset with stiff bristles. ♄. H. Native on Mount Parnassus; of Sicily, and Candia, on the mountains. R. rubiginòsa Crética, Red. ros. 1. p. 93. and p. 125. t. 47. R. rubiginòsa sphærocárpa, Desv. journ. bot. 1813. t. 118. Cupan. pamph. ed. 1. t. 61. Flowers pale blush. Sepals subpinnate. Fruit scarlet.

Clammy Briar. Fl. June, July. Clt. 1821. Shrub 2 to 3 ft.

105 R. AGRE'STIS (Swartz ex Spreng. syst. 2. p. 553.) prickles of branches scattered, recurved; petioles unarmed, villous, and

glandular; leaflets equally serrated, villous and glandular beneath; germens oblong, and are, as well as the peduncles, quite glabrous. ♄. H. Native of Sweden.

Field Briar. Shrub 6 feet.

106 R. pseu'do-rubiginòsa (Lejeune, fl. spa. 1. p. 229.) stem and petioles armed with recurved prickles; leaflets ovate-oblong, beset with glandular pili, covered with rusty glands beneath and on the margins; fruit roundish, hispid. ♄. H. Native of France near Malmedy. Sepals pinnate. Petals red.

False-rusty Rose or False Sweet Briar. Shrub 2 to 3 feet.

107 R. Wolfgangia'na (Bess. enum. p. 61. and p. 67.) leaflets hardly glandular; styles very long, pubescent above; peduncles hispid from glandular bristles; fruit elongated, contracted at the neck, nearly naked, pear-shaped, with hardly any glandular bristles at the base. ♄. H. Native of Podolia, in a wood near Wichlor.

Wolfgange's Briar. Shrub 4 to 5 feet.

108 R. dimórpha (Bess. ex Spreng. syst. append. p. 200.) prickles of branches scattered and recurved; petioles prickly and pubescent; leaflets pubescent on both surfaces; peduncles short, crowded, thickly beset with glandular bristles, as well as the germens, which are ovate and contracted at both ends; calyx thickly beset with glands. ♄. H. Native of Podolia.

Two-formed Briar. Shrub 5 to 6 feet.

109 R. Willdenòvii (Spreng. syst. 2. p. 547.) prickles on the branches opposite, a little recurved; petioles villous, unarmed; leaflets oblong, narrow, equally serrulated, villous beneath, and full of resinous dots; bracteas adpressed; peduncles short, solitary, glabrous, as well as the ovate fruit. ♄. H. Native of Siberia. R. microphýlla, Willd. herb. R. arenària, Bieb. et Stev. in Willd. herb. ex Spreng. l. c.

Willdenow's Briar. Shrub 4 to 6 feet.

110 R. Klu'kii (Bess. cat. hort. crem. 1816. suppl. 4. p. 19. Bieb. fl. taur. suppl. 343.) cauline prickles strong, compressed, dilated at the base, recurved; petioles villous and prickly; leaflets small, elliptic, acute, sharply biserrated, with the serratures glandular, villous above, but rusty and glandular beneath; peduncles and fruit beset with glandular bristles. ♄. H. Native of Tauria. R. rubiginòsa, Bieb. fl. taur. no. 979. exclusive of the synonyms. R. floribúnda, Stev. and R. balsàmea, Bess. Flowers pink. Allied to *R. rubiginòsa*, according to Bieberstein, but according to Besser to *R. álba*.

Kluki's Sweet-briar. Fl. June, Jul. Clt. 1819. Sh. 5 to 6 ft.

111 R. floribu'nda (Bess. hort. crem. ex Spreng. syst. append. but not of Steven.) prickles of branches strong, recurved; petioles prickly and villous; leaflets doubly serrated, wrinkled, glandular beneath and on the margins, as well as pubescent; peduncles aggregate, clothed with glandular pili, as well as the elliptic-oblong fruit. ♄. H. Native of Podolia.

Bundle-flowered Briar. Shrub 5 to 6 feet.

112 R. Montezu'mæ (Humb. et Bonpl. in Red. ros. 1. p. 55. t. 16.) petioles armed with little hooked prickles; branches unarmed; leaflets ovate, sharply serrated, glabrous; flowers solitary, terminal; tube of calyx elliptic, and is as well as the peduncles glabrous. ♄. H. Native of Mexico, on the chain of Porphyry mountains, which bound the valley of Mexico on the north, at the elevation of 1416 toises, on the top of Cerro Ventosa, near the mine of San Pedro. Flowers pale red. Sepals compound, dilated at the end.

Montezuma's Briar. Fl. June. Jul. Clt. 1825. Sh. 4 to 6 ft.

Sect. IX. Cani'næ (from *canis*, a dog; because *R. canina* is commonly called *Dog-rose*. The name is applied to this section because all the species contained in it agree in character with *R. canìna*). Lindl. ros. 97. Prickles equal, hooked. Leaflets ovate, glandless or glandular, with the serratures conniving. Sepals deciduous (f. 76. *g*.). Disk thickened, closing the throat. Larger surculi arched.

113 R. Cauca'sia (Pall. ross. t. 11.) prickles strong, recurved; leaflets soft, ovate; calyx and peduncles hispid; sepals simple; fruit smooth? ♄. H. Native of Iberia. Lindl. ros. p. 97. t. 11. R. leucántha, Bieb. fl. taur. suppl. 351.? Flowers large, growing in bunches, white or pale red.

Caucasian Dog-rose. Fl. Ju. Jul. Clt. 1798. Sh. 10 to 12 ft.

114 R. cilia'to-pe'tala (Bess. enum. 66.) leaflets lanceolate; petals ciliated. ♄. H. Native of Lithuania. This plant differs from *R. villòsa* in the lower stipulas being blunt, and in the ribs being prickly; from *R. Caucàsia* in the leaflets being rounder, in the sepals being more dilated, in the flowers being redder, and the petals being ciliated.

Ciliated-petalled Rose. Shrub.

115 R. cani'na (Lin. spec. 704.) prickles strong, hooked; leaflets simply serrated, pointed, quite smooth; sepals pinnate; fruit ovate, smooth, or rather bristly, like the aggregate flower stalks. ♄. H. Native throughout Europe and the north of Africa; plentiful in Britain, in hedges, woods, and thickets. Smith, engl. bot. 992. Fl. dan. 555. Curt. lond. 299. Lawr. ros. tt. 21. 29. R. dumàlis, Bechst. forstb. 241. et 939. ex Rau. R. Andegavénsis, Bat. fl. main. et loir. 189. Red. ros. 2. p. 9. t. 3. R. glaúca, Lois. in Desv. journ.? R. arvénsis, Schranck, fl. mon. R. glaucéscens, Mer. par. R. nítens, Mer. l. c. R. Teneriffénsis, Donn, hort. cant. ed. 8. p. 169. R. senticòsa, Achar. acad. handl. 34. p. 91. t. 3. Flowers rather large, pale red, seldom white. Fruit ovate, bright scarlet, of a peculiar and very grateful flavour, especially if made into a conserve with sugar. The pulp of the fruit, besides saccharine matter, contains citric acid, which gives it an acid taste. The pulp before it is used should be carefully cleared from the seeds.

Var. β, *surculòsa* (Woods. in Lin. trans. 12. p. 228.) differs from the species in having remarkably strong shoots, bearing sometimes great plenty of flowers.

Var. γ, *nùda* (Woods. l. c. p. 205.) is more doubtful than the last, having the calyx tube globose and the prickles nearly straight. Gathered by Mr. Woods at Ambleside.

Var. δ, *aciphýlla* (Lindl. ros. p. 99.) dwarf; leaves smooth on both surfaces; flowers smaller than those of the species. ♄. H. Native of Germany, about Wircebourg. R. aciphýlla, Rau, 69. with a figure. Red. ros. 2. p. 31. t. 13.

Var. ε, *Egyptìaca* (Lindl. ros. p. 99.) leaflets broad ovate, coarsely serrated, glabrous on both surfaces; receptacle elongated. ♄. H. Native of Egypt. R. I'ndica, Forsk. ægyp. descr. 113.

Var. ζ, *Burboniàna* (Desv. journ. bot. 1813.) leaflets ovate, rather cordate, simply toothed; flowers purple, semidouble; petals rather concave; sepals undivided. R. Gállica Burbónica, Red. ros. 1. p. 74.

Var. η, *nitens* (Desv. journ. bot. 1813. p. 114.) petioles smoothish; leaflets ovate, acute, same colour on both surfaces, smooth and shining; fruit ovate, and are as well as the peduncles smooth. ♄. H. Native of France and Switzerland. Ser. mel. 1. p. 43. R. nítens, Desv. in Mer. fl. par. p. 192.

Var. θ, *obtusifòlia* (Desv. journ. bot. 1813. p. 15.) petioles puberulous, usually glandular; leaflets ovate-roundish, acuminated, the same colour on both surfaces, and rather pilose beneath; fruit ovate, and are as well as the peduncles glabrous. R. obtusifòlia, Desv. journ. bot. 2. p. 1809. p. 317. R. leucántha, Lois. bot. 1802. Bast. suppl. 32. D. C. fl. fr. 5. p. 535. but not of Bieb.

Var. ι, *glaucéscens* (Desv. journ. bot. 1813. p. 114.) prickles slender; petioles glabrous; leaflets ovate, smooth on both surfaces, glaucous beneath; fruit ovate-globose, and are as well as the peduncles glabrous. ♄. H. Native of France. R. glaucéscens, Desv. in Mer. fl. par. 192. R. canìna glaúca, Desv. journ. bot. 1813. p. 116.

Var. κ, *Schottiàna* (Ser. in D. C. prod. 2. p. 116.) branches rugged, unarmed; stipulas and petioles glabrous and hispid; leaflets ovate, acuminated, glabrous, glaucescent beneath; fruit ovate, smooth; peduncles hispid. ♄. H. Native of Podolia. R. glaúca, Schott, ex. Besser. enum. 64.

Var. λ, *pilosiúscula* (Desv. journ. bot. 1813. p. 115.) branches prickly; petioles tomentose and hispid; leaflets ovate, acute, puberulous beneath and smoothish above; fruit ovate, smoothish; peduncles hispid. R. hùmilis, Bess. suppl. cat. crem. 4. R. nitídula, Bess. enum. p. 20. and 61. R. Friedlanderiàna, Besser. enum. 46. 60. 63. R. collìna, Rau, enum. no. 163.

Var. μ, *fastigiàta* (Desv. journ. bot. 1813. p. 114.) prickles strong; petioles puberulous; leaflets ovate, acute, puberulous beneath; fruit ovate, smooth; peduncles hispid. ♄. H. Native of France. R. fastigiàta, Bast. suppl. 30. D. C. fr. 5. p. 535. Red. ros. 2. p. 3. with a figure. R. stylòsa β, Desv. journ. bot. 2. p. 317. Styles approximate, but not joined.

Var. ν, *híspida* (Desv. journ. bot. 1813. p. 114.) branches prickly; petioles smoothish; leaflets ovate, acute, about the same colour on both surfaces, glabrous; fruit ovate, and are as well as the peduncles hispid. R. canìna, var. lanceolàta grandidentàta and ovoidàlis, Desv. l. c. p. 114. and p. 115. R. Andegavénsis, Bast. ess. 189. suppl. 29. D. C. fl. fr. 5. p. 539. Red. ros. 2. p. 9. with a figure. R. sempervìrens, Bast. ess. p. 188. Rau, enum. 120. Lindl. ros. p. 142. but not of Lin.

Var. ζ, *microcárpa* (Desv. journ. bot. 1813. p. 115.) leaflets oblong-lanceolate, velvety beneath; fruit smaller, ovate, glabrous. ♄. H. Native of France.

Var. ο, *Meratiàna* (Ser. in D.C. prod. 2. p. 614.) prickles strongly arched, and are as well as the petioles glabrous; leaflets broad, biserrated, glabrous; flowers usually solitary; fruit large. ♄. H. Native about Paris. R. biserràta, Mer. fl. par. 190. Red. ros. 3. p. 27. with a figure. Perhaps the same as *R. canìna vulgàris*.

Var. π, *ambígua* (Desv. journ. bot. 1813. p. 114.) prickles straight; leaflets ovate-roundish, and are as well as the petioles glabrous; flowers solitary or tern; fruit ovate-globose, and is as well as the peduncles smooth. ♄. H. Native about Malmedy, in France. R. Malmundiariénsis, Lejeune, fl. spa. 1. p. 231. Red. ros. p. 34. with a figure.

Var. ρ, *squarròsa* (Rau, enum. 77.) petioles and primary nerves of leaves glandular; prickles straightish, strong, and much crowded; leaflets doubly serrated. ♄. H. Native of Germany. R. canìna β, Bieb. fl. taur. 1. p. 400. ex Rau, l. c.

Var. σ, *rubiflòra* (Ser. in D. C. prod. 2. p. 614.) prickles strong, and are, as well as the petioles, rather puberulous, rarely hispid; leaflets large, the same colour on both surfaces, smooth, and simply serrated; flowers usually solitary, about the size of those of *Rùbus Idæ̀us;* peduncles and fruit smooth. ♄. H. Native about Geneva.

Common *Dog* Rose. Fl. June, July. Britain. Sh. 6 to 8 ft.

116 R. Forstèri (Smith, engl. fl. 2. p. 392.) prickles scattered, conical, hooked; leaflets simply serrated, smooth above, but hairy on the ribs beneath; sepals doubly pinnate; fruit elliptical, smooth, like the aggregate flower stalks. ♄. H. Native of Europe, in hedges; plentiful in England. Borr. in engl. bot. suppl. 2611. R. collìna β and γ, Woodv. in Lin. trans. 12. p. 392. Flowers pale red.

Forster's Dog-rose. Fl. June, July. Britain. Sh. 6 to 8 ft.

117 R. Gmelìni (Bunge in Led. fl. alt. 2. p. 229.) fruit ovate, glabrous: peduncles hispid; sepals ovate, acuminated, undivided, glandular, and prickly; flower-bearing branches almost unarmed, young sterile ones very prickly; prickles setaceous, unequal; petioles clothed with glandular down; leaflets 5-7, ovate-oblong, simply serrated, pubescent, and glandless beneath. ♄. H. Native of Siberia. R. canìna, Sievers in Pall. nord. beytr. 7. Petals deep rose-coloured, shorter than the sepals, emarginate.

Gmelin's Dog-rose. Fl. June, July. Shrub 3 to 4 feet.

118 R. dumetòrum (Thuill. fl. par. 250. Woods in Lin. trans. 12. p. 217.) prickles numerous, scattered, hooked; leaflets simply serrated, hairy on both surfaces; sepals pinnate, deciduous; peduncles aggregate, slightly hairy; fruit elliptical, smooth, as tall as the bracteas. ♄. H. Native of Europe, in hedges. In England in the southern counties, seldom in any abundance. Borr. in engl. bot. suppl. 2610. R. leucántha β acutifòlia, Bast. in D. C. fl. fr. 5. p. 535. R. sèpium, Borkh. ex Rau, enum. 79. R. solsticiàlis, Bess. prim. fl. gall. 324. R. corymbífera, Gmel. fl. bad. als. 2. p. 427. Synonymes from Lindl. and Ser. Flowers reddish.

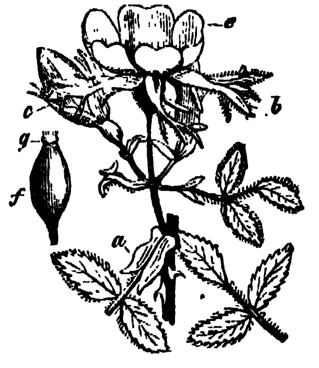
Thicket Dog-rose. Fl. Ju. July. Britain. Sh. 4 to 6 feet.

119 R. bractéscens (Woods. in Lin. trans. 12. p. 216.) prickles aggregate, hooked; leaflets ovate, almost simply serrated, downy beneath; bracteas rising much above the fruit; sepals pinnate, deciduous? peduncles aggregate, occasionally rather hairy; fruit globose, smooth. ♄. H. Native of England, in hedges, about Ulverton, Lancashire, and Ambleton, Westmoreland. Flowers flesh-coloured.

Bractescent Dog-rose. Fl. Ju. July. England. Sh. 6 to 7 ft.

120 R. sarmentàcea (Swartz, mss. Woods, in Lin. trans. 12. p. 213.) prickles hooked; leaflets ovate, doubly serrated, smooth, glandular; peduncles aggregate, smooth or minutely bristly; sepals pinnate, deciduous; fruit broadly elliptic, naked. ♄. H. Native of Europe, in hedges and bushy places common; plentiful in Britain. Borr. in engl. bot. supp. 2595. R. glaucophýlla, Winch, geogr. distri. 45. R. canìna, Roth. fl. germ. 2. p. 560. Curt. lond. fasc. 5. t. 34. Flowers pink, fragrant. Fruit scarlet, as grateful to the palate probably as that of *R. canìna*, with which this equally common plant is generally confounded.

FIG. 76.



Sarmentaceous Dog-rose. Fl. Ju. Jul. Britain. Sh. 8 to 10 ft.

121 R. cæ̀sia (Smith, engl. bot. t. 2367.) prickles hooked, uniform; leaflets elliptical, somewhat doubly serrated, glaucous, hairy beneath, without glands; sepals distantly pinnate, deciduous; flower-stalks smooth, solitary; fruit elliptical, smooth. ♄. H. Native of Scotland, in the highland valleys, but rare; at Taymilt, in Mid-Lorn, Argyleshire; and in Strath Tay between Dunkeld and Aberfeldie, and by the side of Loch Tay. R. canìna pubéscens, Afz. ros. suec. tent. 1. p. 2. R. canìna ζ cæ̀sia, Lindl. ros. p. 99. Flowers of an uniform carnation hue, occasionally white.

Grey Dog-rose. Fl. July. Scotland. Shrub 4 to 5 feet.

122 R. Borrèri (Woods. Lin. trans. 12. p. 210.) prickles hooked; leaflets ovate, doubly serrated, hairy, without glands; sepals pinnate, often doubly pinnate, deciduous; flower-stalks aggregate, hairy; fruit elliptical, smooth. ♄. H. Native of Britain, in hedges and thickets. R. dumetòrum, Smith, engl. bot. 2579. R. rubiginòsa ϑ, Lindl. ros. 88. R. rubiginòsa inodòra, Hook. lond. t. 117. R. sèpium, Börkh. ex Rau, enum. 90? but not of Thuill. R. affìnis, Rau, enum. 79. R. uncinélla β, Besser. enum. 64.? Flowers pale red. Fruit deep scarlet.

Borrer's Dog-rose. Fl. June, July. Britain. Sh. 6 to 10 ft.

123 R. COLLI'NA (Jacq. fl. austr. t. 197.) prickles hooked; leaflets roundish, simply serrated, smooth above, but clothed with hoary pubescence beneath; flower-stalks aggregate, bristly; fruit smooth. ♄. H. Native of Austria and other parts of Europe. Red. ros. 2. p. 13. t. 5. R. frutetòrum, Bess. enum. 1860. R. umbellàta, Leys. pal. 495. R. fastigiàta, Bat. fl. main. et loir. suppl. 30. R. platyphýlla, Rau, enum. 82. R. psilophýlla, Rau, l. c. p. 191. Sepals pinnate, deciduous, bristly. Flowers pink. Peduncles beset with glandular bristles.

Hill Dog-rose. Fl. June, July. Shrub 4 to 5 feet.

124 R. BA'LTICA (Roth, nov. spec. pl. 234.) leaflets oblong-ovate, obtuse, simply serrated; petioles nearly unarmed, pilose; tube of calyx globose, with its base and peduncles beset with glandular bristles; sepals nearly simple, covered with rusty glandular bristles on the outside; bracteas coloured. ♄. H. Native near Rostock by the sea side. Flowers pale red.

Baltic Dog-rose. Fl. June, July. Shrub 5 to 6 feet.

125 R. JUNDZI'LLII (Bess. Cat. hort. crem. 1810.) prickles of branches few, recurved; petioles prickly, and covered with glandular villi; leaflets glandularly biserrated, glaucescent beneath, and rather villous; fruit ovate, hispid at the base; peduncles hispid. ♄. H. Native of Volhynia, Tauria, and Caucasus. R. Jundzilliàna, Bess. enum. p. 46, 61, and 67. R. glandulòsa and R. nitídula, Bess.

Jundzill's Dog-rose. Shrub 5 to 6 feet.

126 R. TURBINE'LLA (Swartz, ex Spreng. syst. 2. p. 554.) prickles of branches few, and a little recurved; petioles unarmed, villous; leaflets equally toothed, clothed with hoary villi beneath; sepals entire, villous, elongated; germens globose, depressed, and are, as well as the aggregate peduncles, glabrous. ♄. H. Native of Sweden.

Small-turban-fruited Dog-rose. Shrub 5 to 6 feet.

127 R. VENÒSA (Swartz ex Spreng. syst. 2. p. 554.) prickles of branches scattered, strong, and recurved; petioles unarmed, glabrous; leaflets doubly serrated, veiny, quite glabrous, glaucescent beneath; sepals elongated, a little cut, with the margins tomentose; germens ovate, and are, as well as the peduncles, glabrous. ♄. H. Native of Sweden.

Veiny-leaved Dog-rose. Shrub 5 to 6 feet.

128 R. CORIIFÒLIA (Fries. ex Spreng. syst. 2. p. 554.) prickles of branches scattered, recurved; petioles unarmed, villous; leaflets coriaceous, opaque, unequally serrated, villous beneath; peduncles solitary, short, glabrous; germens globose, glabrous. ♄. H. Native of Denmark. R. crassifòlia, Liljebl.

Hide-leaved Dog-rose. Shrub 5 to 6 feet.

129 R. SWA'RTZII (Fries. in Billberg Svensk, bot. ex Schrad. neuve entd. 3. p. 219.) germens ovate, and peduncles smooth; branches and petioles beset with recurved scattered prickles; leaflets glabrous on both surfaces, shining, unequally and glandularly serrated; styles exserted. ♄. H. Native of the south of Sweden. Allied to *R. canina.*

Swartz's Dog-rose. Fl. June, July. Shrub 4 to 6 feet.

130 R. SAXA'TILIS (Stev. in Bieb. fl. taur. p. 349.) germens ovate, and are, as well as the peduncles, hispid; cauline prickles scattered, strong, compressed, recurved; petioles clothed with glandular villi, prickly; leaflets largish, unequally and sharply serrated, smoothish on both surfaces, paler beneath; the serratures somewhat duplicate; flowers corymbose. ♄. H. Native of Tauria. Allied to *R. canìna.*

Rock Dog-rose. Fl. June, July. Shrub 4 to 6 feet.

131 R. RUBRIFÒLIA (Vill. dauph. 3. p. 549.) prickles small, distant; leaflets ovate, and are, as well as the branches, glabrous, opaque, discoloured; sepals narrow, entire; fruit ovate-globose, smooth; flowers corymbose; peduncles smooth. ♄. H. Native of Dauphiny, Austria, Savoy, Pyrenees, and Auvergne, in woods. Bell. in act. taur. 1790. p. 229. t. 9. Jacq. fragm. 70. t. 106. Red. ros. 1. p. 35. t. 4. Lindl. in bot. reg. t. 430. R. multiflòra, Reyn. act. laus. 1. p. 70. t. 6. R. rubicúnda, Hall. fil. in Rœm. arch. 1. fasc. 2. p. 6. R. canìna β, Sut. helv. 1. p. 302. R. glaúca, Desf. cat. p. 175. R. glaucéscens, Wulf. in Rœm. arch. 3. p. 376. R. lùrida, Andr. ros. R. cinnamòmea γ, rubrifòlia, Red. ros. 1. p. 134. Stems red. Leaves red at the edges. Flowers small, deep red. Sepals narrow, longer than the petals.

Var. β, *hispidula* (Ser. mus. helv. 1. p. 8 and 12. t. 1.) leaflets ovate; flowers red; fruit corymbose, smooth; peduncles hispid; sepals entire. R. cinnamòmea glaúca, Desv. journ. bot. 1813. p. 120. Red. ros. 1. p. 134.

Var. γ, *Redoútea* (Ser. in D. C. prod. 2. p. 609.) stems and branches reddish; prickles slender, hardly curved; petioles spinulose; corymbs few-flowered; leaflets ovate; petals very pale red, with rose-coloured and dotted margins. R. Redoùtea, Red. ros. p. 3. and Mill. in ann. encycl. 1818. p. 35. R. Redoùtea glaúca, Red. ros. 1. t. 38. p. 101. Lindl. ros. 137. This appears to be a hybrid production between *R. rubrifòlia* and *R. spinosíssima.*

Var. δ, *inérmis* (Ser. in D. C. prod. 2. p. 610.) stem and branches unarmed; petioles prickly; leaflets ovate; peduncles and calyxes smooth; stipulas broad. ♄. H. Native of Switzerland. R. rubrifòlia, Thomas.

Var. ε, *pinnatifida* (Ser. in mus. helv. 1. p. 11. t. 2. f. 11.) leaflets ovate; flowers solitary, terminal; sepals pinnatifid; fruit globose, and are, as well as the peduncles, smooth. ♄. H. Native of Switzerland. R. rubrifòlia germinibus ovatis, and R. montàna germinibus glabris, Schleich. cat. 1815. pp. 24. 46. R. canìna globòsa, Desv. journ. bot. 1813. p. 114.

Red-leaved Dog-rose. Fl. June, July. Clt. 1814. Sh. 5 to 6 ft.

132 R. SERI'CEA (Lindl. ros. p. 105. t. 12.) prickles stipular, compressed; leaflets 7-11, oblong, obtuse, serrated at the apex, silky beneath; flowers solitary, bractless; sepals entire, ending in long points. ♄. H. Native of Gosaingsthan. Flowers pale red? Fruit and peduncles naked.

Silky Rose. Fl. June, July. Shrub 4 to 6 feet.

133 R. MICROPHY'LLA (Roxb. Lindl. ros. p. 146.) prickles under the stipulas straight; stipulas very narrow, spreading at the tip; leaflets 5-9, shining, sharply serrated, glabrous; flowers solitary; calyx beset with straight prickles; sepals short, broadly ovate, apiculated, downy at the edge. ♄. H. Native of China. A charming little shrub, resembling the *Macartney Rose.* Flowers very double, pale red.

Small-leaved Rose. Fl. June, July. Shrub 2 to 3 feet.

134 R. I'NDICA (Lin. spec. 705.) branches glaucous-green, armed with equal hooked prickles; leaflets elliptic, acuminated, glabrous, crenate-serrated, glaucous beneath; stipulas ciliately serrulated; sepals ovate, entire; flowers numerous; fruit turbinate. ♄. H. Native of China, near Canton. Lawr. ros. t. 26. Red. ros. 1. p. 51. t. 142. p. 35. t. 15. R. Sínica, Lin. syst. veg. ed. 13. p. 398. R. semperflòrens cárnea, Rossig. ros. t. 19. R. I'ndica Chinénsis semiplèna, Ser. mel. 1. p. 31. R. reclinàta flore submultiplici, Red. ros. p. 79. with a figure. Flowers red, usually semidouble. Petioles setigerous and prickly. Petals obcordate.

Var. β, *Noisettiàna* (Ser. in D. C. prod. 2. p. 600.) stem firm, and is, as well as the branches, prickly; stipulas nearly entire; flowers panicled, very numerous, semidouble, pale red; styles exserted. R. Noisettiàna, Red. ros. 2. p. 77. with a figure, Noisette rose.

Var. γ, *Ternauxiàna* (Ser. in D. C. prod. 2. p. 600.) stem rather firm, and is, as well as the branches, prickly; leaflets lanceolate, smaller; flowers panicled, red, size of the *Pompone rose.* R. Noisettiàna purpùrea, Red. ros. p. 103. with a figure.

Var. δ, *odoratissima* (Lindl. ros. p. 106. bot. reg. 864.) stem firm; prickles strong; stipulas fringed or entire; flowers rose-coloured, sweet-scented; peduncles thickened; fruit ovate. ♄. H. Native of China. R. odoratíssima, Sweet. hort. suburb. lond. R. I'ndica fràgrans, Red. ros. 1. p. 6. t. 19. Flowers semidouble. Called *sweet-scented Chinese-rose* and *Rose à odeur de thé.*

Var. ε, *longifòlia* (Lindl. ros. p. 106.) stems firm, nearly unarmed; leaflets 3-5, long, lanceolate; stipulas nearly entire; flowers rose-coloured, almost single; peduncles roughish. R. longifòlia, Willd. spec. 2. p. 1079. Red. ros. 2. p. 27. t. 12.

Var. ζ, *pùmila* (Lindl. ros. p. 106.) smaller in every part than the other varieties; flowers purplish; petals ovate. ♄. H. Native of China. R. I'ndica pùmila, Red. ros. 1. p. 115. t. 42. R. I'ndica ζ hùmilis, Ser. mel. 1. p. 44.

Var. η. *caryophýllea* (Red. ros. 3. p. 69. with a figure,) leaflets large, thin; flowers subpanicled; petals cucullately inflexed.

Var. ϑ, *pannòsa* (Red. ros. 2. p. 37. and p. 38. with a good figure,) stem and branches firm and prickly; leaflets ovate, red beneath; stipulas finely denticulated; flowers drooping a little, purple on the outside; petals oblong, concave, outer ones purple, inner ones somewhat cucullate, rose-coloured.

Var. ι, *cruénta* (Red. ros. 1. p. 128. with a figure, and 2. p. 38.) large; stems and branches almost unarmed, firm; leaflets large, red beneath; stipulas almost entire; flowers purplish, drooping, size of those of var. *odoratissima*; petals concave, broad.

Var. κ, *Fraseriàna* (Hortul. Loud. hort. brit. p. 211.) a hybrid with double pink flowers.

Var. λ, *rùga* (Lindl. bot. reg. t. 1389.) flowers double blush, changing to white, sweet-scented. The *ruga-rose* is a hybrid, raised between the *sweet-scented Chinese-rose* and *R. arvénsis.*

Var. ω, *ochroleùca*; flowers double, large, cream-coloured, without any scent. This variety was introduced from China in 1824 by Mr. Parks, and is figured in the thirteenth volume of the Botanical Register. It is commonly called the *yellow Chinese rose.*

† *Garden varieties referrible either to R. I'ndica* or *R. semperflòrens.*

Indian Rose, Monthly Rose, Blush or Common China Rose. Fl. year. Clt. 1789. Shrub 4 to 20 feet.

135 R. SEMPERFLÒRENS (Curt. bot. mag. 284.) branches dark green, armed with scattered compressed hooked prickles, and a very few glands; leaflets 3-5, ovate-lanceolate, crenate-serrated, shining above, glaucous and slightly pubescent beneath, deeply stained with purple; petioles glandular, and slightly setigerous; sepals compound, narrow; fruit spherical. ♄. H. Native of China. Lawr. ros. t. 23. Smith, exot. bot. 2. p. 91. Jacq. schœnbr. 3. p. 281. R. diversifòlia, Vent. cels. t. 35. R. Bengalénsis, Pers. ench. 2. p. 50. R. I'ndica, Red. ros. 1. p. 49. t. 13. p. 123. t. 46. and 2. p. 37. t. 16. Flowers solitary, single or semidouble, deep crimson. There are some very splendid varieties of this species with semidouble crimson flowers in our gardens, and the French appear to have some others still more beautiful, which have not yet been imported.

Ever-flowering China-rose. Fl. year. Clt. 1789. Shrub 3 to 10 feet.

136 R. LAWRENCIA`NA (Sweet, hort. suburb. Lindl. ros. p. 110.) dwarf; prickles large, stout, nearly straight; leaflets ovate, acute, finely serrated; petals acuminated. ♄. H. Native of China. R. semperflòrens mínima, Sims, bot. mag. 1762. R. I'ndica var. ι acuminàta, Red. ros. 1. p. 53. with a figure. R. I'ndica Lawrenciàna, Red. ros. 2. p. 38. Flowers small, single or semidouble, pale blush.

Miss *Lawrence's* China-rose. Fl. year. Clt. 1810. Sh. 1 ft.

137 R. ATROPURPU`REA (Brot. fl. lus. 2. p. 488.) stem and petioles prickly; leaflets 5, lanceolate, serrulated, glabrous, permanent; flowers terminal, solitary or few; germens nearly oval, and are, as well as the peduncles, hispid. ♄. H. Collected in the gardens of Lisbon, where it flowers all the year. Flowers semidouble, about the size of those of *R. moschàta.* Perhaps *R. semperflòrens.*

Dark-purple China-rose. Fl. year. Shrub.

138 R. PSEU`DO-I'NDICA (Lindl. ros. 132.) prickles nearly equal; stipulas very hairy; peduncles covered with little short prickles; calycine tube and sepals very hairy; flowers double, deep yellow; leaves more finely serrated and coriaceous than those of *R. I'ndica.* ♄. G. Native of China. Habit of *R. I'ndica.*

False-Indian Rose. Shrub.

SECT. X. SY'STYLA (from συν, *syn*, together, and στυλος, *stylos*, a column; in reference to the styles being connected). Lindl. ros. p. 111. Styles cohering together into an elongated column. Stipulas adnate. The habit of this section is nearly the same as that of the last division. The leaves are frequently permanent.

139 R. SY'STYLA (Bat. fl. main. et loir. suppl. 31.) surculi assurgent; prickles strong, hooked; peduncles glandular; sepals pinnate, deciduous; styles smooth; floral receptacle conical. ♄. H. Native of France and England, in hedges and thickets; common in Sussex; at Walthamstow, Quendon, and Clapton, near London; at Dunnington Castle, Berkshire; near Penhurst, Kent, and Hornsey, Middlesex. Hills in the south of Scotland. R. collina, Smith, engl. bot. t. 1895. R. stylòsa, Desv. journ. bot. 2. p. 317. R. brevístyla, D. C. fl. fr. suppl. p. 537. R. dibracteàta, D. C. l. c. R. sýstyla *a* ovàta, Lindl. ros. p. 111. Shrub slender. Flowers fragrant, pink or almost white. Fruit ovate-oblong.

Var. β, *lanceolàta* (Lindl. ros. 111.) leaflets ovate-lanceolate; fruit spherical. ♄. H. Native of Ireland.

Var. γ, *Monsòniæ* (Lindl. ros. 111.) stem more humble, erect, many-flowered; branches usually setigerous. ♄. H. Native of England, near Watford. R. collìna Monsòniæ, Red. ros. 3. p. 67.

Var. δ, *leucochròa* (Ser. in D. C. prod. 2. p. 599.) leaves glabrous, not glandular; peduncles hispid; calyxes glabrous. ♄. H. Native of Andegavany. R. leucochròa, Desv. journ. bot. 1809. vol. 2. p. 316. and 1813. p. 113. t. 15. R. brevístyla *a*, D. C. fl. fr. 5. p. 537. R. brevístyla leucochròa, Red. et Thor. ros. 1. p. 91. with a figure. R. sýstyla, Bast. fl. suppl. 31. D. C. fl. fr. 5. p. 537. var. γ.

Var. ε, *glandulòsa* (Ser. l. c.) leaflets 5-7, obovate-elliptic, somewhat biserrulated, glabrous above, but covered with rusty glands beneath; petals tomentose and glandular; column of styles short.

Close-styled Rose. Fl. May, July. Britain. Sh. 8 to 12 ft.

140 R. ARVE'NSIS (Huds. ang. ed. 1. p. 192.) surculi flagelliform; prickles unequal, falcate, scattered; leaflets simply serrated, glaucous beneath; peduncles glandular; sepals pinnate, deciduous; styles smooth; floral receptacle slightly convex; fruit globose or elliptical, smooth. ♄. H. Native of many parts of middle Europe. In England in hedges and thickets, and the borders of fields, chiefly in the midland counties. Smith, engl. bot. t. 188. Lawr. ros. t. 86. Red. ros. 1. p. 89. t. 32. Sims, bot. mag. 2054. R. sylvéstris, Herm. diss. 10. R. scándens, Mœnch. weiss. pfl. 118. R. herperhòdon, Ehrh. beitr. 2. p. 69. R. Hallèri, Krok. siles. 2. p. 150. R. fúsca, Mœnch. meth. 688. R. sérpens, Ehrh. arbr. 35. R. sempervìrens, Rossig. ros. t. 32. R. rèpens, Gmel. fl. bad. als. 2. p. 418. Jacq. fragm. 69. t. 104. R. rámpans, Reyn. mem. laus. 1. p. 69. t. 5. Flowers usually white, slightly scented, generally several together, rarely solitary. Fruit of a dark blood-colour. Shrub sending out many arched trailing shoots.

Var. β, *hýbrida* (Lindl. ros. 113.) surculi thicker and shorter; floriferous stems erect, many-flowered; branches bearing a few bristles; styles free. ♄. H. Native of Switzerland. R. hýbrida, Schleich. cat. R. geminàta, Rau, enum. 39. R. gállica, hýbrida, Gaud. in Ser. mel. bot. 1. p. 39. The branches have a few setæ mixed among the prickles. The flowers are semi-double, of a most delicate flesh-colour. Called in the nurseries *double-hip rose.*

Var. γ, *Andersònii* (Smith, engl. fl. 2. p. 398.) habit stout; flowers large, pale flesh-coloured. Found wild in a hedge in Somersetshire.

Var. ε, *Ayreshìrea* (Ser. in D. C. prod. 2. p. 597.) prickles slenderer, very sharp; leaflets sharply serrated, thin; peduncles beset with glandular bristles. ♄. H. Cultivated in the gardens under the name of *Ayrshire rose.* R. capreolàta, Neill, edinb. phil. journ. no. 3. p. 102. Flowers white, in clusters, fragrant.

Var. ζ, *obtusàta* (Ser. l. c.) leaflets roundish, blunt. ♄. H. Native of Switzerland, about Bern.

Field Rose or White Trailing Dog-rose. Fl. July. Britain. Shrub rambling.

141 R. ABYSSI'NICA (Brown in Salt's abyss. append. 64.) surculi climbing; prickles much crowded, falcate; leaflets ovate, evergreen; peduncles and calyxes tomentose; sepals entire; petioles very rough, with unequal glands and setæ. ♄. H. Native of Abyssinia. Lindl. ros. p. 116. t. 13.

Abyssinian Rose. Shrub cl.

142 R. SEMPERVI'RENS (Lin. spec. 704.) surculi climbing; prickles nearly equal, falcate; peduncles numerous, glandular; leaves evergreen; leaflets ovate-lanceolate, simply serrated, smooth on both surfaces, paler beneath; sepals nearly simple; petioles armed with little hooked prickles; styles hairy. ♄. H. Native of France, Portugal, Italy, Greece, and the Balearic Islands. Lawr. ros. t. 45. Ker. bot. reg. 459. R. scándens, Mill. dict. no. 8. R. Balcárica, Desf. cat. Pers. ench. 2. p. 49. R. atrovìrens, Viv. fl. ital. 4. t. 6. R. sempervìrens globòsa, Red. ros. 2. with a figure. R. sempervìrens var. *a*, scándens, D. C. fl. fr. 5. p. 533. Flowers very numerous, white, and fragrant. Receptacle of flower conical, very thick. Fruit orange-colour, small.—There are varieties of this plant with semidouble and pale rose-coloured flowers. It is a very ornamental plant, rapidly forming a compact covering to old pales or buildings against which it is planted: and the Ayrshire rose is equally good for that purpose.—Smith, græc. t. 483.

Var. β, *microphýlla* (Desf. atl. 1. p. 401.) leaflets nearly orbicular. ♄. H. Found about Tunis.

Var. λ, *latifòlia* (Red. ros. 2. p. 16. and p. 49. with a figure,) leaflets broader; peduncles and fruit hispid; stems green.

Var. δ, *Leschenaultiàna* (Red. et Thor. ros. 3. p. 87. with a figure,) germens ovate, and are, as well as the peduncles, beset with glandular bristles; stems and petioles prickly, pruinose, and violaceous; leaflets ovate-lanceolate. ♄. H. Native of the Nelligery mountains, in Asia. Stems climbing to the height of 60 or 70 feet. Perhaps a proper species.

Var. ε, *microphýlla* (D. C. cat. hort. monsp. 138. fl. fr. 5. p. 533.) leaflets smaller; peduncles and fruit hispid. ♄. H. Red. ros. 2. p. 16.

Var. ζ, *pilósula* (Ser. in D. C. prod. 2. p. 598.) peduncles and petioles usually pilose and hispid. ♄. H. Native of the Eastern Pyrenees.

Var. η, *Russeliàna* (Hort.) flowers pale red. *Russel's rose.*

Var. ϑ, *rose Clare* (Lindl. bot. reg. 1438.) an elegant rose, with spreading corymbs of deep red flowers. It is perhaps a hybrid between the present species and *R. I'ndica.*

Evergreen Dog-rose, Fl. June, Aug. Clt. 1629. Sh. cl.

143 R. PROSTRA'TA (D. C. hort. monsp. 138. fl. fr. 5. p. 536.) surculi prostrate; prickles nearly equal, falcate; leaves evergreen; styles glabrous; flowers usually solitary. ♄. H. Native of the south of France. Red. ros. 1. p. 90. R. arvénsis var. γ prostràta, Ser. in D. C. prod. 2. p. 597.

Var. β, *bibracteàta;* peduncles furnished with 2 or many bracteas; flowers very numerous; leaflets broadish. ♄. H. Native of France. R. arvénsis β bibracteàta, Red. ros. 1. p. 90. Ser. in D. C. prod. 2. p. 597. R. bibracteàta, Bast. ann. litt. and in D. C. fl. fr. 5. p. 537. Flowers white or pale red.

Prostrate Evergreen Dog-rose. Fl. July. Shrub prostrate.

144 R. MULTIFLÒRA (Thunb. jap. 214.) branches, peduncles, and calyxes tomentose; leaflets soft, lanceolate, wrinkled; stipulas pectinated; styles downy; sepals ovate, entire; fruit turbinate, smooth. ♄. H. Native of Japan and China. Sims, bot. mag. 1059. Ker. bot. reg. 425. R. fláva, Donn, hort. cant. ed. 4. p. 121. R. flórida, Poir. suppl. R. diffùsa, Roxb. Flowers single, red, clustered. Fruit bright red, not crowned by the calyx. Red. ros. 2. p. 70.

Var. β, *Thunbergiàna* (Red. ros. 2. p. 70.) flowers white; petioles prickly. ♄. H. Native of Japan. Flowers small, double, clustered.

Var. γ, *cárnea* (Red. ros. 2. p. 69. with a figure,) flowers of a beautiful pink, small, double clustered. ♄. H. Native of China. Lindl. bot. reg. 425. Sims, bot. mag. 1059.

Var. δ, *platiphýlla* (Red. ros. 2. p. 69. with a figure,) leaflets broader; flowers large, double, purple, clustered, changing colour as they fade. ♄. H. Lindl. bot. reg. 1372. R. Thorỳi, Tratt. ros. 2. p. 85. R. Grevíllei and R. Roxbúrghii, Hort.

Var. ζ, *Boursoúltii* (Hort.) flowers small, double, pink, clustered. The garden roses known under the names of *R. Fraseriàna*, *R. purpùrea*, and *R. hyacinthìna* are slight varieties of this.

Many-flowered Rose. Fl. June, July. Clt. 1804. Sh. cl.

145 R. BRUNÒNII (Lindl. ros. p. 120. t. 14.) branches, lanceolate leaflets, and calyxes tomentose and glandular; stipulas serrated; prickles strong, scattered, hooked; sepals entire; styles hairy. ♄. H. Native of Nipaul. R. Brównii, Spreng. syst. 2. p. 556. Leaves simply serrated. Flowers in terminal bunches white or pale red.

Var. β, *nudiúscula* (Lindl. in bot. reg. 829.) leaflets oblong, acute, glabrous; petioles, pedicels, and calyxes glandular.

Var. γ, *Nipalénsis* (Lindl. l. c.) leaflets ovate-lanceolate, distant; petals acute; pedicels and calyxes glandular.

Var. δ, *arbòrea* (Lindl. l. c.) stem arboreous; leaves firmer, pubescent beneath. ♄. H. Native of Persia. R. arbòrea, Pers. ench. 2. p. 50. Shrub upright.

Brown's Rose. Fl. June, July. Clt. 1822. Shrub rambling.

† 146 R. MOSCHA'TA (Mill. dict. no. 13.) branches very sparingly glandular, almost naked; prickles strong, hooked, scattered;

leaflets elliptic, acuminated, glaucous beneath, with the serratures connivent; stipulas entire; sepals compound, acuminated; styles hairy; pedicels glandular, downy, like the ovate tube, and reflexed sepals; fruit small, red. ♄. H. Native of the north of Africa, extending across the continent from Egypt to Mogodor, and thence to Madeira. Jacq. schœnbr. 3. t. 280. Lawr. ros. tt. 53 and 64. Jacq. fragm. 31. t. 34. f. 3. Red. ros. 1. p. 33. t. 5. p. 99. t. 35. R. opsostémma, Ehrh. beitr. 2. p. 72. R. glandulífera, Roxb. Cymes very numerous, many-flowered, corymbose, with hairy ramifications. Flowers pure white, with a slight scent of musk. The Persian attar of roses is obtained from this species.

Var. β, *múltiplex;* flowers double, white, sweet-scented, with the claws of the petals yellow.

Var. γ, *nudiúscula* (Lindl. ros. p. 122.) leaflets oblong, acute, glabrous; petioles, pedicels, and calyxes glandular.

Var. δ, *nìvea* (Lindl. bot. reg. 861.) leaflets 3-5, large, ovate-cordate; flowers corymbose; peduncles and calyxes hispid; petals white, with a tinge of blush, large, obcordate. ♄. H. R. nivea, Dupont, but not of D. C. R. moschàta β, ròsea, Ser. in D. C. prod. 2. p. 598.

Musk Rose. Fl. July, Oct. Clt. 1596. Shrub rambling.

147 R. EVRATÌNA (Bosc. dict. Poir. suppl. 714.) branches and petioles almost unarmed; leaflets 3-5, oval, obtuse, nearly equally toothed, green above, paler and rather glaucous beneath; stipulas with 2 sharp teeth; flowers in bunches, terminal, almost umbellate; peduncles bristly and glandular; sepals entire, acute; germens ovate, hispid. ♄. H. Native of Carolina. Flowers large, pale red.

Evratine Rose. Fl. June, July. Clt.? Shrub.

148 R. RUBIFÒLIA (Brown, in Ait. hort. kew. ed. 2. vol. 3. p. 260.) branches glabrous, armed with scattered, falcate prickles; leaflets ovate-lanceolate, serrated, green and shining above, but paler and downy beneath, with the serratures divaricate; petioles glabrous, with a few prickles; stipulas entire, fringed with glands; styles downy. ♄. H. Native of North America. Peduncles and calyxes glabrous, the former glandular. Flowers small, pale red, about 3 together. Fruit about the size of a pea, round and naked.

Var. β, *macrophýlla* (Ser. in D. C. prod. 2. p. 599.) flowers twin or in fascicles, large, rose-coloured, approximate. R. rubifòlia, Red. ros. 3. p. 71. with a figure.

Var. γ, *fenestràlis* (Lindl. ros. p. 125. t. 15.) flowers solitary; leaflets smaller, smooth on both surfaces. ♄. H. R. fenestràta, Donn, hort. cant. ed. 8. p. 170.

Bramble-leaved Rose. Fl. Aug. Sept. Clt. 1800. Shrub 3 to 4 feet.

SECT. XI. BANKSIA'NÆ (so called in consequence of all the species contained in this section agreeing in character with *R. Bánksiæ*). Lind. ros. p. 125. Stipulas nearly free, subulate, or very narrow, usually deciduous. Leaves usually ternate, shining. Stems climbing. The species of this section are remarkable for their long, graceful, often climbing shoots, drooping white flowers, and ternate shining leaves. They are particularly distinguished by their deciduous, subulate, or very narrow stipulas. Their fruit is very variable. *R. hýstrix* has setigerous branches and *R. setígera* has united styles.

149 R. LÆVIGA'TA (Mich. fl. bor. amer. 1. p. 295.) stipulas linear-lanceolate, half adnate; leaflets shining, glabrous; prickles scattered, falcate; petioles unarmed; fruit muricated; sepals entire, permanent. ♄. H. Native of Georgia, in shady woods. Peduncles and tube of calyx beset with dense, weak, unequal bristles, also the back of the sepals. Flowers solitary, large, white.

Smooth Rose. Shrub cl.

150 R. SI'NICA (Ait. hort. kew. ed. 2. vol. 3. p. 261. Lindl. ros. p. 126. t. 16.) stipulas setaceous, deciduous; cauline prickles equal, falcate; petioles and ribs of leaves prickly; peduncles and fruit beset with straight bristles; sepals entire, permanent. ♄. H. Native of China. Hook. bot. mag. 2847. R. trifoliàta, Bosc. dict. ex Poir. R. ternàta, Poir. suppl. 6. p. 284. R. Cherokeénsis, Donn, hort. cant. ed. 8. p. 170. R. nìvea, D. C. hort. monsp. 137. Red. ros. 2. p. 81. with a figure. Flowers white, solitary. Fruit elliptic, orange red. Disk conical.

Three-leaved *China* Rose. Fl. May, July. Clt. 1759. Sh. rambling.

151 R. RECU'RVA (Roxb. fl. ind. ined. Lindl. ros. p. 127.) stipulas subulate; leaflets 5-9, ovate-lanceolate, acutely serrated, smooth; petioles prickly; fruit muricated. ♄. ◡. G. Native of Nipaul. Flowers white? Branches armed with strong recurved prickles.

Recurved-prickled Rose. Shrub climbing.

152 R. SETI'GERA (Michx. fl. bor. amer. 1. p. 295.) stipulas subulate; petioles rough from little setæ and little recurved prickles; leaflets 3, rarely 5, acutely serrated, smooth; peduncles setigerous; sepals pinnatifid and setigerous; fruit muricated; stem with 1-3 recurved prickles beneath the stipulas. ♄. H. Native of North America. Flowers numerous, sometimes solitary, rose-coloured. The united styles distinguish it from all the other species of this section.

Setigerous Rose. Shrub.

153 R. HY'STRIX (Lindl. ros. p. 129. t. 17.) prickles on branches unequal, crowded, larger ones falcate, small ones straight; stipulas very narrow, united half way, the free part deciduous; leaflets 3, smooth, ovate, shining, simply serrated, with a few prickles on the middle nerve; sepals nearly entire, permanent; fruit bristly. ♄. H. Native of China, in the province of Kiangsi, and of Japan. Branches flagelliform. Flowers large, solitary. Fruit large, oblong, purple.

Porcupine Rose. Shrub rambling.

154 R. MICROCA'RPA (Lindl. ros. 130. t. 18.) cauline prickles hooked, scattered; stipulas subulate; petioles downy or naked; leaflets 3-5, ovate-lanceolate, naked, crenate-serrated; flowers corymbose, with smooth peduncles; fruit pea-formed, unarmed. ♄. H. Native of China, in the province of Canton. Flowers very numerous, small, white.

Small-fruited Rose. Fl. May, Sept. Clt. 1822. Sh. rambl.

155 R. TRIPHY'LLA (Roxb. fl. ind. ex Lindl. ros. p. 138.) shrub climbing and armed; leaves ternate; leaflets lanceolate. ♄. ◡. F. Native of China. Perhaps the same as *R. microcárpa*, or a variety of *R. Sínica.*

Three-leaved Rose. Shrub cl.

156 R. BA'NKSIÆ (Brown, in Ait. hort. kew. ed. 2. vol. 3. p. 258.) branches unarmed; stipulas subulate, rather hairy; leaflets 3-5, glabrous, except at the base of the middle nerve, oblong-lanceolate, simply serrated; sepals ovate, entire; fruit unarmed. ♄. ◡. H. Native of China. Sims, bot. mag. 1954. Red. ros. 2. p. 43. with a figure. Lindl. in bot. reg. 397. R. Banksiàna, Abel. chin. 160. R. inérmis, Roxb.? Flowers drooping, numerous, small, white and very double, with a weak but very pleasant scent.

Var. β, *lùtea* (Lindl. bot. reg. 1105.) flowers double yellow. An elegant shrub when in flower.

Lady *Banks's* Rose. Fl. June, July. Clt. 1807. Sh. cl.

157 R. FRAGARIÆFLÒRA (Ser. in D. C. prod. 2. p. 601.) stem prickly; leaflets petiolulate, ovate, acuminated, entire; flowers corymbose, white; peduncles and calyxes smooth; sepals entire; stipulas solitary? basilar. ♄. ◡. G. Native of China.—Braan. icon. chin. 1821. t. 28. Flowers the size and colour of those of *Fragària vésca.*

Strawberry-flowered Rose. Shrub cl.

158 R. AMYGDALIFÒLIA (Ser. in D. C. prod. 2. p. 601.) branches prickly; leaves trifoliate, exstipulate ?; leaflets oblong-lanceolate, entire, acute; flowers lateral, solitary; peduncles and calyxes hispid; petals longer than the calyx, white; styles combined into a long, filiform column. ♄. G. Native of China. —Braan. icon. chin. t. 19. Sepals broad, acute. Fruit ovate, large.

Almond-leaved Rose. Shrub cl.

† *Species not sufficiently known.*

159 R. HISPA'NICA (Mill. dict. no. 7.) leaves villous on both surfaces; sepals acutely serrated; fruit glabrous. ♄. H. Native of Spain. Mill. Prickles strong. Flowers bright red.

Spanish Rose. Fl. May. Clt. ? Shrub 4 feet.

160 R. XANTHI'NA (Lindl. ros. p. 132.) very like *R. spinosissima*, except in having no setæ, and double flowers the colour of those of *R. sulphùrea*. ♄. F. Native of China.

Yellowish-flowered Rose. Shrub 2 to 3 feet.

161 R. AGRE'STIS (Gmel. fl. bad. als. 2. p. 416.) germens almost globose, and are as well as the peduncles hispid; leaflets round, obtuse, clothed with white tomentum beneath; stem prickly; prickles unequal, straight; flowers solitary. ♄. H. Native of Alsatia, in calcareous soil, in fields. Flowers large, white. Fruit roundish, smooth, red. Perhaps allied to *R. tomentòsa*.

Field Rose. Shrub 1 to 2 feet.

162 R. LYÒNII (Pursh, fl. amer. sept. 1. p. 345.) germens subglobose, glabrous; peduncles hispid; petioles rather prickly; stem glabrous; prickles scattered, straight; leaflets 3-5, ovate-oblong, acute, serrated, smoothish above, tomentose beneath; uppermost leaves simple; flowers usually tern; stipulas linear; sepals tomentose, linear, hardly jagged. ♄. H. Native of Tenessee. Flowers pale red. Leaves small, with coloured veins. Evidently related to *R. Carolina*.

Lyon's Rose. Fl. June, July. Clt. ? Shrub 3 to 4 feet.

163 R. POLLINIA'NA (Spreng. pl. min. cogn. pug. 2. p. 66.) tube of calyx ovate, and is, as well as the peduncles and petioles, beset with glandular bristles; leaflets ovate-roundish, serrated, glabrous on both surfaces, having the teeth glandularly serrated; stem prickly. ♄. H. Grows in hedges, at the foot of Mount Baldo. Flowers large, purple. This species is evidently related to *R. rubiginòsa*.

Pollini's Rose. Shrub 4 to 6 feet.

164 R. HÍSPIDA (Poir. encycl. no. 15.) germens globose, and are as well as the peduncles hispid and prickly; leaflets ovate, clothed with white tomentum beneath; stem prickly; prickles scattered; flowers solitary. ♄. H. Native country unknown. Evidently nearly allied to *R. tomentòsa*.

Hispid Rose. Shrub 6 to 8 feet.

165 R. LOUREIRIA'NA; stem shrubby, tufted, branched, prickly; petioles prickly; tube of calyx round; peduncles unarmed. ♄. H. Cultivated in China and Cochin-china every where, and in the latter country it is called *Hoa-kôé*, and in the former *Mûi-hôa*. R. cinnamòmea, Lour. coch. 323. Leaves with hardly any scent. Flowers single, very red.

Loureiro's Rose. Shrub 3 feet.

166 R. COCHINCHINE'NSIS; stem climbing a little, very prickly; tube of calyx roundish, smooth; petioles and peduncles prickly. ♄. H. Native of Cochin-china, where it is called *Hoa hoüng tau*. R. spinosíssima, Lour. coch. p. 323. Flowers blush-coloured, scentless. Perhaps *R. Sínica*.

Cochin-china Rose. Shrub 6 feet.

167 R. ADENOPHY'LLA (Willd. enum. p. 546.) germens ovate, clothed with glandular bristles; petioles beset with glandular down, unarmed; leaflets simply serrated, glaucous beneath, with glandular margins; prickles of branches scattered. ♄. H. Native country unknown. Flowers single, large, red; petals emarginate. This plant is perhaps allied to *R. parvifòlia*.

Gland-leaved Rose. Shrub 4 to 6 feet.

168 R. TUGURIÒRUM (Willd. enum. p. 544.) germens roundish, glabrous; calyxes pilose; peduncles hispid; petioles villous, prickly; prickles on stem scattered. ♄. H. Native country unknown. Called in Germany *Tapeten Rose.* Perhaps nearly allied to *R. arvénsis*.

Cottage Rose. Shrub.

169 R. VELUTÌNA (Clairv. man. d'herb. 163.) fruit round; leaves cottony beneath, edges glandular. ♄. H. Native of Switzerland, about Winterthur. Perhaps this is a variety of *R. pimpinellifòlia*.

Velvety Rose. Shrub.

170 R. MURICA'TA (Waitz, in Link. enum. 2. p. 56.) stem muricated above; petioles almost naked; leaflets oval, obtuse, serrated, glabrous; peduncles glandular; tube of calyx oblong, naked; sepals with tomentose edges. ♄. H. Native country unknown.

Muricated-branched Rose. Shrub.

171 R. RUFICAU'LIS (Ehrh. beit. 7. p. 138.) prickles very slender, reflexed, covered with bluish bloom; branches unarmed; leaflets lanceolate, acutely serrated, glaucous beneath; tube of calyx globose; sepals undivided, length of corolla; styles shorter than the stamens. ♄. H. Native of America. R. Portlándica, Gord. cat. p. 28. R. Portlándica, Ludw. baumz. 15.

Brown-stemmed Rose. Shrub.

172 R. VERTICILLACA'NTHA (Mer. fl. par. 190.) prickles minute, rather verticillate, reflexed; leaflets oval, glandless; petioles rather glandular; fruit globose, clothed with glandular bristles; sepals undivided. ♄. H. Native about Paris. Perhaps a variety of *R. alpìna*.

Whorled-spined Rose. Shrub 3 to 4 feet.

173 R. MACROCA'RPA (Mer. fl. par. 190.) prickles nearly straight; leaflets oval, toothed, glandless; petioles hardly glandular; fruit globose, and are, as well as the peduncles, smooth; sepals undivided, glandless. ♄. H. Native of France.

Long-fruited Rose. Shrub.

174 R. STIPULA'RIS (Mer. fl. par. 192.) prickles recurved; leaflets doubly serrated, glabrous, glandless; petioles glandular and prickly; stipulas large, entire, glandular; fruit oval, and are as well as the peduncles glabrous; sepals undivided, glandless. ♄. H. Native about Paris. Flowers rose-coloured.

Stipular Rose. Shrub.

175 R. FLEXUÒSA (Rafin. prec. 37. but not of Rau.) stems twisted; prickles solitary, recurved; petioles glabrous and nearly unarmed; leaflets ovate, unequally serrated; flowers solitary; germens oblong, or globose, glabrous. ♄. H. Native of North America. R. Raffinesqueiàna, Tratt. ros. 2. p. 234. Peduncles short. Flowers large, rose-coloured.

Flexuous-stemmed Rose. Shrub.

176 R. ACUMINA'TA (Rafin. ros. amer. in ann. sc. phys. 5. p. 216.) stem and petioles prickly; leaflets 3-5, oval, acuminated, serrated, pubescent beneath; flowers subumbellate; fruit obovate, and are as well as the peduncles beset with glandular bristles. ♄. H. Native of North America, on the banks of the Wabash river.

Acuminated-leaved Rose. Shrub.

177 R. PRAIE'NSIS (Rafin. l. c. 5. p. 215.) stem flexuous; prickles stipular, straight; petioles pubescent; leaflets 5-7, oblong, attenuated at both ends, serrated, glabrous; flowers solitary; fruit ovate, hispid. ♄. H. Native of North America, in the meadows of Kentucky. Flowers white.

Var. β, geminàta (Rafin. l. c.) leaflets obovate ; flowers twin, rose-coloured.

Meadow Rose. Shrub.

178 R. ripa'ria (Rafin. l. c. 5. p. 216.) hispid and prickly ; prickles straight ; leaflets 5, unarmed, ovate, doubly serrated, ciliated, clothed with glaucous pubescence beneath ; flowers solitary ; peduncles angular ; fruit turbinate, oblong, nearly smooth. ♄. H. Native of Maryland, on the banks of the Potowmak river. Flowers purple, fragrant.

Var. β, amœ'na (Rafin. l. c.) flowers double.

River-bank Rose. Shrub.

179 R. dasyste'ma (Rafin. l. c. 5. p. 219.) stems nearly unarmed, villous ; leaflets 5-7, oval or obovate, serrated, velvety beneath ; flowers solitary ; sepals simple ; fruit oblong, hispid. ♄. H. Native of North America.

Thick-stamened Rose. Shrub.

180 R. Waitzia'na (Tratt. ros. 1. p. 57.) fruit ovate, glabrous, scarlet ; sepals appendiculate, bristly on the back ; peduncles hispid ; leaflets roundish-ovate, simply serrated ; scentless, glabrous ; floriferous branches glandular and prickly ; prickles hooked. ♄. H. Native of Saxony, near Altenburgh.

Waitz's Rose. Shrub.

181 R. rubrispi'na (Bosc. dict. ex Poir. suppl. 4. p. 615. and Tratt. ros. 2. p. 179.) fruit prickly, nearly globose ; leaflets 5-7, elliptic, obtuse, glabrous, serrated ; branches and peduncles furnished with small straight prickles ; flowers usually solitary ; sepals beset with glandular hairs on the edges. ♄. H. Native of North America.

Red-spined Rose. Shrub.

182 R. Si'cula (Tratt. ros. 2. p. 68.) fruit globose, and are as well as the peduncles glabrous and unarmed ; leaflets orbicular, sharply and doubly serrated, with the teeth all glandular at the apex ; petioles clothed with glandular villi ; stems prickly ; prickles subverticillate. ♄. H. Native of Sicily, on the tops of the Nebrodes.

Sicilian Rose. Shrub.

183 R. fraxinifòlia (Andr. ros. fasc. 33. ex Tratt. ros. 2. p. 100.) stem glabrous, nearly unarmed ; germens oblong ; peduncles glabrous ; petioles prickly ; leaflets rough, oblong, narrow, acute, serrated ; flowers white, sweet-scented ; inner petals small and flexuous. ♄. H. Native country unknown. Perhaps a variety of *R. sempervìrens.*

Ash-leaved Rose. Shrub.

184 R. Heckelia'na (Tratt. ros. 2. p. 85.) fruit globose, glabrous, muricated ; peduncles very short, tomentose ; leaflets orbicular, doubly toothed, clothed with hoary tomentum on both sides as well as the stipulas, and ciliated with glands ; very blunt at the apex ; stems prickly ; prickles somewhat verticillate. ♄. H. Native of Sicily, on the Nebrodes.

Heckel's Rose. Shrub.

185 R. erube'scens (Andr. ros. fasc. 30. ex Tratt. ros. 1. p. 119.) fruit ovate, and are as well as the peduncles clothed with glandular bristles ; sepals oblong, entire, glabrous ; petioles rather prickly ; leaflets ovate, acute, unequally serrated, discoloured ; cauline prickles scattered and solitary, some straight and setaceous, and others large, recurved, and dilated at the base, dark purple. ♄. H. Native country unknown.

Reddish Rose. Shrub.

186 R. inca'na (Kit. ex Tratt. ros. 1. p. 135.) fruit and peduncles glabrous ; cauline prickles recurved ; petioles almost unarmed, and are, as well as the leaves, villously tomentose. ♄. H. Native of Hungary.

Hoary Rose. Shrub.

187 R. Clusia'na (Waitz, ex Tratt. ros. 1. p. 119.) fruit nearly globose, glabrous ; sepals appendiculated, and are, as well as the peduncles, hispid ; petioles villous, glandular, rather prickly ; leaflets sweet-scented, ovate-lanceolate, simply serrated, pubescent beneath ; stipulas quite entire ; stem and branches unarmed. ♄. H. Native country unknown. Ròsa sine spinis, Clus. hist. 1. p. 115. f. 1. Perhaps a variety of *R. Gállica.*

Clusius's Rose. Shrub 2 to 3 feet.

188 R. gla'bra (Andr. ros. fasc. 21.) fruit ovate ; petioles and peduncles hispid ; flowers of many equal petals ; leaflets oblong, acuminated, serrated, glabrous ; stem glabrous, nearly unarmed. ♄. H. Native country unknown. Size and form of *R. centifòlia pompònia.* Leaves like those of *R. moschàta*, but the plant altogether is more nearly allied to *R. cinnamòmea* ex Tratt. ros.

Glabrous Rose. Shrub 4 to 6 feet.

189 R. Sprengelia'na (Tratt. ros. 2. p. 163.) nearly unarmed ; fruit globose, hispid ; peduncles smoothish ; petioles villous ; leaflets oblong, serrated at the apex, pubescent beneath ; branches nearly unarmed ; prickles very few and straight ; flowers sessile, aggregate. ♄. H. Native country unknown. R. Virgínica, Curt. ex Spreng. nov. prov. p. 36. no. 80.

Sprengel's Rose. Shrub.

190 R. Portenschlagia'na (Tratt. ros. 2. p. 203.) germens ovate, glabrous, coloured ; peduncles very short, and are, as well as the petioles, prickly and glandular ; sepals coloured, subulate, pinnatifid, one-half shorter than the petals ; flowers alternate, solitary, large ; stem unarmed. ♄. H. Native country unknown. Flowers rose-coloured.

Portenschlag's Rose. Shrub.

191 R. Wulfe'ni (Tratt. ros. 1. p. 200.) fruit nearly globose, coloured, glabrous ; peduncles solitary, short, clothed with glandular bristles ; leaflets elliptic, somewhat doubly serrated ; stipulas biauriculate ; branches and petioles very prickly. ♄. H. Native of Germany.

Var. β, rùbra (Tratt. ros. 1. p. 201.) leaves smaller ; leaflets ciliated with glands ; fruit ovate-oblong ; petals deep rose-coloured. ♄. H. Native of Carinthia, on mount Nanas. Leaves, branches, and calyxes red.

Wulfen's Rose. Shrub.

192 R. trichoca'rpa (Waitz, ex Tratt. ros. 2. p. 45.) fruit oblong ; sepals appendiculate, and are, as well as the peduncles, hispid ; petioles glandular and prickly ; leaflets sweet-scented, ovate-lanceolate, simply serrated, glabrous on both surfaces ; stem and branches very glabrous and prickly ; prickles hooked, equal ; stigmas sessile. ♄. H. Native country unknown. Perhaps a variety of *R. álba.*

Hairy-fruited Rose. Shrub 4 to 6 feet.

193 R. concavifòlia (Waitz, ex Tratt. ros. 2. p. 66.) fruit ovate, glabrous ; sepals appendiculate, hairy, glandless ; peduncles hispid ; petioles glandular, prickly ; leaves sweet-scented, ovate, doubly serrated, pubescent on both surfaces ; stipulas with glandular edges ; flowers subcorymbose. ♄. H. Native country unknown.

Concave-leaved Rose. Shrub.

194 R. elli'ptica (Tausch, ex Tratt. ros. 2. p. 69.) fruit ovate, and are, as well as the peduncles, glabrous ; leaflets elliptic, unequally and glandularly serrated, quite entire at the base, glaucescent, and beset with glandular pili ; prickles reflexed, stipular. ♄. H. Native of Bohemia. R. rubiginòsa, Guimpel, deutsch. Holzart. 1. p. 121. t. 91. Fruit blood-coloured.

Elliptic-leaved Rose. Shrub.

195 R. Mau'kschii (Schultes in œstr. fl. ed. 2. vol. 2. p. 69. ex Tratt. ros. 2. p. 218.) fruit nearly globose, and are, as well as the peduncles, glabrous ; petioles beset with glandular bristles ; stem prickles scattered, a little recurved ; leaflets almost

glabrous. ♄. H. Native country unknown. Nearly allied to R. rubiginòsa ex Tratt. l. c.

Mauksch's Rose. Shrub.

196 R. ANDRE'WSII (Tratt. ros. 2. p. 205.) fruit elliptic, glabrous; sepals oblong, quite entire, glabrous; peduncles and petioles hispid; stem unarmed; leaflets somewhat doubly serrated, glabrous, glaucescent beneath; flowers lateral, solitary, deep purple, drooping; fruit pendulous. ♄. H. Native country unknown. R. inérmis, Andr. ros. fasc. 2. Very nearly allied to *R. alpìna.*

Var. β, débilis (Tratt. l. c. p. 206.) stems weak, decumbent; leaflets small, nearly like those of *R. spinosissima;* flowers large, twin, very beautiful, between scarlet and blood-coloured.

Andrews's Rose. Shrub 2 to 3 feet.

197 R. SERAFI'NII (Viviani, add. fl. ital. fragm. and fl. libyc. p. 67. fl. cors. spec. nov. 8.) germens oblong, and are, as well as the peduncles, glabrous; stem and petioles prickly; prickles recurved, falcate; stipulas ovate; leaflets roundish, doubly serrated, with the teeth glandular. ♄. H. Native of Corsica, on mount Coscione.

Serafin's Rose. Shrub 4 to 6 feet.

198 R. GLABRA'TA (Vest, ex Tratt. ros. 2. p. 220.) fruit large, solitary, nearly globose; peduncles very short; leaflets roundish-elliptic, decurrent at the base, doubly serrated, quite glabrous on both surfaces, with glandular margins; prickles scattered, usually twin. ♄. H. Native of Styria. Allied to *R. pimpinellifòlia.*

Smoothish Rose. Shrub 3 to 4 feet.

199 R. SI'MPLEX (Scop. fl. carn. ed. 2. vol. 1. p. 353. ex Tratt. ros. p. 229.) fruit ovate, glabrous; leaflets glabrous beneath; sepals beset with glandular bristles. ♄. H. Native country unknown. R. Scopoliàna, Tratt. l. c. Allied to *R. alpìna* or *cinnamòmea.*

Simple Rose. Shrub 4 to 6 feet.

200 R. ORIENTA'LIS (Dupont in litt. D. C. prod. 2. p. 607.) dwarf; stem prickly, glabrous; prickles conical, slender; young branches puberulous; leaflets roundish, tomentose, serrate-crenated; fruit globose, hispid; peduncles tomentose and hispid; sepals nearly entire. ♄. H. Native of Persia.

Var. α, Oliveriàna (Ser. in D. C. prod. 2. p. 607.) leaflets very veiny and smoothish beneath; peduncles puberulous, but not glandular; fruit glabrous, hispid. ♄. H. Native of Persia.

Var. β, Balbisiàna (Ser. l. c.) leaflets hardly veiny, puberulous beneath; peduncles tomentose and hispid; tube of calyx very hispid and glandular. ♄. H.

Oriental Rose. Fl. June, July. Shrub 2 to 3 feet.

201 R. VENTENATIA'NA (Red. ros. 3. p. 83. with a figure,) cauline prickles unequal, crowded, straight; germ finger-shaped, beset with glandular bristles at the base, as well as the peduncles; flowers nearly sessile. ♄. H. Native country unknown.

Ventenat's Rose. Fl. June, July. Shrub.

202 R. CANE'SCENS (Krok. fl. siles. 2. p. 153. no. 784. ex Tratt. ros. 2. p. 226.) fruit nearly globose, and are hispid, as well as the peduncles; leaflets lanceolate, glabrous on both surfaces, discoloured, simply serrated; principal stem nearly unarmed, canescent; branches prickly and very hispid; stipulas adnate, very long. ♄. H. Native of Silesia.

Canescent Rose. Shrub 4 to 6 feet.

203 R. KROKE'RI (Tratt. ros. 2. p. 231.) fruit globose, and are, as well as the peduncles, glabrous and unarmed; leaflets usually 3, elliptic, obtuse, serrated at the apex, clothed with hoary tomentum beneath; petioles short, involucrated, stipulate; stem 1-flowered. ♄. H. Native of Silesia. R. pygmæ'a, Krok. fl. siles. 2. p. 154. in a note.

Kroker's Rose. Shrub 1 to 2 feet.

204 R. AMBI'GUA (Lejeune. rev. fl. spa. p. 98.) fruit egg-shaped, glabrous, furnished with a few stalked glands; peduncles glabrous, rarely glandular; leaflets glabrous on both surfaces, doubly serrated, acuminated; bracteas and petioles glandularly ciliated. ♄. H. Native about Verviers. Perhaps a variety of *R. canina.*

Ambiguous Rose. Shrub 5 to 6 feet.

205 R. SYLVA'TICA (Tausch, in fl. vol. 2. p. 464. ex Tratt. ros. 1. p. 58.) fruit ovate, and are, as well as the peduncles, hispid; flowers cymose; petioles beset with glandular pili and prickles; leaflets ovate, acute, unequally and deeply glandularly serrated, pilose beneath; stems bristly or prickly. ♄. H. Native of Bohemia, in shady places.

Wood Rose. Shrub 4 to 6 feet.

History.—The rose is known by every body at first sight, and has been a favourite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species and varieties, and the colours are red, white, purple, yellow, black, striped, or in almost numberless shades and mixtures, from single to semidouble and double. Roses are cultivated in every garden, from the most humble cottage upwards. Some species, as *R. centifòlia, R. damascèna,* &c. are also cultivated on a large scale by commercial gardeners for distilling rose-water, and for making attar or essential oil of roses. Six pounds of rose petals will impregnate by distillation a gallon of water strongly with its odour; but a hundred pounds afford hardly half an ounce of attar. The *rose* is also used in medicine. Botanists are not agreed as to the number of original species of this genus, and notwithstanding the labours of many scientific men the genus still remains a chaos, from which it can never be extricated. We have endeavoured in the foregoing pages to render the species as clear as it is practicable from the present knowledge of the genus. The most scientific work which has appeared upon the subject in England is the "Rosarum Monographia," of John Lindley, 1819; and Miss Lawrence has published about ninety plates of "A Collection of Roses from Nature," 1810. In France Guillemeau has published "Histoire Naturelle de la Rose," 1800, and P. J. Redoute and C. A. Thory have published a splendid work in folio, entituled "Les Roses," containing plates of both species and varieties. C. A. Thory has published a separate tract on the culture of roses, entitled "Prodrome de la Monagraphie du genre Rosier," &c. 1820. M. A. Pronville a "Nomenclature Raisonnée", in 1818. J. Sabine has given an account of Scotch roses in Hort. trans. 4. p. 281. Many varieties of the *rose* are yearly raised from seeds in the nurseries.

Varieties are raised from seed on the continent, where the seed ripens better than in this country. A number of varieties have also been raised in this country, especially of the *R. spinosissima* or *Scotch-rose.* New varieties are raised in France and Italy annually. L. Villaresi, royal gardener at Monza, has raised upwards of 50 varieties of *R. I'ndica,* some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. Ample lists of the varieties are given under their proper species.

Propagation.—By seed for new varieties, and chiefly by layers for continuing approved sorts. They are also increased by budding, cuttings, and suckers.

By seed.—The hips containing the seeds are obtained from semidouble and single flowers, and to increase the chance of new varieties, these should be taken from plants that have been planted among or near to the kinds of which a cross is desired. Extracting the stamens from one flower, and dusting the stigmas with the pollen of another kind, might answer in most instances. In France and Italy the usual mode is to form a plantation of double and semidouble sorts, mixed indiscriminately, and take the result of promiscuous impregnation; it is also done in some of the nurseries of this country. The hips generally ripen in October or November. The seeds do not vegetate till the second season after sowing. The first year, instead of sowing them, they may be preserved among sand, or the hips entire may be so preserved a full year, when the husks will be perfectly rotten, and the seed being separated and sown in February will come up in May or June following. The seeds should be sown in soft soil, and in a shady situation, or they may be covered with earth from a ¼ to ½ an inch, according to the size of the seeds. Early in the second spring they may be planted in rows a foot or 2 feet apart every way, according to the size of the sorts. Here they may remain till they flower, which varies in the different sorts from the third to the fifth year, but most commonly they flower the fourth summer.

By layers.—The common mode is to lay down the young shoots of the preceding summer late in autumn or early in the succeeding spring, and then, with the exception of the *moss-rose*, and one or two others, they form rooted plants by the next autumn. But it is now found, that if the same shoots are laid down when the plant is beginning to flower in July, they will, with a few exceptions, produce roots, and be fit to remove the same autumn, by which a whole year is gained. Such sorts as do not root in one year must be left on the stools till the second autumn; but layers made when the shoot is in a growing state, and furnished with healthy leaves, root much more freely than shoots of ripe wood. After the plants are removed from the stools they are planted in nursery rows, and in a year the blossom buds, having been carefully pinched off from the first laying down, they will be fit for removal to their final destination. The stools are then to be pruned, and the soil stirred and enriched.

By suckers.—Many of the commoner sorts admit of being rapidly multiplied in this way, and the plants obtained may be planted in their final destination at once.

By cuttings.—Most sorts might be propagated in this way from cuttings of young wood, cut at a joint where it is beginning to ripen, and planted in sand and vegetable mould under a hand-glass. But this mode is only adopted with such sorts as strike easily, as the Indian and Chinese kinds.

By budding.—This mode of propagating roses is adopted only with the rarer kinds, and such as are difficult to propagate by layers; for it is found that plants so originated, even though on stocks of the hardier sorts, are less durable than such as are raised by any of the other modes. But the chief use of budding in the culture of the *rose* is to produce standard-roses, or to produce several sorts from the same tree or bush. Standard-roses are a modern invention, it is generally supposed of the Dutch, first carried to Paris, and about 30 years ago to England. They are highly artificial objects of great beauty, and form magnificent ornaments to parterres and borders. The stocks are either of the tree rose, *Ròsa villòsa*, or of any sorts of wild roses, which grow to a large size. They are budded at different heights, from 3 to 7 feet, but commonly between 5 and 6 from the ground. A stock in the Paris garden, which carries several sorts, has a naked stem of nearly 15 feet high, and there are others at Malmaison and at Grand Trianon of equal height. The stocks are procured from woods and copses, and after being planted in nursery lines are often budded the same summer, sometimes in summer by the scalope mode of budding, *l'œil puissant* of the French; and never later than the succeeding spring or summer by the common mode. Generally two buds are inserted on opposite sides of the stock, but often 3-4 or a dozen in alternate positions on the upper 6 or 12 inches of the stem. Every stock is supported by a rod, which should reach a foot or eighteen inches higher than the situation of the bud; to this rod the stock is tied, and afterwards the shoots from the buds, which are otherwise liable to be blown out by high winds. The Paris nurserymen being supplied with stronger stocks than can readily be procured in England, and having a better climate and more experience in the culture of roses, excel us in this department of *rose* propagation, and their standards afford an article of commerce with other countries. Their common plants raised by layers are also in extensive demand, but in these we equal if not surpass them. Fine collections of standard roses may be seen in Lee's nursery at Hammersmith, in the Count de Vande's garden at Bayswater, in the duchess of Dorset's at Knowle, and in various other places.

Final situation.—No species of *rose*, wild or cultivated, thrives well in or near large towns, on account of the smoke or confined air. The yellow and Austrian *roses*, *R. lùtea* and *R. bícolor* are difficult to flower in any situation. Roses are generally planted in the front of shrubberies and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn or gravel, either with common box or other edgings, or with edgings of wire, in imitation of basket-work; these last are called baskets of roses; the ground inclosed in the basket margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike root, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells; under this treatment the whole surface of the basket becomes in two or three years covered with rose-buds and leaves, of one or of various sorts. Where one of the larger free growing sorts is employed, as the *moss rose*, or any of the Provins' varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colours of their flowers. By mixing small-flowered with large-flowered sorts, the beauty of the former is lost without adding to the effect of the latter. In rosaries commonly but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctive differences are better seen. Particular compartments are often devoted to one species, as the *Scotch*, *Chinese*, *yellow*, *burnet-leaved*, &c. which has an excellent effect, sometimes a piece of rock-work in the centre is covered with creeping *roses*, and on other occasions they are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge standard *roses* are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds. Standard *roses*, however, have certainly the best effect in flower borders, or when completely detached on a lawn; their sameness of form, and that form very compact and bushy, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity, as *rose* plants, and in their flowers; and therefore to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, or here and there among groups of flowers, or in lines or avenues along flower-walks.

Soil.—Most species of the *rose*, in their wild state, grow in sandy and rather poor soil, excepting such as are natives of woods, where the soil is richer and comparatively moist. But all the cultivated *roses*, and especially the double flowering kinds, require a rich loamy soil, inclining to clay rather than sand, and they require also, like most double flowers, plenty of moisture when in a growing state.

General culture.—To produce strong flowering *roses* requires some attention in pruning; old wood should be yearly cut out, and the young shoots thinned and shortened, according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw out numerous suckers, should be taken up every three or four years, reduced, and replanted, and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil and replace it by new. The points of the shoots of the more delicate sorts of *roses* are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation is immediately after the bloom is over, cutting out old exhausted wood, shortening shoots which have flowered, to a good bud, accompanied with a healthy leaf, but leaving such shoots as are still in a growing state till October. Where very large *roses* are wanted, all the buds, except on that of the extreme point of each shoot, should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half rotten stable dung or partially rotten leaves.

Forwarding and retarding roses.—The earliest flowering *rose* is the *monthly*, which in mild seasons and planted against a wall, will sometimes flower in the beginning of April; the *roses* next in succession are the *cinnamon*, which flowers in May, the *damask*, in the end of May or beginning of June; the *blush*, *York*, and *Lancaster*, *Provins'*, and *Dutch hundred-leaved*, in June, July, and August. The *Virginia* and *musk roses* are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the *monthly*), is also the latest, and generally continues flowering till interrupted by frost. The earliest sorts may be materially forwarded by being planted against a south wall, and if portable sashes be placed before them, and the wall is either flued or heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The *monthly rose*, being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very common mode of obtaining late *roses*, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots of every kind early in the spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

Forcing the rose.—The best sorts for this purpose are the common and *moss Provence*. The Indian sorts force well, or rather in stoves continue in bloom all the year; but the commoner varieties not being fragrant, they are in less repute than the European *roses*. *Rose* plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots 6 or 8 inches in diameter, in rich loam, and plunged in an open airy situation, their flower-buds pinched off as they appear, and the plants put into a state of rest, by excluding the sun and rain, but not a free circulation of air. Abercrombie says, " There is no certainty of obtaining a fine blow of roses in the depth of winter by the most expensive artifices of forcing; and yet fine flowers may be produced early in the spring by any ordinary stove, put in operation in December. When the plants are first introduced, keep the air of the house about 55°, never letting it fluctuate to more than 2 or 3 degrees below the above. In the second week, aim at 60° as the standard; in the third week 65°. When a month has nearly elapsed, begin to increase the heat gradually to 70°, having brought it to this standard, let it afterwards exceed it from 3 to 5 degrees rather than sink below. A succession may be kept up by introducing some pots every 8 or 10 days.

Insects.—All the species of *Rósa* are very liable to the attacks of insects, especially of the aphides; some, particularly the briar and Scotch *rose*, are attacked by the cynips rósæ, which by puncturing the bark, occasions the production of rose-galls, and of those massy tufts often seen on wild *roses*, which were formerly known under the name of bedequar, and used in medicine. A great number of insects seem fond of the flowers of *roses*, from the earwig to the seemingly harmless lady-bird, which deposits its larvæ in the leaves of various species, both wild and cultivated. There seems no remedy for insects on plants in the open air so simple and effectual as gathering them by hand, or removing the leaf or that part of the shoot which is infected by them. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvæ of many others, and especially of the tipula, and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by hand.

† *A genus allied to Rosàceæ.*

XXIII. AMOREU'XIA (this genus is dedicated by Sesse and Mocino to P. J. Amoreux, a botanist of Montpelier). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 638. Genus nòva, Ruiz. et Pav. in herb. Lamb.

Lin. syst. *Icosándria*, *Monogýnia*. Calyx 5-parted, with a short tube, and oblong, acute lobes. Petals 5, obtuse and emarginate at the apex, larger than the calyx, and inserted in its base. Stamens about 20, disposed in one series, shorter than the petals. Ovary ovate, free, 3-celled, many-ovulate. Style filiform, acute. Capsule ovate.—A herb, with alternate, bistipulate, palmatifid leaves on long petioles, having the lobes serrated at the apex, and joined together at the base by a foliaceous membrane. Peduncles solitary, opposite the leaves, or nearly terminal, 1-flowered, inflexed at the apex. Flowers large, red. —Habit of *Neuràda* or *Dryas*, but the characters are not sufficiently known to determine which of the genera it comes nearest.

1 A. palmati'fida (Moc. et Sesse, fl. mex. icon. ined.). ♃. ? G. Native of Mexico.

Palmatifid-leaved Amoreuxia. Pl. trailing.

Cult. A mixture of loam, sand, and peat, will probably suit this plant, and cuttings will perhaps root if planted in sand or mould, with a hand-glass placed over them.

Order **LXXXIV. SANGUISO'RBEÆ** (plants agreeing with *Sanguisórba* in important characters). Lindl. introd. nat. ord. p. 80. Rosàceæ, Tribe VI. Sanguisórbeæ, Juss. gen. p. 336. exclusive of some genera. D. C. prod. 2. p. 588.

Flowers usually unisexual from abortion. Calyx with a thickened tube (f. 78. *a.*) and a 3 (f. 80. *a.*) -4 (f. 79. *b.* f. 77. *b.*) -5-lobed limb, its tube lined with the disk. Petals none. Stamens definite, sometimes fewer than the segments of the calyx, with which they are alternate, arising from the orifice of the calyx; anthers 2-celled, innate, bursting longitudinally, occasionally 1-celled, and bursting transversely. Ovary solitary, simple, with the style proceeding from the apex at the base. Ovulum solitary, always attached to that part of the ovaries which is next the base of the style. Stigma compound or simple. Nut solitary, inclosed in the often-indurated tube of the calyx. Seeds solitary, suspended, or ascending, exalbuminous. Embryo with a superior radicle, and large plano-convex cotyledons.—Herbaceous plants or under shrubs, occasionally spiny. Leaves simple, lobed, or pinnate, alternate, furnished with stipulas. Flowers small, usually capitate. This order differs from *Rosàceæ* in the apetalous flowers and indurated calyx, and the reduction of the carpella to one only. Their general character is astringency. A decoction of *Alchemílla vulgàris* is slightly tonic. *Sanguisórba* is useful as fodder.

Synopsis of the genera.

1 Cercoca'rpus. Calyx coloured, with a cylindrical permanent tube, and a sinuately 5-lobed, deciduous limb. Stamens 20, inserted in the limb of the calyx. Carpel ending in a plumose style.

2 Alchemi'lla. Calyx tubular, contracted at the throat, with an 8-parted limb (f. 77. *b.*). Stamens 1-4. Carpella 1-2. Style filiform, capitate at the apex.

3 Cephalòtus. Calyx coloured, 6-cleft (f. 78. *b.*). Stamens 12 (f. 78. *c.*). Anthers didymous (f. 78. *c.*), glandular on the back. Ovaries 6 (f. 78. *d. h.*), distinct. Styles terminal (f. 78. *i.*). Akenia 1-seeded.

4 Margyrica'rpus. Calyx with the tube contracted at the mouth, the limb 4-5-parted, each segment furnished with a tooth-formed spinula on the outside at the base. Stigma feathery. Carpel 1, drupaceous.

5 Polyle'pis. Calyx with a turbinate angular tube, and a 3-4-cleft limb, furnished with spine-formed teeth above. Stamens 5-20. Stigma pencilled. Carpel drupaceous.

6 Acæ'na. Calyx tubular, armed with glochidate prickles, and furnished with 2 scales at the base. Stamens 2-10. Carpels 1-2, dry. Stigma plumose.

7 Sanguisórba. Flowers hermaphrodite. Calyx 4-cleft, propped by 2 scales at the base. Stamens 4. Carpels 2. Stigma pencil-formed. Akenia dry.

8 Pote'rium. Flowers monoecious or polygamous. Calyx furnished with 3 scales at the base (f. 79. *a.*); the limb 4-parted (f. 79. *b.*). Stamens 20-30. Stigma pencil-formed. Akenia 2, dry.

9 Cliffórtia. Flowers dioecious. Calyx with an urceolate tube and a 3-parted (f. 80. *a.*) limb. Stamens about 30. Stigma plumose. Akenia 1-2.

I. CERCOCA'RPUS (from κερκος, *kerkos*, a shuttlecock, and καρπος, *karpos*, a fruit; in reference to the shape of the fruit). H. B. et Kunth, nov. gen. amer. 6. p. 232.—Bertolònia, Moc. et Sesse, fl. mex. icon. ined.

Lin. syst. *Icosándria, Monogýnia.* Calyx coloured, with a cylindrical permanent tube, and a sinuately 5-lobed deciduous limb, with the throat open. Petals wanting. Stamens 20, inserted in the limb of the calyx. Carpel 1, free. Fruit membranous, tailed by the plumose permanent style, 1-seeded, involved by the calyx.—A tree, with alternate, entire leaves, furnished with 2 petiolar stipulas; and axillary umbellate fascicles of flowers.

1 C. fothergilloìdes (H. B. et Kunth, l. c. t. 559.) ♄. G. Native near the town of Mexico. Bertolònia guieroìdes, Moc. et Ses. fl. mex. icon. ined. Leaves nearly elliptic, coriaceous, glabrous. Calyx clothed with silky down.

Fothergilla-like Cercocarpus. Tree 12 feet.

Cult. A mixture of peat and loam will suit this tree, and cuttings will root if planted in a pot of sand, with a hand-glass placed over them.

II. ALCHEMI'LLA (*Alkemelyeh* the Arabic name of one of the species). Tourn. inst. t. 289. D. C. prod. 2. p. 589.—Alchemílla and Aphànes, Lin. gen. no. 165. and 166. Lam. ill. t. 86. and 87.

Lin. syst. *Di-Tetrándria, Mono-Digýnia.* Calyx tubular (f. 77. *c.*), with the tube rather contracted at the apex; and with an 8-parted (f. 77. *b.*) limb, the alternate lobes or bracteoles the smallest (f. 77. *b.*), sometimes very small and tooth-formed. Petals wanting. Stamens 1-4. Styles lateral, filiform, capitate at the apex. Carpels 1-2, 1-seeded, at length becoming dry and indurated. Seed inverted. Herbs with palmate or lobed leaves. Flowers small, corymbose.

Sect. I. Alchemi'lla (see genus for derivation). Lin. gen. no. 165. Calyx 8-cleft (f. 77. *b.*), alternate lobes smallest (f. 77. *b.*). Stamens 2-4. Perennial plants.

* *Leaves palmately 7-9-cleft.*

1 A. Cape'nsis (Thunb. fl. cap. 1. p. 558.) leaves reniform, somewhat lobed, repandly crenated, and are as well as the stems hairy; racemes axillary and terminal. ♄. G. Native of the Cape of Good Hope, on the sides of hills and mountains. Lam. ill. t. 86. f. 2.

Cape Lady's-mantle. Pl. $\frac{1}{2}$ foot.

2 A. vulga'ris (Lin. spec. 178.) leaves roundish, reniform, plicate, concave, 9-lobed, serrated; stem and petioles smoothish; flowers disposed in dichotomous corymbs. ♃. H. Native of Europe and Siberia, in woods and pastures frequent; plentiful in some parts of Britain. Oed. fl. dan. 963. Smith, engl. bot. t. 597. Mill. fig. t. 18. f. 2. This plant varies much in hairiness and smoothness, as well as in size and stature. Stipulas cut. The whole plant is astringent and slightly tonic. The leaves were formerly used in medicine, and were esteemed to be vulnerary.

Var. β, *glàbra* (D. C. fl. fr. 4. p. 451.) leaves and flowers glabrous; teeth of leaves furnished with a tuft of hairs at the apex. ♃. H. Native of the Alps and the higher Pyrenees, in humid places. A. Pyrenàica, ex Dufour. ann. gen. sc. phys. 8. p. 228. A. lobàta, Pall. itin. 2. p. 569.

Common Lady's-mantle. Fl. Ju. Aug. Brit. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

3 A. hy'brida (Hoffm. germ. 1. p. 79.) leaves roundish-reniform, 9-lobed, serrated, clothed with pubescence; stem and petioles downy; flowers fastigiately-glomerate. ♃. H. Native of Europe, in mountain pastures; in Scotland, on the Seedlaw hills, Angusshire. A. alpìna hýbrida, Lin. spec. 179. A. vulgàris hýbrida, Willd. spec. 1. p. 698. Mill. fig. t. 18. f. 1. A. pubéscens, Lam. ill. no. 1403. but not of Bieb. A. montàna, Willd. enum. 1. p. 190. Wallr. ann. bot. p. 26.—Pluk. phyt. 240. f. 2. Stipulas serrated.

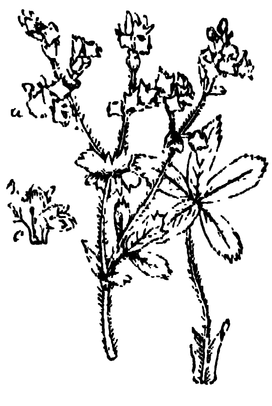
Hybrid Lady's-mantle. Fl. June, Aug. Scotl. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

4 A. pube'scens (Bieb. fl. taur. 1. p. 114.) leaves roundish-reniform, 7-lobed, toothed, silky beneath; corymbs terminal, crowded, clothed with silky villi. ♃. H. Native among rocks on the higher Caucasus. Willd. hort. berl. 2. t. 79.

Pubescent Lady's-mantle. Fl. June, Jul. Clt. 1813. Pl. $\frac{1}{4}$ ft.

* * *Leaves palmate; leaflets 5-7, serrated at the apex.*

FIG. 77.



5 A. ALPÌ'NA (Lin. spec. 179. var. α.) leaves digitate; leaflets 5-7, lanceolate-cuneated, obtuse, serrated at the apex, with the serratures adpressed, clothed with white satiny down beneath. ♃. H. Native of Europe and North America, in mountain pastures; in the mountainous parts of the north of England and Scotland, common among rocks on the banks of mountain rivulets. Smith, engl. bot. t. 244. Oed. fl. dan. 49. A. argéntea, Lam, fl. fr. 3. p. 303. The satiny under side of the leaves of this and the following species has given rise to the generic English name of *Lady's-mantle*.

Alpine Lady's-mantle. Fl. Jul. Britain. Pl. $\frac{1}{4}$ foot.

6 A. SERÍCEA (Willd. enum. p. 171.) leaves digitate; leaflets 7, lanceolate-obovate, obtuse, connected at the base, serrated at the apex, clothed with satiny down beneath. ♃. H. Native of Caucasus. A. alpìna, Bieb. fl. taur. 1. p. 114. exclusive of the synonyms. Much larger in every part than *A. alpìna*.

Silky Lady's-mantle. Fl. June, Jul. Clt. 1813. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

* * * *Leaves digitate; leaflets 3-5, multifid, or serrated all round.*

7 A. PENTAPHY'LLA (Lin. spec. 179.) leaflets 3-5, multifid, glabrous, and rather ciliated; stipulas foliaceous, bi or tridentate at the apex. ♃. H. Native of Europe, on the alps.—Bocc. mus. p. 18. t. 1. Stems creeping.

Five-leafletted Lady's-mantle. Fl. July. Clt. 1784. Pl. cr.

8 A. SIBBALDIÆFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 226. t. 561.) leaves deeply 3-parted, clothed with adpressed pubescence beneath; segments deeply serrated, lateral ones bifid; stipulas 2-4-cleft; stems corymbosely many-flowered at the apex; flowers conglomerate, diandrous, and usually digynous. ♃. G. Native between Mexico and Tolucco, near Tianguillo, and on Mount Orizaba.

Sibbaldia-leaved Lady's-mantle. Fl. July. Clt. 1823. Pl. $\frac{1}{2}$ ft.

9 A. APHANOI'DES (Mutis. in Lin. fil. suppl. 122.) plant smoothish; leaves profoundly 3-parted; segments ciliated, intermediate one trifid, lateral ones bifid; stipulas 2-3-cleft; stems branched, creeping; flowers axillary and terminal, diandrous or tetrandrous and digynous. ♃. G. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 225.

Aphanes-like Lady's-mantle. Pl. creeping.

10 A. VULCA'NICA (Schlecht. et Cham. in Linnæa. 5. p. 573.) pilose; stems flagelliform, trailing; cauline leaves ternate; leaflets cuneated, deeply 5-7-toothed at the apex; stipulas bifid on both sides; flowers axillary, forming small, leafy racemes at the tops of the branches; stamens 2; styles 3. ♃. G. Native of Mexico, on Mount Orizaba.

Volcanic Lady's-mantle. Pl. trailing.

11 A. HIRSU'TA (H. B. et Kunth, l. c.) leaves deeply tripartite, pilose; segments divided in a fan-like manner; stipulas 2-3-cleft; stems racemose, erect, hairy; flowers diandrous and digynous, disposed in glomerate heads. ♃. G. Native of South America.

Var. α, campéstris (Schlecht. et Cham. in Linnæa. 5. p. 572.) stems elongated; leaves canescent beneath. ♃. G. Native of Mexico, in grassy places near Jalapa.

Var. β, alpéstris (Schlecht. et Cham. l. c.) leaves the same colour on both surfaces; stem short. ♃. G. Native of Mexico, on Mount Orizaba.

Hairy Lady's-mantle. Pl. $\frac{1}{4}$ to $\frac{1}{3}$ foot.

12 A. RUPE'STRIS (H. B. et Kunth, nov. gen. amer. 6. p. 224.) leaves profoundly 3-parted, clothed with silky pili beneath; segments deeply serrated; stipulas entire; stems branched, creeping; flowers somewhat corymbose, diandrous and trigynous. ♃. G. Native of South America, on the burning mountain Ruca-Pichincha, near Quito. Habit of *A. áphanes*.

Rock Lady's-mantle. Pl. creeping.

13 A. NIVA'LIS (H. B. et Kunth, l. c. t. 560.) leaves multifid, sheathing, stem-clasping, and imbricating, clothed with silky hairs on the outside; stems tufted; flowers terminal, sessile, usually tern, diandrous, and usually tetragynous. ♃. F. Native of the province of Popayan, on the snowy top of Mount Paramo de Puraca.

Snow Lady's Mantle. Pl. tufted.

14 A. TRIPARTI'TA (Ruiz. et Pav. fl. per. 1. p. 68.) hairy; stems creeping, filiform, dichotomously branched, leafy above; leaves deeply 3-parted; segments cuneiform, 3-5-cleft; stipulas unequally bifid; petioles sheathing: peduncles dichotomously corymbose; flowers diandrous and digynous. ♃. F. Native of Peru, on the cold tops of mountains, in springs.

Tripartite-leaved Lady's-mantle. Pl. $\frac{1}{4}$ foot.

15 A. ORBICULA'TA (Ruiz et Pav. l. c.) leaves orbicularly reniform, lobed, deeply serrated, glabrous above, and clothed with silvery villi beneath; petioles terete, hairy; peduncles dichotomously corymbose; flowers 8-cleft, diandrous, digynous. ♄. F. Native of Peru, on cold mountains in humid places. A'phanes orbiculàta, Pers. ench.

Orbicular-leaved Lady's-mantle. Pl. $\frac{1}{4}$ foot.

16 A. PECTINA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 226.) leaves roundish-reniform, 9-11-lobed, pectinately serrated, clothed with silvery silky down beneath; radical leaves many-lobed, on long petioles; stipulas 3-5-cleft; stems dichotomous; flowers 8-10-cleft, diandrous, usually pentagynous. ♃. F. Native of Mexico, near Jalapa, San Andres, and Cruz Blanca.

Pectinate-leaved Lady's-mantle. Pl. $\frac{1}{4}$ foot.

17 A. PINNA'TA (Ruiz et Pav. fl. per. 1. p. 69.) leaves pinnate; leaflets bifid or trifid; radical ones petiolate, cauline ones clasping the stem; stems branched, sarmentose, creeping; flowers diandrous, digynous. ♃. F. Native of Peru, on the high cold humid mountains of Tarma and Panatahuara. A'phanes pinnàta, Pers.

Pinnate-leaved Lady's-mantle. Pl. $\frac{1}{4}$ foot.

SECT. II. A'PHANES (from *a* priv. and *φαινω*, *phaino*, to appear; that is to say, a plant of no appearance, being small, and lying flat on the ground). Lin. gen. no. 166. Calyx 4-cleft, rarely 5-cleft, with small teeth between the lobes. Stamens 1-2, fertile, the rest sterile. Annual plants.

18 A. ARVE'NSIS (Scop. carn. 1. p. 115.) leaves small, hairy, petiolate, 3-parted; segments 2-3-cleft; flowers axillary, glomerate. ⊙. H. Native throughout Europe, *in* cultivated fields; plentiful in Britain, also of Iberia and Jamaica. Smith, engl. bot. 1011. A'phanes arvénsis, Lin. spec. 179. Oed. fl. dan. t. 973. A. a'phanes, Leers. herb. no. 122.

Corn Parsley-piert. Fl. April, June. Britain. Pl. prostrate.

19 A. CORNUCOPIOI'DES (Rœm. et Schult. syst. 3. p. 471.) leaves hairy, cut, stem-clasping, almost sessile, 3-parted, with the petiole dilated; segments 2-3-cleft; flowers axillary, glomerate; stipulas cut. ⊙. H. Native about Madrid, in cornfields. A'phanes cornucopioìdes, Lag. gen. et spec. nov. p. 99. no. 7.

Cornucopia-like Parsley-Piert. Pl. prostrate.

Cult. The hardy species will grow in any common soil, and are increased by dividing the plants at the root. Those species natives of South America should be grown in small pots, well drained with sherds, and filled with a mixture of peat and loam, and placed among other alpine plants. They are also to be increased by dividing the plants. The annual species are only weeds, and will grow under any circumstance.

III. CEPHALO'TUS (from κεφαλωτος, *kephalotos*, headed; because the filaments of stamens are capitate). Labill. nov. holl. 2. p. 7. t. 145. Brown, gen. rem. p. 68. t. 4. D. C. prod. 2. p. 591.

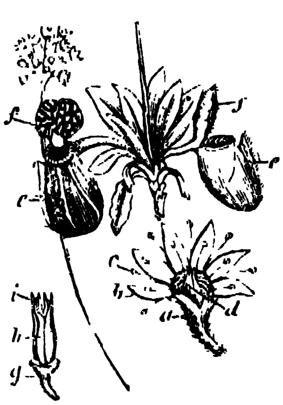
Lin. syst. *Dodecándria, Hexagýnia.* Calyx coloured, 6-cleft (f. 78. *b.*), valvate in æstivation. Petals wanting. Stamens 12 (f. 77. *c.*), inserted in the calyx. Anthers didymous (f. 77. *c.*), glandular on the back. Ovaries 6 (f. 78. *d. h.*), distinct. Styles terminal (f. 78. *i.*). Akenia 1-seeded. Seed erect.—An almost stemless herb, with the leaves all radical and stalked, some of which are elliptical and flat, and others dilated into the kind of leaves called pitchers (f. 78. *e.*), which are generally filled with air, which seems as if confined within them by a lid (f. 78. *f.*), like that of the nepenthes. Scape erect, bearing a panicle of small white flowers at the apex.

1 C. folliculа'ris (Labill. l. c.) ♃. G. Native of New Holland, on the eastern coast, in marshes. Hook. in bot. mag. vol. 5. new series, with a figure. (f. 78.)

Follicled-leaved Cephalotus or New Holland Pitcher-plant. Fl. June, July. Clt. 1823. Pl. 1 ft.

Cult. This plant grows best in turfy peat soil, either in a box or pot: it should be kept rather moist: for this purpose the pots may be kept in pans of water. If moss is allowed to grow on the surface of the mould it will tend greatly to the health of the plants, or moss may be planted on the surface of the soil around the plants. There is no known way of increasing the plant except by seed.

FIG. 78.



IV. MARGYRICA'RPUS (from μαργαρον, *margaron*, pearl, and καρπος, *karpos*, a fruit; resemblance in white fruit). Ruiz et Pav. fl. per. prod. 7. p. 33. H. B. et Kunth, nov. gen. amer. 6. p. 229.

Lin. syst. *Decándria, Monogýnia.* Calyx with the tube coarctate at the apex, and with a 4-5-parted limb, each segment furnished with a tooth-formed spine on the outside at the base. Petals wanting. Stamens 2. Stigma multifid, feathery. Carpel 1, converted into a roundish 1-seeded drupe. Seed pendulous.—A much branched shrub, with impari-pinnate leaves, subulate leaflets, and axillary sessile flowers.

1 M. setòsus (Ruiz et Pav. fl. per. 1. p. 28. t. 8. *f. d.*) ♄. G. Native of Brazil, Peru, Chili, Santa Fe de Bogota, Quito, &c. on arid hills. Empètrum pinnàtum, Lam. dict. 1. p. 567. Ancístrum barbàtum, Lam. ill. 1. p. 77. The leaves are either piliferous or naked at the apex, and therefore *M. setòsus* and *M. læ'vis* of Willd. are both referrible to this plant. The fruit is white, with a grateful acid taste. An infusion of the plant is used against hæmorrhages.

Bristly Pearl-fruit. Fl. June, July. Clt. 1829. Sh. 2 to 4 ft.

Cult. This shrub will grow very well in a mixture of sand and peat, and cuttings are easily rooted in the same kind of soil, with a bell-glass over them.

V. POLYLE'PIS (from πολυ, *poly*, many, and λεπις, *lepis*, a scale; calyx). Ruiz et Pav. fl. per. prod. p. 34. t. 15. H. B. et Kunth, nov. gen. amer. 6. p. 226. D. C. prod. 2. p. 519.

Lin. syst. *Penta-Icosándria, Monogýnia.* Calyx permanent, with a turbinate 3-4-angled tube, furnished above with spine-formed teeth; the throat contracted, and the limb 3-4-parted. Petals wanting. Stamens 5-20, inserted in the throat of the calyx. Anthers woolly. Carpel 1. Style filiform. Stigma pencil-formed. Drupe clavate, 3-4-angled, dry, inclosed within the calyx; angles unequal, alternating with the denticulations of the calyx. Seed pendulous.—Shrubs, with compound leaves, and with the stipulas adnate to the petioles. Flowers racemose.

* *Leaves trifoliate.*

1 P. inca'na (H. B. et Kunth, nov. gen. amer. 6. p. 227.) leaflets 3, crenated, clothed with hoary tomentum beneath, as well as the calyx; racemes axillary, few-flowered, about equal in length to the leaves; flowers pentandrous. ♄. S. Native of South America, on the banks of Rio Blando near Guachucal, in the province of De los Pastos.

Hoary Polylepis. Shrub 2 to 3 feet.

2 P. villòsa (H. B. et Kunth, l. c. p. 228.) leaflets 3, crenated, clothed with hoary villi beneath, and on the calyxes; racemes many-flowered, exceeding the leaves; flowers usually icosandrous. ♄. S. Native of Peru, near Caxamarca, where it is called *Quinuar.*

Villous Polylepis. Shrub 12 to 20 feet.

* * *Leaves pinnate.*

3 P. lanuginòsa (H. B. et Kunth, l. c. p. 228.) leaves of 2-4 pairs of nearly entire, rather emarginate leaflets, clothed with silky woolly down beneath, as well as the calyxes; racemes hardly exceeding the leaves. ♄. S. Native of South America, at the bottom of mount Chimborazo near Calpi. Perhaps sufficiently distinct from the following.

Woolly Polylepis. Shrub 6 to 12 feet.

4 P. racemòsa (Ruiz et Pav. syst. 1. p. 139.) leaves impari-pinnate; leaflets obovate or oblong, crenated, emarginate; flowers racemose, icosandrous. ♄. S. Native of Peru, among broken rocks towards Quinua, Caxamarquilla, and Pillao. De Candolle received a specimen from Bonpland, which he gathered near Caxamarca, and which is referrible to *P. racemòsa*, and distinct from *P. lanuginòsa* in the leaves bearing 4-6 pairs of distinctly sub-emarginate leaflets, not 2-4, as in that species.

Racemose-flowered Polylepis. Shrub.

Cult. See *Margyricárpus* for culture and propagation.

VI. ACÆ'NA (from ακαινα, *akaina*, a thorn; in reference to the calyx being armed with glochidate bristles). Vahl. enum. 1. p. 273. D. C. prod. 2. p. 592.

Lin. syst. *Di-Tetrándria, Mono-Digýnia.* Calyx furnished with 2 scales at the base, tubular, usually armed with glochidate bristles; limb 4-parted. Corolla none. Stamens 2-10. Carpels 1-2, dry, 1-seeded, inclosed within the tube of the calyx. Seed pendulous. Styles terminal. Stigma plumose.—Humble evergreen herbs or subshrubs, with impari-pinnate leaves, serrated leaflets, and spicate racemes or heads of small flowers. Anthers large, purple.

Sect. I. Eucæ'na (from *eu*, good, and *acæna*; genuine species). D. C. prod. 2. p. 592.—Acæ'na, Lin. mant. 200. Jacq. eclog. 1. p. 55. Calyx armed all around with glochidate bristles.

1 A. lappa'cea (Ruiz et Pav. fl. per. 1. p. 66. t. 103. f. a.) flowers racemose, distant, tetrandrous or pentandrous; stem erect; leaflets oblong, serrated. ♄. F. Native of Peru, on the rocks of Tarma.

Burdock Acæna. Pl. ½ foot.

2 A. AGRIMONIOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 231.) flowers alternate, spicate, lower ones remote; stem erect; leaflets oblong, coarsely serrated, glabrous, when young pubescent beneath. ♄. F. Native of Mexico, in cold places near Tianguillo. Allied to *A. Lappàcea.*

Agrimony-like Acæna. Pl. ½ foot.

3 A. ELONGA'TA (Lin. mant. 200.) flowers disposed in elongated spicate racemes; stems ascending; leaflets oblong, serrated, pubescent beneath. ♄. F. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 252.

Elongated Acæna. Shrub 1 foot?

4 A. LATEBRÒSA (Ait. hort. kew. 1. p. 16.) flowers disposed in elongated spikes; peduncles scape-formed; stems procumbent; leaflets oblong, cut, hoary beneath. ♃. H. Native of the Cape of Good Hope. Agrimònia decúmbens, Lin. fil. suppl. 251. Ancístrum decúmbens, Thunb. fl. cap. 1. p. 142. Ancístrum latebròsum, Gærtn. fruct. 1. t. 32.

Dark Acæna. Fl. April, June. Clt. 1774. Pl. ½ to ¾ feet.

5 A. PINNATI'FIDA (Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. 1. b.) plant silky; flowers crowded into cylindrical spikes, lower ones rather remote; stem erect; leaves of 3-5 pairs of deeply 3-5-parted leaflets, with the segments linear; flowers pentandrous or decandrous. ♃. F. Native of the hills of Chili and the Straits of Magellan. Lindl. bot. reg. t. 1271. Fruit covered with glochidate bristles.

Pinnatifid-leaved Acæna. Fl. May, June. Clt. 1822. Pl. ½ foot.

6 A. INCI'SA (Lindl. bot. reg. no. 1271.) plant erect and silky; leaves of 6-7 pairs of oblong, cuneated, deeply serrated leaflets; heads of flowers spicate, lower flowers remote. ♃. H. Native of Chili, at the baths of Collina near the limits of the snow.

Cut-leaved Acæna. Pl. ½ foot.

7 A. MYRIOPHY'LLA (Lindl. bot. reg. no. 1271.) erect, pubescent; leaves of 7-9 pairs of linear deeply pinnatifid leaflets; the segments very narrow and silky beneath; spikes cylindrical, interrupted at the base; fruit ovate, tomentose, glochidate. ♃. F. Native of Chili, about Mendoza.

Myriad-leaved Acæna. Pl. ½ foot.

8 A. SERI'CEA (Jacq. fil. eclog. 1. t. 55.) flowers collected into globose heads; stems decumbent; leaflets obovate, deeply toothed, pubescent, silky on the back. ♃. F. Native of New Spain, at Port Desire. Potèrium austràle, Sal. prod. 2. p. 360. Ancístrum acórna, Lag. nov. spec. p. 7. no. 100. ex Rœm. et Schultes.

Silky Acæna. Pl. ½ foot.

9 A. OVI'NA (Cunningh. in Fields' new south wales, p. 358.) plant covered with white hairs; leaflets deeply cut, pinnatifid; segments oblong, obtuse; spikes oblong; lower flowers remote; stem reclinate, somewhat demersed. ♃. H. Native of New Holland, frequent on the moist lands of Bathurst.

Sheep-fodder Acæna. Fl. June, July. Pl. reclinate.

SECT. II. ANCI'STRUM (from αγκιστρος, *ancistros*, a fish-hook; in reference to the bristles of the calyx, which terminate in hooked points). Forst. gen. t. 2. Lam. ill. p. 22. D. C. prod. 2. p. 592. Calyx tubular, ending at the apex in 4-5 bristles, which are glochidate at the apex.

10 A. SANGUISÓRBÆ (Vahl. enum. 1. p. 294.) spikes globose; stems decumbent; leaves remote; leaflets 7 pairs, cuneated, serrated, silky beneath. ♃. H. Native of New Zealand. Ancístrum anserinæfòlium, Forst. l. c. Ancístrum diándrum, Forst. prod. no. 52. Ancístrum decúmbens, Gært. fr. t. 32. Ancístrum Sanguisórbæ, Lin. fil. suppl. 189. Bristles of calyx 4. Stigma pencil-formed?

Burnet Acæna. Fl. June. Clt. 1796. Pl. decumbent.

11 A. OVALIFÒLIA (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. c.) spikes globose; stems creeping; leaves with 4-5 pairs of oblong and somewhat cuneated leaflets, which are villous beneath. ♄. H. Native of Peru, in humid shady places. Ancístrum rèpens, Vent. hort. cels. t. 5.

Oval-leaved Acæna. Fl. May, June. Clt. 1802. Pl. cr.

12 A. SARMENTÒSA (Carm. in Lin. trans. 11. p. 20.) spikes globose; stems creeping; leaves of 4-5 pairs of sharply serrated leaflets, which are glabrous and veiny above, but silky beneath; stipulas undivided. ♃. H. Native of the Island of Tristan d'Acugna. Ancístrum sarmentòsum, Pet. Th. fl. p. 44. Calyx 4-awned. Stamens 2.

Sarmentose Acæna. Pl. creeping.

13 A. ARGE'NTEA (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. b.) spikes globose; stems creeping; leaves of 3-4 pairs of ovate-oblong serrated leaflets, which are silky beneath. ♃. H. Native of Chili, in bogs and fields. Ancístrum argénteum, H. B. et Kunth, nov. gen. amer. 6. p. 230. Calyx villous outside.

Silvery Acæna. Fl. May, June. Clt. 1822. Pl. creeping.

14 A. ADSCE'NDENS (Vahl. enum 1. p. 297.) spikes globose; stems decumbent; leaves with 5-7 pairs of oblong and obovate serrated smoothish leaflets. ♃. H. Native of the Straits of Magellan. Ancístrum hùmile, Pers. ench. 1. p. 30. Ancístrum lævigàtum, Lag. nov. spec. p. 7.

Ascending Acæna. Fl. May, June. Clt. 1822. Pl. ½ foot.

15 A. LÆVIGA'TA (Ait. hort. kew. 1. p. 68.) terminal spikes cylindrical, lower ones globose; stems decumbent; leaflets oval, deeply crenated, glabrous above, and canescent beneath. ♃. H. Native of the Straits of Magellan.

Smooth Acæna. Fl. June, Aug. Clt. 1790. Pl. dec.

16 A. MAGELLA'NICA (Vahl. enum. 1. p. 297.) spikes of flowers globose; stems erect, glabrous; leaves with 6 pairs of obovate, deeply serrated trifid leaflets, which are canescent beneath. ♃. H. Native of the Straits of Magellan. Ancístrum Magellánicum, Lam. ill. t. 22. f. 2.

Magellan Acæna. Pl. ½ foot.

17 A. TRI'FIDA (Ruiz et Pav. fl. per. 1. p. 67. t. 104. f. c.) spikes globose; stems erect, and are, as well as the leaflets, clothed with canescent tomentum; leaflets 7-8 pairs, cuneiform, 3-5 cleft. ♃. H. Native of Chili, in pastures.

Trifid-leafletted Acæna. Pl. ½ to 1 foot.

18 A. LU'CIDA (Vahl. enum. 1. p. 296.) spikes ovate-oblong; leaflets 8-9 pairs, 3-5-parted, villous beneath, with the segments linear. ♃. H. Native of the Falkland Islands. Ancístrum lùcidum, Lam. ill. t. 22. f. 3. Calyx 4 awned, pilose outside.

Shining-leaved Acæna. Fl. May, June. Clt. 1777. Pl. ½ ft.

19 A. PU'MILA (Vahl. enum. 1. p. 298.) spikes terete; peduncles scape-formed; stems demersed; leaflets 11-12 pairs, oval, crenate-serrated, quite glabrous, shining above. ♃. H. Native of the Straits of Magellan. The fruit is said to be armed; if such be the case this species belongs to the first section, *Eucæ'na.*

Dwarf Acæna. Pl. ¼ foot.

20 A. CYLINDRISTA'CHIA (Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. 2.) spikes cylindrical; peduncles scape-formed; stems demersed; leaflets 10-11 pairs, oblong, serrated, silky beneath. ♃. H. Native of Peru, on the cold hills of Tarma. Calyx 4-awned.

Cylindrical-spiked Acæna. Pl. ½ foot.

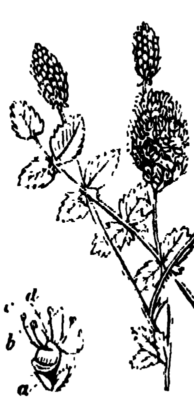
Cult. The species are of easy culture, and are increased by dividing or by seed. A dry situation and sandy soil suit them best.

VII. SANGUISO'RBA (from *sanguis*, blood, and *sorbeo*, to absorb; the *S. officinàlis* was formerly supposed to be a powerful vulnerary). Lin. gen. no. 146. Lam. ill. t. 85.—Pimpinélla species of Tourn. inst. t. 68. Gærtn. fruct. 1. p. 161. t. 32.

Lin. syst. *Tetrándria, Monogýnia.* Flowers hermaphrodite. Calyx 4-cleft (f. 79. *b.*), furnished with two scales on the outside at the base (f. 79. *a.*). Petals wanting. Stamens 4 (f. 79. *c.*). Carpels 2, inclosed within the tube of the calyx. Style pencil-formed at the apex. Seed inverted.—Perennial herbs, with impari-pinnate leaves and small flowers, crowded into very dense, globose, ovate or cylindrical spikes, the flowers expanding from the top.

* *Stamens equal in length to the calyx, or shorter.*

FIG. 79.



1 S. officina'lis (Lin. spec. 169.) spikes ovate; stamens equal in length to the calyx; calyxes and leaves glabrous; leaflets ovate, rather cordate. ♃. H. Native of Europe, in meadows and woods. In Britain in moist meadows, particularly in a chalky and limestone soil: in marly soil about Stafford; in Cambridgeshire at King's-hedges, Whitwell, Ditton, &c.; in Bedfordshire at Bromham, Fenlake, and Cow Meadows; in Oxfordshire at Isley, Cowley, and Binsey. In Scotland in low moist meadows near Dumfries, but by no means common. Smith, engl. bot. 1312. Oed. fl. dan. t. 97. Mart. fl. rust. t. 142. Flowers dark purple. The plant makes good fodder when young.

Var. β, auriculàta (All. ped. no. 292.) leaflets each furnished with a foliaceous stipel, and hence auriculated. ♃. H. Native of Savoy, Switzerland, Piedmont, &c. S. Sabáuda, Mill. dict. no. 2.—Bocc. mus. 19. t. 9. Spikes cylindrical.

Var. γ, Hispánica (Mill. dict. no. 3.) leaflets 4 pairs, pale green above and hairy beneath; spikes of flowers reddish. Miller regards both these varieties as specifically distinct.

Officinal Burnet. Fl. June, Aug. Britain. Pl. 3 to 4 feet.

2 S. ca'rnea (Fisch. hort. gor. ex Link. enum. 1. p. 144.) spikes nearly globose; stamens shorter than the calyx; bracteas ciliated; calyx pubescent; leaves glabrous; leaflets oblong-lanceolate, cordate at the base, crenate-toothed. ♃. H. Native of Siberia in many places. S. rùbra, Schrank, fl. mon. p. 144. t. 69. Leaflets 2 inches long; flowers dark red.

Flesh-coloured-flowered Burnet. Fl. June, Aug. Clt. 1821. Pl. 3 to 4 feet.

3 S. Andersònii; spikes cylindrical; stamens about equal in length to the calyx or a little shorter; bracteas ciliated; calyx glabrous; leaves glabrous; leaflets ovate-lanceolate, cordate, deeply serrated, those of the upper leaves nearly sessile, and those of the lower ones petiolulate and stipulate. ♃. H. Native of Siberia? Grown in the Chelsea botanic garden.

Anderson's Burnet. Fl. July, Aug. Clt ? Pl. 3 to 4 feet.

* * *Stamens exserted.*

4 S. Maurita'nica (Desf. atl. 1. p. 142.) spikes ovate-cylindrical; stamens exserted; calyxes wrinkled; leaflets lanceolate, profoundly serrated, villous beneath, as well as the stem. ♃. H. Native of Algiers, in hedges.—Moris. oxon. sect. 8. t. 18. f. 4. Spikes greenish.

Mauritanian Burnet. Fl. July, Aug. Clt. 1810. Pl. 3 to 4 ft.

5 S. tenuifòlia (Fisch. hort. gor. ex Link. enum. 1. p. 144.) spikes cylindrical; stamens exserted; bracteas ciliated; leaflets glabrous, oblong-lanceolate, nearly sessile, and serrated. ♃. H. Native of Dahuria and China. Spikes of flowers red. Leaflets of the lower leaves petiolulate and stipulate.

Thin-leaved Burnet. Fl. June, Aug. Clt. 1820. Pl. 3 to 4 ft.

6 S. me'dia (Lin. spec. 169.) spikes ovate-cylindrical; stamens but little exserted; bracteas and leaves glabrous; leaflets ovate, rather cordate, toothed. ♃. H. Native of North America from Canada to Carolina, and of Siberia.—Moris. oxon. sect. 8. t. 18. f. 8. Spikes red, not so round as those of *S. officinàlis.*

Middle Burnet. Fl. July, Sept. Clt. 1785. Pl. 3 to 4 ft.

7 S. alpi'na (Bunge in Led. fl. ros. alt. ill. t. 90. fl. alt. 1. p. 142.) spikes elongated, cylindrical, drooping; stamens much exserted: bracteas and calyxes hairy; leaves glabrous; leaflets cordate-oblong, petiolulate, coarsely serrated. ♃. H. Native of Siberia, about fountains. Spikes yellowish.

Alpine Burnet. Fl. July, Sept. Pl. 3 to 4 feet.

8 S. neglе'cta (G. Don, in Loud. hort. brit. p. 42.) spikes cylindrical; stamens much exserted; calyx glabrous; bracteas ciliated; leaflets glabrous, lanceolate, serrated. ♃. H. Native of Siberia? Spikes of flowers white. Anthers dark.

Neglected Burnet. Fl. July, Sept. Clt. 1800. Pl. 3 to 4 ft.

9 S. Canade'nsis (Lin. spec. 169.) spikes long, cylindrical; stamens much exserted; bracteas and leaves glabrous; leaflets ovate-oblong, rather cordate at the base, coarsely serrated. ♃. H. Native of North America from Canada to New York, in humid places.—Corn. can. p. 175. t. 174.—Barrel. icon. rar. 18. t. 739.—Morris. oxon. sect. 8. t. 18. f. 12. Spikes long, slender, white. There is besides this white kind, a long, red, spiked, American Burnet, having the spikes 3 or 4 inches long, while those of the present plant are not above 2 inches long. It is probably a species of which we know nothing.

Canadian Burnet. Fl. July, Sep. Clt. 1633. Pl. 2 to 3 ft.

Cult. All the species of *Sanguisórba* are of the easiest culture; they grow in any common soil, and are readily increased by dividing the plants at the root.

VIII. POTE'RIUM (from *poterium*, a cup; the *P. sanguisórba* is infused in drinks). Lin. gen. no. 1069. Lam. ill. t. 777. D. C. prod. 2. p. 594.—Pimpinélla species, Tourn. Gærtn.—Pimpinélla, Adans. fam. 2. p. 293.

Lin. syst. *Monœ'cia, Polyándria* or *Polygàmia, Monœ'cia.* Flowers monœcious or polygamous. Calyx furnished with 3 scales at the base, having the tube contracted at the apex, and the limb 4-parted. Petals wanting. Stamens 20-30. Ovaries 2, terminated each by a filiform style, crowned by a pencil-formed stigma. Akenia dry, 1-seeded, inclosed in the indurated calyx. Seed inverted.—Herbs or subshrubs, with impari-pinnate leaves and serrated leaflets. Flowers collected into dense globose or cylindrical spikes.

Sect. I. Leiopote'rium (from λειος, *leios*, smooth, and *poterium*; in reference to the smooth fruit of the species contained in this section). D. C. prod. 2. p. 594. Fruit (tube of calyx) smooth, somewhat baccate. Spikes cylindrical. Stems shrubby.

1 P. spinòsum (Lin. spec. 1411.) shrubby; branches rather villous, ultimate ones terminating in spines; leaflets smoothish, serrated; spikes oblong. ♄. G. Native of the islands of the Archipelago, about Constantinople, on Mount Lebanon, Natolia, &c.—Moris. oxon. sect. 8. t. 18. f. 5.—Sab. hort. 2. t. 73. Leaves small. Flowers greenish. Fruit baccate, nearly as in the rose.

Var. β, crispum (D.C. prod. 2. p. 594.) leaflets smaller, nearly entire, rather tomentose beneath, with revolute curled margins. ♄. G. Native of sterile places.

Var. γ, *inérme* (D. C. l. c.) branches elongated, unarmed, beset with spreading hairs; leaflets flat, serrated, glabrous above and rather villous beneath. ♄. H. This variety is probably occasioned by culture.

Spiny Burnet. Fl. April, Aug. Clt. 1595. Sh. 2 to 3 ft.

2 P. caudа'tum (Ait. hort. kew. 3. p. 354.) shrubby; branches unarmed; petioles, peduncles, and under surface of leaves villous; spikes elongated, cylindrical. ♄. G. Native of the Canary Islands. Sims, bot. mag. 2341. Coll. hort. rip. 112. t. 40. Flowers dioecious, sometimes 6-cleft and trigynous, greenish.

Tailed Burnet. Fl. Jan. April. Clt. 1779. Shrub 2 to 3 ft.

Sect. II. Rutidopote'rium (from ρυτις, *rutis*, a wrinkle, and *poterium;* in reference to the wrinkled or warted fruit of the species contained in the section). D. C. prod. 2. p. 594. Fruit (tube of calyx) wrinkled or tuberculated. Spikes globose. Stems herbaceous or frutescent at the very base.

3 P. ancistroi'des (Desf. atl. 2. p. 346. t. 251.) suffruticose at the base; branches angular, decumbent; leaflets 4-5 pairs, ovate-roundish, villous on the nerves beneath. ♄. F. Native of the north of Africa, in the fissures of rocks near Tlemsen, and at the foot of Mount Lebanon. Fruit wrinkled.

Ancistrum-like Burnet. Shrub procumbent.

4 P. sanguisórba (Lin. spec. 1411.) herbaceous; stems and leaves glabrous; leaflets ovate-roundish; lower flowers of the head male, upper ones female. ♃. H. Native of Europe, in high dry pastures on a calcareous soil; plentiful in the chalky counties of England. Smith, engl. bot. 860. Cam. epit. 777. Curt. lond. 2. t. 64. Mart. fl. rust. t. 69. Pimpinélla Sanguisórba, Gærtn. fruct. 1. p. 162. t. 32. Pimpinélla polystèmon, Hall. helv. no. 706. Flowers greenish or purplish. Stipulas cut. Root fusiform. The *burnet* was originally brought into notice by Rocque, a commercial gardener at Walham Green, near London, who found means to procure the patronage of the Dublin and other societies to this plant, which being a novelty, attracted the attention, and called forth the eulogies of Arthur Young, and other leading agriculturists of the day. Miller, however, at the time observed, that whoever will give themselves the trouble to examine the grounds where it naturally grows, will find the plants left uneaten by the cattle when the grass about them has been cropped to the roots; besides, in wet winters and on strong land, the plants are of short duration, and therefore very unfit for the purpose of pasture or hay; nor is the produce sufficient to tempt any persons of skill to engage in its culture. Mr. Curtis says of *burnet,* that it is one of those plants which has for some years past been attempted to be introduced into agriculture, but not answering the farmer's expectation, is now in a great degree laid aside. Cattle are said not to be fond of it; nor is its produce sufficient to answer the expence attending its culture.

Var. β, *pubérulum* (D. C. prod. 2. p. 594.) stems and leaves puberulous. ♃. H. Native of the south of France.

Common *Burnet.* Fl. June, July. Britain. Pl. 1 to 2 feet.

5 P. poly'gamum (Waldst. et Kit. pl. rar. hung. 2. p. 198.) herbaceous; stems angular, and are, as well as the leaves, glabrous; leaflets ovate-oblong; lower flowers of the heads male, middle ones hermaphrodite, upper ones female. ♃. H. Native of Hungary, in dry situations. Heads greenish or purplish.

Polygamous Burnet. Fl. July. Clt. 1803. Pl. 1 to 2 feet.

6 P. agrimonifólium (Cav. elench. hort. madr. 1803.) herbaceous; stems nearly terete, covered with glandular down; leaflets oblong, with smaller ones sometimes intermixed. ♃. H. Native of Spain, in Granada.

Var. β, *hýbridum* (Lin. spec. 1411.) leaflets oval or ovate. ♃. H. Native of the south of France.—Barrel. icon. 632. Pimpinélla agrimonioìdes, Mor. oxon. sect. 8. t. 18. f. 9. Leaves like those of agrimony, sweet-scented.

Agrimony-leaved Burnet. Fl. July, Aug. Clt. 1822. Pl. 2 ft.

7 P. villòsum (Sibth. et Smith, fl. græc. t. 942. ex prod. 2. p. 238.) herbaceous; stems angular from furrows, hairy; leaflets oblong, deeply toothed. ♃. H. Native about Constantinople. Pimpinélla orientàlis villosíssimus, Tourn. cor. 8.

Villous Burnet. Pl. 1 to 2 feet.

8 P. verrucòsum (Link. in litt.) very like *P. sanguisórba,* and differs only in the warted fruit. ♃. H. Native of? Flowers greenish.

Warted-fruited Burnet. Fl. July. Clt. 1828. Pl. 1 to 2 ft.

9 P. a'nnuum (Nutt. mss. in Hook. fl. bor. amer. p. 198.) herbaceous, annual, glabrous; stem erect, dichotomous; leaves with 4-5 pairs of ovate, deeply pectinately pinnate leaflets, having the segments very narrow-linear; heads oval, unisexual? ⊙. H. Native of North America, on the grand rapids of the Columbia river, and on the plains of the Multnomak, and of Louisiana on the Red river.

Annual Burnet. Pl. 1 to 2 feet.

Cult. The hardy herbaceous kinds of *burnet* will grow in any common soil, and are best increased by seeds, as most of them are little better than biennial plants. The shrubby species, or those belonging to the first section, thrive best in a light rich soil, and young cuttings root readily in the same kind of soil under a hand-glass.

IX. CLIFFO'RTIA (this name was given by Eichrodt in honour of George Clifford, the first patron of Linnæus, a merchant of Amsterdam; a catalogue of whose garden at Hartecamp was published by Linnæus under the title of Hortus Cliffortiànus, Amst. 1737. fol.) Lin. gen. no. 1133. Lam. ill. t. 827. D. C. prod. 2. p. 595.—Cliffórtia and Morilándia, Neck. elem. no. 765 and 766. Nènax, Gærtn. fruct. 1. t. 132.

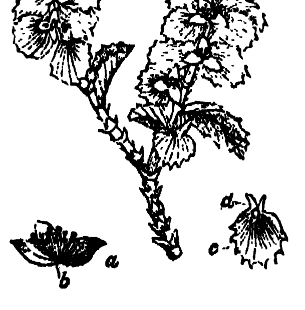
Lin. syst. *Diœ'cia, Polyándria.* Flowers dioecious. Tube of calyx urceolate; limb 3-parted (f. 80. *a.*). Petals wanting. Stamens about 30 in the male flowers (f. 80. *b.*). Ovaries 2 in the female flowers. Styles 2. Stigmas elongated, feathery, bearded. Akenia 1-2, covered by the calyx, dry, indehiscent, 1-seeded. Seed erect. Cotyledons oblong, foliaceous.—Shrubs, all natives of the Cape of Good Hope. The leaves are truly trifoliate, but the form is variable. Stipulas (f. 80. *d.*) adhering to the petioles, which are exceedingly short. Flowers insignificant, axillary, almost sessile.

§ 1. *Multinérvæ* (*multus,* many, and *nervus,* a nerve; leaves with many nerves). *D. C. prod. 2. p. 595. Leaflets solitary, many-nerved at the base. Stipulas simple, but the leaves, although said to be solitary, are probably composed of 3-joined leaflets, furnished with a stipula on each side* (f. 80. *d.*).

1 C. illicifòlia (Lin. spec. 1469.) leaves roundish-elliptic, stem-clasping, glabrous, stiff, somewhat 3-lobed, and spiny-toothed at the apex. ♄. G. Native of the Cape of Good Hope, as are also all the following.—Dill. hort. elth. t. 31. f. 35. Lin. hort. cliff. t. 30. Filaments white; anthers yellow. (f. 80.)

Holly-leaved Cliffortia. Fl. May, Sept. Clt. 1714. Shrub 2 to 3 ft.

FIG. 80.



2 C. CORDIFÒLIA (Lam. dict. 2. p. 47.) leaves ovate, ending in a spine, half stem-clasping, glabrous, stiff, quite entire, or furnished with a spine-like tooth towards the apex. ♄. G. Burch. cat. afr. austr. no. 792.

Heart-leaved Cliffortia. Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

3 C. TRIDENTA'TA (Willd. spec. 4. p. 838.) leaves oblong-cuneiform, entire, and tridentate, nerved, pubescent beneath. ♄. G. C. ruscifòlia, Thunb. prod. 93? Berg. cap. 354.

Tridentate-leaved Cliffortia. Fl. May, Sept. Shrub.

4 C. RUSCIFÒLIA (Lin. spec. 1469.) leaves lanceolate, glabrous, nerved, ending in a spine, entire or furnished with a spine-like tooth on each side. ♄. G. Lin. hort. cliff. t. 31. C. arachnoìdea, Lodd. bot. cab. t. 260.—Pluk. alm. 297. f. 2. There are varieties of this species with glabrous and pubescent branches.

Butcher's-broom-leaved Cliffortia. Fl. June, July. Clt. 1752. Shrub 2 to 3 feet.

5 C. GRAMI'NEA (Lin. fil. suppl. 429.) leaves linear, acuminated, 3-nerved, glabrous, quite entire or remotely setaceously serrated; stipulas large, 3-nerved, adnate to the broad petiole, and drawn out in 2 lobes. ♄. G. Sieb. pl. exsic. cap. no. 86.

Grass-leaved Cliffortia. Shrub 2 feet.

§ 2. *Dichópteræ* (from διχα, *dicha*, double, and πτερον, *pteron*, a wing; in reference to bifid stipulas). *D. C. prod. 2. p. 595. Leaflets* 1-*nerved, solitary at first sight. Stipulas bifid; or the leaves perhaps trifoliate, bistipulate, the lateral leaflets small and tooth-formed.*

6 C. ODORA'TA (Lin. fil. suppl. 431.) leaves ovate, obtuse, serrated, plicately veined, villous beneath. ♄. G. Willd. spec. 4. p. 837.

Sweet-scented Cliffortia. Shrub 2 to 3 feet.

7 C. SERRA'TA (Reichb. ex Spreng. syst. add. p. 209.) leaves spatulate-lanceolate, cuspidately serrated, glabrous; stipulas permanent, imbricated, ovate; branches flexuous, twiggy. ♄. G. C. serràta, Thunb. prod. 2. p. 93. is perhaps the same.

Serrated-leaved Cliffortia. Shrub 2 feet.

8 C. SPICA'TA (Reichb. ex Spreng. syst. add. p. 209.) stem simple, hairy; leaves lanceolate, subverticillate, erect; spikes dense, terminal, leafy. ♄. G.

Spicate Cliffortia. Shrub.

9 C. FERRUGI'NEA (Lin. fil. suppl. 429.) leaves lanceolate, tapering to the base, setaceously serrated, striated, glabrous. ♄. G. C. berberifòlia, Lam. dict. 1. p. 48. Stipulas setaceous, bifid, ferruginous ex Willd. but villous ex Lam.

Rusty Cliffortia. Shrub prostrate.

10 C. FILICAU'LIS (Schlecht. et Cham. in Linnæa. 2. p. 33.) trailing; leaves cuneate-obovate, tridentate, with villously ciliated edges, veinless above; flowers monœcious. ♄. G. Stems rooting.

Thread-stemmed Cliffortia. Shrub creeping.

11 C. CUNEA'TA (Ait. hort. kew. 3. p. 413.) leaves cuneiform, truncate, 3-5-toothed at the apex, striately veined, glabrous on both surfaces. ♄. G.

Cuneate-leaved Cliffortia. Fl. April, May. Clt. 1787. Sh. 2 to 3 feet.

§ 3. *Tenuifòliæ* (from *tenuis*, thin, and *folium*, a leaf; leaves all fine and filiform). *D. C. prod. 2. p. 596. Leaflets 3, subulate, linear or oblong, lateral ones sometimes the shortest, but much like the middle ones, cauline ones usually all abortive, the young or new ones disposed in fascicles in the axils of the stipulas.*

12 C. STROBILI'FERA (Lin. syst. 749.) leaflets linear, acute, glabrous, with scabrous margins, in fascicles in the axils of the stipulas. ♄. G. Pluk. alm. t. 275. f. 2. Stipulas connate in one, bifid. Sometimes there are strobile-formed galls on the branches, whence the specific name.

Strobile-bearing Cliffortia. Fl. May, June. Clt. 1818. Sh. 2 to 3 feet.

13 C. ERICÆFÒLIA (Lin. fil. suppl. 430.) leaflets terete, sulcate, glabrous, in fascicles. ♄. G.

Heath-leaved Cliffortia. Shrub 2 to 3 feet.

14 C. SERPYLLIFÒLIA (Schlecht. et Cham. in Linnæa. 2. p. 34.) leaves cuneated-spatulate, awnless, quite glabrous; flowers monœcious. ♄. G.

Wild-thyme-leaved Cliffortia. Shrub 1½ foot.

15 C. TERETIFÒLIA (Thunb. prod. p. 93.) leaflets terete, subulate, incurved, glabrous, in fascicles. ♄. G.

Terete-leaved Cliffortia. Shrub 1 to 2 feet.

16 C. FILIFÒLIA (Lin. fil. suppl. 430.) leaflets filiform, trigonal, glabrous, in fascicles. ♄. G. Nenax aceròsa, Gærtn. fruct. 1. p. 165. t. 32. f. 7.

Thread-leaved Cliffortia. Shrub 1 to 2 feet.

17 C. JUNIPE'RINA (Lin. fil. suppl. 430.) leaflets subulate, glabrous, mucronate, in fascicles. ♄. G. A much branched shrub. Flowers axillary, sessile. The three leaflets are equal among themselves.

Juniper-like Cliffortia. Shrub 3 feet.

18 S. SARMENTÒSA (Lin. mant. 299.) leaflets linear, villous, in fascicles; branches clothed with velvety pubescence. ♄. G.

Sarmentose Cliffortia. Clt. 1793. Shrub straggling.

19 C. FALCA'TA (Lin. fil. suppl. 431.) leaflets linear, mucronate, nearly falcate, in fascicles, and are, as well as the branches, glabrous. ♄. G. This species is usually confounded with the last, but differs from it in being glabrous.

Falcate-leaved Cliffortia. Fl. June, July. Clt. 1818. Shrub 1 to 2 feet.

§ 4. *Latifòliæ* (from *latus*, broad, and *folium*, a leaf; leaflets broad). *D. C. prod. 2. p. 596. Leaflets 3, oval or obcordate, usually dissimilar in shape, lateral leaflets stipule-formed. Stipulas small.*

20 C. TERNA'TA (Lin. fil. suppl. 430.) leaflets oval-oblong, acute, all nearly equal in size and shape, and are, as well as the branchlets, pilose. ♄. G. C. polygonifòlia, Lin. spec. 1470. hort. cliff. 501. t. 32. Young leaves in fascicles.

Ternate-leaved Cliffortia. Fl. June, July, Clt. 1818. Shrub 2 to 3 feet.

21 C. TRIFOLIA'TA (Lin. spec. 1470.) leaflets in fascicles, veiny, pilose, lateral ones lanceolate, quite entire, middle one obovate, tridentate. ♄. G. Pluk. alm. t. 319. f. 4.

Trifoliate Cliffortia. Fl. April, July. Clt. 1752. Shrub proc.

22 C. OBCORDA'TA (Lin. fil. suppl. 429.) leaflets veinless, glabrous, lateral ones roundish-elliptic, middle one obcordate; branches pubescent. ♄. G. Willd. spec. 2. p. 842.

Obcordate-leafletted Cliffortia. Fl. June, Aug. Clt. 1790. Shrub 2 to 3 feet.

23 C. OBLÌQUA (Spreng. neue. entd. 2. p. 174.) leaflets veiny, quite glabrous, crenulated, lateral ones roundish, obliquely cordate, middle one obcordate; branches glabrous. ♄. G.

Oblique-leaved Cliffortia. Fl. June, July. Clt. 1816. Sh. 2 to 3 feet.

24 C. DENTA'TA (Willd. spec. 4. p. 842.) leaflets obovate, glabrous, veiny, a little toothed at the apex, middle one tridentate; branches pubescent. ♄. G. Allied to *C. obcordàta.*

Toothed-leaved Cliffortia. Fl. June, July. Shrub 2 to 3 ft.

§ 5. *Bifoliolæ* (*bis*, two, *foliola*, leaflets; leaves composed of two opposite leaflets without any middle one). *D. C. prod.* 2. p. 596. *Stipulas small. Leaves of 2 opposite leaflets from the middle one being abortive, lateral ones large. Petiole wanting.*

25 C. CRENA'TA (Lin. fil. suppl. 430.) leaflets 2-3, orbicular, adpressed, denticulated, 7-nerved, glabrous. ♄. G. Perhaps belonging to the preceding section.
Crenate-leaved Cliffórtia. Fl. July, Aug. Clt 1791. Sh. 2 to 3 feet.

26 C. PULCHE'LLA (Lin. fil. suppl. 430.) leaflets 2, orbicular, adpressed, many-nerved, entire, with somewhat erose margins. ♄. G. Willd. spec. 4. p. 839.
Neat Cliffórtia. Fl. April, May. Clt. 1795. Shrub 1½ ft.

27 C. CINE'REA (Thunb. prod. p. 93.) leaflets connate, ovate, trigonal, hoary-tomentose. ♄. G. Perhaps belonging to a different section.
Grey Cliffórtia. Fl. June, July. Clt. 1800. Pl. 2 feet.

Cult. The species of *Cliffórtia* are plants of singular habit, and only deserve to be cultivated on that account. They thrive well in an equal mixture of loam and peat. Cuttings of young wood root freely in sand, under a bell-glass.

ORDER LXXXV. POMA'CEÆ (this order contains trees agreeing in important characters with the *apple* and *pear*). Juss. gen. p. 334. Rich. anal. fr. p. 33. Lindl. Lin. trans. 13. p. 93. introd. nat. ord. p. 83.—Rosàceæ, Tribe VIII. Pomàceæ, D. C. prod. 2. p. 626.

Calyx superior, 5-toothed (f. 83. *a.* f. 81. *a.*), the odd segment posterior. Petals 5 (f. 83. *b.* f. 84. *f.*), unguiculate, inserted in the throat of the calyx, the odd one anterior. Stamens indefinite, inserted in a ring in the throat of the calyx (f. 83. *e.* f. 84. *b.*). Ovaries from 1-5 (f. 82. *e.* f. 83. *c.*), adhering more or less to the sides of the calyx (f. 83. *c.*) and to each other. Ovula usually 2, collateral, ascending, very rarely solitary. Styles from 1-5 (f. 82. *d.*), having simple stigmas. Fruit a pome, 1-5-celled (f. 81. *a.* f. 82. *d.* f. 84. *g.*), seldom spuriously 10-celled, with the endocarp either cartilaginous, spongy, or bony. Seeds ascending, solitary. Albumen none. Embryo erect, with flat cotyledons or convolute ones as in *Chamæmèlis*, and a short, conical radicle. This order is composed of trees or shrubs, with alternate, stipulate, simple, or compound leaves, and terminal cymes of white or pink flowers. *Pomàceæ* is closely allied to *Rosàceæ*, from which it differs in the adhesion of the ovarium to the sides of the calyx, and more or less with each other. Their fruit is always a pome, that is, it is made up of a fleshy calyx, adhering to fleshy or bony ovaria, containing a definite number of seeds. *Pomàceæ* is peculiarly distinguished by their ovula being in pairs and side by side, while *Rosaceæ*, when they have 2 or more ascending ovula, always have them placed one above another. Cultivated plants of this order are apt to produce monstrous flowers, which sometimes depart in a remarkable degree from their normal group. Prussic acid exists in *Cotoneáster microphýlla*, a plant of this order. The fruit as an article of food, and the flowers for their beauty, are the chief peculiarities of this order. The *apple*, the *pear*, the *medlar*, the *quince*, the *service*, the *rowan-tree*, the *mountain-ash*, are all well known, either for their beauty or their use. The wood of the *pear*-tree is almost as hard as box, for which it is even substituted by wood engravers. The timber of the *bean-tree* (*Pỳrus A'ria*) is invaluable for axle-trees. The bark of *Photínia dùbia* is used for dyeing scarlet in Nipaul. Malic acid is contained in considerable quantities in *apples*; it is also almost the sole acidifying principle of the berries of the *mountain-ash*, the *rowan* or *rhodon*-tree (*Pỳrus Aucupària*).

Synopsis of the genera.

1 CRATÆ'GUS. Calyx urceolate, 5-cleft. Petals orbicular. Ovarium 2-5-celled. Styles 2-5, glabrous. Pome fleshy, ovate, containing a bony putamen.

2 RAPHIO'LEPIS. Limb of calyx funnel-shaped, deciduous. Ovary 2-celled, 2-styled. Pome with a thickened closed disk and a chartaceous putamen, containing 2 gibbous seeds.

3 CHAMÆME'LIS. Calyx truncate, with 5 little teeth. Petals small, erose. Stamens 10-15. Ovary 1-celled. Style 1. Ovula 2, erect.

4 PHOTI'NIA. Calyx 5-toothed. Petals reflexed. Ovary villous, 2-celled. Styles 2, glabrous. Pericarp 2-celled, inclosed in the fleshy calyx.

5 ERIOBO'TRYA. Calyx woolly, 5-toothed. Petals bearded. Styles 5, pilose, inclosed. Pome closed, 3-5-celled (f. 81. *a.*).

6 COTONEA'STER. Flowers polygamous. Calyx turbinate, bluntly 5-toothed. Petals short. Stamens length of the calycine teeth. Styles glabrous, shorter than the stamens. Carpels 2-3, parietal, biovulate, inclosed in the calyx.

7 AMELA'NCHIER. Calyx 5-cleft (f. 82. *c.*). Petals lanceolate (f. 82. *a.*). Stamens rather shorter than the calyx. Ovary of 10 cells or of 5 bipartite ones (f. 82. *c.*), with a solitary ovulum in each partition. Styles 5 (f. 82. *d.*), joined at the base. Mature pome 3-5-celled (f. 82. *d.*). Seeds 3-5; endocarp cartilaginous.

8 ME'SPILUS. Calyx 5-cleft (f. 83. *a.*); the segments foliaceous. Petals nearly orbicular (f. 83. *b.*). Disk large, filled with honey. Styles 2-5, glabrous. Pome turbinate, open at the apex, 5-celled; endocarp bony.

9 OSTEOME'LIS. Calyx 5-cleft. Petals oblong. Styles exserted, length of stamens, bearded below. Ovary 5-celled; cells 1-seeded. Pome closed, woolly; endocarp bony.

10 PY'RUS. Calyx urceolate, 5-lobed. Petals roundish. Styles usually 5, rarely 2-3. Pome closed, 5-celled; cells cartilaginous. Seeds 2 in each cell.

11 CYDÒNIA. Calyx 5-cleft (f. 84. *a.*). Petals orbicular (f. 84. *f.*). Styles 5. Pome closed, 5-celled (f. 84. *g.*). Cells cartilaginous, many-seeded. Seeds covered with pulp.

† *Genera doubtful whether they belong to the present order.*

12 DICA'LYX. Flowers superior, 2-3-bracteate. Calyx 5-cleft. Corolla 4-parted. Stamens inserted in the base of the corolla. Styles 2. Drupe baccate, containing a 1-3-celled putamen.

13 PYRENA'RIA. Calyx inferior, 5-sepalled. Stamens numerous, free, hypogynous and somewhat adnate to the base of the

petals. Styles 5. Pome globose, 5-celled; cells covered with papery membranes, containing 2 bony, 1-seeded nuts each.

I. CRATÆ'GUS (from κρατος, *cratos*, strength; in reference to the hardness and strength of the wood). Lindl. in Lin. trans. 13. p. 105. D. C. prod. 2. p. 626.—Cratæ'gus and Mespilus species of other authors.

LIN. SYST. *Icosándria, Di-Pentagýnia.* Calyx with an urceolate tube and a 5-cleft limb. Petals orbicular, spreading. Ovarium 2-5-celled. Styles 2-5, glabrous. Pome fleshy, ovate, closed by the calycine teeth or the thickened disk, containing a bony putamen.—Thorny shrubs or trees, with angular or toothed leaves and terminal corymbs of usually white flowers. Bracteas subulate, deciduous.

§ 1. *Leaves toothed or nearly entire, never angularly lobed.*

1 C. PYRACA′NTHA (Pers. ench. 2. p. 37.) leaves glabrous, evergreen, ovate-lanceolate; lobes of calyx blunt; styles 5. ♄. H. Native of the south of Europe, in uncultivated places and in hedges. Méspilus pyracántha, Lin. spec. 685. Pall. fl. ross. 1. p. 29. t. 13. f. 2.- -Duham. arb. 2. t. 20. no. 2.--Lob. icon. 2. p. 182. f. 1. Flowers white. Fruit about the size of a pea, disposed in cymes, of a beautiful scarlet colour, remaining on the tree nearly all the winter, whence it is called *Buisson ardent* by the French, as also its Greek name *Pyracantha*, which signifies *fire-thorn*. The shrub being evergreen is well adapted for planting against walls or houses, where the green leaves and red fruit have a fine appearance all the winter.

Pyracantha or Evergreen Thorn. Fl. May. Clt. 1629. Sh. 10 to 20 feet.

2 C. CRENULA′TA (Roxb. mss. Lindl. in Lin. trans. 13. p. 106.) leaves ovate-oblong, crenulated, glabrous, shining, retuse at the apex and mucronulate; peduncles lateral, aggregate, elongated, 1 or many-flowered; styles 5. ♄. H. Native of Nipaul. Méspilus crenulàta, D. Don, prod. p. 238. Allied to *C. pyracántha*. Styles glabrous. Fruit 5-celled, 5-seeded. Leaves probably permanent.

Crenulated Evergreen Thorn. Fl. May, Ju. Clt. 1822. Tr.

3 C. CRU′S-GA′LLI (Lin. spec. 632.) leaves obovate-cuneiform, nearly sessile, shining, glabrous, falling off late in the autumn; lobes of calyx lanceolate, subserrated; styles 2. ♄. H. Native of North America. Wats. dend. brit. t. 56. Méspilus crús-gálli, Poir. dict. 4. p. 441. Hort. angl. t. 13. Mill. fig. 178. f. 2. C. lùcida, Wangh. amer. t. 17. f. 42. Méspilus lùcida, Ehrh. Flowers white tinged with red; anthers red. Fruit scarlet, eatable. Stipulas linear. Spines very long.

Var. α, spléndens (D. C. prod. 2. p. 626.) leaves obovate-cuneiform. Ait. hort. kew. 2. p. 170.—Pluk. alm. t. 46. f. 1.

Var. β, pyracanthifòlia; leaves oblong-lanceolate, somewhat cuneiform. Ait. l. c. Méspilus lùcida, Dum. Cours. bot. cult. ed. 2. vol. 5. p. 448.

Var. γ, salicifòlia (D. C. prod. l. c.) leaves oblong-lanceolate, rather cuneiform. Ait. l. c.

Var. δ, lineàris (D. C. prod. 2. p. 626.) leaves linear-lanceolate; spines few, shortish. ♄. H. Méspilus lineàris, Desf. arbr. 2. p. 156. Poir. suppl. 4. p. 70. Styles 1-2. Fruit yellow?

Var. ε, nàna (D. C. prod. 2. p. 626.) leaves oval-lanceolate, paler beneath. ♄. H. Méspilus nàna, Dum. Cours. suppl. p. 386. Branches rather tomentose. Perhaps this is a proper species.

Cockspur Thorn. Fl. May, Ju. Clt. 1691. Tr. 10 to 30 ft.

4 C. SUBSPINÒSA (D. C. prod. 2. p. 626.) leaves oval, ovate, or obovate, crenate-toothed, glabrous, coriaceous, on short petioles; racemes ovate, terminal; calyx glabrous, with the lobes acute. ♄. H. Native of Chili. Méspilus subspinòsa, herb. Vent. Branches unarmed, obviously so in the specimen examined. Fruit one half the size of a pea, nearly dry.

Subspinose Hawthorn. Tree.

5 C. PUNCTA′TA (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, glabrous, serrated; calyxes rather villous, with the lobes subulate and entire. ♄. H. Native of North America. Jacq. hort. vind. 1. and 28. Wats. dend. brit. t. 57. Méspilus cuneifòlia, Ehrh. beit. 3. t. 21. Flowers white. There are varieties of this species with either yellow or red fruit, which are usually dotted. The Indians of the west coast of America make wedges of the wood for splitting trees.

Dotted-fruited Hawthorn. Fl. May, June. Clt. 1746. Tr. 15 to 20 feet.

6 C. ELLI′PTICA (Ait. hort. kew. 2. p. 168.) leaves elliptic, unequally serrated, glabrous; petioles and calyxes glandular; pome globose, 5-seeded. ♄. H. Native of North America. Flowers white. Fruit red.

Elliptic leaved Hawthorn. Fl. May, June. Clt. 1765. Tr. 15 to 20 feet.

7 C. PRUNIFÒLIA (Bosc. ined. D. C. prod. 2. p. 627.) leaves broad-ovate, unequally serrated, glabrous; petioles rather glandular; lobes of calyx glandularly serrated; peduncles and calyxes rather villous. ♄. H. Native of North America. Méspilus prunifòlia, Poir. dict. 4. p. 443. Flowers white. Fruit 2-seeded.

Plum-leaved Hawthorn. Fl. May, June. Clt. 1818. Tree 15 to 20 feet.

8 C. PRUNELLIFÒLIA (Bosc, ined. ex D. C. prod. 2. p. 627.) leaves oval-elliptic, attenuated at both ends, serrated, glabrous; branches rather villous. ♄. H. Native country as well as flowers unknown. Habit referrible to *Prùnus spinòsa.*

Prunella-leaved Hawthorn. Fl. May, June. Tree.

9 C. LATIFÒLIA (Pers. ench. 2. p. 37.) leaves obovate, unequally serrated, rather plicate, and rather villous on the nerves beneath; stipulas and lobes of calyx linear and slightly toothed; corymbs villous. ♄. H. Native of North America. Fruit oval, red.

Broad-leaved Hawthorn. Fl. May, Ju. Clt. 1820. Tr. 20 ft.

10 C. PARVIFÒLIA (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, deeply serrated, pubescent; flowers usually solitary; branches and calyxes villous; stipulas setaceous; lobes of calyx serrated; fruit rather turbinate, 5-seeded. ♄. H. Native of North America. Wats. dendr. brit. 65. Méspilus axillàris, Pers. l. c. Méspilus tomentòsa, Poir. l. c. Méspilus xanthocárpos, Lin. fil. suppl. 254. C. tomentòsa, Lin. spec. 682. Trew. ehrh. t. 17. Flowers small, white. Fruit yellow.

Small-leaved or Gooseberry-leaved Hawthorn. Fl. May, June. Clt. 1704. Shrub 6 feet.

11 C. OVALIFÒLIA (Horn. hort. hafn. suppl. p. 52.) leaves oval, serrated, rather pilose on both surfaces, shining above; stipulas half cordate, deeply serrated, glandular. ♄. H. Native of North America. Allied to *C. crús-gálli*, according to the author.

Oval-leaved Hawthorn. Fl. May, June. Clt. 1810. Tree 10 to 20 feet.

12 C. GLAU′CA (Wall. cat. 673.) leaves elliptic, tapering to both ends, acute, serrulated at the apex, downy and glaucous beneath, but glabrous above; corymbs terminal, many-flowered; calyx woolly. ♄. H. Native of Nipaul and Kamaon. Flowers white.

Glaucous Hawthorn. Tree 20 feet.

13 C. FLEXUÒSA (Poir. suppl. 4. p. 73.) leaves obovate, sharply toothed, pubescent on both surfaces; corymbs small, tomentose; branches flexuous. ♄. H. Native of Carolina. Fruit of a reddish yellow colour. Spines very long, blackish.

Flexuous Hawthorn. Shrub 6 to 10 feet.

14 C. LU'TEA (Poir. suppl. 4. p. 72.) leaves ovate, pubescent, acute at both ends, glandularly serrated; corymbs tomentose. ♄. H. Native country unknown. Spines long and strong. Fruit yellow.

Yellow-fruited Hawthorn. Shrub 6 to 10 feet.

† *Species belonging to the above division but are not sufficiently known.*

15 C. ALPI'NA (Mill. dict. no. 3.) leaves oblong-ovate, serrated, green on both surfaces, on short petioles. ♄. H. Native on Mount Baldo and other Italian mountains. Fruit of an obscure brown colour.

Alpine Hawthorn. Fl. May, June. Clt.? Tr. 20 to 30 ft.

16 C. LU'CIDA (Mill. dict. no. 6.) leaves lanceolate, serrated, shining, paler beneath; spines very long. ♄. H. Native of North America. Flowers corymbose, of a pale red.

Shining-leaved Hawthorn. Fl. May, Ju. Clt.? Sh. 8 to 10 ft.

17 C. PAUCIFLÒRA (Pers. ench. 2. p. 37.) leaves ovate-lanceolate, crenated, pubescent; flowers solitary. ♄. H. Native of Switzerland, about Lausanne. Méspilus pauciflòra, Poir. dict. 4. p. 441.

Few-flowered Hawthorn. Tree.

18 C. UNILATERA'LIS (Pers. ench. 2. p. 37.) leaves cuneated, or oblong-lanceolate, obtuse, crenated; corymbs unilateral. ♄. H. Native of Carolina. (ex herb. Lamb.)

Unilateral-flowered Hawthorn. Tree.

19 C. MAU'RA (Lin. fil. suppl. 253.) leaves oblong, toothed at the apex; corymbs branched; stipulas wanting. ♄. H. Native of Mauritania. Spines none. Stature and appearance of the common *hawthorn;* also the flowers are like it.

Var. β, diversifòlia (Pers. ench. 2. p. 37.) leaves lanceolate, obtuse, quite entire and cuneately trifid, serrated, glabrous, on long petioles; corymbs lateral. ♄. H. Native of the north of Africa.

Moors' Hawthorn. Tree 10 to 14 feet.

§ 2. *Leaves variously lobed or cut.*

20 C. APIIFÒLIA (Mich. fl. bor. amer. 1. p. 287. but not of Med.) leaves deltoid, deeply lobed; lobes acute, deeply toothed; pedicels of corymb usually simple, and are as well as the oblong tube of the calyx villous; calycine lobes rather serrated. ♄. H. Native of Virginia and Carolina, in humid woods. C. oxycántha, Walt. car. p. 147. ex Willd. Flowers white. Fruit scarlet. This shrub is admirably adapted for hedges, and is used for that purpose in some parts of North America.

Parsley-leaved Hawthorn. Fl. May, June. Clt. 1812. Sh. 8 to 10 feet.

21 C. PYRIFÒLIA (Ait. hort. kew. 2. p. 168.) leaves ovate-elliptic, deeply serrated, rather plicate and somewhat hairy; calyxes rather villous, with the lobes linear-lanceolate, and serrated; flowers trigynous. ♄. H. Native of North America, from Pennsylvania to Carolina, in woods and among rocks. Wats. dend. brit. 61. C. leucophæ'os, Mœnch. Weis. p. 31. t. 2. ex Willd. C. edùlis, Hort. The tree is either thorny or unarmed.

Pear-leaved Hawthorn. Fl. June. Clt. 1765. Sh. 6 to 10 ft.

22 C. GLANDULÒSA (Willd. spec. 2. p. 1002. but not of Michx.) leaves obovate-cuneiform, angular, glabrous, shining; petioles, stipulas, and calyxes glandular; fruit oval, 5-seeded. ♄. H. Native of North America. Lodd. bot. cab. 1012. Wats. dend. 58. Méspilus rotundifòlia, Ehrh. beitr. 3. p. 20. Fruit scarlet. Flowers white.

Glandular Hawthorn. Fl. May, Ju. Clt. 1750. Tr. 12 to 20 ft.

23 C. SPATULA'TA (Michx. fl. bor. amer. 1. p. 288.) leaves small, in fascicles, narrowed a long way at the base, somewhat spatulate and trifid; corymbs few-flowered; pedicels short; calyxes tomentose. ♄. H. Native of Virginia and Carolina, in woods. Lodd. bot. cab. 1261. Spines strong.

Spatulate-leaved Hawthorn. Fl. May, June. Clt. 1806. Tree 8 to 12 feet.

24 C. TURBINA'TA (Pursh, fl. amer. sept. suppl. 735.) unarmed, glabrous; leaves obovate-cuneated, deeply serrated; corymbs few-flowered; pedicels short; fruit turbinate. ♄. H. Native of Carolina and Virginia. Said by the author to be allied to *C. spatulàta*, but is omitted by Nuttall.

Turbinate-fruited Hawthorn. Fl. May, Ju. Tree.

25 C. COCCI'NEA (Lin. spec. 682.) leaves ovate, cordate, deeply angled, glabrous, acutely serrated; petioles and calyxes pubescent and glandular; petals orbicular; flowers pentagynous. ♄. H. Native of North America, from Canada to Carolina, in hedges and woods. Wats. dend. brit. t. 62.—Pluk. alm. t. 46. f. 4. Hort. ang. t. 13. f. 1.? Flowers white. Fruit pear-shaped, red, and eatable.

Scarlet-fruited Hawthorn. Fl. May, June. Clt. 1683. Tr. 20 to 30 feet.

26 C. CORDA'TA (Mill. fig. t. 179.) leaves ovate, cordate, deeply angled, glabrous; petioles and calyxes glandless; flowers pentagynous. ♄. H. Native of North America, from Canada to Virginia, in hedges and among rocks. Wats. dend. brit. t. 63. Lindl. bot. reg. 1151. C. populifòlia, Walt. car. 147. Méspilus acerifòlia, Poir. dict. 4. p. 442. Méspilus phænopyrum, Lin. fil. suppl. 254. Flowers white. Fruit round, red, containing 2 seeds.

Cordate-leaved Hawthorn. Fl. May, June. Clt. 1738. Sh. 6 to 10 feet.

27 C. SANGUI'NEA (Pall. fl. ross. 1. p. 25. t. 11.) spinose; leaves obovate, cuneated at the base, somewhat 7-lobed, opaque and pubescent on both surfaces; stipulas serrated; petioles and calyxes glandless; fruit 2-4-seeded. ♄. H. Native of Siberia, about the edges of rivulets. C. oxycántha, Pall. itin. 2. p. 499. Cratæ'gus, Gmel. fl. sib. 3. p. 176. no. 12. exclusive of the synonymes. Flowers rather large, white. Fruit globose, scarlet, or yellow, for the most part 4-seeded.

Bloody-fruited Hawthorn. Fl. May, June. Tr. 12 to 20 ft.

28 C. LOBA'TA (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves ovate, on short petioles, unequally serrated or lobed, rather pubescent beneath; stipulas cut; branches rather villous; flowers in loose corymbs. ♄. H. Native country unknown. Méspilus lobàta, Poir. suppl. 4. p. 71. Flowers white.

Lobed-leaved Hawthorn. Fl. May, Ju. Clt.? Tr. 10 to 20 ft.

29 C. PURPU'REA (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly lobed, ovate, cuneated at the base, serrated, glabrous or pubescent beneath; stipulas rather circinnate; serratures glandular. ♄. H. Native country unknown. Wats. dend. brit. 60. Branches dark purple. Flowers white.

Purple-branched Hawthorn. Fl. May, June. Clt. 1822. Tree 20 to 30 feet.

30 C. FLORENTI'NA (Zucc. obs. 1. no. 72.) leaves ovate-oblong, cordate at the base, deeply serrated, tomentose beneath as well as on the calyxes; fruit ovate-globose, 5-seeded, smooth; lobes of calyx deciduous. ♄. H. Native about Florence. Méspilus Florentìna, Bert. amœn. 29. Pyrus cratægifòlia, Sav. alb. tosc. 1. p. 169. Flowers white.

Florentine Hawthorn. Fl. May, Ju. Clt. 1800. Tr. 20 to 30 ft.

31 C. NI'GRA (Waldst. et Kit. pl. rar. hung. 1. t. 61.) leaves lobately sinuated, serrated, truncate and somewhat cuneated at the base, clothed with hoary villi beneath; stipulas oblong, deeply serrated; calyxes villous, with the segments a little toothed. ♄. H. Native of Hungary. Wats. dend. 64. Méspilus nigra, Willd. enum. 524. Flowers white, pentagynous. Fruit black.

Black-fruited Hawthorn. Fl. My. Ju. Clt. 1819. Tr. 10 to 20 ft.

32 C. PENTA'GYNA (Waldst. et Kit. in Willd. spec. 2. p. 1006.) leaves ovate, usually trifid, serrated, villous in the axils of the

veins beneath; peduncles and calyxes pubescent; lobes of calyx rounded. ♄. H. Native of Hungary. Flowers white, pentagynous. Allied to *C. oxycántha.*

Pentagynous Hawthorn. Fl. May, June. Clt. 1820. Tree 10 to 20 feet.

33 C. fla'va (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, somewhat lobate, crenate-serrated; petioles short; stipulas cordate, and are as well as the calyxes glandular; flowers usually solitary; berries turbinate, 4-seeded. ♄. H. Native from Virginia to Carolina and the island of Orleans, in the St. Lawrence. Wats. dend. brit. t. 59. C. glandulósa, Mich. fl. bor. amer. 1. p. 288. C. Caroliniàna, Poir. dict. 4. p. 442. Méspilus Michaùxii, Pers. ench. 2. p. 38. Petioles winged from the decurrent base of the leaves. Fruit yellow, edible.

Yellow-fruited Hawthorn. Fl. May, June. Clt. 1724. Tr. 12 to 20 feet.

34 C. fi'ssa (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly ovate, deeply lobed, serrated, glabrous on both surfaces, decurrent down the petioles, which are glandless. ♄. H. Native country unknown. Méspilus físsa, Poir. suppl. 4. p. 72.

Cleft-leaved Hawthorn. Fl. May, June. Clt. 1810. Tree 12 to 20 feet.

35 C. Morocca'na (Pers. ench. 2. p. 37.) leaves cuneated, 3-lobed and pinnatifid, glabrous and glandless; stipulas subpalmately cut; corymbs terminal, glabrous; pedicels elongated; lobes of calyx blunt; flowers digynous. ♄. H. Native of Mauritania. Perhaps distinct from *C. Maùra.*

Morocco Hawthorn. Fl. May, Ju. Clt. 1822. Tr. 15 to 20 ft.

36 C. oxyca'ntha (Lin. spec. 683.) leaves obovate-cuneiform, trifid or pinnatifid, glabrous and shining; flowers corymbose, monogynous, digynous and trigynous; calyxes glandless, acute. ♄. H. Native of Europe, in thickets, hedges, copses, and in high open fields; plentiful in Britain. Fl. dan. 634. Jacq. austr. t. 292. f. 2. Méspilus oxycántha, Gærtn. fruct. 2. p. 24. t. 87. Sórbus aculeàta, Cord. hist. 176. Flowers [illegible] occasionally pink, sweet-scented. Fruit mealy, [illegible] red, occasionally yellow; its cells as [illegible] insipid, dark red, permanent. [illegible] as the styles. The May or Common Hawthorn is a very variable plant.

Var. α, obtusàta (D. C. prod. 2. p. 628.) leaves somewhat obovate, 3-lobed, serrated, the same colour on both surfaces; flowers with 1, 2, or 3 styles. Méspilus oxycántha integrifòlia, Wallr. sched. 219. C. oxyacanthoides, Thuill. fl. par. 245. Lindl. bot. reg. 1128. D. C. fl. fr. 4. p. 433. C. oxyacántha, Oed. fl. dan. 634.

Var. β, vulgàris (D. C. l. c.) leaves ovate, cuneated at the base, deeply trifid or pinnatifid, the same colour on both surfaces; lobes acute, diverging, a little serrated; flowers with 1-2-3 styles. Méspilus oxyacántha of most authors.

Var. γ, laciniàta (Wallr. sched. 219.). C. oxyacántha, D. C. fl. fr. 4. p. 433. C. monógyna of most authors, Blackw. herb. 149. Bull. herb. t. 333. f. B. E. F. C. élegans, Poir. C. ròsea, Hort. Méspilus intermèdia, Poir. C. laciniàta, Besser.

Var. δ, monóstyla (D. C. prod. 2. p. 628.) leaves obovate-cuneiform, trifid or jagged, discoloured beneath, at length coriaceous; flowers constantly monogynous; stigma peltate. Méspilus monógyna, Wallr. sched. 221. C. monógyna, Jacq. aust. t. 229. f. 1. Méspilus apiifòlia, Med. gesch. 82. C. Méspilus oxycántha, Smith, engl. bot. 2504.—Fl. dan. 1162. var. α, flòre-plèno. Flowers double white.

The *hawthorn* is also called *white thorn* and *may;* in France *Aubepine;* in Germany, *hagedorn;* in Italy *branco spino.* It is a native shrub of great importance, and is also introduced into narrow plantations as an undergrowth. It will not grow, however, under the drip of trees, and therefore, in a profitable point of view, is only to be considered as affording impenetrable, close, durable, and easily raised fences, called quickset hedges, and it bears clipping to any extent. The timber of such plants as grow singly and attain a tolerable size, is valued by the millwright and turner, and the roots by the cabinet maker. It is often spoiled, Sang observes, through inattention after cutting; if it be allowed to lie in entire logs or trunks, it soon heats and becomes quite brittle and worthless; it therefore ought to be cut up instantly into planks and laid to dry. The *thorn* will not thrive in a wet soil, nor one very hard and poor, much elevated or much shaded; a free deep loam in an airy situation suits it best. The seeds or haws of the *thorn* do not vegetate until the second year after sowing, unless they have been laid up in a heap mixed with earth immediately after gathering, and turned several times, and sown in a bed the next spring; under such treatment many of them will vegetate the same year. The plants should remain in the seed-bed for two years, and afterwards planted out in nursery rows, where they may remain for two or three years before they are planted for hedges. The best quickset hedges are formed by planting them in two rows, about a foot or a foot and a half apart. The hedges two or three years after planting ought to be clipped once or twice every year, in order to keep them in shape and thicken them, and they should be kept perfectly clear of weeds, at least for the few first years.

Sharp-spined or Common Hawthorn, White-thorn, or May. Fl. May, June. Britain. Shrub 10 to 20 feet.

37 C. kyrtóstyla (Fing. in Schlecht. Linnæa. 4. p. 379. t. 3. f. 1.) thorny; leaves 3-lobed, toothed, glabrous on both surfaces or ciliated on the nerves beneath; flowers corymbose, monogynous; style deflexed; calyx hairy, with the segments oblong, acuminated, spreading and obtuse at the apex; fruit oblong, foveolate at the base, containing a 1-seeded, ovate-oblong, brownish nut, which is convex on the back, and 3-4-furrowed. ♄. H. Native [illegible] Europe.

Curved-styled Hawthorn. Fl. May. Tree 10 to 20 feet.

38 C. monógyna (Fing. in Schlecht. Linnæa. 2. p. 380. t. 3. f. 2.) thorny; leaves 3-parted, toothed, ciliated at the base on the petioles and nerves beneath; flowers corymbose, for the most part monogynous; style straight; calyx glabrous, or a little ciliated, with oblong, acuminated, reflexed, obtuse segments; fruit globose, containing 1 or 2 oblong-ovate brown nuts, with 2 furrows on the back of each. ♄. H. Native of Europe.

Monogynous Hawthorn. Fl. May. Tree 10 to 20 feet.

39 C. heterophy'lla (Flugg. ann. mus. 12. p. 423. t. 38.) leaves glabrous, falling off very late in the season, cuneiform-lanceolate, somewhat 3-lobed or pinnatifid at the apex; lobes subserrated, acute; corymbs many-flowered, glabrous; lobes of calyx acuminated; flowers monogynous. ♄. H. Native probably of North America. Lindl. bot. reg. 1161. Flowers white.

Variable-leaved Hawthorn. Fl. May, June. Clt. 1816. Tree 10 to 20 feet.

40 C. Azaro'lis (Lin. spec. 683.) leaves pubescent, cuneated at the base, trifid; lobes obtuse, coarsely few-toothed; branches, corymbs, and calyxes pubescent; lobes of calyx obtuse; flowers with 1-2-3 styles. ♄. H. Native of the south of France and Italy. Andr. bot. rep. 579. Pýrus Azoràlis, Scop. carn. no. 597. Mespilus Azaròlis, All. pedem. 1809.—J. Bauh. hist. 1. p. 67. Flowers white, sweet-scented. Fruit globose, red, usually 2-seeded; hence the common name of the tree at Montpelier *Pommettes de deux closes.* The fruit when fully ripe has an agreeable taste, for which it is esteemed in Italy and the Levant, where it is served up in the dessert.

Azarole Hawthorn. Fl. May, Ju. Clt. 1640. Tr. 15 to 20 ft.

41 C. orienta'lis (Bosc. ined. ex D. C. prod. 2. p. 629.) leaves 3-lobed, pubescent beneath; lobes ovate, deeply toothed at the apex, the middle one trifid; stipulas broad, cut; branches

clothed with hoary tomentum. ♄. H. Native of the Levant. Méspilus orientàlis, Poir. suppl. 4. p. 72.

Oriental Azarole. Fl. May, Ju. Clt. 1810. Tr. 12 to 20 ft.

42 C. ARÒNIA (Bosc. ined. ex D. C. l. c.) leaves pubescent beneath, cuneated at the base, trifid; lobes obtuse, entire or 3-toothed; teeth obtuse, mucronate; branches pubescent. ♄. H. Native of the Levant. Méspilus Arònia, Willd. enum. suppl. C. Azaròlus β, Willd. spec.—Pocock. cr. t. 85. The fruit is said to be yellow.

Aronia Azarole. Fl. May, Ju. Clt. 1810. Tr. 12 to 20 ft.

C. TANACETIFÒLIA (Pers. ench. 2. p. 38.) leaves deeply pinnatifid, downy; lobes oblong, acute, few-toothed; flowers pentagynous; calycine lobes acutish, reflexed, hairy; fruit globose. H. Native of the Levant. Andr. bot. rep. t. 591. Méspilus tanacetifòlia, Poir. dict. 4. p. 440. Smith, exot. bot. 85. Flowers white. Fruit greenish yellow.

Var. β, *Taúrica* (D. C. prod. 2. p. 629.) fruit brick-coloured. . H. Native of Tauria, on hills. C. orientàlis, Bieb. fl. taur. 1. 389. Perhaps Méspilus Celsiàna, Dum. Cours. suppl. p. 286.

Tanzy-leaved Azarole. Fl. May, June. Clt. 1789. Tree 2 to 20 feet.

44 C. ODORATI'SSIMA; leaves deeply pinnatifid, pubescent; lobes lanceolate, acute, serrated; flowers pentagynous, corymbose; calycine segments ovate; fruit globular. ♄. H. Native of the Crimea. Méspilus tanacetifòlia, Andr. bot. rep. 590. Flowers white, very sweet-scented. Fruit yellow, large.

Sweet-scented Azarole. Fl. May, June. Tree 10 to 20 feet.

45 C. LACINIA'TA (Ucria ex herb. Moricand, D. C. prod. 2. p. 629.) leaves deeply pinnatifid, downy; lobes oblong, acute, few-toothed at the apex; calycine lobes acutish, reflexed, hairy; fruit elliptic. ♄. H. Native of Sicily, on mountains. Flowers white.

Jagged-leaved Azarole. Fl. May, June. Clt. 1816. Shrub 6 to 10 feet.

46 C. MELANOCA'RPA (Bieb. fl. taur. 1. p. 386.) leaves usually trifid, serrated in front, acutish at the base; flowers usually pentagynous; calycine lobes acute, reflexed, villous. ♄. H. Native of Tauria, in mountain woods. Flowers white. Fruit black. Allied to *C. oxyacántha*.

Black-fruited Hawthorn. Fl. May, June. Clt. 1820. Tree 10 to 20 feet.

† *Species belonging to the last division of the genus, but are not sufficiently known.*

47 C. MEXICA'NA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 629.) leaves oval, acute, serrated or cut at the apex, ciliated at the base; flowers corymbose; lobes of calyx acute; fruit obovate, 5-seeded. ♄. H. Native of Mexico. Fruit yellowish, 12-15 lines long. Branches spiny.

Mexican Hawthorn. Fl. May, June. Clt. 1823. Tree.

48 C. LÆVIGA'TA (D. C. prod. 2. p. 630.) leaves cuneated, toothed, 3-lobed at the apex, quite glabrous on both surfaces; corymbs subumbellate; lobes of calyx obtuse, reflexed; fruit glabrous, 2-seeded. ♄. H. Native of the Vosges. Méspilus lævigàta, Poir. l. c.

Smooth Hawthorn. Fl. May, June. Tree.

49 C. VI'RIDIS (Lin. spec. 683.) leaves ovate-lanceolate, somewhat 3-lobed, serrated, glabrous; stipulas semicordate; stem unarmed. ♄. H. Native of Carolina. Perhaps a variety of *C. coccinea*.

Green Hawthorn. Fl. May, Ju. Clt. 1810. Tree 10 to 20 ft.

50 C. TRI'LOBA (Pers. ench. 2. p. 37.) leaves cuneiform, villous, tridentate at the apex; calyxes acute, and are, as well as the peduncles, tomentose; fruit 2-seeded. ♄. H. Native of Barbary.

Three-lobed-leaved Hawthorn. Tree.

51 C. OLIVERIA'NA (Bosc. ined. ex D. C. prod. 2. p. 630.) glabrous? leaves cuneiform at the base, and deeply lobed at the apex; lobes obtuse, almost entire; spines subulate, straight. ♄. H. Native of Asia Minor. Branches dark brown. Flowers white.

Oliver's Hawthorn. Fl. May, Ju. Clt. 1820. Tree 10 to 20 ft.

52 C. POIRETIA'NA (D. C. prod. 2. p. 630.) leaves ovate, rather coriaceous, cut, and somewhat lobed, glabrous: stipulas linear-subulate; spines strong, and very long. ♄. H. Native country unknown. Méspilus lineàris, Poir. suppl. 4. p. 72. Flowers white.

Poiret's Hawthorn. Fl. May, Ju. Clt. 1810. Tree 20 ft.

53 C. DISSE'CTA (D. C. prod. 2. p. 630.) leaves sessile, glabrous, green, trifid; lateral lobes deeply toothed, middle one 3-lobed; lobules toothed; branches unarmed, rather tomentose. ♄. H. Native of Persia. Méspilus dissécta, Dum. Cours. bot. cult. ed. 2. vol. 5. p. 456. Flowers white.

Dissected-leaved Hawthorn. Fl. May, June. Tree.

54 C. PECTINA'TA (Bosc. ined. D. C. prod. 2. p. 630.) leaves pinnatifid, running along the petiole, green; lobes 5, deeply toothed. ♄. H. Native of Persia. Allied to *C. tanacetifòlia* and *C. Oliveriàna*.

Pectinate-leaved Hawthorn. Fl. May, July. Tree 20 feet.

N.B.—There are numerous other garden species, but all remain undescribed.

1 *C. trifoliàta*, Bosc. 2 *C. quinquelobàta*, Bosc. 3 *C. odoràta*, Bosc. 4 *C. obovàta*, Bosc. 5 *C. flavéscens*, Bosc. 6 *C. flabellàta*, Bosc. 7 *C. Carpática*, Lodd. cat. 8 *C. flórida*, Lodd. cat.

Cult. The species of *hawthorn* are well fitted for shrubberies or plantations. They are easily propagated by budding or grafting on the common hawthorn. They are all very ornamental when in blossom. The seeds do not vegetate till the second spring after sowing.

II. RHAPHIO'LEPIS (from ῥαφις, *rhaphis*, a needle, and λεπις, *lepis*, a scale; in reference to the narrow subulate bracteas). Lindl. in bot. reg. t. 468. and Lin. trans. 13. p. 105. D. C. prod. 2. p. 630.

LIN. SYST. *Icosándria, Digýnia* Limb of calyx funnel-shaped, deciduous. Filiments filiform. Ovary 2-celled, 2-styled. Pome closed by a thickened disk, containing a chartaceous putamen. Seeds 2, gibbous; the testa very thick and coriaceous.—Trees, natives of China, with evergreen, crenulated, coriaceous, reticulated leaves. Racemes terminal, usually beset with permanent scale-like bracteas. Petals white, but with the filaments usually red.

1 R. I'NDICA (Lindl. in Lin. trans. 13. p. 105.) leaves ovate, acuminated at both ends; petals ovate, acute; stamens shorter than the calyx. ♄. F. Native of India and China. Cratæ'gus I'ndica, Lin. spec. 683. Sims, bot. mag. 1726. Schrank, hort. mon. t. 66. Leaves broad. Bracteas subulate, deciduous. Petals white. Filaments red.

Indian Hawthorn. Fl. Feb. Aug. Clt. 1806. Tree.

2 R. LOUREI'RI (Spreng. syst. 2. p. 508.) leaves lanceolate, unequally serrated, glabrous; flowers corymbose; petals roundish. ♄. F. Native of Cochin-china. Cratæ'gus I'ndica, Lour. coch. p. 319. Fruit eatable.

Loureiro's Indian Hawthorn. Tree 30 feet.

3 R. PHEOSTE'MON (Lindl. coll. no. 3. in a note,) leaves lanceolate, acuminated at both ends; petals roundish; stamens spreading, longer than the calyx. ♄. F. Native of China. R. I'ndica, Ker. bot. reg. 468. Petals white. Filaments brown.

Brown-stamened Indian-hawthorn. Fl. Feb. May. Clt. 1820. Shrub 3 to 6 feet.

4 R. RU'BRA (Lindl. coll. no. 3. t. 3.) leaves ovate-lanceolate, acuminated at both ends; petals lanceolate; stamens straight, longer than the calyx. ♄. F. Native of Cochin-china and China. Cratæ'gus rùbra, Lour. coch. p. 320. Méspilus Sinénsis, Poir. Flowers reddish.

Red Indian Hawthorn. Fl. Feb. May. Clt. 1820. Tree 30 feet.

5 R. SALICIFÒLIA (Lindl. coll. p. 3. in a note, bot. reg. 652.) leaves long, lanceolate; petals lanceolate, about equal in length to the teeth of the calyx; stamens coarctate, shorter than the calyx. ♄. F. Native of China. Racemes panicled. Petals and filaments white.

Willow-leaved Indian Hawthorn. Fl. Feb. May. Clt. 1821. Shrub 3 to 6 feet.

6 R. SPIRA'LIS; leaves cuneate-oblong, acute, serrated, coriaceous, smooth; racemes terminal, simple, and the pedicels furnished with twisted bracteas; flowers digynous; calyx villous at the base. ♄. F. Native of China. Méspilus spiràlis, Blum. bijdr. p. 1102.

Spiral-bracted Indian Hawthorn. Tree.

† *Names of species which occur in the gardens, but are most probably identical with some of the above.*

1 *R. latifòlia*, Lodd. cat. 2 *R. læ'vis*, Lodd. cat.

Cult. The species of *Raphiólepis* grow freely in a mixture of loam, peat, and sand. Ripened cuttings strike root readily if planted in sand, with a hand-glass placed over them. Some of the species stand our winters very well against a south wall, in the open air, when covered by mats in severe weather.

III. CHAMÆME'LIS (from χαμαι, *chamai*, on the ground, and μηλον, *melon*, an apple; in reference to the dwarfness of the shrub, and with a fruit resembling the apple). Lindl. in Lin. trans. 13. p. 164. t. 11. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria, Monogýnia.* Calyx truncate, 5-toothed. Petals 5, small, erect, erose. Filaments filiform, 10-15. Ovary inferior, 1-celled. Style 1. Pome closed, baccate, containing a 1-celled, 1-seeded, bony nut, having a distinct suture.—A shrub, with simple, coriaceous, shining, obsoletely crenated, evergreen leaves, axillary deciduous stipulas, and racemes of flowers, which are leafy at the base.

1 C. CORIA'CEA (Lindl. l. c.) ♄. G. Native of Madeira, on the sea cliffs to the eastward of Funchall, about a mile out of the town, along the Canico road.

Coriaceous-leaved Chamæmelis. Shrub 3 to 4 feet.

Cult. See *Raphiolèpis* for culture and propagation.

IV. PHOTI'NIA (from φωτεινος, *photeinos*, shining; in reference to the leaves). Lindl. in Lin. trans. 13. p. 103. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria, Digýnia.* Calyx 5-toothed. Petals reflexed. Ovarium semi-adherent, villous, 2-celled. Styles 2, glabrous. Pericarp 2-celled, inclosed in the fleshy calyx; testa cartilaginous.—Trees, with simple, coriaceous, evergreen, serrated or quite entire leaves. Flowers white, disposed in terminal corymbose panicles. Fruit small, smooth.

1 P. SERRULA'TA (Lindl. l. c.) leaves oblong, acute, serrulated; pedicels longer than the calyx. ♄. F. Native of Japan and China. Cratæ'gus glàbra, Thunb. jap. 205. Sims, bot. mag. 2105. Lodd. bot. cab. 248. Colla, hort. rip. t. 36. Leaf-buds large, red.

Serrulated-leaved Photinia. Fl. April, July. Clt. 1804. Tree 10 to 20 feet.

2 P. ARBUTIFÒLIA (Lindl. l. c.) leaves oblong-lanceolate, acute, distantly serrated; pedicels longer than the calyx. ♄. F. Native of California. Petioles red, six times shorter than the leaf. Lindl. bot. reg. 491. Cratæ'gus arbutifòlia, Ait. hort. kew. ed. 2. vol. 3. p. 202.

Arbutus-leaved Photinia. Fl. July, Aug. Clt. 1796. Tree 10 to 20 feet.

3 P. INTEGRIFÒLIA (Lindl. l. c.) leaves elliptic, acuminated, quite entire; panicle diffuse. ♄. F. Native of Nipaul. Pyrus integérrima, Wall. ex D. Don, prod. fl. nep. 237. Pedicels bractless. Ovary 3-celled; cells biovulate.

Entire-leaved Photinia. Clt. 1820. Tree 20 feet.

4 P. DU'BIA (Lindl. l. c. p. 104. t. 10.) leaves lanceolate tantly serrated; panicle corymbose, pilose. ♄. F. Nati Nipaul. Méspilus Bengalénsis, Roxb. Méspilus tinctòria Don, prod. fl. nep. 238. Cratæ'gus Shicòla, Hamilt. r Fruit 2-celled. Seed one, large, clothed with a loose te Fruit 1-celled from abortion, and 2-seeded; hence it is ne allied to *Raphiólepis* ex D. Don, l. c. The bark of this tree used in Nipaul to dye cotton red. Hamilt.

Doubtful Photinia. Clt. 1821. Tree 20 feet.

5 P. BENGALE'NSIS (Wall. mss. in Lin. soc. herb.) leaves broad, elliptic-lanceolate, glabrous, distantly toothed, tapering to both ends; panicle thyrsoid, terminal; calyx downy. ♄. F. Native of Bengal. Flowers white.

Bengal Photinia. Tree.

6 P. SIEBÓLDI; leaves cuneate-oblong, obtuse, serrated from the middle to the apex, coriaceous, smooth above, but when in a young state tomentose beneath, as well as the corymbs and calyxes; flowers semidigynous. ♄. F. Native of China. Méspilus Siebóldi, Blum. bijdr. 1102.

Siebold's Photinia. Tree.

7 P. LÆ'VIS (D. C. prod. 2. p. 631.) leaves ovate, acuminated, serrated; umbel of flowers nearly simple. ♄. F. Native of Japan. Cratæ'gus læ'vis, Thunb. fl. jap. 204.

Smooth Photinia. Tree 20 feet.

8 P. VILLÒSA (D. C. prod. 2. p. 631.) leaves oblong, acuminated, serrated, villous; umbel of flowers compound; pedicels villous; fruit villous. ♄. F. Native of Japan. Cratæ'gus villòsa, Thunb. jap. 204. Fruit villous.

Villous Photinia. Tree.

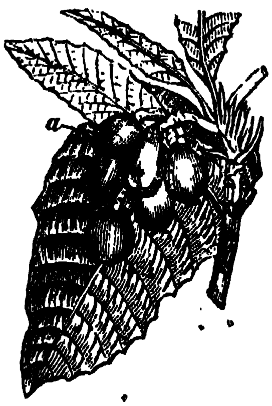
Cult. Trees with fine large shining leaves, and corymbs of whitish flowers, worthy of a place in any garden. For their culture and propagation see *Raphiólepis.*

V. ERIOBO'TRYA (from εριον, *erion*, wool, and βοτρυς, *botrys*, a bunch of grapes; in reference to the bunch of fruit and flowers, which are woolly). Lindl. in Lin. trans. 13. p. 102. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria, Pentagýnia.* Calyx woolly, bluntly 5-toothed. Petals bearded. Stamens erect, length of the calycine teeth. Styles 5, filiform, inclosed, pilose. Pome (f. 81. *a.*) closed, 3-5-celled. Chalaza none. Radicle inclosed between base of the cotyledons.—Small trees, with tomentose branches, broad simply serrated leaves, which are woolly beneath; woolly compound terminal racemes of flowers, and subulate deciduous bracteas. Flowers small, white.

1 E. JAPÓNICA (Lindl. l. c.) leaves broad, rather wrinkled, elliptic, serrated, tapering at the base, tomentose beneath; lobes of calyx rounded. ♄. F. Native of Japan and China. Méspilus Japónica, Thunb. jap. 206. Vent. malm. t. 19. Ker. bot. reg. 365. Hort. trans. 3. t. 11. Dekin, ann. gen. sc. ph. 2. p. 368. t. 32. Cratæ'gus Bibas, Lour. coch. p. 319.—Pluk. alm. t. 371. f. 2. Fruit middle-sized, pear-shaped, yellow, downy, disposed in large pendulous bunches; their taste approaches that of the apple. The loquat when it is intended to produce fruit is grafted on the *Méspilus vulgàris.* It is considered a frame or half hardy tree, but to ripen its fruit with flavour it should have the temperature of the stove; in which, if planted

FIG. 81.



in a border of rich soil, it will add to the variety of the dessert. Sir Joseph Banks (Hort. trans. vol. 1.) considers it as equally good with that of the mango. Lord Bagot, who has fruited the plant in a very superior manner for several years, at Blithfield, gives the following outline of his practice. "The plan I have usually followed has been to give it a winter (out of doors) during the months of July, August, and September, and about the middle of October, to replace it in a very warm situation in the tan. This summer, however, I was obliged to alter my mode; for just at the moment when I was going to put it out for its winter, it became covered with at least twenty bunches of the finest flowers possible. I was therefore obliged to let it remain where it was. The present year's treatment, therefore, is an exception to the former practice; under that, it usually breaks into flower about the end of December, and the fruit becomes ripe in March or April. The last time my plant was in fruit, Sir William Coke, who had resided many years in Ceylon, says, that he was in the constant habit of eating very large quantities of the fruit daily in that island, but that he had never tasted any so good, and with so much flavour, as those produced in my garden."

Japan or Common Loquat. Fl. Oct. Clt. 1787. Tree 10 to 20 feet.

2 E. ELLI'PTICA (Lindl. l. c.) leaves flat, elliptic, obscurely toothed, naked above, and clothed with deciduous tomentum beneath, rounded at the base; thyrse compound, terminal, clothed with fulvous tomentum; calycine lobes oblong. ♄. F. Native of Nipaul. Méspilus Cuíla, Hamilt. mss. in D. Don, prod. fl. nep. p. 238. Flowers white. Fruit downy, yellow.

Elliptic-leaved Loquat. Clt. 1823. Tree 30 feet.

3 E. CORDA'TA (Lindl. l. c.) leaves cordate, obtuse, serrated. ♄. F. Native of Peru. Méspilus lanuginòsa, Ruiz et Pav. fl. per. t. 425. f. 1. Cratæ'gus ferrugínea, Pers. ench. 2. p. 372. Leaves clothed with rusty villi beneath. Fruit round, glabrous.

Cordate-leaved Loquat. Tree.

4 E. OBTUSIFÒLIA (D. C. prod. 2. p. 632.) leaves ovate, obtuse, serrated, glabrous, glaucous beneath; flowers corymbose, pubescent. ♄. F. Native of Peru. Cratæ'gus obtusifòlia, Pers. ench. 2. p. 37.

Obtuse-leaved Loquat. Tree.

5 E.? CHINE'NSIS; leaves ovate-oblong, acute, serrulated, rather villous on the middle nerve beneath; peduncles axillary, crowded, villous; calyxes villous; flowers pentagynous. ♄. F. Native of China. Méspilus Chinénsis, Blum. bijdr. 1102.

China Loquat. Tree.

Cult. See *Raphiólepis* for culture and propagation.

VI. COTONEA'STER (from *Cotoneum*, the Quince-tree, and *aster*, an affixed signification, like; similar downy leaves). Medik. gesch. bot. 1793. Lindl. in Lin. trans. 13. p. 101. D. C. prod. 2. p. 632.

LIN. SYST. *Icosándria, Di-Trigýnia*. Flowers polygamous from abortion. Calyx turbinate, bluntly 5-toothed. Petals short, erect. Stamens length of the teeth of the calyx. Styles glabrous, shorter than the stamens. Carpels 2-3, parietal, biovulate, inclosed in the calyx.—Shrubs, with simple quite entire leaves, which are generally woolly beneath. Corymbs lateral, spreading, furnished with deciduous subulate bracteas. Petals small, permanent.

* *Leaves deciduous.*

1 C. VULGA'RIS (Lindl. l. c.) leaves oval, rounded at the base, tomentose beneath; calyxes and peduncles glabrous; peduncles dichotomous, few-flowered. ♄. H. Native of Europe and Siberia, on hills. In North Wales, upon the cliffs of Llandudno, at Ormeshead. Hook. in engl. bot. suppl. t. 2713. Méspilus Cotoneáster, Lin. spec. 686. Fl. dan. 112. Pall. fl. ross. 1. t. 14. Flowers reddish. Fruit first green, then yellow, then red, and finally black.

Var. α, *erythrocárpa* (Led. fl. alt. 2. p. 219.) fruit red when mature.

Var. β, *melanocárpa* (Led. l. c.) fruit black when ripe. Méspilus Cotoneáster, Pall. fl. ross. 1. p. 30. t. 14. Méspilus melanocárpa, Fisch. in litt.

Var. γ, *depréssa* (Fries. nov. succ. p. 9.) shrub rather thorny; leaves lanceolate, acutish; fruit of 4 carpels. ♄. H. Native of Sweden, on rocks near Warberg.

Common Cotoneaster. Fl. April, May. Clt. 1656. Shrub 3 to 5 feet.

2 C. UNIFLÒRA (Bunge in Led. fl. ross. alt. ill. t. 269.) leaves oblong, attenuated at both ends, glabrous above, and pubescent beneath; peduncles very short, 1-flowered, and are, as well as the calyxes, glabrous. ♄. H. Native of Siberia, in subalpine places. Uva-ursi. Pall. itin. 2. p. 568. Petals greenish white. Styles 3. Pome globose, red.

One-flowered Cotoneaster. Fl. June. Shrub 2 to 3 feet.

3 C. MULTIFLÒRA (Bunge in Led. fl. ross. alt. ill. t. 274.) leaves roundish-oval, attenuated at the base, rounded at the apex, emarginate or with a mucrone, rather puberulous beneath, quite glabrous above; peduncles dichotomous, many-flowered, longer than the leaves, and are, as well as the calyxes, glabrous. ♄. H. Native of Siberia, in the Soongarian desert, among rocks on the mountains of Tschingis-tau and Dschigilen. Pome oblong, purple, 2-3-seeded.

Many-flowered Cotoneaster. Shrub 3 to 5 feet.

4 C. TOMENTÒSA (Lindl. l. c.) leaves elliptic, obtuse at both ends, tomentose beneath; calyx and peduncles woolly. ♄. H. Native of the south of Europe, on the Alps. Méspilus tomentòsa, Willd. spec. 2. p. 1012. but not of Lam. Méspilus eriocárpa, D. C. fl. fr. synop. and suppl. no. 3691.

Tomentose Cotoneaster. Fl. April, May. Clt. 1759. Shrub 3 to 6 feet.

5 C. AFFÌNIS (Lindl. l. c.) leaves ovate or obovate, mucronulate, attenuated at the base, woolly beneath, as well as the petioles, peduncles, and calyxes; peduncles lateral, corymbose, twice-forked, many-flowered. ♄. H. Native of Nipaul, about Chitlong. Méspilus integérrima, Hamilt. mss. Méspilus affìnis, D. Don, prod. fl. nep. p. 238.

Allied Cotoneaster. Fl. Ap. May. Clt. 1828. Sh. 3 to 4 feet.

6 C. ACUMINA'TA (Lindl. l. c. t. 9.) leaves ovate, acuminated, pubescent on both surfaces; calyxes and peduncles pubescent; peduncles usually 3-flowered. ♄. H. Native of Nipaul. Peduncles shorter than those of the preceding species, 1-2, somewhat reflexed. Méspilus acuminàta, Lodd. bot. cab. 919.

Acuminated-leaved Cotoneaster. Fl. April, May. Clt. 1820. Shrub 3 to 5 feet.

7 C. BACILLA'RIS (Wall. ined. Lindl. bot. reg. no. 1229.) leaves obovate, drawn down into the petiole, glabrous; cymes many-flowered, divaricate, and are, as well as the branches, pilose. ♄. F. Native of Kamaon.

Rod Cotoneaster. Shrub.

8 C. OBTU'SA (Wall. ined. ex Lindl. bot. reg. no. 1229.) leaves ovate or obovate, glabrous beneath; cymes crowded, many-

flowered, and are, as well as the branches, glabrous. ♄. H. Native of the mountains of Nipaul and Kamaon.

Obtuse-leaved Cotoneaster. Shrub.

9 C. LAXIFLÒRA (Jacq. ex Lindl. bot. reg. 1305.) leaves oblong, obtuse at both ends, woolly beneath; cymes panicled, pilose; calyxes quite smooth. ♄. H. Native country unknown. Flowers pink.

Loose-flowered Cotoneaster. Fl. April. Clt. 1826. Shrub 3 to 5 feet.

10 C. FRI'GIDA (Wall. ex Lindl. bot. reg. 1229.) leaves oval-lanceolate, tomentose beneath; cymes woolly, many-flowered. ♄. H. Native of Gosaingsthan. Flowers white. Fruit spherical, red.

Frigid Cotoneaster. Fl. April, May. Clt. 1824. Shrub 10 ft.

* * *Leaves evergreen.*

11 C. ROTUNDIFÒLIA (Wall. cat. Lindl. bot. reg. no. 1229.) leaves roundish, pilose beneath, evergreen; peduncles 1-flowered. ♄. H. Native of Gosaingsthan. Cot. microphýlla β, U'va-úrsi, Lindl. bot. reg. 1187. C. U'va-úrsi, Hort. ex Loud. hort. brit. p. 480. Flowers white.

Round-leaved Cotoneaster. Fl. April, May. Clt. 1825. Shrub 3 to 4 feet.

12 C. MICROPHY'LLA (Wall. ex Lindl. bot. reg. 1114.) leaves oblong-cuneated, pubescent beneath, evergreen; peduncles usually 1-flowered. ♄. H. Native of Gosaingsthan. Flowers white.

Small-leaved Cotoneaster. Fl. April, May. Clt. 1824. Shrub 3 to 4 feet.

13 C. BUXIFÒLIA (Wall. cat. ex Lindl. bot. reg. 1229.) leaves ovate, woolly beneath, evergreen; peduncles 3-flowered, woolly. ♄. H. Native of Neelgherry. Flowers white.

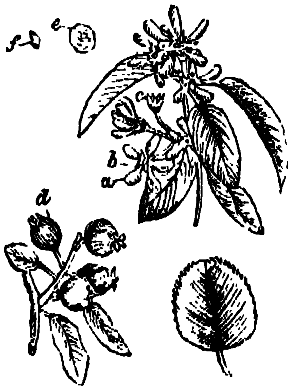
Box-leaved Cotoneaster. Fl. Ap. May. Clt. 1824. Sh. 3 to 4 ft.

Cult. All the species of *Cotoneáster* are well fitted for shrubberies; they are easily increased by laying down the branches or by cuttings, which should be planted in a sheltered situation, with a hand-glass placed over them; they are also propagated by separating the suckers from the roots or by seeds.

VII. AMELA'NCHIER (the Savoy name of the *medlar*). Medik. gesch. 1792. Lindl. in Lin. trans. 13. p. 100. D. C. prod. 2. p. 632.

LIN. SYST. *Icosándria*, *Pentagýnia*. Calyx 5-cleft (f. 82. *c.*). Petals lanceolate (f. 82. *a.*). Stamens rather shorter than the calyx. Ovarium of 10 cells, or of 5 bipartite ones (f. 82. *e.*). Ovula 10, solitary in the partitions of the cells. Styles 5 (f. 82. *d.*), joined together a little at the base. Pome (f. 82. *d.*), when mature 3-5-celled. Seeds 3-5; endocarp cartilaginous.—Small trees, with simple, serrated, deciduous leaves, and racemes of white flowers. Bracteas linear-lanceolate, deciduous.

FIG. 82.



1 A. VULGA'RIS (Mœnch. meth. 682.) leaves roundish-oval, bluntish, pubescent beneath, at length glabrous. ♄. H. Native of Europe, in rugged places. Méspilus Amelánchier, Lin. spec. 685. Jacq. fl. aust. t. 300. Sims, bot. mag. t. 2430. Mill. fig. 178. f. 1. Pýrus Amelánchier, Willd. spec. 2. p. 1015. Arònia rotundifòlia, Pers. ench. 2. p. 39. Cratæ'gus rotundifòlia, Lam. Sórbus Amelánchier, Crantz. Pome dark purple.

Common Amelanchier. Fl. Apr. May. Clt. 1596. Sh. 3 to 4 ft.

2 A. BOTRYA'PIUM (D. C. prod. 2. p. 632.) leaves oblong-elliptic, cuspidate, when young rather villous, but at length glabrous. ♄. H. Native throughout Canada, Newfoundland, and Virginia; plentiful in the higher parts of the Columbia. A. grandiflòra, Dougl. mss. Méspilus Canadénsis, Lin. spec. 185. Cratæ'gus racemòsa, Lam. dict. 1. p. 84. Pýrus botryápium, Lin. fil. suppl. 255. Arònia botryàpium, Pers. ench. 2. p. 39. Méspilus arbòrea, Michx. arb. fr. ed. gall. vol. 2. p. 70. t. 66. Pome purple.

Grape-pear or Canadian Medlar. Fl. April, May. Clt. 1746. Shrub 6 to 8 feet.

3 A. OVA'LIS (D. C. prod. 2. p. 632.) leaves roundish-elliptic, acute, when young rather velvety beneath, but when in an adult state glabrous; racemes coarctate; petals obovate; calyx pubescent. ♄. H. Native of North America, throughout Canada, from Lake Huron to the Saskatchawan and Mackenzie rivers, and as far as the Rocky Mountains. Cratæ'gus spicàta, Lam. dict. 1. p. 84. Pýrus ovàlis, Willd. spec. 2. p. 1014. Arònia ovàlis, Pers. ench. 2. p. 40. Méspilus Amelánchier, Walt. car. p. 184.?

Var. β, *semi-integrifòlia* (Hook, fl. bor. amer. p. 201.) leaves for the most part serrated at the apex. ♄. H. Native about the Grand Rapids and at Fort Vancouver, on the Columbia, and on the high grounds of the Multnomak river.

Var. γ, *subcordàta* (D. C. prod. 2. p. 632.) leaves rather cordate at the base. ♄. H. Native on the mountains of New York. Arònia subcordàta, Rafin. in litt. Màlus microcárpa, Rafin. dec.

Dr. Richardson observes that the *A. ovàlis* " abounds on the sandy plains of the Saskatchawan. Its wood, named by the Crees *Meesassquat-ahtick*, is prized for making arrows and pipe-stems, and is thence termed by the Canadian voyagers *Bois de flèche*. Its berries, about the size of a pea, are the finest fruit in the country, and are used by the Crees under the name of *Meesasscootoom-meena*, both in a fresh and dried state. They make a pleasant addition to pemmican, and make excellent puddings, very little inferior to plum-pudding."

Oval-leaved Amelanchier. Fl. Ap. May. Clt. 1800. Sh. 6 to 8 ft.

4 A. SANGUI'NEA (D. C. prod. 2. p. 633.) leaves oblong, rounded at both ends, sharply serrated, always naked; bracteas and stipulas feathery; racemes capitate; calyx glabrous on the outside. ♄. H. Native of North America, in Canada, Hudson's Bay, Columbia, Lake Huron, Newfoundland, plains of the Saskatchawan. Lindl. bot. reg. 1171. Pýrus sanguínea, Pursh, fl. amer. sept. 1. p. 240. Arònia sanguínea, Nutt. Méspilus Canadénsis γ, rotundifòlia, Michx. fl. bor. amer. 1. p. 391. Fruit blackish purple, eatable. The leaves are hairy when young. It differs principally from *A. botryàpium* in the fewer flowers, much shorter raceme, and shorter, broader, and more ovate petals.

Bloody-fruited Amelanchier. Fl. April, May. Clt. 1800. Shrub 4 to 8 feet.

Cult. See *Cotoneáster* for culture and propagation.

VIII. ME'SPILUS (from μεσος, *mesos*, the half, and πιλος, *pilos*, a bullet; fruit resembling half a bullet). Lindl. in Lin. trans. 13. p. 99. D. C. prod. 2. p. 633.—Méspilus species of Lin. and others.—Mespilóphora species of Neck.

LIN. SYST. *Icosándria*, *Di-Pentagýnia*. Calyx 5-cleft (f. 83. *a.*), the segments foliaceous (f. 83. *a.*). Petals nearly orbicular (f. 83. *b. g.*). Disk large, full of honey. Styles 2-5 (f. 83. *f.*), glabrous. Pome turbinate, open, 5-celled. Endocarp bony. In a wild state the trees are furnished with spines, but in the cultivated state they are unarmed. Leaves lanceolate, serrulated, deciduous. Flowers large, nearly sessile, usually solitary, white. Bracteas permanent.

1 M. Germa'nica (Lin. spec. 684.) leaves lanceolate, undivided, a little downy, but most so beneath; flowers solitary. ♄. H. Native of Europe and Siberia, in woods and among bushes; in England, in all the hedges about Minshill, Cheshire; about Ashburnham, Sussex, truly wild. Smith, engl. bot. 1523. Gærtn. fr. 2. p. 43. t. 87. Duham. arbr. 2. t. 4. Pall. fl. ross. t. 13. f. 1.

Var. α, sylvéstris (Mill. dict. no. 1.) thorny; fruit small.—Wild Medlar, *Neflier du bois*. Fruit obovate, middle-sized, dry, and worthless.

Var. β, stricta (D. C. prod. 2. p. 633.) unarmed; leaves doubly serrated. Ait. hort. kew. 2. p. 172.

Var. γ, diffùsa (D. C. prod. 2. p. 633.) unarmed; leaves almost entire. Ait. l. c. Duham. arb. fr. 1. t. 3. Seeds usually abortive. The following garden *medlars* belong to this variety:

1 *Blake's large medlar.*

2 *Dutch medlar, common, large Dutch, broad-leaved Dutch, large-fruited, large German, neflier à gros fruit, neflier de Hollande à gros fruit.* Fruit large, oblate. The largest of any, but not so good as the following.

3 *Nottingham medlar, common, small-fruited, narrow-leaved Dutch.* Fruit obovate, middle-sized. This is the best of all the *medlars*.

4 *Stoneless medlar, neflier sans noyeau, neflier sans pepins, French medlar.* Fruit small, obovate, of little merit.

Use.—The *medlar* is eaten raw in a state of incipient decay; its taste and flavour are peculiar, and by some much esteemed.

Propagation.—By seeds, by layers, or by grafting on seedlings of their own species, or on any kind of plant of *Pomàceæ*. Miller observes that if the stones are taken out of the fruit as soon as it is ripe, and immediately planted, they will come up the following spring and make good plants in two years. He prefers raising from seed to grafting on the *Cratæ'gus*. Forsyth says, "those who wish to keep the sorts true, should propagate them by grafting on their own stocks."

Soil.—The soil in which the *medlar* thrives best is a loamy rich earth, rather moist than dry, but not on a wet bottom.

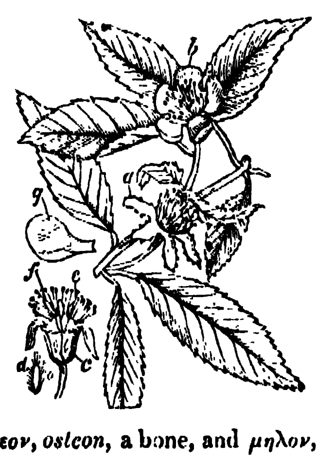
Final planting.—The *medlar*, like the *quince*, is usually grown as standards or espaliers; the former may be planted from 20 to 30, and the latter from 15 to 20 feet apart.

Mode of bearing.—On small spurs at the ends and sides of the branches.

Pruning.—Forsyth recommends the same sort of treatment as for the quince. Cut out all the dead and cankery wood, and keep the tree thin of branches, when it is desired to have large fruit. Care is requisite to train standards with tall stems. Espaliers will require a summer and winter pruning, as in the apple tree.

German or Common Medlar. Fl. May, July. Britain. Tree 10 to 20 feet.

FIG. 83.



2 M. Smi'thii (D. C. prod. 2. p. 633.) leaves oblong, elliptic, serrated, pubescent on the nerves beneath; flowers usually solitary. ♄. H. Native country unknown. M. grandiflòra, Smith, exot. bot. 1. p. 33. t. 18. Flowers white, one half smaller than those of the common *medlar*. Stipulas of the sterile branches large and foliaceous.

Smith's Medlar. Fl. May, Ju. Clt.? Tree 20 feet.

Cult. For culture and propagation see *common medlar*.

IX. OSTEOME'LIS (from οστεον, osteon, a bone, and μηλον, *melon*, an apple; in reference to the bony endocarp). Lindl. in Lin. trans. 13. p. 98. t. 8. D. C. prod. 2. p. 633.

Lin. syst. *Icosándria, Pentagýnia.* Calyx 5-cleft. Petals oblong, flat, spreading. Stamens erect. Styles 5, exserted, length of stamens, bearded below, permanent. Ovary 5-celled; cells 1-seeded. Pome closed, woolly; endocarp bony.—A shrub with pinnate leaves, entire leaflets, and opposite subulate bracteas under the calyxes.

1 O. anthyllidifòlia (Lindl. l. c.). ♄. G. Native of the Sandwich Islands. Pyrus anthyllidifòlia, Smith, in Rees' cycl. no. 29. Flowers subcorymbose. Fruit small, crowned by the styles and calyx.

Kidney-vetch-leaved Osteomelis. Shrub 4 to 6 feet.

Cult. A mixture of loam and peat will suit this shrub, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them. But the best and surest method of increasing it, when it shall be introduced to the gardens, would be to graft it on the *Cydònia Japónica*.

X. PY'RUS (*peren*, Celtic for the pear). Lindl. in Lin. trans. 13. p. 97. D. C. prod. 2. p. 633.—Pyrus, Màlus and Sórbus, Tourn.—Pyrus and Sórbus, Lin.—Pyróphorum and Apyróphorum, Neck.

Lin. syst. *Icosándria, Pentagýnia.* Calyx with an urceolate tube, and a 5-lobed limb. Petals roundish. Styles usually 5, rarely 2 or 3. Pome closed, 5-celled; putamen cartilaginous. Seeds 2 in each cell; testa cartilaginous.—Trees or shrubs, with simple or pinnate leaves, and terminal, many-flowered cymes. Bracteas subulate, deciduous.

Sect. I. Pyro'phorum (from *pyrus*, a pear, and φορεω, *phoreo*, to bear; the trees contained in this section bear pears). D. C. prod. 2. p. 633. Petals flat, spreading. Styles 5, free. Pome more or less turbinate or nearly globose, never umbilicate at the base, as in the apple section. Pedicels simple, umbellate. Leaves simple, glandless.

1 P. commu'nis (Lin. spec. 686.) leaves ovate, serrated, glabrous on both surfaces, as well as the buds and branches; peduncles umbellate. ♄. H. Native of Europe, in woods and hedges; plentiful in some parts of Britain. Smith, engl. bot. 1784. P. A'chras, Gærtn. fruct. 2. p. 44. t. 87. P. sylvéstris, Dod. pempt. 800. Pyráster, Ray, syn. 452. The tree is thorny in a wild state, but unarmed in the cultivated state.

Var. α, A'chras (Wallr. sched. 213.) thorny; leaves ovate, acuminated, quite entire, on long petioles, when young woolly as well as the calyx, but at length becoming smooth; pome drawn out at the base. ♄. H. *Wild pear* or *iron pear*.

Var. β, pyráster (Wallr. sched. p. 214.) thorny; leaves roundish, acute, sharply serrated, when young glabrous as well as the calyxes; pome rounded at the base. ♄. H. Gærtn. fruct. 2. t. 87. f. 2.

The *pear* tree is called *poirier* in French, *birnbaum* in German, and *pero* in Italian. In its wild state, the *pear* is a thorny tree, with upright branches, tending to a pyramidal form, in which it differs materially from the apple tree. The twigs or spray hang down; the flowers in terminal villous corymbs, produced from wood of the preceding year, or from buds gradually formed on that of several years' growth, on the extremities of very short protruding shoots, technically spurs. It is found in a wild state in Britain, and abundantly in France and Germany, as well as other parts of Europe, not excepting Russia, as far as latitude 51°. It grows in almost any soil. The cultivated tree differs from the apple, not only in having a tendency to the pyramidal form, but also in being more apt to send out tap roots, in being as a seeding plant much longer in coming into bearing, and when on its own root, or grafted on a wild *pear* stock, of being much longer lived. In a dry soil it will exist for centuries, and still keep its health, productiveness, and vigour. "The period at which the *Teinton squash pear* first sprang from seed," Mr. Knight observes, "probably now cannot at all be ascertained; but I suspect from its present diseased and worn-out state, that it existed at least as early as the beginning of the sixteenth century; for another kind, the *barland*, which was much cultivated in the early part of the seventeenth century, still retains a large share of health and vigour; and the identical trees which supplied the inhabitants of Herefordshire in the 17th century with liquor, are likely to do the same good to those of the 19th." The remarks on the history of the apple will apply, almost without exception, to the *pear*. The Romans in Pliny's time possessed 32 sorts, and the fruit is still more valued than the apple, both in Italy and France.

Use.—As a dessert fruit, the *pear* is much esteemed, and generally preferred to the apple. It is also used for baking, compôts, marmalade, &c. Dried in an oven, the fruit will keep upwards of a year, either with or without syrup. This mode of preparing the *pear* is about as common in France as the making of apple pies in this country. Bosc (Nouveau Cours d'Agric. in loco.) describes two methods of drying *pears* for preservation, and adds that he has tried them after 3 years' keeping, and found them still very good. Perry, the *poiré* of the French, is made from the fermented juice, in the manner of cider, and the best sorts are said by Withering to be little inferior to wine. The wood of the *pear* tree is light, smooth, and compact, and is used by turners and to make joiners' tools, and picture frames to be dyed black. The leaves will produce a yellow dye, and may be used to give a green to blue cloths.

Criterion of a good pear.—Dessert *pears* are characterised by a sugary aromatic juice, with the pulp soft and sub-liquid, or melting, as in the *beurrés* or *butter pears*. Kitchen *pears* should be large of size, with the flesh firm, neither breaking nor melting, and rather austere than sweet, as the *wardens*. Perry *pears* may be either large or small, but the more austere the taste the better will be the liquor. Excellent perry was made from the wild *pear*.

Varieties.—Tusser, in 1573, in his list of fruits, mentions "peeres of all sortes." Parkinson enumerates 64 sorts; Mortimer, 1708, has many sorts, and Miller has selected 80 sorts, and describes them from Tournefort. In France, the varieties of the *pear* are much more numerous than even the varieties of the apple. The Catalogue of the Luxembourg contains 189 select sorts. The catalogue published by the Horticultural Society in the present year contains 677, which, until it appeared, the nomenclature of *pears* was in a very imperfect state; this list we insert without any variation.—"The new and superior sorts which have of late been added to this important class of fruits, are found to be most valuable. The greater part of them have been obtained from Belgium, and some of them have far exceeded the expectations generally formed of them on their first introduction, especially as regards their adaptation to this climate, in which many, instead of requiring the assistance of walls, as all the best old sorts do, produce abundantly and in great perfection on standards. A knowledge of the excellence of these new kinds has occasioned a great number of the old sorts, formerly reckoned very good, to be now marked as only second-rate in the following table. The sorts distinguished as being of the first-rate quality are still too numerous for any collection; the character of first-rate, as relates merely to quality, could not, however, be withheld from many which nevertheless will be found to deserve only secondary estimation, when their properties, as exhibited in the other columns, are attended to. In a collection so rich in good sorts, possessing also hardiness and abundant bearing, none ought to be cultivated for the table except those of the first excellence. Where kinds of secondary or inferior quality are marked as table fruit in the following enumeration, it may be understood as only indicating their having been used as such, and being of a nature rather adapted for that than for perry or kitchen use. In regard to situation, it may be necessary to state, that those marked as succeeding as standards, are calculated to do so in the southern and middle parts of the kingdom, or even considerably more to the northward, in particularly well-sheltered places." Hort. cat. 106. The abbreviations are as follow:

Prevailing colour,—p. pale; d. dark; b. brown; y. yellow; r. red; g. green; rus. russet.

Form.—pyr. pyriform; o. pyr. obtuse pyriform; obo. obovate; ro. roundish; obl. oblong; irr. pyr. irregularly pyriform; turb. turbinate; obt. ell. obtuse-elliptic; ob. oblate; rou. round.

Size.—1, large; 2, middle-sized; 3, small.

Use.—K. kitchen; T. table; P. perry.

Texture.—C. crisp; B. buttery; J. juicy; T. tender, such as are softer than the crisp yet not so fine as the buttery.

Quality.—1, first-rate; 2, second-rate; 3, indifferent or bad.

Season.—The months of ripening are placed in numbers, 1 for Jan., 2 for Feb., and so forth.

Situation.—W. wall; S. standard.

Propagation.—The *pear* may be propagated by layers or suckers, but not easily by cuttings. These modes, however, are productive of very indifferent plants, and are justly rejected in favour of raising from seed, and grafting or budding.

From seed.—This mode is adopted either for the purpose of obtaining new varieties, or for producing *pear* stocks; in the former case the same principles of selection or crossing are to be followed as in raising seedling apples, between which and the *pear* tree the chief difference is, that the latter requires a longer period, nearly double, to come into bearing.

In raising pears for stocks, the seeds from perry-makers are generally made use of, but the most proper are those from the wild *pears*, as likely to produce plants more hardy and durable. There is, however, less difference between the *pear* stocks or those raised from the cultivated fruit and wild *pear* stocks, than there is between the free apple and crab stocks. The seeds being procured, may be sown and afterwards treated as directed for seedling crab or apple-tree stocks.

By grafting and budding.—The most common stocks on which the *pear* is grafted, are the common *pear* and wild *pear*; the *pear*, is, however, dwarfed and brought earlier into a bearing state by grafting or budding on the quince or white-thorn. The *pear* will also succeed well on the whitebeam, medlar, service, or apple, but stocks of the wild *pear* and quince are in most general use. *Pears*, on free stocks, grow most luxuriantly in good soil and on a dry bottom, those on wild *pear* stocks grow less rapidly, but are deemed more durable, and will thrive on the poorest soil, if a hardy variety and not over pruned. "On the quince," Miller observes, "breaking *pears* are rendered gritty and stony; but the melting sorts are much improved; trees on these stocks may be planted in a moist soil with more success than those on the wild *pear* stocks or thorns." On the thorn, *pears* come very early into bearing, continue prolific, and in respect to soil will thrive well on a strong clay, which is unsuitable both to those on quinces or wild *pears*, but it is supposed to have an unfavourable influence on the fruit, in rendering it smaller and hard; and the graft or buds require to be inserted very low, that the moisture of the earth may tend to favour the swelling or enlargement of the diameter of the stock, which does not increase proportionably to, nor ever attains, the same size as the stem of the *pear*. The free and wild *pear* stocks are to be planted in nursery rows at the same distances as recommended for free or wild apples; and the quince and thorn at the same distance as the Paradise stocks and creeper apples; in other respects the management is the same as for the apple.

Choice of sorts.—Select from the catalogue given, according to purpose and quality.

Choice of plants.—Abercrombie takes trees at one year from the graft, and thence to the sixth year or older. Forsyth says "I would advise those who intend to plant *pear* trees, instead of choosing young ones, to look out for the oldest that they can find in the nursery, and with strong stems."

Soil and site.—"A dry deep loam," Abercrombie observes, "is accounted the best soil for the *pear*-tree, when the stock is of its own species; on a quince stock it wants a moist soil, without which it will not prosper. Gravel is a good sub-soil, where the incumbent mould is suitable. Cold clay is a bad sub-soil; to prevent fruit trees from striking into it, slates may be laid just under the roots. For wall trees the soil should be made good to the depth of 2 or 3 feet; for orchard trees 18 inches may do. *Pear* trees, on their own stocks, will thrive on land, where apples will not even live; supposing the plants to be hardy varieties, little removed from wild *pears*, and to have room to grow freely as standards. To the more choice of the early autumn and prime winter *pears*, assign south-east, or west walls." Knight and M'Phail recommend a strong, deep, loamy soil, and the latter a high wall for training the better sorts.

Final planting is performed any time, in mild weather, from October to March; standards are placed from 25 to 40 feet apart every way; half standards from 20 to 30 feet; and dwarf standards, in borders, from 15 to 20 feet from stem to stem. Wall and espalier trees are planted from 15 to 30 feet, according as they may have been grafted or budded on *pear* or quince stocks.

Mode of bearing.—As in the apple tree, "The *pear* tree," M'Phail observes, "does not produce blossoms on the former year's wood, as several other sorts of trees do. Its blossom-buds are formed upon spurs growing out of wood not younger than one year old, and consequently, projecting spurs all over the tree must be left for that purpose."—"In some *pears*," Mr. Knight observes, "the fruit grows only on the inside of those branches which are exposed to the sun and air; in others it occupies every part of the tree."

Pruning and training standards.—"Permit these to extend on all sides freely. Several years may elapse before any cross-placed, very irregular, or crowded branches, dead or worn out bearers, require pruning, which give in winter or spring. Keep the head moderately open in the middle." "Pruning," Knight observes, "is not often wanted in the culture of the *pear* tree, which is rarely much encumbered with superfluous branches; but in some kinds, whose form of growth resembles the apple tree, it will sometimes be found beneficial."

Wall trees and espaliers will require a summer and winter pruning.

Summer pruning.—"While the spray is young and soft, but not until the wood-shoots can be distinguished from spurs, rub off the foreright, the disorderly, spongy, and superfluous shoots of the year, rather than let them grow woody, so as to require the knife. Retain some of the most promising, well-placed, lateral, and terminal shoots, always keeping a leader to each main branch, where the space will permit. Leave the greater number on young trees not fully supplied with branches. Train in these at their full length all summer, in order to have a choice of young wood in the winter pruning. Occasionally, on old trees, or others where any considerable vacancy occurs, some principal contiguous shoot may be shortened in June to a few eyes, for a supply of several new shoots the same season."

Winter pruning "may be performed any time from the beginning of November until the beginning of April. If on young trees or others a further increase of branches is necessary to fill up either the prescribed space or any casual vacuity, retain some principal shoots of last summer, to be trained for that purpose. As, however, many young shoots will have arisen on the wood branches and bearers, of which a great part are abundant and disorderly, but which have received some regulation in the summer pruning, we must now cut these out close to the mother branches, while we are preserving the best in the more open parts. Examine the parent branches, and if any are very irregular or defective in growth, either cut them out close, or prune them to some eligible lateral to supply the place; or if any branches be over extended, they may be pruned in to such a lateral, or to a good fruit-bud. Cut out the least regular of the too crowded, also any casually declined bearers, with decayed, cankery, and dead wood. The retained supply of laterals and terminals should be laid in as much at length as the limits allow, in order to furnish a more abundant quantity of fruit-buds. During both courses of pruning, be particularly careful to preserve all the orderly fruit spurs, emitted at the sides and ends of the bearers; if, however, any large, rugged, projecting spurs, and woody barren stumps or snags occur, cut them clean away close to the branches, which will render the bearers more productive of fruit-buds, and regular in appearance. As each tree is pruned, nail or tie the branches or shoots to the wall or trellis. If afterwards, in consequence of either pruning out improper or decayed wood, or of former insufficient training, there are any material vacuities or irregularities in the arrangement, unnail the misplaced and contiguous branches and lay them in order."

Mr. Knight's mode of training the *pear* tree is as follows:—"A young *pear* stock, which had two lateral branches upon each side, and was about 6 feet high, was planted against a wall early in the spring of 1810; and it was grafted in each of its lateral branches, two of which sprang out of the stem, about 4 feet from the ground, and the others at the summit in the following year. The shoots these grafts produced were about a foot long, were trained downwards, the undermost nearly perpendicular, and the uppermost just below the horizontal line, placing them at such distances, that the leaves of one shoot did not at all shade those of another. In the next year the same mode of training was continued, and the year following I obtained an abundant crop of fruit.

"An old St. Germain *pear* tree, of the spurious kind, had been trained in a fan-form against a north-west wall in my garden, and the central branches, as usually happens in old trees thus trained, had long reached the top of the wall, and had become wholly unproductive. The other branches afforded but very little fruit, and that never acquiring maturity, was consequently of no value, so that it was necessary to change the variety as well as to render the tree productive. To attain these purposes, every branch which did not want at least 20 degrees of being perpendicular, was taken out at its base, and the spurs upon every other branch, which I intended to retain, were taken off closely with the saw and chisel. Into these branches, at their subdivisions, grafts were inserted at different distances from the root, and some so near the extremities of the branches, that the tree extended as widely in the autumn after it was grafted, as it did in the preceding year. The grafts were also so disposed, that every part of the space the tree previously covered, was equally well supplied with young wood. As soon in the succeeding summer as the young shoots had attained sufficient length, they were trained almost perpendicularly downwards, between the larger branches and the wall to which they were nailed. The most perpendicular remaining branch upon each side was grafted about 4 feet below the top of the wall, which is 12 feet high, and the young shoots, which the grafts upon these afforded, were trained inwards, and bent down to occupy the space from which the old central branches had been taken away, and therefore very little vacant space any where remained in the end of the first autumn. A few blossoms, but not any fruit, were produced by several of the grafts in the succeeding spring; but in the following year and subsequently I have had abundant crops, equally dispersed over every part of the tree."

Heading down and pruning old pear trees.—"The method of pruning *pear* trees," Forsyth observes, "is very different from that practised for apple trees in general. The constant practice has been to have great spurs, as big as a man's arm, standing out from the walls, from a foot to 18 inches or upwards." The constant cutting of these spurs, he says, brings on the canker, and the fruit produced is small, spotted, and kernelly. Forsyth's practice with such trees was to cut them down, and renew the soil at their roots, and he refers to a beurré *pear*, restored from an inch and a half of bark, which, in 1796, bore 450 fine large pears, &c.

C. Harrison and various other gardeners adopt a mode of keeping only short spurs, by which much larger fruit is produced. According to this plan, each spur bears only once, when it is cut out, and succeeded by an embryo bud at its base.

This bud, at the end of the first season, is no more than a leaf-bud, but at the end of the second summer it has become a blossom-bud, and bears the third summer. Some useful observations on the management of *pear*-trees, in correspondence with the above, will be found in various parts of the Caledonian Horticultural Society's memoirs.

Insects, diseases, &c.—The *pear*-tree is liable to the attacks of the same insects as the apple-tree, and the fruit of the summer kinds, when ripe, is liable to be eaten by birds, wasps, &c. which must be kept off by shooting, hanging bottles of water, and other usual preventatives. For other points of culture, and gathering, and storing, see the apple.

Common Pear. Fl. April. Britain. Tree 20 to 30 feet.

2 P. Bollwylleria'na (D. C. fl. fr. suppl. p. 530.) leaves ovate, coarsely serrated, tomentose beneath and on the buds, when young velvety above, but glabrous in the adult state; corymbs many-flowered. ♄. H. Native country unknown, but cultivated in the gardens around Bollwyller, a town in Alsace, in the time of Bauhin, whence the trivial name. P. Bollwylleriàna, J. Bauh. hist. 1. p. 59. with a figure. P. Pollvèria, Lin. mant. 244. Lodd. bot. cab. 1009. Koop. pomol. 2. p. 38. t. 4. ex Reich. Fruit turbinate, small, orange-yellow. Flowers white.

Bollwyllerian Pear. Fl. April. Clt. 1786. Tree 20 feet.

3 P. salvifòlia (D. C. prod. 2. p. 634.) leaves lanceolate, quite entire, tomentose beneath, when young velvety above, but in the adult state glabrous; buds tomentose. ♄. H. Native of France, about Aurelia. Cœnomànum sylvéstris et cúlta, D. C. fl. fr. p. 531. in a note. Poirier sauger, D. Ourch. in bibl. phys. econ. mai. 1817. p. 299. Branches thick. Fruit large, elongated, and very useful for making perry. Flowers white.

Sage-leaved or Aurelian pear. Fl. April, May. France. Tree 20 to 30 feet.

4 P. amygdalifórmis (Vill. cat. strasb. 322. D. C. suppl. p. 531.) thorny; leaves oblong, acute, quite entire, tomentose beneath, when young velvety above, but in the adult state glabrous, 6 times longer than the petioles; buds tomentose; flowers corymbose. ♄. H. Native of Provence and Dauphiny, in woods. P. sylvéstris, Magn. bot. 215. P. salicifòlia, Lois. not. 79. Flowers white.

Almond-formed Pear. Fl. April, May. Clt. 1810. Tree 10 to 20 feet.

5 P. eleagnifòlia (Pall. nov. act. petr. 7. 1789. p. 355.) leaves oblong-lanceolate, acute, quite entire, tomentose on both surfaces, hardly longer than the petioles; flowers corymbose. ♄. H. Native of Iberia, Tauria, and Caucasus. P. orientàlis, Horn. suppl. 52. P. eleagnifòlia, Steud. nom. Flowers white.

Eleagnus-leaved Pear. Fl. April, May. Clt. 1800. Tree 20 feet.

6 P. salicifòlia (Lin. suppl. 255.) leaves linear-lanceolate, acute, quite entire, hoary, clothed with white tomentum beneath, about 3 times the length of the petioles; buds clothed with white tomentum; corymbs few-flowered. ♄. H. Native of Siberia and Caucasus. Ker. bot. reg. 514. Pall. itin. 3. p. 734. t. N. f. 3. fl. ross. 1. t. 9. Flowers white, on short pedicels, corymbose, never solitary.

Willow-leaved Pear. Fl. April, May. Clt. 1780. Tree 6 to 12 feet.

7 P. I'ndica (Colebr. Wall. pl. rar. asiat. 2. t. 172.) leaves ovate or ovate-cordate, acute, serrulated, glabrous, white beneath as well as the petioles and calyxes; claws of petals shorter than the calyx; umbels sessile, few-flowered; styles villous at the base. ♄. H. Native of the mountains of Silhet, in Bengal. Flowers white. Fruit with an austere taste, about the size of the wild *pear*. Leaves lobed in the young plants.

Indian Pear. Tree 20 feet.

8 P. cuneifòlia (Guss. pl. rar. p. 202.) leaves oblong-oval, crenulated at the base, when young clothed with floccose down beneath, but in the adult state glaucescent and smooth; peduncles corymbose, clothed with woolly tomentum when young as well as the calyxes; teeth of calyx lanceolate; petals obcordate; fruit globose. ♄. H. Native of Calabria, on hills. Fruit sour. Flowers white or pale red. Allied to *P. parviflòra*, Desf. and *P. salicifòlia*.

Wedge-leaved Pear. Fl. Mar. April. Tree.

9 P. lana'ta (D. Don, prod. fl. nep. 237.) leaves broadly elliptic, acuminated, doubly serrated, clothed with white wool beneath as well as on the branches; corymbs terminal, compound, woolly; calycine lobes ovate, acuminated, ♄. H. Native of Nipaul, in Sirinagur. Perhaps referrible to Sect. III. *Aria.*

Woolly Pear. Fl. May, June. Clt. 1818. Tree 20 feet.

10 P. crena'ta (D. Don, prod. fl. nep. p. 237.) leaves ovate, acutely crenated, on long petioles, glabrous above, but when young clothed with white tomentum beneath as well as the branches; corymbs simple, woolly; calycine lobes ovate, acutish. ♄. H. Native of Upper Nipaul, at Suembu. This species comes near to *P. Bollwylleriàna*, but differs in the leaves of that species being shorter and broader, serrated, not crenated, and in the flowers being more numerous.

Crenate-leaved Pear. Fl. May. Clt. 1820. Tree 20 feet.

11 P. Nu'ssia (Hamilt. ex D. Don, l. c.) leaves elliptic, mucronate, coriaceous, crenulated, glabrous, but when young woolly beneath, as well as the branches; corymbs terminal, panicled, covered with white woolly down; pome spherical. ♄. H. Native of the higher mountains of Nipaul. Fruit small, about the size of that of *P. arbutifòlia.*

Nussia Pear. Tree 20 feet.

12 P. variolòsa (Wall. cat. 680.) leaves ovate, acuminated, crenated, glabrous in the adult state, on long petioles, when young clothed with yellowish tomentum beneath; umbels terminal; pedicels and calyxes woolly. ♄. H. Native of Nipaul and Kamaon. Flowers white. Fruit nearly globose, not umbilicate at the base.

Variolose Pear. Fl. April, May. Tree 20 feet.

13 P. Pa'shia (Hamilt. ex herb. Lin. soc.) leaves ovate, acuminated, rather cordate at the base, crenated or serrated, glabrous in the adult state, but downy beneath when young, as well as the petioles, pedicels, and calyxes; cymes terminal; fruit globular. ♄. H. Native of Narainhetty.

Pashia Pear-tree. Tree 10 to 20 feet.

14 P. Sine'nsis (Lindl. hort. trans. 6. p. 396. bot. reg. 1248.) leaves cordate, apiculated, shining, serrated, when young pubescent beneath; peduncles corymbose; calyx glabrous inside; fruit warted, bony. ♄. H. Native of China and Cochin-china. Ri vulgo Nas, Kæmpf. amœn. 800. Pýrus commùnis, Loir. cochin. p. 321. Flowers white. This tree is called indiscriminately *Chinese pear*, *sandy pear*, or *snow pear*. Fruit gritty.

Chinese Pear. Fl. April, May. Clt. 1820. Tree 15 to 20 feet.

15 P. Sina'ica (Thouin, mem. mus. 1. p. 170. t. 9.) leaves ovate-oblong, rather crenated, acutish, clothed with white pubescence beneath, but glabrous and shining above; buds white from pubescence; flowers corymbose; fruit nearly globose. ♄. H. Native of mount Sinai. Wats. dendr. 49. P. Sinài, Desf. arb. 2. p. 144. Duham. ed. nov. 6. t. 57. P. Pérsica, Pers. ench. 2. p. 40. Much branched, diffuse. Leaves minutely crenulated, falling off late in the autumn. Flowers white.

Mount *Sinai* Pear. Fl. April, May. Clt. 1820. Tree 20 ft.

16 P. niva'lis (Lin. fil. suppl. 253.) leaves oval, quite entire, obtuse, mucronate, clothed with white silky down beneath; corymbs terminal; fruit globose. ♄. H. Native of the Alps of

Austria. Jacq. austr. 2. t. 107. Flowers white. Fruit very acid, but when ripe and becoming putrid, very sweet.

Snow Pear. Fl. April, May. Tree 6 to 10 feet.

17 P. Michau'xii (Bosc, in Poir. suppl. 4. p. 432.) leaves oval, quite entire, acutish, glabrous on both surfaces, and shining above; peduncles usually twin, when bearing the fruit thick and woody; fruit globose. ♄. H. Native of North America.

Michaux's Pear. Fl. April. Tree 20 feet.

18 P. parviflòra (Desf. cor. 78. t. 58.) leaves ovate, quite entire, hoary beneath; corymbs terminal; fruit globose. ♄. H. Native of Candia. P. sylvéstrus Crética, C. Bauh. pin. p. 439. Tourn. cor. 43. Flowers red.

Small-flowered Pear. Tree 20 to 30 feet.

Sect. II. Ma'lus (*mel* or *mal*, Celtic, for the apple, which the Greeks have rendered *μηλον*, and the Latins *malus*). Tourn. inst. t. 406. Petals flat, spreading. Styles 5, somewhat connected at the base. Pome usually globose and depressed, always umbilicate at the base. Pedicels simple, umbellate. Leaves simple, glandless.

19 P. ace'rba (D. C. prod. 2. p. 635.) leaves ovate, acute, crenated, quite glabrous when young, as well as the calycine tube; flowers corymbose. ♄. H. Native of Europe, in woods and hedges. P. Màlus austèra, Wallr. sched. 215. Màlus acèrba, Merat, fl. par. 187. D. C. suppl. 530. P. màlus sylvéstris, Fl. dan. 1101. P. Màlus, Smith, engl. bot. 179. Flowers white tinged with red. There are numerous varieties with acerb fruit; they are commonly called *cider apples*, and in French *pommier à cidre*. The fruit of the *wild apple* is globose, yellowish, with a tinge of red, very acid, and astringent, yet there are several varieties among the *wild crabs*, some of them of excellent flavour when baked with plenty of sugar, even surpassing many cultivated apples. The expressed juice of any of them, called verjuice, is used to cure sprains and scalds, being often kept by good housewives in the country for that purpose.

Sour or Wild Apple or Crab. Fl. March, April. Britain. Tree 15 to 20 feet.

20 P. Ma'lus (Lin. spec. 686.) leaves ovate or elliptic, acute, serrated, clothed with white down beneath, as well as on the calyxes, petioles, &c.; flowers corymbose; styles glabrous. ♄. H. Native of Europe, in woods, hedges, and parks; plentiful in Britain. Màlus mìtis, Wallr. sched. 215. Flowers umbellate, beautifully variegated with white and rose-colour, and slightly fragrant.

The *apple* tree is called *pomme* and *pommier doux* or *pommier à couteau* in France, *apfel* in German, and *pomo* or *melo* in Italian. It has the branches more horizontal than the pear tree; the flowers terminate in umbels, produced from the wood of the preceding year, but more generally from very short shoots or spurs from wood of two years' growth. The fruit in its wild state is termed a crab. It is a native of most countries of Europe in its wild state, and the improved varieties form an important branch of culture in Britain, France, and Germany, for the kitchen, the table, and for the manufacture of cider. From whence we received the cultivated *apple* is unknown, but in all probability it was introduced by the Romans, to whom 22 varieties were known in Pliny's time, and afterwards the stock of varieties greatly increased at the Norman conquest. According to Stow, *carps* and *pepins* were brought into England by Mascal, who wrote on fruit trees in 1572.

The *apple* tree is supposed by some to attain to a great age. Haller mentions some trees in Herefordshire that attained 1000 years, and were highly prolific; but Mr. Knight considers 200 years as the ordinary duration of a healthy tree grafted on a crab stock, and planted in a strong tenacious soil. Speechly (Hints, 58.) mentions a tree in an orchard at Burton-joyce near Nottingham, of about 60 years old, with branches extending from 7 to 9 yards round the bole, which in 1792 produced upwards of 100 pecks of apples. Of all the different fruits that are produced in Britain, none can be brought to so high a degree of perfection, with so little trouble; and of no other is there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our island affords. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland Islands (Cal. hort. mem. vol. 2.), as well as in Devonshire and Cornwall; some sorts are ripe in the beginning of July, and others which ripen later will keep till June. Unlike other fruits, those which ripen latest are the best.

Use.—For pies, tarts, sauces, and the dessert, the use of the *apple* is familiar to every one. The fermented juice forms cider, a substitute both for grape wine and malt liquor. In confectionary it is used for comfits, marmelades, jellies, pastes and tarts, &c. In medicine, verjuice or the juice of crabs is used for sprains, and as an astringent and repellent, and, with the proper addition of sugar, Withering thinks a very grateful liquor might be made with it, little inferior to Rhenish wine. Lightfoot affirms, mixed with cultivated apples, or even alone, if thoroughly ripe, it will make a sound masculine wine. The apple when ripe is laxative; the juice is excellent in dysentery; boiled or roasted apples fortify a weak stomach. Scopoli recovered from a weakness of the stomach and indigestion from using them, and they are equally efficacious in putrid and malignant fevers, with the juice of lemons or currants. In perfumery, the pulp of apples, beat up with lard, forms pomatum; and Bosc observes (N. cours d'Agricultiur, &c.) that the prolonged stratification of apples with elder-flowers, in a close vessel, gives the former an odour of musk, extremely agreeable. In dyeing, the bark produces a yellow colour, and in general economy the wood of the tree is used for turning, and various purposes where hardness, compactness, and variegation of colour are objects.

Criterion of a good apple.—Apples for the table are characterized by firm juicy flesh, elevated poignant flavour, regular form, and beautiful colouring; those for kitchen use by the property of falling, as it is technically termed, or forming in general a pulpy mass of equal consistency, when baked or boiled. Some sorts of apples have the property of falling when green, as the *Keswick, Carlisle, Hawthornden*, and other codlins; and some only after being ripe, as the *Russet* tribe. Those which have this property when green are particularly valuable for affording sauces to geese early in the season, and for succeeding the gooseberry in tarts. For cider an apple must possess a considerable degree of astringency, with or without firmness of pulp or richness of juice. The best kinds, Knight says, are often tough, dry, and fibrous; and the *Siberian Harvey*, which he recommends as one of the very best cider-apples, is unfit either for culinary purposes or the table. Mr. Knight has found that the specific gravity of the juice of any apple recently expressed indicates with very considerable accuracy the strength of the future cider. Considering the various uses of the apple, it may be regarded as a fruit of more use and benefit to the public in general than all the other fruits the produce of this island.

Varieties.—Tusser in 1573 mentions in his list of fruits "apples of all sorts." Parkinson in 1629 enumerates 57 sorts. Evelyn about 30 years afterwards says (Pomona pref.), "it was through the plain industry of one Harris, a fruiterer to Henry VIII. that the fields and environs of about 30 towns in Kent only, were planted with fruit from Flanders, to the universal benefit and improvement of the county." Gibson (Churches of Dove and Homelacy,) mentions that Lord Scudamore, ambassador to the court of France in the time of Charles I., collected in

Normandy scions of cider-apples, and when he returned to England encouraged the grafting them throughout the county of Hereford. Hartlip in 1566 speaks of one who had 200 sorts of apples, and "verily believes that there are nearly 500 sorts in this island." Ray in 1688 selected from the information of the most skilful gardeners about London a list of 78 sorts. Succeeding writers have been enabled greatly to increase the list, partly from the almost continual accession of sorts received from the continent during intervals of peace, but principally from the great numbers raised from seeds. A variety of *apple*, like those of most other plants, appears only to have a limited duration; and hence on taking a retrospective view of the lists of sorts given by Parkinson, Evelyn, and other authors, many of them are not now to be found, or are so degenerated or diseased as no longer to deserve the attention of the planter. "The *moil*," Mr. Knight observes, "and its successful rival the *red-streak*, with the *musts* and *golden-pippin*, are in the last stage of decay, and the *stire* and *fox-whelp* are hastening rapidly after them." After making a great variety of experiments for several years, and after many attempts to propagate every old variety of the *apple*, this author observes (Treat. on Apple and Pear, 15.), "I think I am justified in the conclusion, that all plants of this species, however propagated from the same stock, partake in some degree of the same life, and will attend the progress of that life in the habits of its youth, its maturity, and its decay, though they will not be any way affected by any incidental injuries the parent tree may sustain after they are detached from it." Mr. Knight next directed his attention to raising new varieties from seeds, and has by crossing one sort with another, and by having constantly several thousands of seedlings rearing, from which as they show fruit, to select the best sorts, succeeded in producing several new varieties of apples, much esteemed for the table and the press. Of several of these sorts, and those obtained, accounts will be found in the work above quoted, and in Horticultural Transactions. Several eminent horticulturists in different districts are now engaged in a similar manner, and there can be little doubt a great and valuable accession will be constantly made to this class of fruits. Some, however, as Williamson (Hort. trans. 3. p. 291.) and Speechly (Hints, 188.) consider that the deterioration of the *apple* and other fruits may be owing to the climate, and that the return of genial summers would restore to us from old trees as good fruit as heretofore.

A numerous list of varieties may be considered as puzzling to the inexperienced person, who has to select for a garden or an orchard; but if each of these varieties were correctly figured and described, including the character and habits of the tree, as well as the leaves, roots, blossoms, and fruit, the list could not be too extensive of a fruit so universally grown and liked as the apple; for almost every garden and orchard differs in soil, climate, aspect or situation; and, consequently, to be planted in the best manner, must require a corresponding difference in the varieties of each species of fruit with which it is to be planted. Sabine, however, (Hort. trans. 3. p. 263.) considers, that the stock of *apples* requires reduction rather than increase, and observes that one of the chief objects to which the attention of the Horticultural Society is at present directed, is to make a judicious selection. A great variety of *apple* trees in a bearing state may be seen in different nurseries both in Britain and Ireland, but especially near London; from these in the autumn the fruit may be tasted from the trees, and either young plants newly worked or plants in a state of bearing fixed on, and marked to be taken up at the proper season. The advantages of this mode, especially to such as possess but a small garden, are too obvious to require comment.

The only catalogue of *apples* which can be depended upon for accuracy yet published, is that by the Horticultural Society of London in the present year, which none but a public body could have brought to such perfection. It is as follows.

The columns explain 1. The prevailing colour. 2. The usual form. 3. The average size. 4. The use, whether for table, kitchen, or cider. 5. The quality. 6. The usual season of perfection. The abbreviations employed are as follows:

1. *Prevailing colour.*—p. pale; d. dark; y. yellow; r. red; g. green; rus. russet; str. streaked; br. brownish.

2. *Form.*—Pea. pearmain-shaped; i. e. of the form of a truncated cone; calv. calville-shaped, when the ribs of the fruit are particularly prominent; ob. oblate; obl. oblong; ro. roundish; rou. round; con. conical; ro.-obl. roundish-oblong; ov. ovate; ov.-obl. ovate-oblong; obo. obovate.

3. *Size.*—1. very large; 2. middle-sized; 3. small.

4. *Use.*—T. table; K. kitchen; C. cider.

5. *Quality.*—1. first-rate; 2. second-rate; 3. indifferent or bad.

6. *Season, times of ripening.*—The months of ripening are placed in numbers beginning at Jan. for the 1st, and so on to December, the 12th.

Propagation and culture.—The *apple*, like most other hardy trees, may be propagated by seeds, cuttings, suckers, layers, and by engrafting and budding; by seeds to obtain new varieties, and stocks, and by other modes for continuing such as are in esteem.

By seeds.—The first business here is the choice of seeds, which should be taken from fruits having the properties it is desired to perpetuate or improve in the greatest degree. The sorts of apples proper for crossing or reciprocal impregnation, appear to be those which have a great many qualities in common, and some different qualities. Thus the *golden-pippin* has been crossed by other *pippins* or *rennets*, and not by *calvils* or *codlings*. A small-sized apple, crossed by a large sort, will be more certain of producing a new variety than the above mode; but will be almost equally certain of producing a variety destitute of valuable qualities; the qualities of parents of so opposite natures being as it were crudely jumbled together in the offspring. Mr. Knight's mode of cutting out the stamens of the blossoms to be impregnated, and afterwards when the stigmas are mature, introducing the pollen of that intended for the male parent, is unquestionably the most scientific mode of performing the operation. In this way he produced those excellent apples, the *Downton, red* and *yellow Ingestrie*, and *Grange pippins* from the same parents; viz. the seed of the *orange-pippin* impregnated by the pollen of the *golden-pippin*. The *Bringwood-pippin* he produced from the *golden-pippin*, dusted with the pollen of the *golden-harvey apple*.

The seeds may be sown in autumn in light earth, covered an inch, and either in pots or beds. The end of the first year they should be transplanted into nursery rows, from six inches to a foot apart every way. Afterwards they should be removed to where they are to produce fruit, and for this purpose the greater the distance between the plants the better. It should not be less than 6 or 8 feet every way. The quickest way of bringing them into a bearing state, Williams, of Pitmaston, considers, (Hort. trans. 1. p. 333.) is to let the plants be furnished with lateral shoots from the ground upwards; so disposed as that the leaves of the upper shoots may not shade those situated underneath, pruning away only trifling shoots. This mode of treatment occurred to him on reflecting on Mr. Knight's theory of the circulation of the sap. Observing the change in the appearance of the leaves of his seedling plants, as the trees advanced in growth, he thought it might be possible to hasten the progress of the plants, and procure that peculiar organization of the leaf necessary to the formation of blossom-buds at a much earlier age. He, in consequence, adopted the mode above described, and succeeded in procuring fruit from seedling *apples* at four, five, and six years of age, instead of waiting eight, ten, and even fifteen years, which must be the case by the usual mode of planting close, and pruning to naked stems. Macdonald, an eminent Scotch horticulturist, has also succeeded in obtaining fruit from seedlings at an early period by grafting, already stated as one of the uses of that mode of propagation. In 1808, he selected some blossoms of the *nonpareil*, which he impregnated with the pollen of the *golden-pippin* and of the *Newton-pippin*. When the apples were fully ripe, he selected some of the best, from which he took the seeds and sowed them in pots, which he placed in a frame. He had eight or nine seedlings, which he transplanted into the open ground in the spring of 1809. In 1811, he picked out a few of the strongest plants and put them singly into pots. In spring, 1812, he observed one of the plants showing fruit-buds. He took a few of the twigs and grafted them on a healthy stock on a wall, and in 1813 he had a few apples. This year (1816) his seedlings yielded several dozens, and also his grafts; and he mentions that the apples from the grafts are the largest. He is of opinion that in giving names to seedlings raised in Scotland the word Scotch should be mentioned. Ringing has also been recommended by various authors as inducing precocity, and particularly by Hempel, (Hort. trans. I. appendix,) who says he has proved it experimentally. A very common practice among those who raise fruit trees from seed is, in the second or third season to select such plants only as have broad and roundish leaves, throwing away the rest, experience having taught that the former more frequently produce fruit of improved quality, or at least larger, than those plants which have narrow-pointed leaves. The width and thickness of the leaf, Mr. Knight observes, "generally indicate the size of the future apple, but will by no means convey any correct idea of the merits of the future fruit. Where these have the character of high cultivation, the qualities of the fruit will be far removed from those of the native species, but the apple may be insipid or highly flavoured, green, or deeply coloured, and of course well or ill calculated to answer the purposes of the planter. An early blossom in the spring, and an early change of colour in the autumnal leaf, would naturally be supposed to indicate a fruit of early maturity; but I have never been able to discover any criterion of this kind on which the smallest dependence can be placed. The leaves of some varieties will become yellow and fall off, leaving the fruit green and immature; and the leaves in other kinds will retain their verdure long after the fruit has perished. The plants whose buds in the annual wood are full and prominent, are usually more productive than those whose buds are small and shrunk in the bark; but their future produce will depend much on the power the blossoms possess of bearing the cold, and this power varies in the different varieties, and can only be known from experience. Those which produce their leaves and blossoms rather early in the spring are generally to be preferred, for though they are more exposed to injury from frost, they less frequently suffer from the attacks of insects, the more common cause of failure. The disposition to vegetate early or late in the spring, is, like almost every other quality in the *apple* tree, transferred in different degrees to its offspring; and the planter must therefore seek those qualities in the parent tree which he wishes to find in the future seedling plants. The most effective method I have been able to discover of obtaining such fruits as vegetate very early in the spring has been by introducing the pollen of the *Siberian crab* into the blossom of a rich and early *apple*, and by transferring in the same manner the pollen of the *apple* to the *Siberian crab*. The leaf and habit of many of the plants that I have thus obtained possess much of the character of the *apple*, whilst they vegetate as early in the spring as the *Siberian crab*, and I possess at least two plants of this family." Abercrombie observes, "as the *codling* is a sort found to change very little from seed, or not for the worse, new plants of it are sometimes raised by sowing the kernels, not by way of experiment for a new uncertain variety, but with some dependence in having a good sort resembling the *parent*."

By cuttings.—Every variety of *apple* may be grown from cuttings, though some with much greater facility than others. All those of the *Burknott* and *codling* tribes grow as well this way as by any other, and some allege that the trees so raised are not liable to canker (Hort. trans. 1. p. 120.), which is supposed to be owing to their putting out no tap root, but spreading their numerous fibres from the knots or burrs horizontally. Even the *golden-pippin* may be continued in this way, and the trees have remained seven years in perfect health, when grafts taken not only from the trees, but from the very branch, part of which was divided into cuttings, cankered in two or three years. "All *apple* trees raised in this way," Bigg observes, "from healthy one-year old branches, with blossom-buds upon them, will continue to go on bearing the finest fruit in a small compass for many years. Such trees are peculiarly proper for forcing, and not liable to canker" (Hort. trans. 1. p. 65.). The cuttings are to be chosen from young wood of horizontal or oblique branches, rather than from upright ones; from six to eight inches or more in length, with a small portion of old wood at the lower end. Cut off the tip of the shoot, and all the buds, excepting two or three next the tip or upper extremity; then smooth the sections at the lower end, and insert three or four inches in sandy loam, pressing the earth firmly to them, watering and covering them with a hand-glass. The proper time for this operation is early in February, and the glass should not be touched, excepting to give water, till the shoots have sprung an inch or two. Shade during the mid-day sun, and begin to harden by giving air in July; finally, remove the glass in August, and in October transplant to nursery rows, or in pots according to future intention. With the *Burknott* all that is necessary is to plant the cuttings in a shady border, and treat them like those of the gooseberry or currant.

By layers.—The success of this mode of propagation may be considered as certain; but it has nothing peculiar in its application to the *apple*. The after treatment of the plants is the same with that for those originated by the following or foregoing modes.

By suckers.—This mode is generally confined to the *Paradise* and *creeping apple* for stocks.

By grafting and inoculation.—This may be said to be the universal practice in propagating the *apple*. The first consideration is the choice of stocks; of these there are five sorts in common use;—*seedling apples*, used for full standards and riders or wall standards; *seedling crabs*, for standards and half standards; *codling apples*, from layers or cuttings for dwarfs and espaliers; *Paradise apples*, from layers or cuttings for low dwarfs and trained trees; *creeper apples*, from layers or cuttings for the best dwarfs or bushes.

Stocks of seedling apples.—The seeds should be selected from the fruit of vigorous growing young or middle-aged healthy trees; but when wanted in larger quantities they are procured from cider makers; private propagators will adopt the first mode. The sowing and after treatment is the same as for *seedling crabs*.

Seedling crabs.—"A preference," Mr. Knight observes, "has generally and justly been given to *apple* stocks raised from seed of the native kind or *crab*, as being more hardy and durable than those produced from the *apple*. The offspring of some varieties of the *crab*, particularly of those introduced from Siberia, vegetate much earlier in the spring than other trees of the same genus; and hence the inexperienced planter will probably be led to suppose that such stocks would accelerate the vegetation of other varieties in the spring, and tend to produce an early maturity of the fruit in autumn. In this, however, he will be disappointed. The office of the stock is, in every sense of the word, subservient, and it acts only in obedience to the impulse it receives from the branches; the only qualities, therefore, which are wanting to form a perfect stock are vigour and hardiness."

Seed sowing and culture.—In collecting the seeds to sow, it must be remembered that the habits, as well as the diseases, of plants are often hereditary, and attention should be paid to the state of the tree from which seeds are taken; it should be large and of free growth, and rather in a growing state than one of maturity or decay. The *crab* trees, which stand in cultivated grounds, generally grow more freely, and attain a larger stature than those in hedges or woods, and therefore appear to claim preference. The seed should be taken from the fruit before it is ground for vinegar, and sown in beds of good mould an inch deep. From these the plants should be removed in the following autumn to the nursery, and planted in rows at three feet distance from each other, and 18 inches between each plant. Being here properly protected from cattle and hares, they may remain till they become large enough to be planted out, the ground being regularly worked and kept free from weeds. Rev. J. Venables (Hort. soc. trans. vol. 1. ser. 2. p. 39.) has never found a satisfactory reason why the pips of the best apples should produce most frequently trees little better than the *crab*, while other products of our gardens are not deteriorated from the parent stock. It would seem that much of the peculiar flavour of fruit depends upon the leaf, and whatever determines the first organization of this member of the tree, must have considerable influence on its produce. In the growth of those seeds furnished with albumen, the albumen is converted into a substance resembling sugar, and this saccharine material affords the first nourishment to the growing plant, and supports it till the radicles spread and are enabled to draw a supply of aliment from the earth; but as the apple pip is destitute of albumen, we may easily discover the source from which this deficiency is to be supplied. It was evidently intended that the apple itself decaying on the ground, and enriching the soil around the pips with its saccharine juices, should supply the young tree with its earliest nutriment. When, therefore, we separate the pips from the apple for the purpose of sowing, we deprive the seedling of a material part of its appropriate nourishment, and consequently raise a tree in no way resembling the qualities of its parent. We have no account of the manner in which the best *apples* and *pears* were raised in the 15th and 17th centuries, and possibly the best fruits of those days may have been a selection from numbers raised of an inferior quality. It is probable that we owe some of our best fruits more to the undisturbed production of nature than to the operations of art. An apple has fallen from some tree, and lain unobserved, the fruit has decayed on the spot, and enriched the ground; and, from the soil thus peculiarly prepared by nature, has sprung up a tree, whose produce has proved of peculiar excellence and flavour. According to the above theory, apples should be sown instead of pips, or pips of one sort introduced into the fruit of another, and then sown, or the ground manured with rotten apples. The seedling from this mode of sowing will be more likely to produce fruit of superior flavour than by sowing the pips alone.

Codling stocks are raised chiefly from layers, which at the end of the season are taken off and planted in nursery rows, 2 feet between the rows, and 1 foot from plant to plant.

Paradise stocks, or as they are called by the French, *Doucin stocks*, are raised from either layers or suckers; and stocks raised from *creeping apples*, so named from their aptitude to throw out suckers, or the *Dutch Paradise*, chiefly from the latter mode. They may be planted in nursery rows, somewhat closer than the codling stocks.

All stocks require to stand in the nursery till they are from half an inch to an inch thick at the height at which they are to be grafted; such as are intended for full standards or riders will, in general, require to grow three or four years before they are fit for this operation; those for half standards two years, and those for dwarfs one year. The ground between them must be kept clear of weeds, and stirred every winter; the side shoots of the plants, at least to the height at which they are intended to be grafted, rubbed off as they appear, and all suckers carefully removed. Where budding is adopted, the stocks may be worked at nearly half the diameter of stem requisite for grafting; and stocks for dwarfs, planted in autumn or spring, may be inoculated the succeeding summer. No great advantage, however, is gained by this practice, as such plants require to stand at least another year before they have produced their bud-shoots.

Soil and situation of the nursery.—"A difference of opinion appears to have always prevailed respecting the quality of the soil proper for a nursery. Some have preferred a very poor, and others a very rich soil; and both perhaps are almost equally wrong. The advocates for the poor soil appear to me to have been misled by transferring the feelings of animals to plants, and inferring that a change from want to abundance must be agreeable and beneficial to both. But plants in a very poor soil become stunted and unhealthy, and do not readily acquire habits of vigorous growth when removed from it. In a soil which has been highly manured the growth of young *apple* trees is extremely rapid, and their appearance, during 2 or 3 years, generally indicates the utmost exuberance of health and vigour. These are, however, usually the forerunners of disease, and the 'canker's desolating tooth' blasts the hopes of the planter. In choosing the situation for a nursery, too much shelter or exposure should be equally avoided, and a soil nearly similar to that in which the trees are afterwards to grow should be selected where it can be obtained. Pasture ground or unmanured meadow should be preferred to old tillage, and a loam of moderate strength, and of considerable depth, to all other soils." (Treat. on Appl. and Pear.)

Grafting.—The first business is to select the scions. At whatever season scions are to be inserted, Mr. Knight observes, "the branches which are to form them should be taken from the parent stock during the winter, and not later than the end of the preceding year; for if the buds have begun to vegetate in the smallest degree, and they begin with the increasing influence of the sun, the vigour of the shoots, during the first season, will be diminished, and the grafts will not succeed with equal certainty; though a graft of the *apple* tree very rarely fails, unless by accidental injury or great want of skill in the operator. The amputated branches must be kept alive till wanted, by having the end of each planted in the ground a few inches deep in a shady situation." Stocks destined to form standard trees may either be grafted at the usual height at which the lateral branches are allowed to diverge, which is commonly six feet, or they may be grafted near the ground, and a single shoot trained from the grafts, so as to form the stem of the tree. The propriety of grafting near the ground or at the height of six or seven feet, will depend on the kind of fruit to be propagated, whether it be quite new, and just beginning to bear, or a middle-aged variety. In new and luxuriant varieties, and these only should be propagated, it will be advantageous to graft when the stocks are three years old, as the growth of such will be more rapid, smooth, and upright than that of the *crab*, and there will be no danger of their being injured by beginning to bear too early. "Middle-aged varieties will be most successfully propagated by planting stocks of six or seven feet high, and letting them remain ungrafted till they become firmly rooted in the places in which the trees are to stand. One graft only should be inserted in each stock; for when more are used they are apt to divide when loaded with fruit, and to cleave the stock, having no natural bond or connexion with each other. When the stocks are too large for a single scion, I would recommend that the grafts be inserted in the branches, and not in the principal stem." This practice is not uncommon in various parts of England, and in general use in Germany with free stocks, where, however, they often neglect to graft the trees, and thus, as Mr. Neill observes, produce an endless variety of sorts, some good, but most of them little better than *crabs*. Stocks intended to form half standards are grafted at three or four feet from the ground, and those for dwarfs at eight or ten inches or lower. Miller and Knight agree in recommending to graft near the ground, where lasting and vigorous trees are wanted; but the practice of the continental gardeners, and the opinions of some in this country, are in favour of leaving a stem below the graft of not less than a foot in length. A kind of grafting generally adopted for moderate sized stocks is the whip or tongue method, or the new mode of saddle-grafting adopted by Mr. Knight; and the general time for the *apple* is in the end of February and the greater part of March. Much depends on the season and situation; the guiding principle is to make choice of the time when the sap of the stock is in full motion, while that of the scions, from having been previously cut off and placed in the shade, is less so. The common season for budding the *apple* is July, and there is nothing peculiar to this tree in performing that operation.

Transplanting grafted trees in the nursery.—"It has been recommended," Knight observes, "to remove grafted trees once or twice during the time they remain in the nursery, under the idea of increasing the number of their roots, but I think this practice only eligible with trees which do not readily grow when transplanted. I have always found the growth of young *apple* trees to be much retarded, and a premature disposition to blossom to be brought on by it; and I could not afterwards observe those trees which had been twice removed grow better than others. It has also been supposed that many small roots, proceeding immediately from the trunk, are in the future growth of the tree to be preferred to a few which are large; but as the large roots of necessity branch into small, which consequently extend to a greater distance, the advantages of more transplantations than from the seed-bed to the nursery, and thence to the garden or orchard, may reasonably be questioned."

The choice of sorts depends upon the object in view. The first thing an inexperienced gardener has to do is to consider the various uses of the apple, and then determine what is wanted, according to family, market, or other purpose to be supplied; the next thing is to consider how those wants are to be supplied in his given soil, situation, and circumstances; and the last thing is to study the catalogue of sorts, and to select accordingly. Another source of choice is, as may respect the soil, situation, and climate of the garden or orchard, in which they are to be planted, or the character, whether of dwarfs, espaliers, or wall-trees, which they are to assume there. The winter and spring table apples may require a south wall in one district, while in another they may attain equal maturity as standards or espaliers. Where there is ample room a selection of large sorts, as the *Alexander* and *Baltimore* apples, or of such as are the most beautifully coloured, as the *violet*, *carnation*, &c. may be made to gratify the eye; or where room is wanting, useful sorts and great bearers are to be preferred, as the *golden* and *ribston pippin*, *summer pearmain*, *codlins*, *grey russet*, *summer* and *winter Calvilles*, &c. In general small sized fruit, as the *Harveys* and *Granges*, are to be preferred for standards, as less likely to break down the branches of the trees, or be shaken down by winds, middling sorts for walls and dwarfs, and the largest of all for espaliers. In respect to a soil liable to produce canker, sorts raised from cuttings may be desirable, as the *Burknott* and *codling* tribe; and where an occupier of a garden has only a short interest therein, such as come into immediate bearing, as the *Burknotts* and others from cuttings, and the *Hawthorndean*, *Apius's apple*, and other short-lived dwarf sorts on *Paradise* or *creeping* stocks, may deserve the preference. On the contrary, where a plantation is made on freehold property, or with a view to posterity, new varieties on *crab* or free stocks should always be chosen, as the *Grange*, *Ingestrie*, *Harvey*, &c. Some excellent sorts will grow and produce crops every where, as the *Hawthorndean*, *codling*, and *Ribston pippin*; the latter of which, Nicol says, will grow at John O'Groat's house, and may be planted in Cornwall; others are shy bearers in cold situations, as the *Newtown pippin* of America, &c.

Choice of plants for planting.—This depends in some degree on the object in view, the richness of the soil, and the shelter.

Young trees are more likely to succeed in exposed sites and poor soils, but the *apple* will bear transplanting at a greater age than any other fruit tree. It may be planted in open weather from November till February.

Soil and site for permanent planting.—Any common soil, neither extremely sandy, gravelly, nor clayey, on a dry subsoil, and with a free exposure, will suit the *apple*. On wet hilly subsoils it will do no good, but after being planted a few years will become cankered, and get covered with moss. When fruit trees must be planted on such soils they should first be rendered as dry as possible by under-draining; next provision must be made for carrying off the rain water by surface gutters; and, lastly, the ground should not be trenched above a foot deep, and the trees planted rather in hillocks of earth above the surface than in pits dug into it. There is no point of more importance than shallow trenching and shallow planting in cold wet soils, in which deep pits and deep pulverization only serve to aggravate their natural evils of moisture and cold. See Sang. in cal. hort. mem. 4. p. 140. "The *apple* tree," Mr. Knight observes, "attains its largest stature in a deep strong loam or marly clay; but it will thrive in all rich soils, which are neither very sandy nor wet at bottom. It succeeds best," he adds, "in situations which are neither high nor remarkably low. In the former its blossoms are frequently injured by cold winds, and in the latter by spring frosts, particularly when the trees are planted in the lowest part of a confined valley. A south or south-east aspect is generally preferred on account of the turbulence of the west, and the coldness of north winds; but orchards succeed well in all aspects, and where the violence of the west wind is broken by an intervening rise of ground, south-west aspect will be found equal to any." "All the sorts of *apple* trees," Abercrombie observes, "may be planted in any good common soil, with a free exposure, whether that of a garden, orchard, or field, so that the ground be neither very low, nor excessively wet, nor subject to inundation in winter. Avoid as far as possible very strong clayey and gravelly soils."

Mode of bearing.—"In all the varieties of the common *apple* the mode of bearing is upon small, terminal, and lateral spurs, or short robust shoots, from half an inch to two inches long, which spring from the younger branches of two or more years' growth, appearing first at the extremity, and extending gradually down the side, the same bearing branches and fruit spurs continue many years fruitful." Abercrombie.

Pruning.—"As, from the mode of bearing, *apple* trees do not admit of shortening in the general bearers, it should only be practised occasionally; first, where any extend out of limits, or grow irregular or deformed; and secondly, a good shoot contiguous to a vacant space is shortened to a few eyes, to obtain an additional supply of young wood from the lower buds of this shoot for filling up the vacancy. But to shorten without such a motive is not merely cutting away of the first and principal bearing part of the branches, but also occasions their putting forth many strong useless wood-shoots, where fruit-spurs would otherwise arise; and both effects greatly tend to retard the trees in bearing, whereas the fertile branches being cultivated to their natural length, shoot moderately, and have fruit-spurs quite to the extremity." Abercrombie.

Espaliers and wall-trees require a summer and winter pruning.

The summer pruning.—"Train in the young shoots of the same year which are likely to be wanted in the figure, and retrench them where ill placed or too numerous; for as the trees continue bearing many years on the same branches, they only require occasional supplies of young wood; therefore begin in May or June to pinch off or cut out all foreright, ill placed, and superfluous shoots, retaining only some of the promising laterals in the more vacant parts, with a leader to each branch; train in these between the mother-branches at their full length all summer, or where any vacancy occurs some strong contiguous shoot may be shortened, in June, to a few eyes to furnish several laterals the same season. Keep the shoots in all parts closely trained, both to preserve the regularity of the espalier, and to admit the air and sun to the advancing fruit."

"*The winter pruning* may be performed from November till the beginning of April. This comprehends the regulation of the wood branches, the bearers, and the young shoots. First examine the new shoots trained in the preceding summer, and, if too abundant, retain only a competency of well-placed and promising laterals, to furnish vacant parts with a leading shoot to each parent branch. Continue these mostly at their full length, as far as there is room. Cut out close the superabundant and irregular young shoots, and where any of the elder branches appear unfruitful, cankery, or decayed, cut them either clean out, or prune short to some good lateral, as may seem expedient. Also prune into order any branches which are very irregular or too extended. Carefully preserve all the eligible natural fruit spurs, but remove all unfruitful stumps or snags, and large projecting rugged branches. As each espalier is pruned, let the old and new branches be laid in at convenient distances according to the size of the fruit, 4, 5, or 6 inches asunder, and neatly tied or nailed to the wall or trellis."—*Abercrombie.*

Heading down apple-trees that are much cankered, is strongly recommended by Forsyth, who gives an example of one after it had been headed down four years, which bore plenty of fine fruit. The point at which it was headed down was within 18 inches of the soil, and under it on the stump were two large wounds, made by cutting out a cankery part, and which, being covered with the composition, were soon nearly filled up with sound wood. Very little pruning is at first given to trees so cut, but afterwards a regular succession of bearing wood is kept up by removing such as have borne three or four years. Thus, one branch which has done bearing is cut off, and succeeded by another, and when that is tired also, it is cut off and replaced by a third, and so on.

Grafting old apple-trees of indifferent sorts with superior varieties, is an obvious and long tried improvement. In this case, if the tree is a standard, it is only headed down to standard height; in old subjects, most commonly the branches only are cut over within a foot or two of the trunk, and then grafted in the crown or cleft manner.

On fertilising the blossoms of pear and apple-trees.—An almost general unproductiveness, as to the fruit of the superior varieties of *pear* and *apple-trees*, has long been a subject of complaint with horticulturists, both in south and north Britain. The Rev. George Swayne (Hort. trans. 5. p. 208.) has a tree of the *Gansell's bergamot pear*, which had for a long time baffled all his attempts to alter its unfertile habits. The tree had all the appearance of health and sufficient luxuriance, and produced a profusion of blossoms at the proper season, but has never borne more than three or four pears in any one year. Before the blossoms expanded, he cut off all the flowers in each corymb, except the lower three, in this tree, and another tree of the *brown beurré*. He divested these trees of at least three-fourths of all their flower-buds. On the *beurré* this operation subsequently appeared to have the best effect, for there was scarcely an instance in which the remaining blossoms did not set, which afterwards produced a fine crop of pears. But on the *Gansell*, although the blossoms at first seemed to set, and many of them did not fall till Midsummer, yet not a single pear arrived at maturity. By dissecting many of the largest which fell off last, it was plain that the kernels had not been impregnated, indicating some imperfections in the essential parts of the blossom. In the following spring, he impregnated the stigmas of many of the flowers with the pollen of the *beurré pear*, and most of them came to perfection and produced large well-formed fruit. The cross impregnation had not produced any change in the appearance of the fruit, nor was any difference in flavour discovered. Before he impregnated the blossoms, he cut off all the buds in the corymb, except the three lowest ones, as in the former year. Whether the result of the above-detailed experiments be such as to authorise an expectation that artificial assistance in vegetable fecundation will hereafter become of so much importance to gardeners in the instances just alluded to, as in those at present recognised of the cucumber, the melon, the hautbois strawberry, &c. must be left to others to ascertain.

Injuries, insects, diseases, &c.—The misletoe (*Viscum album*) is frequently, through negligence, suffered to injure trees in orchards, and different species of mosses and lichens those of gardens. "Moss," Mr. Knight observes, "appears to constitute a symptomatic rather than a primary disease in fruit trees; it is often brought on by a damp or uncultivated soil, by the age of the variety of fruit, and by the want of air and light, in closely planted, unpruned orchards. In these cases it can only be destroyed by removing the cause to which it owes its existence."

Blights.—Whatever deranges and destroys the organization of the blossoms, and prevents the setting of the fruit, is in general termed a blight, whether produced by insects, parasitical plants, or an excess of heat or cold, drought or moisture. One of the most injurious insects with which the *apple* tree has been visited is the *Aphis lanigera* of Lin., the *Eriosòma mali* of Leach, woolly aphis, apple-bug, or American blight. "The eriosomàta," Leach observes, "form what are called improperly galls on the stalks of trees, near their joints and knobs, which are in fact excrescences, caused by the efforts of nature to repair the damage done to the old trees by the perforation of those insects, whose bodies are covered with white down." *Sam. entym.*—There is no way of getting rid of these insects, but cleaning them off with a brush and water, together with amputation when it has been some time at work; but even this will not do unless resorted to at an early stage of its progress. The caterpillars of many species of butterfly and moth, and the larvæ of various other genera of the hemiptera and lepidoptera, &c. as Scarabæus, Curculia, &c., attack the *apple* tree in common with other fruit-trees; and on a large scale it is difficult, if not impracticable, to avoid their injurious effects. Burning straw or other materials under the trees has been long recommended; but the principal thing to be relied on is regimen; that is, judicious subsoil and surface soil, culture and pruning.

Ripening the fruit.—Berard, in an essay on the ripening of fruits, which gained the prize of the French Academy of Sciences in 1821, found that the loss of carbon is essential to the ripening of fruit; that this carbon combines with the oxygen of the air, and forms carbonic acid, and that when the fruit is placed in an atmosphere deprived of oxygen, this function becomes suspended, and the ripening is stopped. Hence it results, that most fruits may be preserved during a certain period, by gathering them a few days before they are ripe, and placing them in an atmosphere free from oxygen. The most simple process for effecting this consists in placing at the bottom of a bottle, a paste formed of line, sulphate of iron, and water; then introduce the fruit, so as they may rest detached from the bottom of the bottle and from each other, and cork the bottle and cover it with cement. Peaches, plums, and apricots have been kept in this way for a month, and apples for three months. (Journ. R. Jnot. xi. p. 396.) Duduit of Mazeres, has found that one-third of boiled apple-pulp, baked with two-thirds of flour, having been properly fermented with yeast for twelve hours, makes a very excellent bread, full of eyes, and extremely palatable and light.—*New Monthly Mag. June*, 1821.

Storing the fruit.—The fruit-room ought to be well ventilated, and for this purpose it ought to have a fire-place. The fruit-room was formerly a mere loft, where fruit was kept on the floor in common with onions, with no proper means of separation. Now, however, they are regularly fitted up either with shelves, on which to place sieves of different sorts of fruit, or with close shelves, for jars or boxes, &c., according to the various modes adopted for preserving them. The room may be of any form, but one long and narrow is generally best adapted for ventilation, and heating or drying when necessary by a flue. The system of shelves may be placed along one side, and may be raised to the height of six feet or more, according to the number wanted. These shelves are formed of open work, on which to place the sieves of fruit, each of which should be numbered, in order to know the kind of fruit contained in each.

Apple-tree. Fl. April. Britain. Tree 3 to 30 feet.

21 P. DIOI'CA (Willd. arb. 263. spec. 5. p. 1018.) leaves oval, serrated, clothed with tomentum beneath as well as on the calyxes; flowers usually solitary, dioecious from abortion; petals linear, length of calyx; styles glabrous. ♄. H. Native country unknown, but cultivated in gardens, and perhaps has originated from the *Pỳrus Màlus*. P. apétala, Munch. hausv. 5. p. 247. Màlus dioíca, Audib. cat.

Dioecious Apple-tree. Fl. April, May. Clt. 1818. Tree 10 to 20 feet.

22 P. ASTRACA'NICA (D. C. prod. 2. p. 635.) leaves oval-oblong, acute, somewhat doubly serrated, pale beneath and villous on the nerves, glabrous above, with the rachis puberulous. ♄. H. Native about Astracan. Màlus Astracánica, Dum. Cours. ed. 2. vol. 5. p. 426. Perhaps only a variety of *P. Màlus*.

Astracan Apple-tree. Fl. April, May. Clt. 1810. Tree 15 to 20 feet.

23 P. SPECTA'BILIS (Ait. hort. kew. 2. p. 175.) leaves oval-oblong, serrated, glabrous as well as the calycine tube; umbels sessile, many-flowered; petals ovate, unguiculate; styles woolly at the base. ♄. H. Native of China. Curt. bot. mag. 267. Màlus spectábilis, Desf. arbr. 2. p. 141. Màlus Sinénsis, Dum. Cours. ed. 2. vol. 5. p. 429. When it blossoms in perfection no tree can be more showy than the Chinese *apple* tree. The flowers are large, of a pale red, when open semidouble, and the buds are of a deeper hue.

Showy or Chinese Apple-tree. Fl. April, May. Clt. 1780. Tree 20 to 30 feet.

24 P. PRUNIFÒLIA (Willd. spec. 2. p. 1018.) leaves ovate, acuminated, serrated, quite glabrous as well as the calyx; peduncles pubescent; styles woolly at the base. ♄. H. Native of Siberia? Pỳrus Màlus β. Ait. hort. kew. 2. p. 175. Màlus hỳbrida, Desf. arb. 2. p. 141.? Mill. fig. t. 269. The leaves resemble those of the cherry tree; they are on long petioles. The flowers are white, much like those of the pear tree. The fruit is globose, when ripe yellowish coloured, but red on the side exposed to the sun, of an austere taste, decaying like the fruit of the medlar, and then more palatable.

Plum-leaved or Siberian Crab. Fl. April, May. Clt. 1758. Tree 20 to 30 feet.

25 P. BACCA'TA (Lin. mant. 75.) leaves ovate, acute, equally serrated, glabrous, length of petioles; peduncles crowded; lobes of calyx deciduous. ♄. H. Native of Siberia and Dahuria. Wats. dend. t. 51. Pall. fl. ross. t. 10. Màlus baccàta, Desf. arb. 2. p. 141.—Amm. ruth. t. 31. Flowers white. Fruit roundish, yellow tinged with red, about the size of a cherry; the pulp is red, and is used for making quasar punch in Siberia.

Berried or Small-fruited Crab-tree. Fl. Apr. May. Clt. 1784. Tree 15 to 20 feet.

26 P. QUINQUIFLÒRA (Hamilt. ex Lin. soc. herb.) leaves elliptic, acute, downy on the nerves and petioles; pedicels elongated, sessile, 5-6-together, axillary; calycine segments subulate. ♄. H. Native of Chitlong. Flowers white?

Five-flowered Crab-tree. Tree.

27 P. SIEVE'RSII (Led. fl. alt. 2. p. 222.) leaves ovate, rather tomentose; flowers umbellate. ♄. H. Native of Siberia, at the river Uldschar, in the Kirghisean Steppe. P. nòva species, Sievers, in Pall. nord. beytr. 7. p. 292. A bush with many stems rising from the same root. Fruit very acid.

Sievers's Crab-tree. Fl. April, May. Tree 8 to 12 feet.

28 P. CORONA'RIA (Lin. spec. 687.) leaves broad-ovate, rounded at the base, serrated, and rather angular, smooth; peduncles corymbose, glabrous. ♄. H. Native of North America, from Pennsylvania to Carolina. Sims, bot. mag. 2009. Wats. dendr. brit. icon. Màlus coronària, Mill. Flowers red, and with a very fragrant odour. The fruit is small, sour, and unfit for any thing but to make vinegar of.

Garland or Sweet-scented Crab-tree. Fl. May. Clt. 1724. Tree 20 feet.

29 P. ANGUSTIFÒLIA (Ait. hort. kew. 2. p. 276.) leaves oblong-lanceolate, dentately-serrated, tapering to the base, shining; peduncles corymbose. ♄. H. Native of Carolina, in woods. Wats. dend. brit. 132. Lindl. bot. reg. 1207. P. coronària, Wang. amer. 61. t. 21. f. 47. Màlus sempervìrens, Desf. arbr. 2. p. 141. Flowers reddish.

Narrow-leaved Crab-tree. Fl. My. Clt. 1750. Tr. 10 to 20 ft.

SECT. III. A'RIA (*Aria* is a name given by Theophrastus to a tree, probably from the name of a place, as many places bear that name). D. C. prod. 2. p. 635. Petals spreading, flat. Styles usually 2 or 3. Pome globose. Flowers disposed in racemose corymbs; peduncles branched. Leaves simple, glandless, clothed with white tomentum beneath.

30 P. A'RIA (Ehrh. beitr. 4. p. 20.) leaves elliptic, cut, serrated, clothed with adpressed white tomentum beneath; corymbs flat; styles about 2. ♄. H. Native of Europe and Siberia, in groves; in Britain, in mountains on a chalky soil, and in the fissures of limestone rocks. Smith, engl. bot. 1858. Cratæ'gus, A'ria, Lin. spec. 681. Fl. dan. t. 302. Méspilus A'ria, Scop. Sórbus A'ria, Crantz. austr. 1. p. 2. f. 2.—Bauh. hist. 1. p. 65. Young branches very white and downy. Leaves doubly serrated, sometimes with several marginal lobes. Flowers white, in corymbose compound tufts. Fruit globular, scarlet, dotted, mealy, acid, and astringent.

Var.* α, *obtusifòlia (D. C. prod. 2. p. 636.) leaves flat, oval, obtuse, simply serrated, glabrous above in the adult state. ♄. H. Fl. dan. t. 302. P. A'ria ovàlis, Hortul.

Var.* β, *acutifòlia (D. C. l. c.) leaves oval, stiff, acute at both ends, concave, doubly serrated, grey, cobwebbed above. ♄. H. Cratæ'gus longifòlia, Duham. ed. nov. 4. t. 34. P. alpìna, Willd. enum. 527.

Var.* γ, *undulàta (Lindl. hort. trans. 7. p. 234.) leaves flat, oval-lanceolate, broad, undulated, unequally and deeply serrated, acuminated, cobwebbed above.

Var.* δ, *angustifòlia (Lindl. l. c.) leaves oval, obtuse, concave, somewhat simply serrated, woolly above.

Var.* ε, *rugòsa (Lindl. l. c.) leaves large, ovate-elliptic, doubly serrated, shining above and wrinkled, white beneath.

Var.* ζ, *Crética (Lindl. l. c.) leaves flat, orbicularly elliptic, crenate-serrated, retuse, cuneated at the base, smooth above and hoary beneath; branches cobwebbed. P. A'ria rotundifòlia, Hortul. P. Græ'ca, Hortul.

Var.* η, *bullàta (Lindl. l. c.) leaves concave, elliptic, acuminated, blistered, coarsely serrated at the apex, entire at the base. P. A'ria acuminàta, Hortul.

Aria or Common White Beam-tree or White Wild Pear. Fl. May. Brit. Tree 20 to 30 feet.

31 P. EDU'LIS (Willd. enum. p. 527.) leaves oblong, cuneated at the base, unequally and doubly serrated, tomentose beneath; flowers corymbose. ♄. H. Native of France. Wats. dend. brit. t. 52. Cratæ'gus edùlis, Hort. P. intermèdia, var. angustifòlia, D. C. prod. 2. p. 636.—Flowers white. Fruit red, sapid, and edible.

Edible-fruited White Beam-tree. Fl. May. Clt.? Tree 20 to 30 feet.

32 P. INTERME'DIA (Ehrh. beitr. 4. p. 20.) leaves ovate, deeply lobed and toothed, clothed with white adpressed tomentum beneath; corymbs flat. ♄. H. Native of Europe, especially towards the north. In Britain on the walls of Castle Dinas y brān, Denbighshire. Cratæ'gus A'ria β, Lin. spec. 681. Cratæ'gus Scándica, Wahl. fl. ups. 165. Sórbus hỳbrida, Huds. 216. Wither. 461. P. hỳbrida, Smith, fl. brit. p. 534. Flowers white. Fruit red, edible.

Var.* α, *latifòlia (D. C. prod. 2. p. 636.) leaves broad-ovate. ♄. H. Native of France. Cratæ'gus latifòlia, Poir. 4. p. 444. Duham. arb. 1. t. 80. Sórbus latifòlia, Pers. Cratæ'gus dentàta, Thuill. fl. par.

Intermediate White Beam-tree. Fl. My. Wales. Tr. 20 to 30 ft.

33 P. VESTI'TA (Wall. cat. 679.) leaves, cymes, and young branches clothed with white tomentum; leaves elliptic or obovate-elliptic, acuminated, serrated towards the apex; corymbs branched, terminal. ♄. H. Native of Nipaul and Kamaon. Flowers white. Fruit red? Habit of *P. A'ria*.

Clothed White Beam-tree. Tree 20 to 30 feet.

34 P. KAMAONE'NSIS (Wall. cat. no. 678.) leaves oblong, pinnatifidly lobed and serrated, acuminated, clothed with white down beneath; corymbs, young branches, and petioles tomentose; fruit pear-shaped, about the size of a common medlar, red. ♄. H. Native of Kamaon and Sirmore. Flowers small, white.

Kamaon White Beam-tree. Tree 20 to 30 feet.

SECT. IV. TORMINA'RIA (from *tormina*, gripings; the fruit of *P. torminàlis* was supposed to cure gripings and dysentery by their astringency). D. C. prod. 2. p. 636. Petals spreading, flat, rather unguiculate. Styles 2-5, connected together, glabrous. Pome turbinate at the base, rather dry, truncate at the apex in consequence of the calycine lobes being deciduous. Leaves lobately angular, glabrous when in the adult state. Flowers corymbose; peduncles branched.

35 P. TORMINA'LIS (Ehrh. beitr. 6. p. 92.) leaves ovate, somewhat cordate, deeply lobed; lobes serrated, acute, lower ones spreading; when young downy beneath, but in the adult state glabrous. ♄. H. Native of Europe, in woods and hedges. In England chiefly in the midland and southern counties. Cratæ'gus torminàlis, Lin. spec. 681. Smith, engl. bot. t. 298. Fl. dan. 798. Jacq. aust. t. 443. Sórbus torminàlis, Crantz. aust. p. 85. Flowers white, numerous, in large terminal downy corymbose panicles. Styles 3-4 or 5. The fruit is not much larger than that of the *hawthorn*, becomes agreeably acid and wholesome after the frost has touched it, and may sometimes be seen in the London fruit-shops. Ray prefers its flavour to the *true service*, which latter is now become obsolete.

Griping or Common Wild Service-tree. Fl. Ap. May. Brit. Tr. 30 to 40 ft.

36 P. RIVULA'RIS (Dougl. mss. Hook. fl. bor. amer. p. 203. t. 68.) leaves ovate, entire, and angularly somewhat 3-lobed, rather acuminated, acutely serrated, pubescent beneath; corymbs terminal, simple; calyxes hairy, and densely tomentose inside; styles 3-4, connected at the base. ♄. H. Native of Nootka

Sound, and other parts of the north-west coast of America. Petals roundish, white. Pome small, hardly half an inch long, subglobose, red or yellow. The wood is employed for making wedges, and is so hard as to be susceptible of a fine polish. The fruit is used as an article of food, and is called in the language of the Chenook tribe of Indians *Pow-itch*.

River-side Wild Service-tree. Fl. Ap. May. Tree 15 to 20 ft.

SECT. V. ERIÓLOBUS (from εριον, *erion*, wool, and λοβος, *lobos*, a lobe; in reference to the woolly lobes of the calyx). D. C. prod. 2. p. 636. Petals spreading, flat, somewhat unguiculate, rather tridentate at the apex. Styles 5, elongated, rather connected, very hairy at the base. Pome globose, glabrous, crowned by the calycine lobes, which are clothed with tomentum.

37 P. TRILOBAˋTA (D. C. prod. 2. p. 636.) leaves palmate-lobed, glabrous; middle lobe 3-lobed, lateral ones usually 2-lobed; lobules serrated. ♄. H. Native of Mount Lebanon. Crataeˋgus trilobàta, Labill. dec. 4. p. 15. t. 10. Poir. suppl. 1. p. 291. Flowers white.

Three-lobed-leaved Service-tree. Fl. May, June. Clt. 1810. Tree 20 feet.

SECT. VI. SÓRBUS (from the Celtic *sormel*, composed of *sor*, wild, and *mel*, an apple; wild apple). Lin. gen. no. 623. Petals spreading, flat or concave. Styles 2-5. Pome globose or turbinate. Leaves impari-pinnate. Flowers corymbose; peduncles branched.

38 P. AURICULAˋTA (D. C. prod. 2. p. 636.) leaves of 3 pairs of leaflets, hairy beneath, the lower 2 or 4 leaflets distinct, but the ultimate ones are joined into one large, ovate, crenated leaflet. ♄. H. Native of Egypt. Sórbus auriculàta, Pers. ench. 2. p. 39. Corymb compact. Flowers white. Perhaps only a variety of *Sórbus pinnatífida*.

Auricled-leaved Service-tree or Mountain-ash. Fl. May. Clt. 1800. Tree 20 to 30 feet.

39 P. PINNATIˊFIDA (Ehrh. beitr. 6. p. 93. Smith, engl. bot. 2331.) leaves deeply pinnatifid or half pinnate, clothed with hoary down beneath, as well as the petioles and peduncles; styles about 3. ♄. H. Native of Gothland and Thuringia, in mountain woods. In the Western Isles of Scotland on the mountains, particularly in rocky situations on Cairn na Callich, and other mountains at the north end of the Isle of Arran. P. hýbrida, Smith, fl. brit. p. 534. but not of Willd. spec. 2. p. 1022. Sórbus hýbrida, Lin. spec. p. 684. Lin. fil. fasc. 11. t. 6. Fl. dan. t. 301. Crataeˋgus Aˋria γ Fénnica, Lin. spec. ed. 2. p. 167. Flowers cymose, cream-coloured. Pome globose, red. This species is an intermediate plant between *P. aucupària* and *P. Aˋria*.

Var. β, arbúscula (Poir. suppl. 5. p. 164. under Sórbus,) dwarf; leaflets nearly glabrous, obtuse, outer ones usually confluent. ♄. H. Native of Germany. This is a variety either of *P. pinnatífida* or *P. aucupària*.

Pinnatifid-leaved Service-tree or Mountain-ash. Fl. May. Scotland. Tree 20 to 30 feet.

40 P. MICROCAˊRPA (D. C. prod. 2. p. 636.) leaves pinnate, glabrous, as well as the petioles; leaflets acuminated, unequally and deeply serrated, the serratures ending in a setaceous mucrone; pome globose, red. ♄. H. Native of North America, from Carolina to New York. Sórbus aucupària α, Michx. fl. bor. amer. 2. p. 291. Sórbus micrántha, Dum. Cours. ed. 2. vol. 5. p. 464. Sórbus microcárpa, Pursh. fl. amer. sept. 1. p. 341. Flowers whitish.

Small-fruited Mountain-ash. Fl. May, June. Tree 12 ft.

41 P. SAMBUCIFÒLIA (Cham. in Linnæa. 2. p. 36.) leaves with 5 pairs of ovate, lanceolate, sharply serrated, acuminated leaflets, which are pilose on the nerves and margins, and bearded at the apex; stipulas clothed with rufous villi. ♄. H. Native of Kamtschatka.

Elder-leaved Mountain-ash. Shrub.

42 P. AUCUPAˋRIA (Gærtn. fruct. 2. p. 45. t. 87.) leaves pinnate, downy beneath when young; leaflets uniform, serrated, glabrous; buds and peduncles downy; pomes globose. ♄. H. Native of Europe and Siberia, in mountains, woods, and hedges; plentiful in some parts of Britain. Sórbus aucupària, Lin. spec. 683. Crantz. aust. 2. p. 49. t. 1. f. 4. Smith, engl. bot. t. 337. Mill. fig. t. 43. Fl. dan. 1034. Méspilus aucupària, All. Flowers white, numerous, with a light almond-like scent; petals concave. Fruit small, globose, scarlet, very juicy, sour, and bitter; they are eaten in some parts of Scotland and Wales, and afford an agreeable fermented liquor, and by distillation a strong spirit; soaked in water to extract some of its bitterness, and then boiled with sugar, makes a kind of jelly, which is tolerably flavoured. Birds of the thrush kind devour them with avidity, and our mountain-ash trees planted for ornament in most parts of England are thus unfortunately stripped early in autumn of their produce. The *mountain-ash* in profitable planting is chiefly valuable as a nurse tree, growing very fast when young, and enduring the most severe exposure. The timber is used by wheel-wrights, and for other common country purposes; the bark is used by tanners, and the berries afford a dye. As an undergrowth it affords tolerable poles and hoops. It will grow in any soil, dry or wet, and as to situation, it is found on the sea shore, and near the tops of the highest mountains. It seems to thrive best on the sides of moist rocky dells and dingles. In the days of superstition the *mountain-ash* was considered as an object of great veneration. It is even to be found at this day growing in the neighbourhood of Druidical circles of stones in Scotland. The *roddon* tree was formerly in Scotland especially famous as a protection against charms and witchcraft. The tree is called in Scotland *rhodon* or *roddon* tree, *roan* tree, and *rantry*. In England *mountain-ash*, *quick-bean*, *witchen* or *whitten*. In Germany the fowlers' bait-springs or nooses of hair, are suspended in the woods, with these berries attached to them to entice the red-wings and field-fares, whence the specific name *aucuparia*.

Fowlers' or Common Mountain-ash or Roan-tree. Fl. May. Britain. Tree 20 to 40 feet.

43 P. AMERICAˋNA (D. C. prod. 2. p. 637.) leaves pinnate; leaflets oblong, acute, almost equally serrated, at length quite glabrous; pomes globose (purple, Pursh; fulvous, Torrey). ♄. H. Native of North America, in Canada and throughout the woody country; Newfoundland; on the north-west coast, and in the subalpine prairies of the high mountains. Wats. dend. brit. t. 54. Flowers white.

American Mountain-ash. Fl. May. Clt. 1782. Tr. 15 to 20 ft.

44 P. FOLIOLÒSA (Wall. cat. 677. pl. asiat. rar. 2. p. 81. t. 189.) leaves pinnate, with 7-8 pairs of elliptic-lanceolate, mucronate leaflets, which are serrated at the apex, pubescent beneath; cymes branched, terminal, pubescent. ♄. H. Native of Nipaul. Flowers white. Pome small, obovate-roundish, red.

Leafy Mountain-ash. Tree 20 feet.

45 P. URSIˋNA (Wall. cat. 675.) leaves pinnate, with numerous pairs of leaflets; leaflets lanceolate, blunt at both ends, mucronate at the apex and cuspidately serrated, rusty beneath; corymbs, branches, rachis, and nerves of leaves clothed with rusty villi. ♄. H. Native of Nipaul, Kamaon, and Gosaingsthan. Pomes globular, red, about the size of those of the *common mountain-ash*.

Badger's Mountain-ash. Tree.

46 P. DOMEˊSTICA (Smith, engl. bot. t. 350.) leaves pinnate; leaflets uniform, serrated towards the points, clothed with deciduous cottony down beneath: buds glabrous, clammy, acumi-

nated; flowers panicled; fruit pear-shaped. ♄. H. Native of Europe, in mountainous parts. In England in the mountainous parts of Cornwall; also in the moorlands of Staffordshire. P. Sórbus, Gærtn. fruct. 2. p. 45. t. 87. Sórbus doméstica, Lin. spec. 684. Crantz. stirp. fasc. 2. p. 48. t. 2. f. 3. Jacq. fl. aust. t. 447. Flowers about the size of those of the *hawthorn*, cream-coloured. Styles usually 5. The *true service-tree* is of slow growth, and, according to Kroker, does not come into bearing before it is 60 years old. The fruit is obovate, about an inch in length, reddish spotted, extremely austere, causing a most painful and durable irritation in the throat if tasted in an unripe state; but when mellowed by frost or keeping, it becomes brown, soft, and eatable, resembling a medlar, though to most people less agreeable. It is common in Italy, and ripens at Genoa in September, where it is esteemed good in dysentery and fluxes. The wood, which is very hard, is held in repute for making mathematical rulers and excisemen's gauging sticks. In Italy they have many varieties obtained from seeds; but those generally known in this country are only three; the pear-shaped, the apple-shaped, and berry-shaped. The tree is recommended by Forsyth and Abercrombie to be grown as a standard at 20 or 30 feet distance, and to be pruned and otherwise treated like the apple and pear. It may also be grafted in the same manner on the same kind of stocks, or it may be propagated by seeds, cuttings, or layers, but the first mode is preferable. It is late in the autumn before the fruit can be gathered; after it is collected wipe it dry, and lay it on dry straw, spread on the open shelves of the fruit room, and in about a month it will become mellow and fit for use.

Domestic or True Service-tree. Fl. May. Britain. Tree 20 to 60 feet.

47 P. LANUGINÒSA (D. C. prod. 2. p. 637.) leaves pinnate; leaflets serrated, clothed with cottony down beneath, as well as the petioles and buds; pomes globose. ♄. H. Native of Hungary? Sórbus lanuginòsa, Kit. in litt. Flowers whitish.

Woolly Service-tree. Fl. May. Tree 20 to 30 feet.

48 P. SPU'RIA (D. C. prod. 2. p. 637.) leaves pinnate, of 3 pairs of leaflets, hairy beneath; leaflets ovate, crenated, terminal one the largest; rachis glanduliferous above. ♄. H. Native country unknown. Pyrus hýbrida, Mœnch. weiss. t. 6. ex Willd. spec. 2. p. 1022. Sórbus spùria, Pers. ench. 2. p. 39. Méspilus sorbifòlia, Poir. suppl. 4. p. 72. Flowers white. Fruit red. This tree is perhaps a hybrid between *P. aucupària* and *P. arbutifòlia*. Styles 5. Probably referrible to the following section.

Spurious Service-tree. Fl. May. Clt. 1800. Tree 20 to 30 ft.

SECT. VII. ADENORHA'CHIS (from *αδην*, *aden*, a gland, and *ραχις*, *rachis*, the spine of the back; in reference to the rachis of the leaves bearing glands). D. C. prod. 2. p. 637. Petals spreading, unguiculate, with the limbs concave. Styles 2-5. Pome globose. Leaves simple, bearing glands along the rachis on the upper side. Flowers corymbose. Peduncles branched.

49 P. ARBUTIFÒLIA (Lin. fil. suppl. 256.) leaves obovate-oblong, acute, crenate-serrate, downy beneath, as well as the calyxes; corymbs few-flowered, shorter than the leaves; fruit pear-shaped. ♄. H. Native of North America, throughout Canada from Lake Huron to the Saskatchawan, Newfoundland, &c. Cratæ'gus pyrifòlia, Lam. dict. 1. p. 83. Arònia pyrifòlia, Pers. ench. 2. p. 39. Cratæ'gus serràtus, Poir. suppl. 1. p. 292. Méspilus arbutifòlia, Lin. spec. 685. Smith, arb. t. 86. Méspilus arbutifòlia *α* erythrocárpa, Michx. fl. bor. amer. 1. p. 292. Mill. fig. t. 109. Flowers white. Pome red.

Var. β, intermèdia (Lindl. hort. trans. 7. p. 229.) fruit globose, brown. ♄. H.

Var. γ, serótina (Lindl. l. c.) leaves shining, velvety beneath; fruit late, party-coloured. ♄. H.

Arbutus-leaved Pyrus. Fl. May. Clt. 1700. Sh. 4 to 6 ft.

50 P. FLORIBU'NDA (Lindl. hort. trans. 7. p. 230.) branches cinereous, reclinate; leaves oblong-lanceolate, acute, on long petioles, tomentose beneath, as well as the calyxes; fruit spherical; corymbs many-flowered, longer than the leaves. ♄. H. Native of North America? Lindl. bot. reg. 1006. Flowers white. Fruit black.

Bundle-flowered Pyrus. Fl. May, June. Shrub.

51 P. DEPRE'SSA (Lindl. l. c. p. 230.) stems humble, reclinate; leaves oblong, obtuse, tomentose beneath, as well as the calyxes; fruit pear-shaped; corymbs length of the leaves. ♄. H. Native of North America. Flowers white. Fruit dark purple.

Depressed Pyrus. Fl. May. Shrub 1 to 2 feet.

52 P. MELANOCA'RPA (Willd. enum. p. 526.) stem humble, erect, glabrous; leaves oblong, acute, shining, serrated, glabrous beneath, as well as the calyxes and peduncles; fruit roundish-turbinate. ♄. H. Native of North America, from Canada to Virginia, and on the mountains of Carolina. P. arbutifòlia *β*, Willd. spec. 2. p. 1013. Arònia arbutifòlia, Pers. ench. 2. p. 39. Corymbs more crowded than those of the last species, and the pomes are black. Flowers white.

Var. β, subpubéscens (Lindl. hort. trans. 7. p. 232.) leaves when young tomentose beneath, but glabrous in the adult state.

Black-fruited Pyrus. Fl. May, June. Clt. 1700. Sh. 2 ft.

53 P. PU'BENS (Lindl. hort. trans. 7. p. 232.) stem erect; branches pubescent; leaves oblong or obovate, abruptly acuminated, smooth; fruit spherical, and are, as well as the calyxes, quite glabrous; corymbs loose, many-flowered; fruit with a glabrous disk. ♄. H. Native of North America. Flowers white. Fruit round, large, dark purple. Both this and the following have the robust foliage and habit of *P. chamæméspilus.*

Downy Pyrus. Clt. 1810. Shrub 4 to 5 feet.

54 P. GRANDIFÒLIA (Lindl. l. c.) stem erect, and is, as well as the branches, smoothish; leaves oblong or obovate, acute, glabrous; fruit spherical, and are, as well as the calyxes, glabrous; corymbs few-flowered, coarctate: fruit with a villous disk. ♄. H. Native of North America. Lindl. bot. reg. 1154. Flowers white. Fruit dark purple.

Great-leaved Pyrus. Clt. 1810. Shrub 4 to 5 feet.

SECT. VIII. CHAMÆME'SPILUS (*chamæ* in botany usually signifies false, and *Mespilus*, the medlar; false medlar). D. C. prod. 2. p. 637. Petals erect, connivent, concave. Styles 2. Pome ovate. Leaves simple, glandless. Flowers disposed in capitate corymbs.

55 P. CHAMÆME'SPILUS (Lindl. in Lin. trans. 13. p. 98.) leaves ovate, serrated, glabrous. ♄. H. Native of Europe, in mountainous parts. Cratæ'gus chamæméspilus, Jacq. aust. t. 231. hort. vind. 213. Méspilus chamæméspilus, Lin. spec. 685. Sórbus chamæméspilus, Crantz aust. 83. t. 1. f. 3. Leaves clothed with deciduous down when young. Flowers reddish. Fruit round, red.

Bastard-Medlar or Quince. Fl. May, June. Clt. 1683. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

56 P.? ALNIFÒLIA (Lindl. l. c.) glabrous: leaves roundish, toothed at the apex, feather-nerved, rather glaucous beneath; raceme simple, elongated. ♄. H. Native of North America, at Fort Mandan. Pome black, sugary.

Alder-leaved Pyrus. Shrub.

57 P. TOMENTÒSA (D. C. prod. 2. p. 637.) leaves oval-lanceolate, rather crenulated, on short petioles, clothed with white tomentum beneath, as well as the branchlets, and with cinereous

villi above. ♄. H. Native of Siberia. Màlus tomentòsa, Dum. Cours. ed. 2. vol. 5. p. 438. Said to be allied to *P. baccàta*, but the flowers as well as the fruit are unknown.

Tomentose Pyrus. Tree.

58 P. rubicu'nda (Hoffmans. verz. 1824. p. 192.) leaves ovate, acumina'ed, glabrous; pome like that of *P. Màlus*, yellow on one side, and red on the other, côvered with a kind of glaucous bloom. ♄. H. Native country unknown.

Reddish Pyrus. Tree.

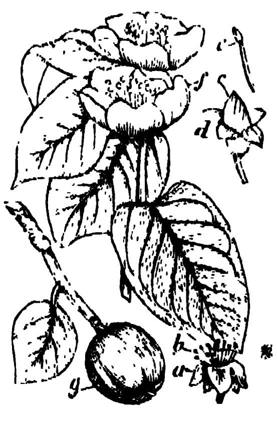
Cult. All the species of *Pỳrus* are either trees or large shrubs. They are both useful and ornamental; free growers thrive in any soil, and may be planted in shrubberies, or to stand singly. They may be raised from seeds, cuttings, layers, or by engrafting the rarer on the commoner sorts.

XI. CYDO'NIA (so named from being a native near Cydon in Candia). Tourn. inst. 632. t. 405. Pers. ench. 2. p. 40. D. C. prod. 2. p. 638.—Pỳrus species of Lin. and others.

Lin. syst. *Icosándria, Pentagýnia.* Calyx 5-cleft (f. 84. *a.*). Petals orbicular (f. 84. *f.*). Stamens erect (f. 84. *b.*). Styles 5. Pome closed (f. 84. *g.*), 5-celled; cells cartilaginous, many-seeded. Seeds covered with mucilaginous pulp.—Trees, with undivided, quite entire, or serrated leaves, and large flowers, which are either solitary, or few together in a kind of umbel.

Sect. I. Cydònia (see genus for derivation). Lindl. in Lin. trans. 13. p. 97. Lobes of calyx rather foliaceous, and serrulated. Stamens disposed in a single series.

FIG. 84.



1 C. vulga'ris (Pers. ench. 2. p. 40.) leaves ovate, blunt at the base, quite entire, clothed with white tomentum beneath, as well as the calyxes and pedicels; flowers few, in a kind of umbel. ♄. H. Native of the south of Europe, among rocks and in hedges. Pỳrus Cydònia, Lin. spec. 687. Jacq. austr. t. 342. Woodv. med. bot. t. 79. Cydònia Europæ'a, Savi, alb. tosc. 1. p. 90. The *Quince-tree* is low, much branched, and generally crooked and distorted. The flowers are large, white, or pale red, and appear in May. The fruit varying in shape in the different varieties, globular, oblong, ovate or obovate; it has a peculiar and rather pleasant apple-smell, and an austere taste. It is mentioned by Tusser in 1753, but has never been very much cultivated.

Use.—The fruit is not eaten raw, but stewed, or in pies or tarts along with apples it is much esteemed. In confectionary it forms an excellent marmalade and syrup. When apples are flat and have lost their flavour, Forsyth observes, a quince or two in a pie or pudding will add a quickness. In medicine the expressed juice, repeatedly taken in small quantities, is said to be cooling, astringent, and stomachic, &c. A mucilage, prepared from the seeds, was formerly much in use, but is now supplanted by the simple gums. The fruit taken in small quantity is supposed to restrain vomiting and alvine fluxes. In nursery-gardens the plants are much used as stocks for the pear.

The varieties of the quince are as follow:—

1 *Common quince, coignassier commun.* This and the two following are often confused with each other; it is very probable that from seeds of either sort varieties have been, and still may be, obtained, some of which would produce apple-shaped, and some pear-shaped fruit.

2 *Apple-shaped quince, coignassier malifórme, coignassier pomifórme.* Cyd. vulgàris *α* malifórmis, Mill. dict. no. 2. Fruit nearly globose, of the same quality as the last.

3 *Pear-shaped quince, coignassier pyrifórme.* Cyd. vulgàris *γ* oblónga, Mill. dict. no. 1. Leaves oval or oblong; fruit pear-shaped, of the same quality as the two last species.

4 *Portugal quince, coignassier de Portugal.* Cyd. vulgàris, var. *β* Lusitánica, Mill. dict. no. 3. This is a good sort, and distinct from the preceding kinds; it does not become, however, except in very favourable seasons, of so deep an orange; its leaves are broader; its growth less contracted, consequently it is the best sort for grafting pears upon.

5 *Orange quince.* This and the following possess characters differing so little from what may be found among sub-varieties of the others, that they are scarcely worth distinguishing.

6 *Large-fruited quince, coignassier à gros fruit.*

Propagation.—Generally by layers, but also by cuttings, and approved sorts may be perpetuated by grafting. In propagating for stocks nothing more is necessary than removing the lower shoots from the larger, so as to preserve a clean stem as high as the graft; but for fruit-bearing trees it is necessary to train the stem to a rod till it has attained 4 or 5 feet in height, and can support itself upright.

Soil and site.—The *quince* prefers a soft moist soil, and rather shady or at least a sheltered situation. It is seldom planted but as a standard in the orchard, or to grow singly in the garden, and a very few trees are sufficient for any family.

Time of planting, the mode of bearing, and all the other particulars are the same as for the apple and pear.

Common Quince. Fl. May, June. Clt. 1573. Tree 20 feet.

2 C. Sumbòshia (Hamilt. in D. Don, prod. fl. nep. p. 237.) leaves cordate, oval, mucronate, quite entire, clothed with white tomentum beneath, as well as the branchlets and calyxes; stipulas elliptic, acute, glandularly serrated; peduncles solitary, terminal, tomentose; calycine segments oblong; pome attenuated at the base. ♄. H. Native of Nipaul, where it is called in the Nawaricc language *Sumboshi-swa*, and *Bhee* in that of Sirinigur. Very like *Cydònia vulgàris.*

Sumboshi or Nipaul Quince. Fl. May, June. Tree 20 feet.

3 C. Sine'nsis (Thouin, in ann. mus. 19. p. 145. t. 8 and t. 9.) leaves ovate, acuminated at both ends, acutely serrated, when young rather villous, but in the adult state glabrous, as well as the calyxes; stipulas oblong-linear, glandularly serrated. ♄. H. Native of China. Pỳrus Sinénsis, Poir. suppl. 4. p. 452. Flowers white. Fruit egg-shaped, large, hard, and nearly dry, greenish. Seeds about 30 in each cell, many of which are abortive. This appears to be an intermediate plant between the last and the following.

Chinese Quince. Fl. May, June. Clt. 1818. Tree 20 feet.

Sect. II. Chænome'les (from χαινω, *chaino*, to open, and μηλον, *melon*, an apple; when the plant was first so called, the fruit examined was split at the top, from some cause or other; perhaps from heat). Lindl. l. c. Lobes of calyx short, obtuse, and quite entire. Stamens inserted in 2 series.

4 C. Japo'nica (Pers. ench. 2. p. 40.) leaves oval, somewhat cuneated, crenate-serrated, quite glabrous on both surfaces, as well as the calyxes; stipulas reniform, serrated. ♄. H. Native of Japan. Pỳrus Japónica, Thunb. fl. jap. p. 207. Curt. bot. mag. t. 622. Moris, fl. consp. t. 1. p. Chænomèles Japónica, Lindl. l. c. Flowers deep scarlet, solitary, or 2-3 together. A very ornamental plant. There is also a white flowered variety, which is also very ornamental.

Japan Quince. Fl. year. Clt. 1815. Shrub 4 to 6 feet.

Cult. All the species of *quince* are very ornamental when in blossom. The three first species answer well to be planted as standards singly in any conspicuous situation. The *C. Japónica* is one of the most elegant hardy shrubs yet introduced to our gardens, as it produces its beautiful scarlet flowers the greater part of the year. It is a very proper plant for training against a wall. All the species may be increased by ripened cuttings off the roots, planted in a sheltered situation, with a hand-glass placed over them. They are also to be increased by grafting the one on the other, or on any of the plants contained in the present order.

† *Genera doubtful whether they belong to the present order.*

XII. DICA'LYX (from δις, *dis*, double, and καλυξ, *kalyx*, a calyx; so named in consequence of the calyx being calyculated by bracteas, which assume the appearance of an outer calyx.) Lour. coch. p. 663. Blume, bijdr. 1116. Decàdia, Lour. Sariàva, Reinwdt.

Lin. syst. *Icosándria, Digýnia.* Flowers superior. Calyx 5-cleft, permanent, calyculated by 2-3 bracteas. Corolla deeply 4-parted. Stamens numerous, inserted in the base of the corolla. Ovary inferior, 3-celled; cells many-seeded. Seeds pendulous. Styles 2, crowned by obtuse trigonal stigmas. Drupe baccate, containing a 1-3-celled nut; nut 1-seeded, 2 of the cells being usually vacant. Seeds albuminous. Embryo linear, somewhat incurved, inverted.

1 D. TINCTÒRIUS (Blum. bijdr. 1116.) leaves oblong, acuminated, rounded at the base or acutish, finely serrulated, smooth, rather pubescent at the ribs beneath, as well as the tips of the branches and peduncles; peduncles crowded, short, axillary; fruit smooth. ♄. S. Native of Java, in mountain woods.

Var. β; leaves smaller, very much acuminated, acute at the base, sharply serrated, covered with strigose down on the middle nerve beneath, as well as the branches. Perhaps a species.

Dyer's Dicalyx. Tree 20 feet.

2 D. ODORATI'SSIMUS (Blum. bijdr. p. 1116.) leaves elliptic-oblong, large, acute at both ends, but rather bluntish at the apex, coarsely and obtusely serrated, glabrous; panicles axillary, rather tomentose; fruit smooth. ♄. S. Native of Java, on the mountains. Flowers white.

Very-sweet-scented Dicalyx. Tree 30 feet.

3 D. ALUMINÒSUS (Blum. bijdr. 1117.) leaves oblong-lanceolate, acuminated at both ends, bluntish at the apex, glabrous, with blunt exserted serratures; panicles axillary, finely tomentose; fruit smooth. ♄. S. Native of Java and Cochin-china. Decàdia aluminòsa, Lour. coch. 315. Flowers small white. The wood and leaves are much used in dyeing by the natives of Cochin-china.

Aluminous Dicalyx. Tree.

4 D. COSTA'TUS (Blum. bijdr. 1117.) leaves oblong, tapering to both ends, smooth, finely serrulated; spikes short, axillary; fruit ribbed. ♄. S. Native of Java, on the mountains of Burangrang. Flowers white.

Ribbed Dicalyx. Tree.

5 D. JAVA'NICUS (Blum. bijdr. 1117.) leaves elliptic-oblong, acuminated, acute at the base, finely serrulated above the middle, smooth, rather pubescent on the veins beneath; spikes panicled, axillary, and terminal, and are, as well as the branches, densely tomentose. ♄. S. Native of Java, on the mountains.

Java Dicalyx. Tree.

6 D. SALACE'NSIS (Blum. bijdr. 1118.) leaves elliptic-oblong, acute at both ends, finely serrulated, and are, as well as the branches, quite glabrous; spikes simple or branched, axillary and terminal, short, densely tomentose. ♄. S. Native of Java, on Mount Salak. Flowers white.

Salak Dicalyx. Tree.

7 D. SESSILIFÒLIUS (Blum. bijdr. 1118.) leaves nearly sessile, oval, acute at both ends, finely serrulated, and are, as well as the branches, glabrous; spikes branched, axillary and terminal, rather tomentose; fruit smooth. ♄. S. Native of Java, on the top of Mount Gede. Flowers white.

Sessile-leaved Dicalyx. Tree.

8 D. SPICA'TUS (Blum. bijdr. 1118.) leaves lanceolate, acuminated at both ends, quite entire or serrulated, and are, as well as the branches, glabrous; spikes axillary and terminal, simple or branched, clothed with silky tomentum; fruit ovate, glabrous. ♄. S. Native of Java. Flowers white.

Var. β; leaves narrow, oblong-lanceolate.

Spiked Dicalyx. Tree.

9 D. CILIA'TUS (Blum. bijdr. 1119.) leaves oblong-lanceolate, acuminated at both ends, nearly entire, and are, as well as the branches, glabrous; spikes branched, axillary, downy; bracteas and calyxes ciliated; fruit oval, smooth; calycine segments ovate, acute. ♄. S. Native of Java, on Mount Tjerimai.

Ciliated Dicalyx. Tree.

10 D. ACUMINA'TUS (Blum. bijdr. 1119.) leaves oblong-lanceolate, acuminated at both ends, finely serrulated at the apex, and are glabrous as well as the branches; panicles axillary or almost terminal, smooth. ♄. S. Native of Java, on Mount Salak. This species comes very near D. sylvàticus of Lour, but the leaves are acuminated, and the serratures hardly conspicuous.

Acuminated-leaved Dicalyx. Tree.

11 D. SYLVA'TICUS (Lour. coch. p. 663.) leaves lanceolate, serrate, glabrous; racemes simple, almost terminal. ♄. S. Native of Cochin-china. Rumph. amb. 5. t. 104. Flowers white.

Wood Dicalyx. Tree 30 feet.

Cult. A mixture of loam, peat, and sand will suit the species of this genus, and ripened cuttings will probably root if planted in sand, with a hand-glass placed over them.

XIII. PYRENA'RIA (from *pyren*, a cherry-stone; in reference to the bony seeds). Blum. bijdr. 1119.

Lin. syst. *Polyándria, Pentagýnia.* Calyx inferior, of 5 sepals, bibracteate, imbricate. Petals 5, imbricately-conniving at the base. Stamens numerous, free, hypogynous, and somewhat adnate to the base of the petals. Anthers bursting outwardly. Ovary 5-celled; cells biovulate. Styles 5, approximate, emarginate. Pome globose, depressed, fleshy, 5-celled; cells covered with a papery membrane, containing each two bony seeds. Seeds exalbuminous. Embryo erect, with leafy contortuplicate cotyledons. This genus has the habit of *Pomàceæ*, but from the structure of the calyx and insertion of the stamens it comes nearer to *Ternstrœmiàceæ*.

1 P. SERRA'TA (Blum. bijdr. 1120.) ♄. S. A tree, with alternate, stalked, oblong, serrated, coriaceous, exstipulate leaves; axillary solitary 1-flowered peduncles, and white flowers. ♄. S. Native of Java, on the higher mountains.

Serrated-leaved Pyrenaria. Tree.

Cult. For culture and propagation see *Dicàlyx.*

Order LXXXVI. CALYCA'NTHEÆ (plants agreeing with *Calycánthus* in important characters). Lindl. bot. reg. no. 404. D. C. prod. 3. p. 1.—Calycanthinæ, Link, enum. 2. p. 66.—Calycánthus, Lin. gen. no. 639. Lam. ill. t. 445. dict. 1. p. 565. Willd. hort. berol. no. 80.—Rosàceis affines, Juss. gen. Vent. Nees.—Monimìcis affìnes, Juss. ann. mus. 14. p. 119.—Magnòliis affìnes, Batsch. t. 116.

Calyx coloured, with a fleshy urceolate tube, girding the ovaries (f. 85. *b.*) and a many-parted limb; segments unequal, disposed in many series (f. 85. *d. a.*), imbricate. Petals wanting. Stamens numerous, inserted in several series in a fleshy disk in the throat of the calyx; the inner ones sterile. Anthers adnate, bursting longitudinally outwardly by 2 cells. Carpels numerous (f. 85. *b.*), inserted on the inside of the tube of the calyx, as in *Ròsa*, 1-celled, biovulate, only one of the ovula coming to maturity, and therefore 1-seeded from abortion. Styles terminal, distinct, exserted from the tube of the calyx: stigmas simple. Carpels of akenia inclosed in the fleshy tube of the calyx, 1-seeded; the pericarp rather corneous. Seed conformed to the cavity of the akenia, ascending, having the hylum nearly opposite the cicatrice of the pericarp. Embryo exalbuminous, straight, with convolute cotyledons, and an inferior radicle.—This order is composed of beautiful hardy early-flowering shrubs, with simple, exstipulate, scabrous, feather-nerved leaves. Flowers yellowish, sweet-scented, or lurid purple, hermaphrodite, solitary, pedicellate, terminal, or in the axils of the leaves of the present or preceding year. The wood, leaves, and flowers of *Calycánthus flòridus* have a scent resembling the quince, hence it is called *American allspice*. *Calycántheæ* agrees with *Rosàceæ* in the carpels or akenia being inserted in the inner sides of the calyx as in *Ròsa*, and with *Granàteæ* in the opposite leaves, and in the convolute cotyledons of the embryo; in this last respect it also agrees with *Combretàceæ*. *Calycántheæ* differs from *Rosàceæ* and *Pomàceæ* in the form of the embryo, and from *Granàteæ* in the form and imbricate æstivation of the calyx. It differs from both the last-mentioned orders in the absence of petals, in the numerous lobes of the calyx, and in the anthers bursting outwardly.

Synopsis of the genera.

1 Calyca'nthus. Lobes of calyx disposed in many series, lanceolate, coriaceous, coloured. Stamens deciduous, 12 outer ones fertile.

2 Chimona'nthus. Lobes of calyx oval, obtuse, outer ones form of bracteas. Stamens permanent, 5 outer ones fertile.

I. CALYCA'NTHUS

I. CALYCA'NTHUS (from καλυξ, *calyx*, a calyx; and ανθος, *anthos*, a flower; in reference to the calyx being coloured, and appearing like a corolla). Lindl. bot. reg. no. 404. Nees. nov. act. bonn. 11. p. 107.—Buttnèria, Duham. arbr. 1. p. 114. but not of Lin.—Beurrèria, Ehret, pict. t. 13.—Bastèria, Adans. fam. 2. p. 294.—Pompadoùra, Buchoz.—Calycánthus species, Lin. Lam. Willd.

Lin. syst. *Icosándria, Polygýnia.* Lobes of calyx disposed in many series (f. 88. *a. d.*), imbricate, lanceolate, all somewhat coriaceous and coloured. Stamens unequal, deciduous, 12 outer ones fertile. Akenia numerous (f. 85. *b.*).—Shrubs, natives of North America, with brachiate branches; and terminal and axillary flowers, rising after leaves, of a lurid purple colour; they are sweet-scented as well as the bark and leaves.

1 C. flòridus (Lin. spec. 718.) leaves ovate, downy beneath as well as the branchlets. ♄. H. Native of Carolina, on the shady banks of rivulets. Curt. bot. mag. t. 503. Duham. arb. 1. t. 45. Lam. ill. t. 445. f. 1. Guimp. abb. holz. t. 4. C. stérilis, Walt. car. 151. Mill. fig. t. 60. Branches spreading. Wood and roots smelling strong of camphor. Flowers usually sterile, with a sweet apple scent. Fruit turbinate.

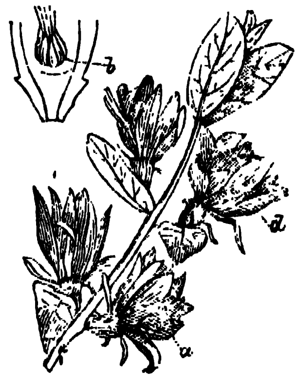
Var. a, oblóngus; leaves oblong. Ait. hort. kew. ed. 2. vol. 3. p. 282.

Var. β, ovàtus; leaves roundish-ovate. Ait. l. c.

Florid or Common American Allspice. Fl. May, Aug. Clt. 1726. Shrub 4 to 6 feet.

2 C. fe'rtilis (Walt. car. p. 151.) leaves ovate-lanceolate, acuminated, glaucous and pubescent beneath. ♄. H. Native of Carolina, on the mountains. Lindl. bot. reg. t. 404. Guimp. abb. holz. t. 5. C. glaúcus, Willd. enum. p. 559. D. C. prod. 3. p. 2. Andr. bot. rep. 539. Flowers fertile, of a lurid purple colour, but with very little scent (f. 85.).

FIG. 85.



Var. β, oblongifòlius (Nutt. gen. amer. 1. p. 312.) leaves ovate-lanceolate, elongated. ♄. H. Native on the mountains of North Carolina.

Fertile-flowered American Allspice. Fl. May, Aug. Clt. 1726. Shrub 4 to 6 feet.

3 C. lævigа'tus (Willd. enum. p. 559. hort. berol. t. 80.) leaves oblong or ovate, gradually acuminated, rather wrinkled, and rough to the touch on the upper surface, but glabrous and green beneath. ♄. H. Native of Pennsylvania, Virginia, and Carolina, on the mountains. Pursh, fl. sept. amer. 1. p. 358. Nutt. gen. amer. 1. p. 312. Guimp. abb. holz. t. 6. Lindl. bot. reg. 481. C. fèrax, Michx. fl. bor. amer. 1. p. 305. Branches strictly erect. Flowers lurid purple, hardly sweet-scented? C. Pennsylvánicus, Lodd. cat. ex Lond. hort. brit. p. 214.

Smooth American Allspice. Fl. May, July. Clt. 1806. Sh. 3 to 6 feet.

Cult. These shrubs are well worth growing for the exquisite scent of their blossoms, resembling that of ripe apples or quinces; they all grow best in peat borders, although they will grow in any kind of soil, but not so freely as in peat. They are usually increased by layers, put down in the summer.

II. CHIMONA'NTHUS

II. CHIMONA'NTHUS (from χειμων, *cheimon*, winter, and ανθος, *anthos*, a flower; in reference to the time of flowering, which is from December to February). Lindl. bot. reg. no. 404. and 451. D. C. prod. 3. p. 2.—Meràtia, Nees. in nov. act. bonn. 11. p. 107.—Calycánthus species of Lin.

Lin. syst. *Icosándria, Polygýnia.* Lobes of calyx imbricate, oval, obtuse; outer ones in the form of bracteas; inner ones larger and appearing like a corolla. Stamens nearly equal, permanent, the 5 outer ones fertile, connate at the base, at maturity.—Shrubs, with the flowers rising before the leaves, in the axils of the leaves of the preceding year. Flowers very sweet-scented, yellowish, but purplish inside. Bark and leaves without scent.

1 C. fra'grans (Lindl. bot. reg. 404.). ♄. H. Native of Japan. Calycánthus præ'cox, Lin. spec. 718. Ait. hort. kew. ed. 1. vol. 2. p. 220. t. 10. Curt. bot. mag. t. 466. Lam. ill. t. 445. f. 2. Meràtia fràgrans, Nees. l. c.

Var. β, grandiflòra (Lindl. bot. reg. t. 451.) flowers larger and more spreading. Perhaps a proper species, for the fruit of *C. fràgrans* is lageniform, thicker above the base, and tapering at the apex into a long neck, but in the present plant, according to the figure, the fruit is oblong and tapering to the base.

Var. γ, lùteus; flowers yellow, both inside and outside.

Fragrant Winter-flower. Fl. Dec.-Feb. 1766. Sh. 6 feet.

Cult. The delightful fragrance of the blossoms, makes the *C. fràgrans* and its varieties desirable objects in all collections.

They thrive in almost any kind of soil, and are usually increased by layers, but young cuttings will also strike root, if planted in a pot of sand, with a bell-glass placed over them, in a little bottom heat. The plants endure our winters in the open air, in a sheltered situation, with very little protection in severe weather. But as they flower during the winter months, the plants are liable to be injured by the frost, if planted in an exposed situation, they are therefore seen to most advantage under shelter, as in a greenhouse, pit, or conservatory.

ORDER LXXXVII. GRANA'TEÆ (this order only contains the species of *Pomegranate* and their varieties). D. Don, in edinb. phil. journ. july 1826. p. 134. D. C. prod. 3. p. 3. A genus of *Myrtàceæ*, Juss. and all other authors.

Calyx with a turbinate tube (f. 86. *a.*) and a 5-7-cleft coriaceous, tubular limb (f. 86. *e.*); segments valvate in æstivation. Petals 5-7 (f. 86. *b.*). Stamens numerous; filaments free; anthers 2-celled, bursting in front, by 2 chinks. Style filiform. Stigma capitate, papulose. Fruit large, spherical (f. 86. *c.*), crowned by the limb of the calyx (f. 86. *d.*), indehiscent; the fruit is the tube of the calyx, divided horizontally into two chambers or parts (f. 86. *f.*), the upper division 5-9-celled, and the lower division 3-celled; the dissepiments membranous, separating the cells; the placentas of the upper division of the fruit fleshy, reaching from the parietes to the centre; those of the lower division progressing irregularly from the bottom of the fruit. Seeds innumerable, exalbuminous, covered with pellucid baccate pulp. Embryo oblong, with a short, straight radicle, and foliaceous, spirally convolute cotyledons. This order is composed of trees or shrubs, with tetragonal subspinose branches, opposite, deciduous leaves, rarely verticillate or alternate; they are oblong-lanceolate and dotless, usually disposed in fascicles in the axils. Flowers 2-5, scarlet, almost sessile, rising near the tops of the branches.—This order only consists of one genus, the well-known *pomegranate*. It differs from *Myrtàceæ*, in the leaves being destitute of dots, and in being without the marginal nerve, also in the economy of the fruit, the pulpy seeds, and in the convolute cotyledons; from *Calycánthceæ* in the valvate calyx, and in the anthers bursting inwardly; from *Memecyleæ* in the indefinite stamens; from *Combretàceæ* in the many-celled ovary, and in the situation of the seeds; from *Vochysièæ* in the indefinite stamens and regular flowers; and from all in the structure of the fruit.

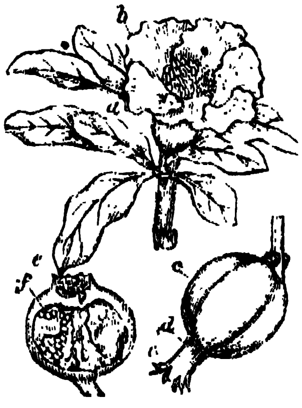
I. PU'NICA (*Punicus*, Carthaginian, because it is a native of the countries from the north of Africa to Rome; or from *puniceus*, scarlet, from the colour of the flowers). Tourn. inst. t. 401. Lin. gen. no. 618. Gærtn. fr. 1. t. 38. D. C. prod. 3. p. 3.

LIN. SYST. *Icosándria, Monogýnia.* Character the same as the order.

1 P. GRANA'TUM (Lin. spec. 676.) leaves lanceolate; stem arboreous. ♄. H. Native of Barbary, from whence it has migrated into the south of Europe, and now as it were become indigenous.

Var. a, rùbrum; flowers scarlet, single; pulp surrounding the seed, reddish. ♄. H. Wild in the places stated above. Trew, ehret. t. 71. f. 1. Poit. et Turp. arb. fr. 22. Schkuhr, handb. t. 131. *b.* Sims. bot. mag. 1832.

FIG. 86.



* *flòre-plèno;* flowers double, scarlet. More impatient of cold than the single variety. Trew. ehret. t. 71. f. 2.

Var. β, albéscens; corolla white; calyx yellowish; pulp surrounding the seeds pale. ♄. H. Less impatient of cold than the preceding variety. Andr. bot. rep. 96.

* *flòre-plèno;* flowers double, white, having the calyx yellowish. ♄. H. This variety is very impatient of cold.

Var. γ, flàvum; flowers yellow. This variety is very rare.

The rind of the fruit and the flowers of the pomegranate are the parts directed for medicinal use. They are both powerful astringents, and have long been successfully employed as such both externally and internally as gargles, in diarrhœas, &c. The dose in substance is from half a drachm to a drachm. In infusion or decoction to half an ounce. The pulp is subacid, allaying heat, quenching thirst, and gently laxative.

Common *Pomegranate.* Fl. June, Sept. Clt. 1548. Tree 15 to 30 feet.

2 P. NA'NA (Lin. spec. 676.) leaves linear; stem shrubby. ♄. G. Native of the West India Islands, and South America; about Demerara, &c. Sims, bot. mag. 634. Trew. ehret. t. 71. f. 3. Flowers red. Perhaps only a variety of the preceding. The flowers are much smaller than those of the common *pomegranate*, and the fruit is about the size of a nutmeg. In the West Indies, where it is a native, it is planted for hedges, and continues flowering all the year.

Dwarf Pomegranate. Fl. Jul. Sept. Clt. 1723. Sh. 5 to 6 ft.

Cult. There is no tree more showy than the *Pomegranate*, when in flower. It is best planted against a wall with a south aspect. All the varieties strike root freely from cuttings or layers; the rarer varieties are sometimes increased by grafting on the commoner kinds. Those varieties most impatient of cold had better be grown in pots, that they may the more easily be protected by placing under shelter in the winter.

ORDER LXXXVIII. MEMECY'LEÆ (plants agreeing with *Memècylon* in important characters). D. C. prod. 3. p. 5.

Calyx with an ovate or subglobose tube and a 4-5-lobed or 4-5-toothed limb. Petals 4-5, inserted in the calyx and alternating with its lobes. Stamens 8-10, or double the number of the petals; filaments free; anthers incurved, 2-celled. Style filiform. Berry crowned by the limb of the calyx, 2-4-celled. Seeds few, exalbuminous. Cotyledons foliaceous, convolute. Radicle straight.—Intratropical shrubs, with simple, quite entire, dotless, opposite leaves, which are nearly always feather-nerved; and axillary pedicellate flowers. This is a very doubtful order, but is, on account of its convolute cotyledons, allied to *Calycánthceæ, Granàteæ*, and *Combretàceæ*, but from the form of the anthers and the number of the parts of the flower, it is nearer related to *Melastomàceæ*, nor is it far removed from *Myrtàceæ* in the habit, flowers, and opposite leaves.

Synopsis of the genera.

1 MEME'CYLON. Calyx with a globose tube and a bluntly 4-

toothed limb. Petals 4. Stamens 8. Berry dry, globose, 2-4-celled.

2 SCU'TULA. Calyx with a truncate, spreading, fleshy, saucer-formed limb. Petals 4-5. Stamens 8-10. Berry 8-celled; cells 1-seeded.

3 MOURI'RIA. Calyx furnished with 2 scales at the base; limb urceolate, 5-toothed. Petals 5. Stamens 10. Berry 1-4-celled, 1-4-seeded.

I. MEME'CYLON (from μεμηκυλον of Dioscorides, the Greek name of the fruit of the A'rbutus). Lin. gen. no. 481. Lam. dict. 4. p. 88. ill. t. 284. Pet. Th. obs. p. 57. and p. 58. but not of Mitch. D. C. prod. 3. p. 5.—Valikàha, Adans. fam. 2. p. 84.

LIN. SYST. *Octándria, Monogýnia.* Calyx with a hemispherical or subglobose tube, and a small limb striated at the bottom, and with a bluntly 4-toothed, repand, or entire border. Petals 4, oval. Stamens 8, longer than the petals; filaments free; anthers incurved, fixed by the middle, acutely beaked at one end, and blunt at the other, and bearing 2 polliniferous cells each. Style 1, filiform, bearing a simple stigma. Berry nearly dry, globose, crowned by the limb of the calyx; when young 2-4-celled, cells 2-seeded; but when mature 1-celled, and 1-seeded. Nut brittle, easily separated from the calyx. Seed pendulous, exalbuminous. Cotyledons foliaceous, convolute. Radicle superior, acute.—Shrubs having the branches nodose, at the origin of the leaves. Leaves glabrous, rarely 3-nerved, usually feather-nerved. Flowers axillary, in fascicles, or in racemose heads, of a bluish-violet colour. Bracteoles small, opposite, sometimes connate under the flowers and at the bifurcations of the pedicels.

* *Branches tetragonal.*

1 M. TRINE'RVE (D. C. prod. 3. p. 5.) branches acutely tetragonal; leaves almost sessile; flowers in fascicles, nearly sessile, at the knots of the branches. ♄. S. Native of the East Indies. Leaves bluntish, with revolute margins, 2 inches long and 1 broad.

Three-nerved-leaved Memecylon. Shrub 3 to 4 feet.

2 M. ANGULÒSUM (Reichb. in Sieb. pl. exsic. maur. 2. no. 116.) branches acutely tetragonal; leaves on very short petioles, oval, rather attenuated at both ends, bluntish, 1-nerved; flowers pedicellate, in fascicles at the knots of the branches. ♄. S. Native of the Mauritius. Melaleùca ovalifòlia, Poir. suppl. 3. p. 624. Petioles 1-2 lines long. Leaves 2 inches long and 10-12 lines broad. Pedicels usually bifid and 2-flowered.

Angular-branched Memecylon. Shrub 3 to 4 feet.

3 M. OLO'PTERUM (D. C. prod. 2. p. 5.) branches 4-winged; the wings curled; leaves sessile, ovate-roundish, somewhat emarginate at the apex, shining on both surfaces, scarcely 1-nerved. ♄. S. Native of Madagascar. Leaves 5-6 lines long and 4 lines broad. Flowers solitary, pedicellate in the specimen examined but it is badly preserved.

All-winged-stemmed Memecylon. Shrub 2 feet.

4 M. SUBQUADRANGULA'RE (D. C. prod. 2. p. 6.) branches tetragonal at the apex; leaves sessile, ovate, bluntish, 1-nerved; flowers pedicellate, in fascicled umbels at the knots of the branches. ♄. S. Native of the East Indies. Leaves 2 inches long and an inch broad. Pedicels 2-3 lines long. Border of calyx entire. Flower-bud tetragonal, acute.

Subquadrangular-branched Memecylon. Shrub 3 to 4 feet.

* * *Branches terete.*

5 M. CAPITULA'TUM (Lin. spec. 497.) branches nearly terete; leaves oval, on short petioles, bluntish, 1-nerved; peduncles axillary, 3-times longer than the petiole, bearing a head of flowers. ♄. S. Native of Ceylon. Burm. zeyl. t. 30. Lam. ill. t. 284. f. 1. Blum. bijdr. p. 1094. Fruit globose, rather ventricose at the base, crowned by the bluntly 4-toothed calyx.

Small-headed-flowered Memecylon. Fl. July. Clt. 1796. Shrub 3 to 5 feet.

6 M. SPHÆROCA'RPUM (D. C. prod. 2. p. 6.) branches nearly terete; leaves on short petioles, oval, obtuse, sub-attenuated at the base, 7-nerved; peduncles axillary, many-flowered, hardly longer than the petioles. ♄. S. Native of the Mauritius. M. tinctòrium, Sieb. pl. exsic. maur. 2. p. 115. and perhaps of Willd. Leaves yellowish when dried, with rather revolute margins, 2 inches long and 1 broad. Fruit exactly globose, smaller than those of the preceding, with the limb of the calyx caducous. Flower-bud conical, acute. Border of calyx nearly entire.

Round-fruited Memecylon. Shrub 3 to 4 feet.

7 M. LAXIFLÒRUM (D. C. prod. 2. p. 6.) branches nearly terete; leaves on short petioles, ovate, acutish, 1-nerved; peduncles axillary, twice the length of the petiole; flowers umbellate. ♄. S. Native of the Mauritius. Rheed. mal. 5. t. 19.? M. tinctòrium, Willd. spec. 2. p. 347.? Blum. bijdr. p. 1094.? Fruit ovate. Leaves 12-15 lines long and 6-7 lines broad. Border of calyx repandly toothed.

Loose-flowered Memecylon. Shrub 3 to 5 feet.

8 M. RAMIFLÒRUM (Lam. dict. 4. p. 88.) branches nearly terete; leaves on short petioles, elliptic, bluntish, 1-nerved; flowers in umbellate fascicles, borne in the axils and beneath the leaves; style twice the length of the stamens. ♄. S. Native of the Mauritius and Ceylon. M. umbellàtum, Blum. bijdr. p. 1094.? Melaleùca bícolor, Poir. suppl. 3. p. 624. The figure in Burm. zeyl. t. 31. agrees well with this species, but the flowers are there represented as tetrandrous, not octandrous.

Branch-flowered Memecylon. Shrub 4 to 5 feet.

9 M. EXCE'LSUM (Blum. bijdr. p. 1094.) branches?; leaves on short petioles, elliptic-oblong, bluntly acuminated, glabrous, and rather veiny, pale beneath; fascicles of flowers corymbose, axillary; fruit oval. ♄. S. Native of Java, on Mount Salak.

Tall Memecylon. Tree 30 feet.

10 M. OVA'TUM (Smith, in Rees' cycl. vol. 23. no. 3.) branches nearly terete? leaves on long petioles, ovate, bluntly acuminated; peduncles rising on the naked parts of the branches, aggregate, umbelliferous; base of calyx 8-nerved. ♄. S. Native of the East Indies. Petioles half an inch long. Leaves 3 inches long.

Ovate-leaved Memecylon. Shrub 4 to 6 feet.

11 M. EDU'LE (Roxb. cor. 1. t. 82.) branches terete; leaves on short petioles, broadly ovate, obtuse, 1-nerved; peduncles tetragonal, usually rising from the knots beneath the leaves, umbellately racemose, many-flowered; style about equal in length to the stamens. ♄. S. Native of Coromandel, in every jungle. Fruit juicy, crowned by the 4-toothed limb of the calyx; when ripe they are eaten by the natives; they have much pulp of a bluish-black colour, and of an astringent quality.

Edible Memecylon. Clt. 1820. Tree 10 to 12 feet.

12 M. ACUMINA'TUM (Smith, in Rees' cycl. no. 4.) branches terete? leaves on short petioles, elliptic, acute; peduncles axillary, very short, umbelliferous; style about equal in length to the petals. ♄. S. Native country unknown.

Acuminated-leaved Memecylon. Tree.

13 M. GRA'NDE (Retz, obs. 4. p. 26.) arboreous; leaves ovate, acuminated, 1-nerved, on short petioles; peduncles axillary, 4-5-cleft, many-flowered. ♄. S. Native of the East Indies. Blum. bijdr. p. 1095. Nedum-Schatti, Rheed. mal. 2.

t. 15. Flowers purple. Fruit globose, ex Blum. Perhaps many species are confused under this name.

Great Memecylon. Tree 10 to 12 feet.

14 M. CORDA'TUM (Lam. dict. 4. p. 89. ill. t. 284. f. 2.) branches nearly terete; leaves sessile, cordate at the base, stem-clasping, ovate; peduncles axillary, branched; fruit crowned by the largish, bluntly 4-toothed limb of the calyx. ♄. S. Native of the East Indies and the Mauritius.

Var. a, pedunculòsum (D. C. prod. 2. p. 7.) peduncles nearly equal in length to the leaves; leaves smaller. ♄. S. Native of the East Indies.

Var. β, brèvipes (D. C. l. c.) peduncles much shorter than the leaves; leaves larger. ♄. S. Native of the Mauritius.

Cordate-leaved Memecylon. Shrub 4 to 5 feet.

15 M. FE'RREUM (Blum. bijdr. p. 1095.) branches terete? leaves petiolate, oval, very blunt, sometimes retuse, attenuated at the base, coriaceous, veinless; umbels corymbose, axillary; fruit globose. ♄. S. Native of Java, on the mountains.

Iron Memecylon. Shrub 4 to 5 feet.

16 M. CINNAMOMIOI'DES; leaves elliptic, obtusely acuminated, 3-nerved, glabrous, attenuated at the base; peduncles axillary, aggregate, longer than the petioles, umbellate, few-flowered. ♄. S. Native of Sierra Leone. (v. s. herb. Lamb.)

Cinnamon-like Memecylon. Shrub 5 to 6 feet.

17 M. AFZE'LII; leaves elliptic, attenuated at both ends, coriaceous, 1-nerved, ending in a long acumen at the apex; peduncles twin or tern, axillary; flowers umbellate. ♄. S. Native of Sierra Leone. (v. s. herb. Lamb.)

Afzelius's-leaved Memecylon. Shrub 5 to 6 feet.

18 M. BLACKIOI'DES; leaves large, sessile, very broad, coriaceous, strongly 3-nerved, the lateral veins running into a marginal nerve; corymbs compound, pedunculate, axillary. ♄. S. Native of Sierra Leone, in the woods in the low lands.

Blackia-like Memecylon. Shrub 6 to 10 feet.

Cult. A mixture of sand, loam, and peat suits the species of *Memècylon*. Young cuttings, planted in a pot of sand, with a hand-glass placed over them in heat root freely.

II. SCU'TULA (from *scutula*, a little saucer; form of the limb of the calyx). Lour. coch. p. 235. D. C. prod. 3. p. 7.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx with the tube adhering to the ovary, and with a truncate, spreading, fleshy, saucer-formed limb. Petals 4-5, connivent, seated on the border of the calyx. Stamens 8-10, with inflexed filaments and curved oblong anthers. Style filiform, simple at the apex. Berry 8-celled; cells 1-seeded. Seed compressed.—Small smooth trees, with opposite, lanceolate, quite entire leaves; and axillary and terminal peduncles, bearing blue or violaceous flowers. This genus is probably not distinct from *Memècylon*.

1 S. SCUTELLA'TA (Lour. l. c.) peduncles axillary, many-flowered; berries compressed. ♄. G. Native of Cochin-china. Flowers and fruit violaceous.

Saucer-calyxed Scutula. Shrub 8 feet.

2 S. UMBELLA'TA (Lour. l. c.) umbels terminal; berries roundish. ♄. G. Native of Cochin-china. Flowers white and party-coloured.

Umbellate-flowered Scutula. Shrub 4 feet.

Cult. See *Memècylon* for culture and propagation,

III. MOURI'RIA (*Mouririchira* is the Guiana name of *M. Guianénsis*). Juss. gen. 320. Lam. ill. t. 360. D. C. prod. 2. p. 7.—Mourìri, Aubl. guian. 1. p. 452. t. 180.—Petalòma, Swartz, prod. p. 73. fl. ind. occ. 2. p. 831. t. 14.

LIN. SYST. *Decándria, Monogýnia.* Calyx furnished with 2 scales at the base; tube adhering to the ovary; limb urceolate, 5-cleft. Petals 5, broad at the base, inserted near the apex of the calyx, and alternating with its teeth, twisted in æstivation. Stamens 10, rather unequal. Anthers oblong, opening by 2 pores at the apex. Ovary nearly globose. Style filiform. Stigma capitate. Berry globose, crowned by the coarctate toothed tube of the calyx, 1-4-celled, 1-4-seeded.—Glabrous shrubs with nodose branches, opposite, feather-nerved, acute, quite entire, coriaceous leaves, and axillary peduncles. This genus is allied to *Melastomàceæ*, according to Richard, but according to R. Brown and E. Meyer it is intermediate between *Myrtàceæ* and *Melastomàceæ;* with the first it agrees in the elevated dots and feather nerves of the leaves, and with the last in the structure of the anthers.

1 M. MYRTILLOI'DES (Poir. dict. sc. nat. 33 p. 163.) leaves almost sessile, ovate, attenuated, oblique at the base; pedicels solitary, 1-flowered. ♄. S. Native of Hispaniola and Jamaica, in woods in the lowlands. Petalòma myrtilloides, Swartz, fl. ind. occ. 2. p. 833. t. 14.—Sloane, hist. 2. p. 78. t. 87. f. 3. Flowers white. Berry ovate, black, 1, rarely 2-seeded, and 1-celled, ex Swartz. The bark is smooth and grey, with some very white spots, whence its name of *silver-wood*. The wood is hard, tough, heavy, and good for looms, handles, staves for oars, &c.

Myrtle-like Silver-wood. Clt. 1823. Shrub 2 to 3 feet.

2 M. GUIANE'NSIS (Aubl. guian. 1. p. 453. t. 180.) leaves on short petioles, ovate, acuminated, feather-nerved; peduncles crowded in the axils of the leaves, 1 or few-flowered; style filiform. ♄. S. Native of Guiana, in woods at the river Sinimari, where it is called *Mourichira*. Lam. ill. t. 360. Petalòma Mourìri, Swartz, fl. ind. occid. 835. Flowers yellow. Berry globose, yellow, dotted with red, 1-celled, 4-seeded. ex Aubl. Wood hard and whitish.

Guiana Silver-wood. Clt. 1817. Shrub 3 to 4 feet.

3 M. CAULIFLÒRA (D. C. prod. 2. p. 7.) leaves nearly sessile, ovate, much acuminated, somewhat cordate at the base; peduncles rising in umbellate fascicles from the old trunk. ♄. S. Native of Brazil, in woods. Petalòma caulifl òra, Mart. mss. Trunk straight; branches horizontal. Petals white. Filaments of a rose white colour. ex Mart. Young fruit 5-celled, or only 2-4-celled from abortion.

Stem-flowered Silver-wood. Tree 10 to 12 feet.

4 M. GRANDIFLÒRA (D. C. prod. 2. p. 8.) leaves on short petioles, ovate, acuminated, feather-nerved; peduncles short, few-flowered, crowded at the axils along the branches; style compressed. ♄. S. Native of Para, in Brazil. Petals oval, attenuated at the base, thick, rather coriaceous. Anthers large.

Great-flowered Mouriria. Shrub 3 to 4 feet.

† *Species not sufficiently known.*

5 M. MEXICA'NA (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 8.). ♄. S. Native of Mexico. Like *M. Guianénsis*, but the petals are rose-coloured; anthers hardly acute at the base, and the berries are red and 4-celled.

Mexican Silver-wood. Shrub.

Cult. See *Memècylon* for culture and propagation.

ORDER LXXXIX. COMBRETA'CEÆ (plants agreeing with *Combretum* in important characters). R. Br. nov. holl. 1. p. 351. in a note, Rich. in dict. class. 4. p. 353. D. C. diss. ined. in soc. hist. nat. gen. prod. 3. p. 9.—Myrobalàneæ, Juss. dict. sci. nat. 31. p. 458.

Flowers hermaphrodite, rarely polygamous from abortion. Calyx with the tube adhering to the ovary (f. 88. *a.*); and with a 4-5-lobed (f. 88. *c. c.* f. 89. *a.*) limb, which falls off as the flower decays. Petals sometimes wanting (f. 88. *e.*), but usually

4-5 (f. 89. *b.*), inserted near the top of the tube of the calyx, and alternating with its lobes (f. 89. *b.*). Stamens inserted in the tube of the calyx (f. 88. *c.* f. 89. *a.*), usually double the number of the lobes of the calyx (f. 89. *c.*), rarely equal or triple that number; filaments exserted, free, filiform or subulate; anthers 2-celled, bursting lengthwise. Ovary 1-celled, 2 (f. 88. *a.*)-5 (f. 89. *c.*) -ovulate; ovula pendulous from the apex of the ovarium. Style 1, slender (f. 88. *d.* f. 89. *d.*). Stigma simple. Fruit drupaceous, baccate or nucamentaceous, 1-celled, indehiscent, 1-seeded from abortion, and usually furnished with longitudinal wings. Seed pendulous, filling the cavity of the pericarp, exalbuminous. Embryo straight, having the radicle directed to the hylum, with an inconspicuous plumule, and foliaceous cotyledons, which are sometimes flattish and reflexed by a middle plait, but usually convolute, that is, spirally folded round the axis, continuous with the radicle.—Trees or shrubs, for the most part natives within the tropics, with alternate or opposite, exstipulate, feather-nerved, entire leaves, and axillary or terminal spikes or racemes of flowers.

Combretàceæ agrees with *Myrtàceæ*, in the structure of the embryo; in this respect it also accords with *Rhizophòreæ;* and with *Alangièæ*, and *Onagrarièæ*, in the general structure of the flower. With *Eleágneæ* and *Santalàceæ*, the apetalous genera agree in many important particulars. The properties are mostly astringent.

Combrètum and *Quisquàlis* are among the most splendid of the climbing plants of the tropics, adorning the trees from which they hang with garlands of white, crimson, and yellow flowers. The bark of *Bucìda Bùceras* is used with success in Guiana for tanning leather. The juice of *Terminàlia vérnix* is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of *Terminàlia Benzòin.* The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid.

Synopsis of the genera.

Tribe I.

Terminalie'æ. Flowers apetalous.

1 Buci'da. Flowers hermaphrodite, apetalous. Calyx with an urceolate 5-toothed limb. Stamens 10. Drupe baccate, containing an angular putamen.

2 Agathisa'nthes. Flowers dioecious, apetalous. Calyx 5-parted. Stamens 10. Drupe baccate, umbilicate, containing a compressed 1-seeded nut.

3 Termina'lia. Flowers usually polygamous from abortion, apetalous. Calyx campanulate, 5-cleft (f. 88. *a.*) Stamens 10 (f. 88. *c.*). Drupe crowned by the calyx, usually dry and 1-seeded (f. 87. *a. b.*).

4 Penta'ptera. All as in *Terminàlia*, but differs in the fruit being furnished with 5-7 vertical exserted wings.

5 Getònia. Flowers hermaphrodite, apetalous. Calyx campanulate, 5-parted. Stamens 10. Fruit ovate, oblong, crowned by the calyx, pentagonal.

6 Chuncòa. Flowers apetalous, some hermaphrodite, and some male. Calyx 5-cleft. Stamens 10. Fruit drupaceous, 5-angled; angles winged, two of the wings larger than the rest.

7 Ramatue'lla. Flowers unknown. Fruit 5-angled; angles winged at the apex.

8 Conoca'rpus. Flowers hermaphrodite, apetalous. Calyx 5-cleft. Stamens 5-10. Fruit corky, scale-formed, closely imbricated into a head resembling a cone.

Tribe II.

Combre'teæ. Flowers with 4 to 5 petals.

9 Laguncula'ria. Flowers hermaphrodite. Calyx 5-cleft, permanent. Petals 5, minute. Stamens 10, inclosed. Fruit marginate, coriaceous, crowned by the calyx.

10 Guil'ra. Flowers hermaphrodite. Calyx tubular, 5-toothed. Petals 5, small. Stamens 10. Capsule narrow, pentagonal.

11 Combre'tum. Flowers hermaphrodite. Calyx cylindrical (f. 89. *a.*) or campanulate, 4-5-toothed. Petals 4-5 (f. 89. *b.*). Stamens 8-10. Fruit narrow, oval, furnished with 4-5 vertical wings (f. 89. *e.*).

12 Cacou'cia. Flowers hermaphrodite. Calyx campanulate, 5-toothed. Petals 5. Stamens 10-14. Fruit ovate, 5-angled, pulpy inside.

13 Lumni'tzera. Flowers hermaphrodite, with 2 bracteas under each. Calyx tubular, 5-toothed. Petals 5. Stamens 10. Fruit dry.

14 Quisqua'lis. Flowers hermaphrodite. Calyx tubular, 5-cleft. Petals 5. Stamens 10. Fruit dry, 5-angled.

† *Genera not sufficiently known.*

15 Cerato'stachys. Flowers hermaphrodite. Calyx with an entire limb. Petals 8, small. Stamens 8-16, unequal. Drupe baccate, crowned by the limb of the calyx.

16 Bruguie'ra. Flowers hermaphrodite. Tube of calyx furnished with 2 scales in the middle. Petals 5. Stamens 10. Ovarium adnate to the calyx, containing 4 pendulous ovula. Fruit unknown.

17 Bobu'a. Flowers hermaphrodite. Calyx 5-cleft. Petals 5. Stamens 20-30. Fruit ovate, few-seeded.

Tribe I.

TERMINALIEÆ (plants agreeing with *Terminàlia* in having apetalous flowers). D. C. prod. 3. p. 9.—Myrobalàneæ, Juss. in ann. mus. 5. p. 222.—Terminaliàceæ, Jaum. exp. fam. 1. p. 178. t. 29.—Eleagnòrum, gen. Juss. gen. p. 75. Flowers apetalous, usually dioecious or polygamous.

I. BUCI'DA (from *βους*, *bous*, an ox; Dr. Browne had named this tree *buceras*, from *βους* and *κεραs*, from the shape of the process terminating the spike of flowers resembling a bull's horn). Lin. gen. 541. Lam. ill. t. 356. Gærtn. fruct. 3. p. 208. t. 217.—Bùceras, P. Browne, jam. t. 23. f. 1.—Hudsònia, Robins, in Lun. hort. jam. 2. p. 310. but not of Lin.

Lin. syst. *Decándria, Monogýnia.* Flowers hermaphrodite. Limb of calyx urceolately-campanulate, 5-toothed, deciduous. Petals wanting. Stamens 10, inserted by 2 series, 5 at the base of the limb, and the 5 longest inserted between the incisures of the calyx. Anthers didymous. Style subulate, acute. Drupe baccate, containing an angular putamen. Ovula 3. Seed 1, cylindrically oblong.—West India trees, with scattered leaves, crowded at the tops of the branches. Peduncles axillary. Flowers disposed in spikes or heads.

1 **B. BU'CERAS** (Lin. spec. 556.) leaves ovate-cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, densely clothed with adpressed silky pubescence. ♄. S. Native of the West Indies, in low swampy clayey lands near the coast. Flowers small, yellowish. Sloane, hist. 2. t. 189. f. 3. Browne, jam. t. 23. f. 1. Lam. ill. t. 356. The ends of the branches sometimes shoot out into a monstrous spongy excrescence, like an ox's horn, probably formed by insects; hence the specific name. Browne says this tree is remarkable for its slender crooked branches, and the tufted disposition of the leaves, that it grows to a considerable size, is reckoned an excellent timber tree, and that the bark is greatly esteemed by tanners. In Jamaica it is called *Black olive*, in Antigua *French oak*, and in the French Islands *Grignon*.

Ox-horn Olive-bark-tree. Fl. Aug. Sept. Clt. 1793. Tr. 20 to 30 feet.

2 **B. ANGUSTIFÒLIA** (D. C. prod. 2. p. 10.) leaves cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, clothed with rufous velvety down. ♄. S. Native of Guiana. This species comes very near to *Bùcida bùceras*, but the leaves are not half so broad, and on shorter petioles, and the spikes are more numerous from the same knot, and the stamens are more exserted.

Narrow-leaved Olive-bark-tree. Tree 20 feet.

3 **B. CAPITA'TA** (Vahl. ecl. 1. p. 50. t. 8.) leaves cuneiform, bluntish, with villously ciliated margins; flowers disposed in subglobose capitate spikes. ♄. S. Native of Mont Serrat, Porto Rico, St. Domingo, and Jamaica. Hudsònia, Robins in Lun. hort. jam. 2. p. 310. and Sloan. hist. 2. p. 176. t. 228. f. 3. Flowers yellowish. Bracteas villous. Calyxes glabrous.

Capitate-flowered Olive-bark-tree. Tree 20 to 30 feet.

4 **B. MEGAPOTA'MICA** (Spreng. syst. append. p. 177.) racemes subcorymbose; bracteas silky; calyxes woolly; leaves oblong-lanceolate, obtuse, rather mucronate. ♄. S. Native of Brazil, at the Rio Grande.

Rio Grande Olive-bark-tree. Tree.

Cult. The species of *Bùcida* grow best in a mixture of loam and peat, and cuttings of well-ripened wood strike freely, if planted in a pot of sand, with a hand-glass placed over them, in heat.

II. AGATHISA'NTHES

(from *αγαθις*, *agathis*, a round head, and *ανθος*, *anthos*, a flower; in reference to the flowers being disposed in pedunculate heads). Blum. bijdr. p. 645. D. C. prod. 3. p. 10.

LIN. SYST. *Diœ̀cia*, *Decándria*. Flowers dioecious, apetalous. Calyx of the male flowers 5-parted, with the lobes conniving imbricately. Stamens usually 10; filaments very short, inserted in a flat disk; anthers didymous. Calyx of the female flowers with a short 5-toothed limb. Style short, bifid, perforating the flat disk. Ovary 1-ovulate. Drupe baccate, umbilicate, containing a 1-seeded compressed nut. Embryo exalbuminous, inverted.—A tree 120 feet high, with crowded, oblong, quite entire, coriaceous leaves; and axillary and lateral, solitary or twin stalked heads of flowers. This genus is intermediate between *Bùcida* and *Ceratóstachys*.

1 **A. JAVA'NICA** (Blum. l. c.). ♄. S. Native of Java, in woods on the higher mountains on the west side of the island, where it is called by the natives *Hirung*.

Java Agathisanthes. Tree 120 feet.

Cult. See *Bùcida* for culture and propagation.

III. TERMINA'LIA

(from *terminus*, end; so named from the leaves being in bunches at the ends of the branches, intermixed with spikes of flowers). Lin. mant. 21. Jacq. coll. 1. p. 130. D. C. prod. 2. p. 10.—Catáppa, Myrobálanus, and Badàmia, Gærtn.—Terminàlia, Pàmia, Taniboúca, and Fatræ'a, Juss.

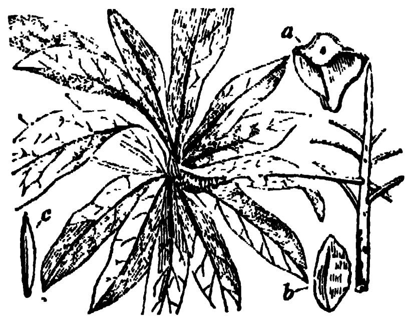
LIN. SYST. *Polygàmia*, *Monœ̀cia*. Flowers usually polygamous from abortion. Limb of calyx campanulate (f. 88. *c. e.*), deciduous, 5-cleft; lobes acute. Petals wanting. Stamens 10, inserted by 2 series, longer than the calyx. Ovary biovulate (f. 88. *a.*). Style filiform, acutish (f. 88. *d.*). Drupe not crowned by the calyx, usually dry, indehiscent, 1-seeded. Seed amygdalaceous. Cotyledons spirally convolute (f. 88. *b.*).—Tropical trees and shrubs, with alternate leaves, usually crowded at the tops of the branches. Flowers disposed in spikes; spikes racemose or panicled; the flowers in the lower part of the spikes hermaphrodite, in the upper part male. This genus is divisible by the fruit, but that in most of the species being unknown, the greater part of them remain in uncertain divisions. Those species with a 4-cleft calyx and 8 stamens ought probably to be excluded from the genus.

SECT. I. CATA'PPA (the Molucca name of *T. Catáppa*). Gærtn. fruct. 2. p. 206. t. 127. and 3. p. 207. t. 217.—Terminàlia, Lam. ill. t. 848. Drupe compressed, winged at the margins (f. 87. *a.*), or much attenuated, containing a woody putamen.

1 **T. TANIBOU'CA** (Smith in Rees' cycl. vol. 35. no. 11.) leaves elliptic, acuminated at both ends, quite entire, when young rather pubescent, when adult smooth; petioles glandless. ♄. S. Native of French Guiana. Lam. ill. 848. f. 3. R. Br. prod. nov. holl. 1. p. 351. Taniboúca Guianénsis, Aubl. guian. 1. t. 178. Catáppa Guianénsis, Gærtn. fruct. 3. p. 207. t. 217. *Tanibouca* is the Guiana name of the tree.

Tanibouca Terminalia. Tree 25 feet.

FIG. 87.



2 **T. ANGUSTIFÒLIA** (Jacq. hort. vind. 3. t. 100.) leaves linear-lanceolate, rather repand, attenuated at both ends, pubescent beneath and on the petioles, or pilose; petiole furnished with 2 glands at the apex. ♄. S. Native of the East Indies. Cròton Benzòe, Lin. mant. 297. T. Benzòin, Lin. fil. suppl. Lam. dict. 1. p. 349. Catáppa Benzòin, Gærtn. fr. 2. p. 206. t. 127. T. Benzòe, Pers. Branches in whorles. This tree produces one kind of benzoin; it is procured by wounding the tree; it is composed of large white and light brown pieces, breaking very easily between the hands. When gently dried it forms a white powder, formerly in great request as a cosmetic. Its scent is one of the most agreeable. But the most striking ingredient of this resin is the benzoic acid.

Narrow-leaved Terminalia. Clt. 1692. Tree 30 to 40 feet.

3 **T. VE'RNIX** (Lam. dict. 1. p. 350.) leaves linear-lanceolate, tapering to both ends, glabrous as well as the branches and petioles. ♄. S. Native of the Moluccas. A'bor vernicis, Rumph. amb. 2. p. 259. t. 86. Perhaps the petiole is furnished with 2 glands. The juice of the tree is employed in the countries of its natural growth as a varnish.

Varnish Terminalia. Tree 15 feet.

4 **T. MAURITIA'NA** (Lam. dict. 1. p 349. ill. t. 848. f. 2.) leaves oblong-lanceolate, attenuated at both ends, rather repand, glabrous; petiole furnished with 2 glands at the top. ♄. S. Native of the Mauritius and Bourbon, where a resin is collected

from the tree similar to Benzoin. T. angustifòlia, Pet. Th. obs. pl. afr. austr. 19. Catáppa Mauritiàna, Gærtn. fil. 3. p. 207. exclusive of the synonyme of Aublet.

Mauritian Terminalia. Tree 40 to 50 feet.

5 T. Cata'ppa (Lin. mant. 519.) leaves obovate, tapering to the base, pubescent beneath; glands small, situated at the base of the leaves on the under surface at the sides of the middle nerve. ♄. S. Native of the East Indies, and now cultivated in many of the West India islands. Jacq. icon. rar. 1. t. 197. Lam. ill. t. 848. f. 1. Adamàrum, Rheed. mal. 4. t. 3. and 4. Fruit ovate-roundish, compressed. Leaves obtuse, and somewhat acuminated. Drupe about 3 inches long, egg-shaped, containing an oblong kernel, which has the taste of an almond, and may be used for the same purposes, but it does not contain so much oil. Within the tropics the trees are commonly planted near houses in avenues, and seats are placed under them, for the enjoyment of the close extensive shade they afford. The timber is light and lasting, and is useful for many purposes. The bark and leaves yield a black pigment, with which the Indians dye their teeth, and Indian ink is made. Blume describes his *T. Catáppa* (bijdr. p. 610.) as having the leaves cordate at the base, obsoletely crenulated, glabrous, and rather pubescent on the mid-rib beneath.

Var. β, subcordàta (Willd. spec. 4. p. 968.) leaves obovate, rather cordate at the base, obtuse, pubescent beneath, or glabrous in the adult state; glands small, situated at the base of leaves beneath, at the sides of the middle nerve. ♄. S. Native of the West Indies, but only perhaps cultivated there. H. B. et Kunth, nov. gen. amer. 6. p. 113. T. intermèdia, Bert. ex Spreng. syst. 2. p. 359. Hardly distinct from the species.

Catappa Terminalia. Clt. 1778. Tree 20 to 40 feet.

6 T. Molluca'na (Lam. dict. 1. p. 349.) leaves obovate, obtuse at the base, and biglandular, quite entire, glabrous on both surfaces in the adult state, standing on short petioles. ♄. S. Native of the Moluccas and East Indies. Catáppa, Rumph. amb. 1. p. 174. t. 68. This species differs from *T. Catáppa* in the flowers being usually double the size, in the disk being large and villous, and in the drupe being larger and hardly crested.

Molucca Terminalia. Clt. 1804. Tree 30 to 40 feet.

7 T. glabra'ta (Forst. prod. p. 389. pl. escul. p. 52.) leaves obovate, cuneated at the base, quite entire, glabrous on both surfaces; petioles longish, pubescent. ♄. S. Native of the Friendly and Society Islands. Spreng. antiq. bot. t. 2. According to Forster, this species differs from *T. Catáppa* in the leaves being glabrous beneath, and not above half the size, and in the nut being very much smaller, oval, less furrowed, never marginate, but acute, compressed, and membranous, and as if it was appendiculated at the apex. In the South Sea islands this tree is cultivated near the huts and in the burial-places. In the language of Otaheite it is named *Auwira* or *e-Tara-iri* and *e-Tara-heimi*, and is accounted sacred to their idols. The wood is used in building boats, and in making drums, benches, &c. The kernels are eaten and have the flavour of almonds.

Smooth Terminalia. Tree 30 to 50 feet.

8 T. Januare'nsis (D. C. prod. 3. p. 11.) leaves oblong-lanceolate, quite entire, or crenately repand; peduncles lateral, few-flowered; drupe compressed, quadrangular, winged. ♄. S. Native of Brazil, on Mount Cercovado, near Rio Janeiro. Catáppa Braziliénsis, Raddi, quar. piant. add. p. 26. f. 6. in act. soc. ital. 1820. vol. 18. p. 414. but not *T. Braziliénsis* of Spreng. Perhaps a species of *Combrètum.*

Rio Janeiro Terminalia. Tree 6 to 10 feet.

9 T. fagifòlia (Mart. fl. bras. 1. p. 42. t. 29.) leaves in fascicles, ovate, or oval-oblong, acutish, mucronate, glandless, clothed with silky villi on both surfaces; spikes naked at the base, axillary, crowded with flowers, shorter than the leaves; drupe large, furnished with 2 wings. ♄. S. Native of Brazil, in the province of Minas Geraes, where it is called *Caxapora de Gentio.* Nectary fleshy, plicately 5-lobed at the base of the style.

Beach-leaved Terminalia. Tree 10 to 30 feet.

10 T. lanceola'ta (Mart. l. c.) leaves in fascicles, ovate-lanceolate, acutish, mucronate, clothed with silky pubescence. ♄. S. Native of Brazil, in the province of Bahia. Said to be like the preceding, but the branches are slenderer, epidermis thinner, and the leaves are lanceolate, green, and tapering more to the base.

Lanceolate-leaved Terminalia. Shrub 3 to 10 feet.

11 T. arge'ntea (Mart. fl. bras. 1. p. 43.) leaves opposite, ovate, acuminated, pubescent above, and shining and silky beneath. ♄. S. Native of Brazil, in the province of Bahia, at Villa do Rio da Contas. A yellow resinous juice flows from this tree, which is used instead of gamboge by the inhabitants.

Silvery Terminalia. Tree.

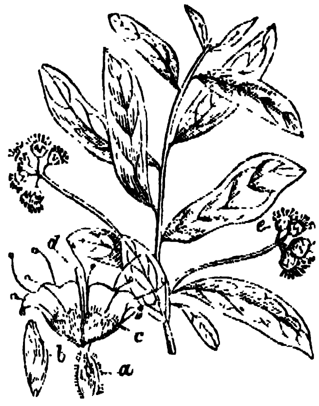
12 T. seri'cea (St. Hil. fl. bras. 2. p. 243.) leaves oblong, acuminated, quite entire, glandless, clothed with silky silvery down; flowers disposed in dense heads. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Drupe winged.

Silky Terminalia. Tr. 20 ft.

13 T. austra'lis (St. Hil. fl. bras. 2. p. 240. t. 128.) leaves lanceolate, tapering into the petiole at the base, acute, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. ♄. S. Native of Brazil, in the province of Minas Geraes. Flowers yellowish. Drupe winged on each side. (f. 88.)

Southern Terminalia. Tree. 8 to 10 feet.

FIG. 88.



Sect. II. Myroba'lanus (μυροβαλανος, a name under which Dioscorides speaks of an Egyptian tree, whose fruit yields a perfumed liquor, from μυρον, *myron*, perfume, and βαλανος, *balanos*, a nut). D. C. prod. 3. p. 12.—Myrobálanus and Badàmia, Gærtn. fruct. 2. p. 90. t. 97.—Myrobálanus, Lam. ill. t. 849. Drupe ovate or a little compressed, dry or baccate, containing a roundish, angularly-furrowed putamen.

14 T. obova'ta (St. Hil. fl. bras. 2. p. 241.) leaves obovate-oblong, narrowed into the petiole at the base, mucronulate, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. ♄. S. Native of Brazil, in the province of Minas Geraes, on the mountains called Serra Negra, where it is called *Carascos.* Drupe ovoid, attenuated at both ends.

Obovate-leaved Terminalia. Tree 20 feet.

15 T. adama'ntum (St. Hil. fl. bras. 2. p. 241.) leaves oblong, narrowed at the base, rounded at the apex, and mucronulate, quite entire, glandless, pubescent; spikes naked at the base, but dense-flowered above the middle. ♄. S. Native of Brazil, in the province of Minas Geraes, in the Distrito Diamantes.

Adamant Terminalia. Tree.

16 T. latifòlia (Swartz, fl. ind. occ. 2. p. 747.) leaves alternate, obovate, tapering to the base, obtuse, and almost entire, glabrous on both surfaces, glandless. ♄. S. Native of Jamaica, in all the great inland woods. Racemes length of leaves. Drupe ovate, acuminated, boat-shaped, fleshy, coriaceous. Nerves of young leaves as well as the petioles covered with very short velvety down. Calyxes pubescent.

Var. β, dichótoma (Meyer, esseq. 177.) flowers woolly. ♄. S.

Native of Guiana, in the island of Arowabisch, in woods. Probably a distinct species.

Broad-leaved Terminalia. Clt. 1800. Tree 30 to 40 feet.

17 T. BENGALE'NSIS (Roxb. hort. beng. p. 33.) leaves alternate, obovate, obtuse, quite entire, glabrous on both surfaces, glandless as well as the petioles. ♄. S. Native of Bengal. T. rotàta, Roxb. in herb. Lamb. Perhaps *T. myrobálana*, Roth. is referrible to this species.

Bengal Terminalia. Tree 100 feet.

18 T. BELLE'RICA (Roxb. cor. 2. p. 54. t. 198.) leaves alternate, elliptic, quite entire, acutish at both ends, glabrous, on long petioles; petiole furnished with 2 small, opposite, or subalternate glands at the apex. ♄. S. Native of the East Indies, on the mountains. Myrobálanus Bellérica, Breyn. icon. 18. t. 4. Gærtn. fruct. 2. p. 90. t. 97. Tàni, Rheed. mal. 4. t. 10. Drupe ovate, bluntly pentagonal, fleshy. Flowers fetid. A quantity of insipid gum like gum-arabic issues from this tree when wounded. The kernel of the nut is reported to intoxicate if eaten in any great quantity.

Belleric Terminalia. Clt. 1818. Tree 100 feet.

19 T. CHE'BULA (Retz. obs. 5. p. 31. Roxb. cor. 2. p. 52. t. 197.) leaves nearly opposite, ovate, acutish, petiolate, glabrous above in the adult state, but when young they are clothed with silky villi on both surfaces; glands 2 at the top of the petiole, and many on the margin of the limb. ♄. S. Native of the East Indies, on the mountains. Myrobálanus Chébula, Gærtn. fruct. 2. p. 90. t. 97. Drupe ovate, bluntly angular, the alternate angles the largest; flesh hard and brittle. Nut pentagonal. The outer coat of the fruit mixed with salt of steel makes a very durable ink. The galls, called cadacay by the Tamuls, are found on the leaves of this tree, and are probably produced by the punctures of insects on the tender leaves. With them and alum the best and most durable yellow is dyed, and in conjunction with ferruginous mud a black is procured from them.

Chebula Terminalia. Clt. 1796. Tree 40 to 50 feet.

20 T. CI'TRINA (Roxb. hort. beng. p. 33.) leaves alternate, ovate, acuminated, quite entire, glabrous, petiolate; petioles furnished with 2 thick glands at the apex. ♄. S. Native of the East Indies. Myrobálanus citrina, Gærtn. fruct. 2. p. 90. t. 97. Drupe ovate-oblong, tapering downwards, yellowish.

Citron-fruited Terminalia. Clt. 1823. Tree 40 to 50 feet.

21 T. ARU'TA (Hamilt. mss. in herb. Lamb.) leaves alternate, elliptic, puberulous as well as the petioles, which are furnished with 2 or 3 opposite glands at the apex; fruit obovate. ♄. S. Native of the East Indies.

Aruta Terminalia. Tree.

22 T. NI'TIDA (Roxb. in herb. Lamb.) leaves alternate, elliptic, tapering to both ends, acuminated at the apex, glabrous; spikes axillary; calyx very woolly inside. ♄. S. Native of the East Indies.

Nitid-leaved Terminalia. Tree.

23 T. PRO'CERA (Roxb. cor. 3. t. 224.) leaves alternate, obovate, quite entire, obtuse, with an acumen, on short petioles, glabrous, but bearing hairs in the axils of the lateral nerves, and bearing 2 glands on the under surface at the base at the sides of the middle nerve. ♄. S. Native of Coromandel. Branches horizontal, whorled. Limb of calyx rotate. Drupe oblong, obscurely 5-angled.

Tall Terminalia. Clt. 1816. Tree 50 to 100 feet.

24 T. FATRÆ'A (D. C. prod. 3. p. 12.) leaves alternate, hardly petiolate, oval, quite entire, obtuse, or mucronate, glabrous on both surfaces. ♄. S Native of Madagascar. Fatræ'a, Juss. dict. sci. nat. 16. p. 206. Pet. Th. obs. pl. afr. aust. p. 19. Myrobálanus Fatræ'a, Poir. suppl. 3. p. 708. T. Madagascariénsis, Spreng. syst. 2. p. 358. Drupe ovate, olive-formed, obsoletely angular.

Fatræa Terminalia. Clt. 1826. Tree 20 to 40 feet.

25 T. RHOMBOI'DEA (Spreng. syst. 2. p. 358.) leaves alternate, oblong-lanceolate, acutish at both ends, quite entire, glabrous, on short petioles. ♄. S. Native of Madagascar. Myrobálanus, Lam. ill. t. 849. f. 1. Myrobálanus rhomboídea, Poir. suppl. 3. p. 708. Drupe dry, oval, rather rhomboid, acutish at both ends, with 6-7 acute deep angles.

Rhomb-fruited Terminalia. Shrub 6 to 10 feet.

26 T. BADA'MIA (D. C. prod. 3. p. 12.) leaves obovate; drupe dry, elliptic, smooth; flesh spongy; putamen with 6 wings. ♄. S. Native of Madagascar. Badàmia Commersònii, Gærtn. fruct. 2. p. 90. t. 97. Myrobálanus, Lam. ill. t. 849. f. 2. Myrobálanus Terminàlia, Poir. suppl. 3. p. 707. Flowers unknown. *Badamier* is the name of the tree in the Isle of France.

Badamia Terminalia. Tree 30 feet.

27 T. PA'MEA (D. C. prod. 3. p. 13.) leaves alternate, oblong, attenuated at the base, acutish at the apex, petiolate, glabrous; drupes oblong, bluntly trigonal, rather baccate. ♄. S. Native of French Guiana, in woods. Pâmea Guianénsis, Aubl. guian. 2. p. 946. t. 359. Leaves crowded at the tops of the branches. Flowers unknown. *Pame* is the Guiana name of the tree.

Pame Terminalia. Tree 4[illegible] feet.

† *Fruit of the following species unknown, or very doubtful.*

* *Flowers 4-cleft, octandrous.*

28? T. ERYTHROPHYLLA (Burch. cat. no. 1749. trav. 1. p. 400.) leaves alternate and opposite, quite entire, elliptic, acuminated, glabrous, rather ciliated, glandless; petioles very short, pubescent as well as the branches. ♄. G. Native of the Cape of Good Hope. Peduncles axillary, shorter than the leaves. Spikes ovate, capitate. Flowers hermaphrodite. Perhaps a species of *Combrètum*.

Red-leaved Terminalia. Tree 40 feet.

29 T.? VILLÒSA (Spreng. neue. entd. 2. p. 111.) leaves alternate, oblong, attenuated at both ends, denticulated, petiolate, glabrous above, villous beneath; panicles axillary, clothed with rusty villi. ♄. S. Native of Brazil. Calyx corolline, villous inside. Stamens 8, exserted. Perhaps a species of *Combrètum*.

Villous Terminalia. Shrub.

30 T.? DI'SCOLOR (Spreng. l. c.) leaves obovate-oblong, quite entire, glabrous, rufous beneath; panicle terminal; branches angularly-compressed, glabrous. ♄. S. Native of Brazil. Calyx 5-lobed. Stamens said to be 8.

Discoloured-leaved Terminalia. Tree.

* * *Flowers 5-cleft, decandrous.*

31 T. ARBU'SCULA (Swartz, fl. ind. occ. 750.) leaves scattered, ovate-lanceolate, entire, on short petioles, pubescent when young, at length glabrous; spikes length of the leaves. ♄. S. Native of the north of Jamaica. Limb of calyx urceolate, 5-toothed, villous inside. Stamens 10, exserted. Fruit unknown.

Shrubby Terminalia. Clt. 1822. Shrub 6 to 10 feet.

32 T. SERI'CEA (Burch. cat. geogr. afr. austr. no. 2399.) leaves alternate, crowded at the tops of the branches, oblong, mucronate, sessile, quite entire, clothed with silky adpressed villi on both surfaces; spikes shorter than the leaves, pedunculate, ovate, clothed with silky villi. ♄. S. Native of the Cape of Good Hope. Limb of calyx 5-cleft. Stamens inclosed in the specimen examined, but they were probably not mature.

Silky Terminalia. Shrub 6 to 8 feet.

33 T.? MONA'PTERA (Roth. nov. spec. 382.) leaves alternate, oblong-ovate, acutish, obtuse at the base, wrinkled above and pubescent, but tomentose beneath, and biglandular at the base; drupe ovate, tomentose, furnished with 1 or 3 wings. ♄. S.

Native of the East Indies. Perhaps a species of *Pentáptera* or *Combrètum*.

One-winged-fruited Terminalia. Tree.

34 T. PANICULA'TA (Roth. nov. spec. p. 383.) leaves petiolate, oblong-oval, obtuse at both ends, rather pilose, quite entire, biglandular beneath at the base; spikes densely panicled, tomentose. ♄. S. Native of the East Indies. Fruit unknown.

Panicled Terminalia. Tree.

* * * *Species whose fruit and stamens remain undescribed.*

35 T. CILIA'TA (Spreng. syst. 2. p. 359.) leaves obovate-oblong, obtuse, attenuated at the base, ciliated, quite glabrous on both surfaces, glandless at the base; peduncles racemose, elongated, biglandular at the base. ♄. S. Native of the East Indies.

Ciliated-leaved Terminalia. Tree.

36 T.? RETICULA'TA (Roth. nov. spec. 381.) leaves opposite, oval, obtuse at both ends, quite entire, clothed with silky pili, dotted above, and reticulated with black beneath. ♄. S. Native of the East Indies. Petioles 3 lines long, clothed with rufous velvety down. Spikes compound. Stamens exserted. Fruit unknown. Perhaps a species of *Pentáptera*.

Reticulated-leaved Terminalia. Shrub or tree.

37 T. PUNCTA'TA (Roth. nov. spec. p. 381.) leaves alternate, elliptic, attenuated at both ends, glandless, quite entire, obtuse at the apex, pubescent, dotted above, on long petioles. ♄. S. Native of the East Indies. Spikes simple, a little longer than the petioles. Stamens longer than the calyx. Fruit unknown.

Dotted-leaved Terminalia. Shrub or tree.

38 T. ELLI'PTICA (Willd. spec. 4. p. 969.) leaves oblong-elliptic, obtuse, quite entire, glabrous above, and rather pilose beneath, biglandular at the base. ♄. S. Native of the East Indies. Glands of leaves cup-shaped, somewhat pedicellate. Spikes panicled, terminal. Stamens and fruit unknown.

Elliptic-leaved Terminalia. Shrub or tree.

39 T. TRIFOLIA'TA (Spreng. syst. 2. p. 358.) leaves ternate, lanceolate, bluntish, glabrous, of a different colour beneath; racemes panicled, smooth. ♄. S. Native of Brazil. The rest unknown.

Trifoliate Terminalia. Shrub or tree.

40 T. MACROSTE'MON (Spreng. syst. 2. p. 14.) leaves oblong-lanceolate, acuminated, coriaceous, veiny, quite glabrous on both surfaces; branches of panicle verticillate, pubescent; stamens elongated. ♄. S. Native of Brazil. The rest unknown.

Long-stamened Terminalia. Shrub or tree.

41 T. LU'CIDA (Hoffmansegg. ex Mart. fl. bras. 1. p. 43.) leaves opposite, ovate-oblong, acute, coriaceous, glabrous on both surfaces, and glandless at the base; spikes numerous, aggregate, pubescent. ♄. S. Native of Brazil in moist woods, in the province of Para. Fruit unknown.

Shining-leaved Terminalia. Shrub or tree.

42 T. FI'RMA (Mart. ex Spreng. syst. 2. p. 358.) leaves in bundles, obovate, mucronate, coriaceous, with revolute margins, glabrous on both surfaces and reticulated; spikes terminal, aggregate, villous. ♄. S. Native of Brazil on high mountains, in the province of the Rio-Negro. The rest unknown.

Firm Terminalia. Tree.

43 T. BRASILIE'NSIS (Spreng. syst. 2. p. 358.) leaves oblong, membranous, glandularly crenated, veiny, smoothish; flowers in fascicled racemes. ♄. S. Native of Brazil. The rest unknown.

Brazil Terminalia. Shrub or tree.

Cult. See *Bùcida* for culture and propagation. p. 657.

IV. PENTA'PTERA (from πεντε, *pente*, five, and πτερον, *pteron*, a wing; in reference to the fruit being furnished with 5 wings). Roxb. hort. beng. p. 34. D. C. prod. 2. p. 14.

LIN. SYST. *Polygàmia, Monœ'cia.* All as in *Terminàlia*, except the drupe, which is coriaceous and ovate, furnished with 5-6 regular vertical wings.—East Indian trees, with opposite or sub-opposite petiolate leaves, which are biglandular at the base. Spikes of flowers axillary and terminal, usually so close together as to form a brachiate panicle. Flowers 5-cleft, decandrous. Perhaps only a section of *Terminàlia*, or perhaps numbers of the Indian species of *Terminàlia*, whose fruit are unknown, are referrible to this genus.

1 P. TOMENTÒSA (Roxb. l. c. D. C. diss. t. 1.) leaves nearly opposite, on short petioles, ovate, repandly crenulated, obtuse at both ends, mucronate at the apex, somewhat dotted beneath, and velvety on the nerves, and bearing 2 thick cup-shaped glands at the base. ♄. S. Native of the East Indies, where it is called *Usun* or *Usuna*. Terminàlia alàta, Roth. nov. spec. 378. Leaves 7-9 inches long, and 3 broad. Spikes disposed in a brachiate panicle. Flowers hairy. Fruit glabrous, with the wings coriaceous and much extended.

Tomentose Pentaptera. Tree 40 ft.

2 P. PANICULA'TA (Roxb. l. c.) leaves nearly opposite, petiolate, oval-oblong, acutish, obtuse at the base, quite entire, glabrous on both surfaces, coriaceous, bearing 2 thick cyathiform glands at the base beneath. ♄. S. Native of Coromandel, where it is called *Ninmeeri* and *Pokarakai*. Leaves 5-6-inches long, and 2 inches broad. Spikes clothed with adpressed velvety down, forming a brachiate panicle. Flowers hairy.

Panicled Pentaptera. Tree 40 ft.

3 P. ARJU'NA (Roxb. l. c. D. C. diss. t. 2.) leaves nearly opposite, petiolate, oblong, acute, bluntish at the base, quite glabrous on both surfaces, entire, bearing 2 small glands at the origin of the pagina. ♄. S. Native of the East Indies, where it is called *Urjoon*, whence the trivial name. Leaves glaucescent, 3-5 inches long, and an inch broad. Spikes usually tern, panicled. Drupe furnished with 6-7 thick coriaceous wings.

Urjoon Pentaptera. Tree 50 ft.

4 P. OBOVA'TA (D. C. prod. 3. p. 14.) leaves opposite, on short petioles, obovate, very blunt at the apex or emarginate, and rather narrowed at the base, quite entire, glabrous on both surfaces, bearing 2 marginal concave glands at the origin of the limb. ♄. S. Native of the East Indies, where it is called *Mardemarum*. Terminàlia alàta, Leschen. herb. Leaves 3 inches long, and 1 broad, sometimes glandless. Spikes usually tern, panicled. Flowers in fascicles along the rachis.

Obovate-leaved Pentaptera. Tree 40 feet.

5 P. CUNEA'TA (D. C. prod. 3. p. 14.) leaves opposite, petiolate, oblong, cuneate-elliptic, acutish, quite entire, glabrous above, and clothed with rufous pubescence beneath, bearing 2 small glands at the base. ♄. S. Native of the East Indies. Terminàlia cuneàta, Roth. nov. spec. p. 379. Spikes constituting a terminal panicle. Flowers in fascicles along the rachis. Drupe ovate, 5-angled, 5-furrowed; angles winged. Leaves sometimes glandless.

Cuneate-leaved Pentaptera. Tree 50 ft.

6 P. CRENULA'TA (D. C. prod. 3. p. 15.) leaves nearly opposite, on short petioles, oblong-oval, acutish, but somewhat cordate at the base, crenulated, dotted above, rufous beneath, and furnished with 2 glands at the base. ♄. S. Native of the East Indies. Terminàlia crenulàta, Roth. nov. spec. p. 380. Perhaps the same as P. crenulàta, Roxb. hort. beng. p. 34. Spikes opposite, superior ones tern. Flowers pubescent, in fascicles. Fruit unknown.

Crenulated-leaved Pentaptera. Tree 40 ft.

7 P. MARA'DU; leaves nearly opposite, long, oblong, glabrous above; fruit large, 5-winged. ♄. S. Native of the East Indies. Terminàlia Maràdu, Hamilt. mss. in herb. Lamb.

Muradu Pentaptera. Tree 50 ft.

8 P. GLA'BRA (Roxb. hort. beng. p. 34.) leaves nearly opposite, oblong or obovate-oblong, obtuse, glabrous, furnished with 2 glands at the base on the middle nerve, discoloured beneath; panicle terminal, composed of spikes. ♄. S. Native of the East Indies, where it is called *Della-madoo*.

Glabrous Pentaptera. Tree 50 ft.

9 P. ALA'TA (Banks, herb.) leaves elliptic-obovate, obtuse, and mucronate, glabrous, furnished with 2 glands at the base of the limb; branches, rachis, and calyxes drooping; spikes on long peduncles, axillary or terminal, simple. ♄. S. Native of Tranquebar.

Winged-fruited Pentaptera. Tree 40 ft.

† *Species only known by name from Roxb. hort. beng. p.* 34.

10 P. CORIA'CEA (Roxb.) Native of Coromandel, where it is called *anemutti*. Perhaps the same as *Terminàlia coriàcea* of Rottl.

Coriaceous-leaved Pentaptera. Tree 40 ft.

11 P. BIALA'TA (Roxb.) Native of the East Indies.

Two-winged-fruited Pentaptera. Tree 40 ft.

Cult. See *Bùcida* for culture and propagation, p. 657.

V. GETO'NIA (the author does not say from whence this name is derived). Roxb. cor. 1. t. 87. Gærtn. fruct. 3. p. 210. t. 217. D. C. prod. 2. p. 15.—Calycópteris, Lam. ill. t. 357. Poir. suppl. 2. p. 41.

LIN. SYST. *Decándria, Monogýnia*. Limb of calyx permanent, campanulate, cleft almost to the base into 5 parts; lobes lanceolate, 3-nerved. Petals wanting. Stamens 10, exserted, disposed in 2 series, shorter than the calycine lobes, 5 inserted at the recesses of the lobes, and the other 5 inserted in the bottom of the calyx. Anthers orbicular, didymous. Style filiform, obtuse, pubescent. Nut roundish, pentagonal, crowned by the calyx, 1-celled, 1-seeded.—Climbing shrubs, with opposite ovate acuminated leaves, on short petioles, full of small resinous dots beneath. Racemes axillary, or constituting a terminal panicle.

1 G. FLORIBU'NDA (Roxb. cor. 1. t. 87.) leaves ovate, acute, pubescent above, and clothed with rusty tomentum beneath; panicle terminal. ♄. ◡. S. Native of Malabar. Roth. nov. spec. 216. Perhaps the same as Calycópteris floribúnda, Lam. ill. t. 357. a native of Madagascar, which, according to Poir. suppl. 2. p. 41. has glabrous leaves.

Bundle-flowered Getonia. Clt. 1815. Shrub cl.

2 G. NU'TANS (Roxb. hort. beng. p. 33.) leaves ovate, ending in a long abrupt acumen, glabrous above except the nerve, pubescent beneath; racemes for the most part axillary, longer than the leaves. ♄. ◡. S. Native of the East Indies. G. nítida, Roth. nov. spec. 217. Flowers nearly twice the size of those of the preceding species.

Var. β, *brachystàchya* (D. C. prod. 3. p. 15.) leaves ovate, acute, glabrous above except the nerve, pubescent beneath; racemes axillary, shorter than the leaves. ♄. S. Native country unknown. Perhaps a variety of *G. floribúnda*, or perhaps a species.

Nodding-racemed Getonia. Clt. 1816. Shrub cl.

Cult. See *Combrètum* for culture and propagation, p. 670.

VI. CHUNCO'A (*Arbol del Chunchu* is the name of the first species in Peru). Pav. in Juss. gen. p. 76. (1789.) Poir. suppl. 2. p. 258. Gimbernàtia, Ruiz et Pav. fl. per. prod. p. 138. t. 36. (1794).

LIN. SYST. *Decándria, Monogýnia*. Flowers some of them hermaphrodite, and others male. Limb of calyx 5-toothed, deciduous. Petals wanting. Stamens 10, filiform, length of the calyx; anthers roundish. Style filiform. Fruit drupaceous, oblong, coriaceous, 5-angled; angles winged, the 2 opposite ones the largest. Seed one, pendulous.—Peruvian trees, with alternate scattered leaves, and axillary spikes or racemes of flowers; those flowers at the base of the spikes hermaphrodite, and those at the apex male. The internal structure of the seeds is scarcely known. Ventenat doubts if the cotyledons are truly convolute. The genus is probably distinct from *Terminàlia*.

1 C. OBOVA'TA (Poir. l. c.) leaves obovate, acuminated; spikes pendulous; fruit 5-winged. ♄. S. Native of Peru, at Cuchera and Macora, where it is called *Arbol del Chunchu*. Gimbernàtia obovàta, Ruiz et Pav. prod. 138. syst. 174. and Spreng. syst. exclusive of the synonyme of Aublet.

Obovate-leaved Chuncoa. Tree 40 feet.

2 C. OBLO'NGA (Poir. l. c.) leaves oblong; spikes crowded; fruit furnished with 2 wings. ♄. S. Native of Peru, in woods at Pozuzo. Gimbernàtia oblónga, Ruiz et Pav. l. c.

Oblong-leaved Chuncoa. Tree.

3 C. BRASILIE'NSIS (St. Hil. fl. bras. 2. p. 244.) leaves obovate-oblong, quite entire, biglandular at the base; spikes nearly sessile, many-flowered; fruit pubescent. [illegible]. S. Native of Brazil, in the provinces of Minas Gera[illegible] and Goyaz.

Brazilian Chuncoa. Tree 20 ft.

Cult. See *Bùcida* for culture and propagation, p. 657.

VII. RAMATUE'LLA ([illegible]*aturelle* is the vernacular name of the tree). D. C. prod. 3. [illegible] 16.—Ramatuèla, H. B. et Kunth, nov. gen. amer. 7. p. 253. [illegible] 656.

LIN. SYST. and flowers unknown. Fruit coriaceous and woody, indehiscent, 1-seeded, 5-angled; angles winged above, and ending in a tapering beak at the apex. Seed ovate-subconical, marked by the raphe on one side. Cotyledons convolute.—A shrub, having the leaves crowded by threes or fours at the tops of the branches, quite entire, coriaceous. Peduncles terminal, but at length lateral. Fruit sessile, crowded into heads.

1 R. ARGE'NTEA (H. B. et Kunth, l. c.) ♄. S. Native of South America, on the banks of the river Atabapo. Leaves obovate-cuneated, glabrous above, and silky beneath.

Silvery Ramatuella. Shrub 5 to 6 feet.

Cult. See *Bùcida* for culture and propagation, p. 657.

VIII. CONOCA'RPUS (from κωνος, *konos*, a cone, and καρπος, *karpos*, a fruit; in reference to the scale-formed fruit being so closely imbricated in a head as to resemble a small fir-cone). Gærtn. fruct. 2. p. 470. t. 177. H. B. et Kunth, nov. gen. amer. 6. p. 113. but not of Adans.—Conocárpus spec. Jacq. and Lin. —Rudbèchia, Adans. fam. p. 80. but not of Lin.

LIN. SYST. *Penta-Decándria, Monogýnia*. Tube of calyx 5-cleft, deciduous. Petals wanting. Stamens 5-10, exserted; anthers cordate. Ovarium compressed, biovulate. Style 1. Fruit corky, scale-formed, closely imbricated, indehiscent, 1-seeded. Seed pendulous. Cotyledons involute.—Shrubs, with alternate quite entire leaves, rarely nearly opposite ones. Heads of flowers pedunculate; flowers crowded.

SECT. I. EUCONOCA'RPUS (from ευ, *eu*, well or good, κωνος, *konos*, a cone, and καρπος, *karpos*, a fruit; this section contains those species whose fruit is so densely imbricated as to appear like a fir-cone). D. C. prod. 3. p. 16. Fruit somewhat boat-shaped, hardly winged on the margins, awnless at the apex, imbricated backwards. Tube of calyx not drawn out beyond the ovarium, with a sessile limb seated obliquely on the ovary.

1 C. ERE'CTA (Jacq. amer. 78. t. 52. f. 1. H. B. et Kunth, nov. gen. amer. 6. p. 118.) leaves oblong-lanceolate, tapering to both ends, thickish, glabrous, or when young rather downy, usually biglandular at the base; heads of flowers panicled. ♄. S. Native of South America, West Indies, Tropical Africa, and Asia, in sandy places near the sea or on banks of rivers, as far up as the tide reaches, and usually growing along with mangroves. —Sloane, hist. 2. p. 161. f. 2.—Cat. car. t. 33.

Erect Conocarpus. Clt. 1752. Shrub 6 to 8 feet.

2 C. PROCU'MBENS (Jacq. amer. 79. t. 51. f. 2.) stems much branched, procumbent; leaves obovate, glabrous; heads panicled. ♄. S. Growing along with the last, and lying flat on the ground. C. erécta var. β, procúmbens, D.C. prod. 3. p. 16.

Procumbent Conocarpus. Clt. 1730. Pl. prostrate.

3 C. ACUTIFÒLIA (Willd. in Rœm. et Schultes. syst. 5. p. 574.) stems erect; leaves lanceolate, acute at both ends; heads of flowers solitary and axillary, or aggregate at the tops of the branches; branches pubescent. ♄. S. Growing along with the two preceding species.

Acute-leaved Conocarpus. Clt. 1820. Shrub 5 to 8 feet.

4 C. SERI'CEA (Forst. in herb. Lher.) leaves oblong, acuminated at both ends, clothed with silky villi on both surfaces even in the adult state; heads panicled. ♄. S. Native of South America? C. erécta var. γ serícea, D.C. prod. 3. p. 16.

Silky Conocarpus. Shrub.

SECT. II. LEIOCARPUS (from λειος, *leios*, smooth, and καρπος, *karpos*, a fruit). Fruit loosely imbricated backwards, amply winged on the margins, and ending in a short acumen at the apex. Tube of calyx stretched out a little beyond the ovarium. —African species.

5 C. LEIOCA'RPA (D. C. prod. 2. p. 16.) leaves oval, glandless, glabrous, hardly pubescent on the nerve beneath; heads axillary, pedunculate, solitary; fruit quite glabrous. ♄. S. Native of Senegal and Gambia.

Smooth-fruited Conocarpus. Shrub 5 to 6 feet.

SECT. III. ANOGEI'SSUS (from ανα, *ana*, upwards, and γεισσον, *geisson*, a tile; in reference to the scale-like fruit being imbricated upwards in the heads). D. C. prod. 3. p. 16. Fruit imbricated upwards, drawn out into a long acumen at the apex. Tube of calyx drawn out beyond the ovarium, and so slender as to give the limb the appearance of being pedicellate.—Indian species.

6 C. ACUMINA'TA (Roxb. hort. beng. p. 34.) leaves glandless; heads axillary, pedunculate, solitary; fruit clothed with adpressed villi. ♄. S. Native of the East Indies, where it is called *panch-maun*. Andersònia acuminàta, Roxb. herb. Leaves elliptic, acute, glabrous above, and clothed with adpressed down beneath. Heads globose, shorter than the leaves.

Acuminated Conocarpus. Shrub.

† *A species not sufficiently known.*

7 C. LATIFÒLIA (Roxb. hort. beng. p. 34.) ♄. S. Native of the East Indies. Leaves glandless, quite glabrous, elliptic, apiculated by a mucrone. Heads solitary, globose, on short velvety peduncles. Perhaps the same as C. latifòlia, Roxb.

Broad-leaved Conocarpus. Shrub.

Cult. See *Bùcida* for culture and propagation, p. 657.

Tribe II.

COMBRETEÆ (plants agreeing with *Combrètum* in the flowers being furnished with petals). Flowers hermaphrodite, with 4-5 petals and 8-10 stamens.

IX. LAGUNCULA'RIA (meaning not explained). Gærtn. fruct. 3. p. 209. t. 217. D. C. prod. 3. p. 17.—Spenocárpus, Rich. anal. fr. p. 92.—Conocárpus species of Lin.

LIN. SYST. *Decándria, Monogýnia.* Limb of calyx permanent, somewhat campanulate, 5-toothed; teeth obtuse. Petals 5, minute, spreading, caducous. Stamens 10, disposed in two series, inclosed. Style subulate. Stigma capitate. Fruit with 5 unequal ribs, coriaceous, crowned by the calyx, valveless, 1-seeded. Cotyledons convolute. Radicle very long.—A tree or shrub, with opposite leaves and opposite spikes of bractless flowers. Seed germinating within the nut.

1 L. RACEMÒSA (Gærtn. l. c.) leaves elliptic, obtuse, glabrous; flowers racemose; calyxes clothed with white tomentum. ♄. S. Native of Guiana, Brazil, and the West Indies, in marshes by the sea side. Conocárpus racemòsa, Lin. spec. 251. Jacq. amer. 80. t. 53. Swartz, obs. 79. Schousbòa commutàta, Spreng. syst. 2. p. 332.—Sloane, hist. t. 187. f. 1.

Racemose-flowered Laguncularia. Clt. 1822. Sh. or tree.

Cult. See *Bùcida* for culture and propagation, p. 657.

X. GUIE'RA (*Guier* is the name of the tree in Senegal). Juss. gen. 320. Lam. ill. t. 360. D. C. prod. 3. p. 17.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx oblong, slender, somewhat cylindrical, with a tubular campanulate 5-toothed limb. Petals 5, oblong-linear, small. Stamens 10, exserted; anthers globose. Ovary oblong. Style 1, filiform. Capsule narrow, pentagonal, 1-celled, 1-5-seeded. Seeds hanging by a thread, oblong. Cotyledons convolute?—A shrub, with opposite ovate entire leaves. Flowers crowded into spicate heads, sessile along the rachis, with large foliaceous bracteas at the base of the head of flowers, and other small ones at the base of the flowers.

1 G. SENEGALE'NSIS (Lam. ill. t. 360. Poir. suppl. 2. p. 861.) ♄. S. Native of Senegal. Leaves dotted beneath. Heads of flowers girded by a 4-leaved involucrum. Calycine tube or fruit bearded.

Senegal Guiera. Shrub 5 to 6 feet.

Cult. See *Bùcida* for culture and propagation, p. 657.

XI. COMBRE'TUM (a name given by Pliny to a climbing plant, but to what plant is not at present known). Lœfl. itin. p. 308. Lin. gen. no. 457. Gærtn. fruct. 1. p. 176. t. 36. G. Don, in Lin. trans. 15. p. 413. D. C. prod. 2. p. 18. Ætia, Adans. fam. 2. p. 84.—Poivrea, Comm.—Cristària, Sonn. voy. ind. 2. t. 140. but not of Cav.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx with a 4-5-toothed (f. 89. *a.*) deciduous limb. Petals 4-5 (f. 89. *b.*), inserted at the top of the calyx. Stamens 8-10, exserted. Ovary 2-5- (f. 89. *c.*) -ovulate. Style filiform (f. 89. *d.*). Fruit 4-5-winged. Seed 1, pendulous.—Climbing or erect shrubs, rarely herbs, with entire, opposite or tern, rarely alternate leaves. Spikes solitary or twin, axillary, and terminal, opposite, or 3 or 4 in a whorl, usually disposed in a terminal panicle. Flowers bracteate, almost sessile, rarely pedicellate. Petals scarlet, red, white, rarely orange.

SECT. I. EUCOMBRE'TUM (from *eu*, well or good, and *combretum;* this section contains what are considered the genuine species of the genus). Calyx 4-toothed. Corolla 4-petalled. Stamens 8. Fruit 4-winged. Cotyledons reflexed by a plait in the middle?

§ 1. *Calyx campanulate. Spikes axillary and terminal. Flowers secund.*

1 C. SECU'NDUM (Jacq. amer. 103. t. 176. f. 30. ed. pict. p. 53. t. 260. f. 26. G. Don, in Lin. trans. 15. p. 419.) climbing, glabrous; branches sub-quadrangular; leaves ovate-lanceolate; calyxes and ovaries covered with resinous dots; petals scale-formed, elliptic, mucronate, cucullate. ♄. ◡. S. Native of Guiana and the Island of Trinidad. Lam. ill. t. 282. f. 1. C. élegans, H. B. et Kunth, nov. gen. amer. 6. p. 109. C. láxum, Aubl. guian. 1. p. 251. t. 137. Flowers large, secund. Petals yellow, a little shorter than the calycine teeth. Calyx covered with rusty dots outside. Stamens scarlet, disposed in one series, nearly an inch long.

Secund-flowered Combretum. Clt. 1818. Sh. cl.

2 C. OXYPE'TALUM (G. Don, in Lin. trans. 15. p. 420.) climbing, glabrous; branchlets somewhat quadrangular; leaves ob-

long, membranous, attenuated at both ends, covered with resinous rusty dots beneath, as well as the calyxes; petals scale-formed, obovate-lanceolate, acuminated; stamens very long. ♄ . ◡. S. Native of Guayaquil. Very like the preceding, but differs in the membranous leaves tapering to both ends, and in the shape of the petals.

Sharp-petalled Combretum. Shrub cl.

3 C. FORMÒSUM (G. Don, in Lin. trans. 15. p. 420.) climbing; leaves oblong-elliptic, acuminated, beset with resinous rusty dots beneath, but when in a young state clothed with rusty down, as well as the calyxes; flowers crowded; petals scale-formed, cuneate-lanceolate, acuminated. ♄ . ◡. S. Native of Brazil, near Rio Janeiro. Very like the two preceding species, but differs in the young leaves and calyx being clothed with rusty down.

Beautiful Combretum. Shrub cl.

4 C. MICROPE'TALUM (D. C. prod. 3. p. 19. St. Hil. fl. bras. 2. p. 249.) leaves elliptic-oblong, acuminated, smoothish above, and lepidotted beneath; spikes simple, dense-flowered, on short peduncles, about equal in length to the leaves; calyx rubiginose, with a tetragonal tube; petals obovate-lanceolate; stamens very long. ♄ . ◡. S. Native of Brazil, in the provinces of Minas Geraes and Minas Novas. Petals yellow.

Small-petalled Combretum. Shrub cl.

5 C. ROTUNDIFÒLIUM (Rich. act. soc. hist. nat. par. I. 791. p. 108.) climbing; leaves ovate-roundish, mucronate, glabrous; spikes opposite, bractless; flowers secund? calyx glabrous on the inside. ♄ . ◡. S. Native of Cayenne. Leaves of the branches oval, of the branchlets roundish. Calyx lepidotted on the outside. Stamens very long, purple? Fruit with ample membranous wings.

Round-leaved Combretum. Shrub cl.

6 C. MACROCA'RPUM (Beauv. fl. d'ow. 2. p. 90. t. 118. f. 2.) fruit large, 4-winged; wings deeply cordate at the apex. ♄ . ◡. S. Native of the west coast of Africa, at Benin.

Large-fruited Combretum. Sh. cl.

§ 2. *Calyx tubular. Flowers disposed in terminal fascicles or umbels.*

7 C. LEUCOPHY'LLUM (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 421.) erect, clothed with fulvous villi; leaves oblong, mucronate; racemes corymbose or umbellate; floral leaves white, and constituting an involucrum to the head of flowers, and with a linear white bractea to each flower; petals lanceolate, obtuse, 4 times longer than the calyx. ♄ . S. Native of Sierra Leone, not far from Free-town, and of Senegal at St. Louis. C. trigonoides, Perr. in litt. ex D. C. prod. 3. p. 20. Flowers pedicellate, scarlet. Stamens scarlet, much longer than the petals, bearing black anthers.

White-leaved Combretum. Sh. 4 to 6 feet.

8 C. LANUGINÒSUM (G. Don, in Lin. trans. 15. p. 422.) erect; leaves orbicular, emarginate; flowers in fascicles; petals oval, crenulated, a little longer than the calyx. ♄ . S. Native of Abyssinia. Shrub branched, woolly. Stamens long.

Woolly Combretum. Sh. 4 to 6 feet.

9 C. PUNCTA'TUM (Blum. bijdr. p. 640.) climbing; leaves elliptic-oblong, acuminated, dotted on both surfaces; spikes capitate, panicled, axillary, and terminal; calyx villous inside. ♄ . ◡. S. Native of Java, on the mountains.

Dotted-leaved Combretum. Sh. cl.

§ 3. *Calyx tubular. Spikes axillary, never terminal.*

10 C. EXTE'NSUM (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 422.) climbing, glabrous; leaves oblong or obovate, coriaceous; spikes slender, short, solitary, dense-flowered; petals ovate, acute, shorter than the calyx. ♄ . ◡. S. Native of the Moluccas. Flowers small, white. Stamens white, disposed in one series, much exserted. Stigma subcapitate.

Extended Combretum. Sh. cl.

11 C. HERBA'CEUM (G. Don, in edinb. phil. journ. 1824. p. 344. and Lin. trans. 15. p. 423.) herbaceous, humble; stems simple, pubescent; leaves alternate, lanceolate, mucronate, clothed with silky villi beneath, but glabrous above in the adult state; peduncles twin, few-flowered; petals ovate, acute, a little longer than the calyx. ♃. S. Native of Sierra Leone, common in the low lands. Root woody. Flowers small, white. Stamens not much exserted.

Herbaceous Combretum. Fl. Feb. Pl. 1 foot.

12 C. DUARTEA'NUM (St. Hil. fl. bras. 2. p. 248.) leaves elliptic, acuminated, lepidotted on both surfaces; spikes shorter than the leaves; tube of calyx tetragonal; branches glabrous; petals lanceolate, very narrow at the base. ♄ . ◡. S. Native of Brazil. Limb of calyx funnel-shaped.

Duarte's Combretum. Sh. cl.

§ 4. *Calyx turbinately-campanulate. Racemes axillary and terminal, panicled. Flowers pedicellate.*

13 C. PANICULA'TUM (Vent. choix. p. 58.) leaves oblong, obtuse; panicle terminal, bracteated, hairy; calyxes pubescent; bracteas very short; flowers pedicellate. ♄ . ◡. S. Native of Senegal and Sierra Leone. Flowers scarlet.

Panicled-flowered Combretum. Sh. cl.

14 C. SPINÒSUM (G. Don, in edinb. phil. journ. 1824. p. 345.) erect, glabrous; branches spinescent; leaves on long petioles, oval, membranous; flowers pedicellate; calycine teeth nearly obsolete; petals oval, obtuse; stamens not much exserted. ♄ . S. Native of Sierra Leone, in the low lands. Flowers small, scarlet, collected into fascicles. Anthers black.

Spinose Combretum. Shrub 6 to 8 feet.

15 C. SMEATHMA'NNI (G. Don, in Lin. trans. 15. p. 425.) climbing, hairy; leaves elliptic, acuminated, floral ones yellow; bracteas very large; racemes elongated; flowers pedicellate. ♄ . ◡. S. Native of Sierra Leone. Flowers solitary, in the axils of large bracteas. Stamens exserted.

Smeathmann's Combretum. Shrub cl.

§ 5. *Calyx turbinately campanulate. Spikes axillary and terminal, usually disposed in the manner of a panicle.*

16 C. E'LEGANS (St. Hil. fl. bras. 2. p. 277. t. 129.) climbing; leaves elliptic, acute, acuminated, puberulous above, and clothed with yellowish tomentum beneath; spikes simple, on short peduncles; petals lanceolate, acute, hairy; calycine tube cylindrical. ♄ . ◡. S. Native of Brazil, in the province of Minas Geraes. Branches covered with yellowish tomentum. Petals yellow.

Elegant Combretum. Shrub cl.

17 C. FARINÒSUM (H. B. et Kunth, nov. gen. amer. 6. p. 110. G. Don, in Lin. trans. 15. p. 425.) climbing, glabrous; leaves elliptic-oblong, obtuse, rather coriaceous, rounded at the base, mealy beneath; spikes usually twin, many-flowered; petals scale-formed; stamens very long. ♄ . ◡. S. Native of Mexico, between Acapulco and Venta del Exido. Flowers subsecund, orange-coloured.

Mealy Combretum. Fl. April, July. Clt. 1825. Sh. cl.

18 C. FRANGULÆFÒLIUM (H. B. et Kunth, nov. gen. amer. 6. p. 109. t. 538.) climbing, glabrous; leaves elliptic, lepidotted on both surfaces; spikes solitary, rarely twin; bracteas oblong, acute, villous; petals crenated, rather fan-shaped. ♄ . ◡. S. Native on the banks of the Orinoco, near Angustura, and Carichana. Stamens long.

Frangula-leaved Combretum. Shrub cl.

19 C. LA'XUM (Jacq. amer. p. 104. and pict. p. 53.) climbing, glabrous; leaves ovate; spikes erect, loose-flowered; calyx pubescent; petals roundish, shorter than the calyx. ♄ . ◡. S.

Native of the West India Islands. Lam. ill. t. 282. f. 1.—Lœfl. itin. p. 308. Flowers small, white. Stamens long, inserted in the bottom of the calyx.

Loose-flowered Combretum. Shrub cl.

20 C. MEXICA'NUM (Humb. et Bonpl. pl. æquin. 2. p. 156. t. 132.) humble, glabrous; young branches compressed; leaves elliptic, membranous, rather cordate at the base; spikes disposed in the manner of a panicle, clothed with rusty tomentum, short, many-flowered; petals somewhat reniform, shorter than the calyx. ♄. S. Native of Mexico, near Acapulco, by the sea-side. Flowers sub-secund, with the petals and stamens white and the anthers yellow. Stamens 3-times the length of the calyx.

Mexican Combretum. Shrub 6 feet.

21 C. OBTUSIFÒLIUM (Rich. act. soc. hist. nat. par. 1791. p. 108.) leaves obovate, obtuse, quite glabrous; peduncles terminal and axillary, of many spikes; branches clothed with rufous pubescence; calyx pubescent; stamens hardly exserted. ♄. S. Native of Cayenne. Leaves almost elliptic. Very like *C. Mexicànum.*

Obtuse-leaved Combretum. Shrub.

22 C. PULCHE'LLUM (Mart. ex G. Don, in Lin. trans. 15. p. 428.) climbing, puberulous; leaves elliptic, oblong, brownish beneath; spikes disposed in the manner of a panicle; calyxes and peduncles clothed with fuscous villi; petals rather reniform, reflexed. ♄. ◡. S. Native of Brazil, at the Rio Negro. Flowers small, scarlet. Petals a little longer than the calyx, reflexed. Stamens 3-times the length of the calyx.

Neat Combretum. Shrub cl.

23 C. BU'GI (St. Hil. fl. bras. 2. p. 247. t. 130.) climbing; leaves elliptic, bluntly acuminated, glabrous; calycine tube cylindrical; spikes disposed in the manner of a panicle, on short peduncles; petals roundish. ♄. ◡. S. Native of Brazil, on the banks of the Rio St. Francisco, in the western part of the province of Minas Geraes, in the Certao or great desert, where it is called *Bugi.* Flowers polygamous; calyx downy; petals yellow.

Bugi Combretum. Shrub cl.

24 C. RACEMÒSUM (Beauv. fl. d'ow. 2. p. 90. t. 118. f. 1.) climbing, glabrous; leaves ovate-oblong, acute, shining; panicle of many spikes; spikes elongated, tufted at the apex; petals lanceolate, obtuse. ♄. ◡. S. Native of Benin, on the west coast of Africa. Flowers middle-sized, white, on short pedicels. Petals much longer than the calyx. Stamens very long.

Racemose-flowered Combretum. Fl. Feb. Jul. Clt. 1826. Sh. cl.

25 C. A'LBIDUM (G. Don, in Lin. trans. 15. p. 429.) climbing, glabrous; leaves on long petioles, oblong, obtuse, or somewhat orbicular, dotted and green above, and white beneath; panicle of many spikes; spikes crowded with flowers; calyxes pubescent; petals small. ♄. ◡. S. Native of the East Indies. C. láxum, Roxb. hort. beng. p. 88. Stamens very long.

White-leaved Combretum. Shrub cl.

26 C. NA'NUM (Hamilt. mss. in D. Don, prod. fl. nep. p. 219.) humble, erect; leaves oblong or ovate, obtuse, glabrous; spikes simple and sometimes branched at the base; calyxes pubescent; petals ovate, obtuse. ♄. S. Native of Nipaul. Flowers small, white. Stamens very long.

Dwarf Combretum. Clt. 1825. Shrub ½ to 1 foot.

27 C. ROXBU'RGHII (G. Don, in Lin. trans. 15. p. 429.) climbing, glabrous; leaves ovate, obtuse; panicle composed of many loose-flowered spikes; rachis and calyxes pubescent. ♄. ◡. S. Native of the East Indies. Leaves pubescent when young.

Roxburgh's Combretum. Shrub cl.

28 C. ODORA'TUM (Pav. mss. in herb. Lamb. G. Don, in Lin. trans. 15. p. 430.) climbing; branchlets puberulous; leaves oblong or obovate-oblong, rounded, and somewhat emarginate at the apex, coriaceous, glabrous; panicle composed of many spikes; spikes crowded with flowers; petals reniform. ♄. ◡. S. Native of Guayaquil. Flowers red or scarlet. Stamens 3-times the length of the calyx.

Sweet-scented Combretum. Shrub cl.

29 C. GLUTINÒSUM (Perr. in litt. D. C. prod. 3. p. 21.) unarmed, erect, arboreous, glabrous; leaves somewhat verticillate, ovate, petiolate, coriaceous, mucronate; racemes branched at the base or twin, elongated, bractless. ♄. S. Native of Senegal. Flowers yellow, on different branches from the leaf-bearing ones. Branches as well as the young leaves clammy.

Clammy Combretum. Shrub.

30 C. PYRAMIDA'TUM (Desv. in Hamilt. prod. fl. ind. occ. p. 35.) branches complanate, rather greyish; leaves obovate, somewhat emarginate, mucronulate; capsule pyramidal, with acute angles, not winged. ♄. S. Native of Guiana. The rest unknown.

Pyramidal-capsuled Combretum. Shrub.

31 C. PU'BERUM (Rich. in act. soc. hist. nat. par. 1791. p. 108.) climbing, glabrous; leaves oblong, coriaceous, rather cordate at the base, shining above; panicle terminal, composed of many spikes; branches, rachis, and calyxes clothed with rusty down; stamens short; bracteas setaceous. ♄. ◡. S. Native of Cayenne. Flowers small.

Downy Combretum. Shrub cl.

32 C. GLA'BRUM (D. C. prod. 3. p. 19.) climbing, glabrous; leaves elliptic, acuminated; spikes disposed in a terminal panicle; bracteas setaceous. ♄. ◡. S. Native of French Guiana.

Glabrous Combretum. Shrub cl.

§ 6. *Calyx turbinately campanulate. Spikes axillary, never terminal.*

33 C. TOMENTÒSUM (G. Don. in edinb. phil. journ. 1824. p. 346. and in Lin. trans. 15. p. 430.) climbing, clothed with fuscous tomentum; leaves oval, mucronate, smoothish above in the adult state; spikes loose-flowered; petals oval, obtuse, a little shorter than the calyx; stamens short. ♄. ◡. S. Native of Sierra Leone. Flowers small, white.

Tomentose Combretum. Shrub cl.

34 C. MICRA'NTHUM (G. Don, in edinb. phil. journ. 1824. p. 347.) erect; branches pubescent; leaves oblong, bluntly mucronate, glabrous in the adult state; spikes slender; petals linear-cuneated, 4-times the length of the calycine teeth; stamens not much exserted. ♄. S. Native of Sierra Leone. C. parviflòrum, Rchb. in Sieb. pl. exsic. seneg. no. 35. hort. bot. t. 62. Flowers small, red or scarlet, on short pedicels. Stamens very little longer than the petals.

Small-flowered Combretum. Shrub 5 to 6 feet.

35 C. MÓLLE (R. Br. in append. to Salt. trav. G. Don, in Lin. trans. 15. p. 431.) climbing, villous; leaves oblong-lanceolate, acuminated, cordate at the base; spikes elongated; calycine teeth very short; petals small; stamens twice the length of the calyx. ♄. ◡. S. Native of Abyssinia.

Soft Combretum. Shrub cl.

36 C. LATIFÒLIUM (G. Don, in Lin. trans. 15. p. 432.) climbing, glabrous; leaves ample, coriaceous, oblong, acuminated, sometimes rounded; spikes short, crowded with flowers; calyxes pubescent; petals obovate, obtuse; stamens twice the length of the calyx. ♄. ◡. S. Native of the East Indies. C. macrophýllum, Roxb. hort. beng. p. 88.? Flowers small, red.

Broad-leaved Combretum. Shrub cl.

37 C. CHINE'NSE (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 432.) climbing, and covered with rusty scales or dots; leaves elliptic, acute at both ends, green above; spikes loose-flowered; petals small; stamens but little exserted. ♄. ◡. G. Native of China. Flowers middle-sized, scarlet?

Chinese Combretum. Shrub cl.

38 C. VELUTI'NUM (D. C. prod. 3. p. 20.) leaves ovate, acuminated, clothed with soft villi on both surfaces as well as the branches and peduncles; spikes axillary, solitary, simple; pedicels very short. ♄. S. Native of Brazil. Terminàlia argéntea, Mart. bras. 1. p. 43.? Fruit large, 4-winged, pubescent; wings glabrous. Petioles hardly 2 lines long.

Velvety Combretum. Shrub cl.?

39 C. PEDICELLA'RE (D. C. prod. 3. p. 20.) leaves oval-oblong, velvety, but especially beneath, as well as the branches, petioles, and peduncles; racemes axillary, solitary, simple; pedicels about one half the length of the fruit. ♄. ◡? S. Native of Brazil. Very like the preceding species, but the petioles and pedicels are half an inch long. Fruit ovate, acuminated, 4-winged, clothed with short, rufescent, lepidotted down.

Pedicelled Combretum. Shrub cl.?

40 C. A'LTUM (Perr. in litt. D. C. prod. 3. p. 20.) quite glabrous; leaves elliptic, attenuated at both ends, smooth, quite entire, on short petioles; racemes at the base of the branches; fruit solitary, 4-winged, pruinose, or brownish purple between the wings, and lepidotted. ♄. ◡? S. Native of Senegal, at the lake called Du Panier, 28 miles from St. Louis.

Tall Combretum. Shrub cl.

41 C. MUCRONA'TUM (Thonn. in herb. Vahl. ex herb. Puer. D. C. prod. 3. p. 20.) climbing? branchlets pubescent; leaves on short petioles, elliptic, somewhat obovate, obtuse at the base, and acuminately mucronate at the apex, glabrous, but with the petiole and nerve rather pubescent; racemes pedunculate, elongated, bractless. ♄. ◡. S. Native of Guinea. Calyxes and racemes velvety. Fruit glabrous, with membranous wings. Not known whether it belongs to the present division of the genus or not.

Mucronate-leaved Combretum. Shrub cl.

42 C. WALLI'CHII (D. C. prod. 3. p. 21.) erect, glabrous; leaves opposite, petiolate, mucronately acuminated; spikes pedunculate, axillary, simple, shorter than the leaves, bractless. ♄. S. Native of Nipaul. Flowers small, glabrous on the outside and villous inside.

Wallich's Combretum. Shrub.

SECT. II. POI'VREA (in honour of N. Poivre, intendent of the Mauritius in 1766, a patron of botany). Poívrea. Comm. ined. Pet. Th. obs. pl. afr. aust. p. 28. D. C. prod. 3. p. 17. Cristària, Sonn. voy. ind. 2. t. 140. but not of Cav.—Gonocárpus, Hamilt. prod. but not of Thunb. Calyx 5-toothed. Petals 5. Stamens 10, exserted. Ovary 2-5, ovulate. Fruit with 5 wings. Cotyledons truly convolute.

§ 1. *Calyx tubular. Spikes axillary and terminal, usually disposed in the manner of a panicle.*

43 C. COMÒSUM (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 433.) climbing; branches pubescent; leaves elliptic, acute, somewhat cordate at the base, pubescent when young, but glabrous in the adult state; panicle of many spikes; spikes bearing a tuft of flowers at the apex; bracteas lanceolate, acute; petals spatulate, obtuse; stamens long. ♄. ◡. S. Native of Sierra Leone; very common. Lindl. bot. reg. 1105. Flowers crimson or red.

Tufted-flowered Combretum. Fl. Feb. Ju. Clt. 1822. Sh. cl.

44 C. INTERME'DIUM (G. Don, l. c.) climbing; branches pubescent; leaves elliptic-obovate, mucronate, pubescent when young, but glabrous in the adult state: bracteas ovate, mucronate; petals spatulate, obtuse. ♄. ◡. S. Native of Sierra Leone. Very like *C. comòsum*, but the flowers are larger and denser.

Intermediate Combretum. Clt. 1822. Shrub cl.

45 C. PILÒSUM (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 434.) climbing, pilose; leaves oblong-lanceolate, acuminated, auricled at the base; panicle of many spikes; spikes short; calyxes and peduncles beset with fuscous pili; petals obovate, oblong, ciliated. ♄. ◡. S. Native of the East Indies. Flowers crowded, white, about the size of those of *C. comòsum*. Stamens twice the length of the petals.

Pilose Combretum. Shrub cl.

46 C. BARBA'TUM (Newman, mss. G. Don, in Loud. hort. brit. p. 157.) hairy in every part; leaves ovate-oblong; panicle of many spikes; spikes long; petals obovate, bearded at the apex. ♄. ◡. S. Native of Maranham. Flowers white, rather large.

Bearded-petalled Combretum. Clt. 1820. Shrub cl.

47 C. OVA'LE (R. Br. in append. to Salt. trav. in abyssin. G. Don, in Lin. trans. 15. p. 435.) erect; leaves oval-oblong, obtuse, white beneath, when young pubescent, but glabrous in the adult state; branches and calyxes pubescent; spikes axillary and terminal, short, loose-flowered; petals obovate-oblong, obtuse; stamens exserted. ♄. S. Native of Abyssinia. Flowers probably white.

Oval-leaved Combretum. Shrub erect?

48 C. ALTERNIFÒLIUM (Jacq. amer. p. 104.) climbing, glabrous; branches spinescent; spines recurved; leaves alternate, oblong, glabrous, shining above; panicle of many spikes; spikes short; flowers crowded; petals lanceolate, obtuse, twice the length of the calyx; stamens exserted. ♄. ◡. S. Native of South America. C. decándrum, Jacq. amer. ed. pict. p. 53. t. 260. f. 27. C. spinòsum, Humb. et Bonpl. pl. æquin. 2. p. 161. Poívrea alternifòlia, D. C. prod. 3. p. 17. Flowers small, white, on short pedicels. The juice is very clammy, and is used as a substitute for glue.

Alternate-leaved Combretum. Shrub cl.

49 C. PAVÒNII (G. Don, in Lin. trans. 15. p. 436.) climbing; branches pilose; leaves oblong or ovate, acuminated, mucronate, somewhat cordate at the base, clothed with rusty villi beneath; panicle of many spikes, elongated; petals lanceolate; stamens a little longer than the petals. ♄. ◡. S. Native of Guayaquil. C. decándrum, Ruiz, et Pav. mss. in herb. Lamb. Flowers scattered, middle-sized, probably scarlet.

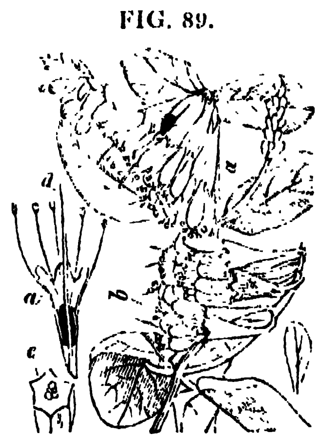
Pavon's Combretum. Shrub cl.

50 C. ERIOPE'TALUM; shrub bushy; leaves oval, quite glabrous, attenuated at both ends; spikes opposite, slender, rather velvety; flowers distant, bractless; calyxes glabrous; petals oblong, hairy. ♄. S. Native of St. Domingo and Cuba, about the Havannah. Poivrea eriopétala, D. C. prod. 3. p. 18.

Woolly-petalled Combretum. Shrub.

§ 2. *Calyx tubular. Panicle of several spikes. Flowers secund.*

FIG. 89.



51 C. PURPU'REUM (Vahl. symb. 3. p. 51.) climbing, glabrous; leaves oblong-lanceolate, acute, dark green, shining; panicle of many spikes; flowers loose; petals elliptic-oblong, obtuse; stamens long. ♄. ◡. S. Native of Madagascar. Ker. bot. reg. 429. Sims, bot. mag. 2102. C. coccíneum, Lam. dict. 1. p. 734. ill. 282. f. 2. Cristària coccínea, Sonn. itin. 2. p. 247. t. 140. Poívrea coccínea, D. C. prod. 3. p. 18. Flowers scarlet, secund.

Purple Combretum. Fl. June, Dec. Clt. 1818. Shrub cl.

52 C. GRANDIFLÒRUM (G. Don,

in edinb. phil. journ. 1824. p. 340. and Lin. trans. 15. p. 421.) climbing, hairy; leaves oblong; spikes short, axillary, and terminal; calyx pubescent; petals obovate, obtuse; stamens long. ♄ . ◡. S. Native of Sierra Leone, in the low lands. Hook, bot. mag. t. 2944. C. Afzeliànum, G. Don, in Lin. trans. 15. p. 437. Flowers large, scarlet, secund. Anthers yellow. (f. 89.)

Great-flowered Combretum. Fl. May, Jul. Clt. 1824. Sh. cl.

§ 3. *Calyx turbinately-campanulate. Spikes numerous, terminal, disposed in the manner of a panicle.*

53 C. DECA'NDRUM (Roxb. cor. 1. p. 43. t. 59.) climbing, clothed with fuscous down; leaves oblong, acuminated, floral ones yellowish; panicle composed of numerous close-flowered spikes; petals ovate, mucronate; stamens short. ♄. ◡. S. Native of the East Indies. C. Roxbúrghii, Spreng. syst. 2. p. 331. Poívrea Roxbúrghii, D. C. prod. 3. p. 18. Flowers small, white, shorter than the bracteas.

Decandrous Combretum. Fl. Feb. Jul. Clt. 1826. Sh. cl.

54 C. SQUAMÒSUM (Roxb. hort. beng. p. 88. G. Don, in Lin. trans. 15. p. 438.) climbing, lepidotted; leaves ovate, acuminated, coriaceous, rusty beneath and on the calyxes; panicle of many spikes; spikes loose-flowered; petals small; stamens short. ♄ . ◡. S. Native of the East Indies. Flowers small, inconspicuous.

Scaly Combretum. Shrub cl.

55 C. ACULEA'TUM (Vent. choix. t. 58. in a note) erect, bushy, spinose; spines a little hooked, solitary, under the leaves; leaves almost opposite, ovate, pubescent, on short petioles, and are as well as the calyxes and branches pubescent; racemes short; flowers pedicellate; bracteas oblong-linear. ♄ . S. Native of Senegal. Guièra nudiflòra, Rchb. in Sieb. pl. exsic. seneg. no. 35. C. secúndum, Mirb. elem. t. 44. f. 5.? but not of Jacq. Poívrea aculeàta, D. C. prod. 3. p. 18. Flowers white. Petals hairy.

Prickly Combretum. Shrub 4 to 6 feet.

§ 4. *Calyx turbinately campanulate. Spikes axillary, never terminal.*

56 C. SERI'CEUM (G. Don, in edinb. phil. journ. 1824. p. 347. and in Lin. trans. 15. p. 21.) suffruticose, erect; leaves nearly opposite, lanceolate, bluntish, clothed with silky villi beneath; spikes dense-flowered; rachis, ovaries, and calyxes clothed with villous tomentum; petals about equal in length to the calyx; stamens short. ♄ . S. Native of Sierra Leone. Flowers white, on short pedicels.

Silky Combretum. Shrub 2 to 3 feet.

† *Species not sufficiently known.*

57 C. FERRUGÍNEUM (G. Don, in Lin. trans. 15. p. 440.) leaves on short petioles, lanceolate, acuminated, glabrous, attenuated at the base, rusty beneath; spikes axillary and terminal. ♄ . S. Native of South America.

Rusty Combretum. Shrub.

58 C. CORDA'TUM (G. Don, in Lin. trans. p. 440.) leaves on short petioles, large, roundish-cordate, pubescent when young; panicle terminal, composed of spikes. ♄ . S. Native of Hispaniola. Flowers small.

Cordate-leaved Combretum. Shrub.

† *Species only known by name from Roxburgh's Hortus Bengalénsis.*

1 *C. ovalifòlium* (Roxb. l. c. p. 28.). ♄ . ◡. S. Native of Coromandel.

2 *C. acuminàtum* (Roxb. l. c.). ♄ . ◡. S. Native of Bengal.

3 *C. costàtum* (Roxb. l. c.). ♄ . ◡. S. Native of the East Indies.

4 *C. rotundifòlium* (Roxb. l. c. p. 88.). ♄ . ◡. S. Native of Bengal.

Cult. As few plants surpass the *Combrèta* in the elegance and brilliancy of their blossoms, so their species have become great favourites with collectors. A few, as the *C. purpùreum*, *C. comòsum*, and *C. grandiflòrum*, are the greatest ornaments of our stoves; but some of the species, not yet introduced to our gardens, outvie them in beauty. All of them thrive well in a mixture of loam and peat, and young cuttings root readily if planted in a pot of sand; placed in a moist heat, with a hand-glass over them. The climbing species are well fitted for training up the rafters, or covering trellis-work in a stove.

XII. CHRYSO'STACHYS (χρυσος, *chrysos*, gold, and σταχυς, *stachys*, a spike; in reference to the dense spikes of golden yellow flowers). Pohl. pl. bras. 2. p. 65.

LIN. SYST. *Decándria, Monogýnia.* Calyx campanulate, obsoletely 5-toothed; teeth short, bluntish. Petals 5, alternating with the teeth of the calyx, roundish and bluntly emarginate, unguiculate at the base. Stamens 10, very long, rather flexuous, inserted in the base of the calyx. Ovary ovate.—A climbing shrub, with opposite, coriaceous, entire leaves. Spikes dense, terminal, and axillary, panicled, opposite, bracteate. Flowers small, golden yellow.

1 C. OVATIFÒLIA (Pohl. pl. bras. 2. p. 66. t. 143.) leaves ovate-elliptic, glabrous; ovaries and rachis of the spike clothed with yellow down. ♄ . ◡. S. Native of Brazil, in the northern part of the province of Goyaz.

Ovate-leaved Chrysostachys. Shrub cl.

Cult. This is a fine stove climber. Its culture and propagation are the same as that for *Combrètum*, which see.

XIII. CACOU'CIA (Guiana name of *C. coccínea*). Aubl. guian. 1. p. 450. t. 179. Juss. gen. 320. Lam. ill. t. 359. D. C. prod. 3. p. 22.—Schousbœ'a, Willd. spec. p. 578.—Hambérgera, Scop. int.—Hambérgia, Neck. elem.

LIN. SYST. *Decándria* and *Dodecándria, Monogýnia.* Limb of calyx tubularly campanulate, acutely 5-toothed, deciduous. Petals 5, alternating with the calycine teeth, and larger than them. Stamens 10-14, inserted in the base of the limb of the calyx, filiform, long. Ovary, according to Kunth, containing 3 pendulous ovula. Style filiform, acute. Berry or drupe ovate, quadrangular, acute at both ends, not crowned by the calyx, pulpy inside, 1-2-seeded. Cotyledons thick and fleshy.—Climbing shrubs, with alternate and opposite leaves, sometimes the lower ones are verticillate; they are ovate, acuminated, standing on short petioles. Flowers scarlet, alternate, bracteate at the base, disposed in long terminal spikes.

1 C. COCCI'NEA (Aubl. l. c.) fruit ovoid, acute at both ends, somewhat pentagonal. ♄ . ◡. S. Native of Guiana, on the banks of the river Sinemari. Schousbœ'a coccínea, Willd. l. c. Flowers scarlet.

Scarlet-flowered Cacoucia. Shrub cl.

2 C. CHINE'NSIS (Adr. Juss. ined. ex D. C. prod. 3. p. 22.) fruit acutely pentagonal. ♄ . ◡. S. Native of China, where it is called *Koinze.* Pet. gazoph. t. 37. f. 8. ex Juss. Fruit one half smaller than those of the first species, bearing 2 seeds near the apex. Spermaderm blackish, membranous. Cotyledons large, fleshy.

China Cacoucia. Shrub cl.

3 C.? TRIFOLIA'TA (D. C. prod. 3. p. 22.) fruit oblong, 5-winged; wings stiff. ♄ . ◡. S. Native of Java. Combrètum trifoliàtum, Vent. choix. t. 58. Cacoùcia lùcidum, Blum. bijdr. p. 641. Leaves opposite or 3 in a whorl, oval-oblong, glabrous. Panicle of many spikes. Flowers greenish, decandrous. Bracteas linear. Fruit sometimes 6-winged, according to Blum.

Trifoliate Cacoucia. Shrub cl.
Cult. See *Combrètum* for culture and propagation, p. 666.

XIV. LUMNI'TZERA (in honour of Stephen Lumnitzer, author of Flora Posoniensis, 1 vol. 8vo. Leipzig, 1791). Willd. nov. act. nat. cur. berl. 4. (1803) p. 186. but not of Jacq. (1817). D. C. prod. 3. p. 22.

Lin. syst. *Decándria, Monogýnia.* Bracteoles 2, very short, under each flower. Limb of calyx tubular, 5-toothed; teeth obtuse. Petals 5, inserted in the calyx and longer than it, reflexed. Stamens 10, 5 of which are shorter than the petals, and the longest 5 about the length of the petals. Ovary oblong, compressed. Style subulate. Drupe dry, 1-seeded.—A shrub, with alternate leaves, and intra-foliaceous racemes of flowers. The structure of the seed is hardly known, and therefore the genus may not be distinct from *Cacoùcia.*

1. L. racemòsa (Willd. l. c.). ♄ . ◡. S. Native of the East Indies. Jussieuæ'a racemòsa, Rottl. herb. Branches cinereous, glabrous. Leaves obovate, quite entire, rather fleshy, glabrous, tapering into the petiole. Racemes naked.
Racemose-flowered Lumnitzera. Shrub cl.
Cult. See *Combrètum* for culture and propagation, p. 666.

XV. QUISQUA'LIS (from *quis,* who, and *quàlis,* what kind; when the name was given to this genus it was uncertain to what class or order it belonged). Rumph. amb. 5. p. 71. Lin. gen. no. 539. Lam. ill. t. 357. Blum. bijdr. p. 638. D. C. prod. 3. p. 22.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx slender, lengthened out much above the ovarium, deciduous, with a 5-cleft border. Petals 5, oval-oblong, obtuse, longer than the calycine teeth. Stamens 10, exserted, inserted in the throat of the calyx, alternate ones shorter than the others. Ovarium ovate-globose, containing 4 ovula. Style filiform, obtuse, exserted. Drupe dry, 5-angled, 1-seeded. Cotyledons fleshy, large, plano-convex, ex Blume.—Climbing shrubs, with opposite, rarely alternate, ovate, quite entire leaves; and axillary and terminal spikes of changeable-coloured flowers, usually varying from white to red.

1 Q. I'ndica (Lin. spec. 556.) pubescent; bracteas ovate-rhomboid, aristately acuminated, one under each flower; leaves ovate, acuminated; petals oval, oblong, clothed with adpressed pubescence. ♄ . ◡. S. Native of Java. Amboyna, Lam. ill. t. 257. Sims, bot. mag. 2033. Ker. bot. reg. 492. Flowers beautiful, changeable in colour from orange to red, sweet-scented.
Indian Quisqualis. Fl. May, Aug. Clt. 1815. Shrub cl.

2 Q. pube'scens (Beauv. fl. d'ow. 1. p. 67.) pubescent; leaves cordate or oblong, acuminated, with a rounded base; bracteas ovate, acuminated. ♄ . ◡. S. Native of Guinea. Flowers like those of *Q. I'ndica.*
Pubescent Quisqualis. Clt. 1815. Shrub cl.

3 Q. ebractea'ta (Beauv. fl. d'ow. 1. p. 57. t. 34.) smoothish; flowers bractless; petals oblong, glabrous. ♄ . ◡. S. Native of Guinea, in the kingdom of Waree. Leaves oval-oblong, lower ones smaller and roundish. Flowers white.
Bractless-flowered Quisqualis. Shrub cl.

4 Q. gla'bra (Burm. fl. ind. 104. t. 28. f. 2.) leaves ovate, acute, and are as well as the minute bracteas quite glabrous. ♄ . ◡. S. Native of Java. Flowers in spikes; spikes all opposite.
Smooth Quisqualis. Clt. 1815. Shrub cl.

5 Q. Loure'iri; leaves ovate, acute, glabrous; corymbs terminal. ♄ . ◡. G. Native of Cochin-china. Q. I'ndica, Lour. coch. p. 274. Racemes corymbose. Flowers from white to red. The seeds are astringent and anthelmintic.
Loureiro's Quisqualis. Shrub cl.

6 Q. villòsa (Roxb. hort. beng. p. 90.) leaves oblong, somewhat cordate, villous as well as the linear-lanceolate bracteas; flowers pubescent. ♄ . ◡. S. Native of the East Indies.
Villous Quisqualis. Shrub cl.
Cult. Some of the species of *Quisquàlis* are equal in elegance to the species of *Combrètum* when in flower: their culture and propagation are the same, see p. 666.

† *Genera belonging to Combretàceæ, but are not sufficiently known.*

XVI. CERATO'STACHYS (from κερας, *keras,* a horn, and σταχυς, *stachys,* a spike; in reference to the heads of flowers being intermixed with spongy processes). Blum. bijdr. p. 644. D. C. prod. 3. p. 23.

Lin. syst. *Octo-Dodecándria, Monogýnia.* Limb of calyx entire. Petals usually 8, small. Stamens 8-16, unequal. Ovary biovulate. Style short, crowned by a [illegible] stigma. Drupe baccate, crowned by the limb of the calyx, containing a 1-seeded compressed nut. Embryo exalbuminous? inverted.—A tall tree, with scattered, oblong, [illegible] entire leaves; and axillary spikes of flowers. Flowers disposed in dense heads, intermixed with spongy, filiform processes. The place which this genus should occupy in the order is uncertain, from the embryo being unknown.

1 C. arbòrea (Blume l. c.). ♄ . S. Native of Java, on Mount Salak.
Tree Ceratostachys. Tree 40 feet.
Cult. See *Bùcida* for culture and propagation, p. 657.

XVII. BRUGUIE'RA (in honour of Bruguiere, the well-known French botanist). Pet. Th. dict. sc. nat. 5. p. 375. gen. nov. mad. no. 70. p. 21. but not of Lam. D. C. prod. 3. p. 23.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx furnished with 2 scales in the middle; limb 5-lobed, obtuse. Petals 5, oblong-lanceolate, spreading. Stamens 10, equal in length to the petals. Style acute. Ovary adnate to the calyx, containing 4 pendulous ovula. Fruit unknown.—A small tree, with alternate, oval, smooth, succulent leaves, tapering into the petiole. Racemes axillary. Flowers small, white. The genus, according to Petit Thours, is nearly allied to *Combrètum.*

1 B. Madagascarie'nsis (D. C. prod. 3. p. 23.). ♄ . S. Native of Madagascar, in places inundated with salt water.—Kada-kandel, Rheed. mal. 6. t. 37.
Madagascar Bruguiera. Tree.
Cult. See *Combrètum* for culture and propagation, p. 666.

XVIII. BOBU'A (*Bobu* or *Bombu* is the name of the tree in Ceylon). D. C. prod. 3. p. 23.—Bòbu, Adans. fam. pl. 2. p. 11.—Eugenioìdes, Lin. fl. zeyl. p. 192.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx ovate, adnate to the ovary; limb 5-cleft, with very short blunt lobes. Petals 5, alternate with the lobes of the calyx, and longer than them. Stamens 20-30, free, longer than the petals. Style filiform. Stigma subcapitate. Fruit (berry?) ovate, indehiscent, few-seeded. Seed unknown.—A tree, with alternate, obovate-oblong, acute, glabrous, dotless, usually serrated leaves; and axillary, simple peduncles, bearing subspicate distant flowers; pedicels very short, each propped by 2 or 3 bracteas just under the calyx. This is a very doubtful genus.

1 B. lau'rina (D. C. prod. 2. p. 24.) spikes simple and panicled, shorter than the leaves; leaves serrated. ♄ . S. Native of Ceylon. Laùrus, Burm. zeyl. p. 139. t. 62.—Eugenioìdes, Lin. fl. zeyl. 192. no. 409. Bòbu, Herm. zeyl. 9. Burm. zeyl. 26. Bómbu, Petiv. mus. p. 39. ex Lin. Mýrtus

laúrina, Retz. obs. 4. p. 27. Mýrtus serràta, Kœnig. Eugènia laúrina, Willd. spec. no. 30. Flowers 4 or 5-cleft.

Laurel-like Bobu. Tree.

Cult. See *Bùcida* for culture and propagation, p. 657.

XC. VOCHYSIE'Æ (plants agreeing with *Vochýsia* in important characters). St. Hil. mem. mus. 6. p. 265. E. Meyer in nov. act. bonn. 2. p. 812. D. C. prod. 3. p. 25.—Vochysiànæ, Juss. herb.—Vochysiàceæ, Mart. nov. gen. 1. p. 123, 124.

Calyx of 4-5 sepals (f. 90. *d.* f. 91. *a.*). Sepals connected at the base, imbricate in æstivation (f. 91. *a.*), unequal; the upper one drawn out into a spur (f. 90. *d.* f. 91. *b.*). Petals 1- (f. 90. *b. a.*) 2-3 (f 91. *d. c.*) or 5, alternating with the calycine lobes, and inserted at their base. Stamens 1 (f. 90. *c.*) -5, usually opposite the petals, rarely alternating with them, and inserted in the bottom of the calyx, the most of them usually sterile and small, only one fertile and bearing an ovate (4-celled, ex Martins) anther. Ovarium free, or adhering to the calyx, 3-celled (f. 91. *h.*); ovula 1-2, or few in each cell, attached to the base of the axis. Style 1 (f. 90. *g.* f. 91. *r.*). Stigma 1. Capsule trigonal (f. 91. *h.*), 3-celled, 3-valved; valves opening along their middle. Seeds exalbuminous. Embryo straight, inverted. Cotyledons large, foliaceous, plicate, convolute. Radicle short, superior. South American trees, with opposite tetragonal branches. Leaves opposite or verticillate, but sometimes alternate at the tops of the branches, quite entire, feather-nerved, bistipulate at the base. Flowers racemose, panicled or thyrsoid, usually terminal; pedicels bracteate.

This order agrees with *Guttiferæ* and *Marcgraviàceæ* in the habit and flowers, but is distinguished from them in the stamens being inserted in the calyx. It agrees with *Combretàceæ* in the cotyledons being convolute, and in the inverted seeds; and with some of the genera of *Onagràriæ*, especially with *Lopèzia*, in the stamens being solitary from abortion. Perhaps this order comes nearer to *Violarieæ* than to any other, an affinity which is pointed out by the irregular flowers, trilocular ovarium, and stipulas; in fact, in every plant of that order the stamens are also perigynous.

Synopsis of the genera.

Sect. I. *Ovarium free. Calyx 5-parted.*

1 Callisthe'ne. Upper sepal drawn out into a large spur at the base (f. 90. *d.*). Petal 1, obcordate (f. 90. *b.*). Stamen 1 (f. 90. *c.*), without any rudiments of sterile ones. Valves of capsule without a dissepiment; cells 1-2-seeded (f. 89. *c.*).

2 Amphilòchia. Upper sepal drawn out into a short spur at the base. Petal 1, obcordate. Fertile stamen 1, usually without any rudiments of sterile ones. Valves of capsule bent in so much as to form dissepiments; cells 1-2-seeded.

3 Vochy'sia. Upper sepal drawn out into a long spur at the base (f. 91. *b.*). Petals 3 (f. 91. *d.*), middle one the largest (f. 91. *c. i. k.*). Stamens 3, lateral ones sterile. Valves of capsule opening in the middle. Seed solitary in the cells, winged.

4 Salve'rtia. Upper lobe of calyx furnished with a spur at the base. Petals 5, upper 2 very narrow. Stamens 3, lateral ones sterile. Valves of capsule opening in the middle; cells 2-seeded.

5 Qua'lea. Upper sepal furnished with a spur at the base. Petals 1, rarely 2. Stamens 1, rarely 2. Valves of capsule opening in the middle. Seeds winged.

Sect. II. *Ovary adnate to the calyx. Calyx 4-parted.*

6 Eri'sma. One of the lobes of the calyx furnished with a spur at the base. Petal 1. Fertile stamen 1, sterile 4.

† *Genera doubtful whether they belong to the present order.*

7 Loza'nia. Calyx with a ventricose tube, and a 5-parted permanent limb. Petals wanting. Disk quadrangular, filling the bottom of the calyx. Stamen 1, small, inserted under the ovary. Capsule trigonal, 3-celled, 3-valved. Seeds 6. Stigmas 3, small, capitate.

8 Aga'rdhia. Calyx of 3 sepals. Petals 5, convolute. Stamen 1, bearing a large 2-celled anther. Style 1. Drupe oval, 3-celled, 3-valved.

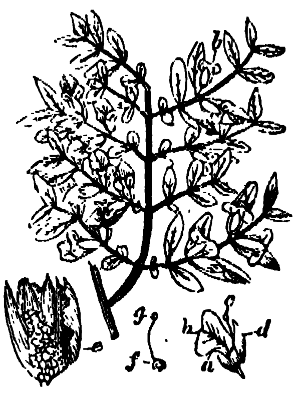
9 Schweigge'ria. Calyx of 3 sepals. Petals 3, one of which is spurred. Stamen 1. Pistil none. Fruit unknown.

§ 1. *Ovarium free from the calyx. Calyx 5-parted.*

I. CALLISTHE'NE (to the memory of Callisthenes, an ancient philosopher). Mart. bras. 1. p. 123. D. C. prod. 2. p. 25.

Lin. syst. *Monándria, Monogýnia.* Calyx of 5 unequal parts (f. 90. *d.*), upper one large, and drawn out into a spur (f. 90. *d.*). Petal one (f. 90. *a. b.*), obcordate. Stamen 1 (f. 90. *c.*), alternating with the petal, without any rudiments of sterile stamens. Anther 4-celled; cells separating by pairs. Ovary free, 3-celled; cells containing few ovula. Capsule 3-celled (f. 90. *e.*), 3-valved; valves without a dissepiment; cells 1-2-seeded. Seeds adnate to the angles of the central, thick, trigonal placenta.—Resinous trees; with minute axillary buds, covered with white grains. Leaves and branches opposite and distich, coetaneous, stipulate, deciduous. Flowers axillary and lateral. Petals yellowish.

FIG. 90.



1 C. ma'jor (Mart. l. c. t. 75.) glabrous; leaves elliptic or ovate-oblong, obtuse or acute; flowers solitary in the axils of the leaves, and therefore opposite. ♄. S. Native of Brazil, in hot sandy places. Petals yellow, lined with scarlet. (f. 90.)

Larger Callisthene. Tree 10 to 12 feet.

2 C. mìnor (Mart. l. c. t. 76.) pubescent; leaves linear-oblong, obtuse, ending in a glandular mucrone; flowers solitary in the axils, and therefore opposite. ♄. S. Native of Brazil, in the high plains called Chepada de Parana. Petals cream-coloured.

Smaller-Callisthene. Tree 15 to 26 feet.

3 C. fascicula'ta (Mart. l. c. p. 126.) leaves ovate-oblong, obtuse, rather emarginate, glabrous above, and villous beneath; flowers axillary, in fascicles. ♄. S. Native of Brazil, in the desert between Serra de St. Antonio, and the river St. Francisco, in the province of Minas Geraes. Petals cream-coloured.

Fascicled-flowered Callisthene. Tree.

Cult. See *Voschýsia* for culture and propagation, p. 670.

II. AMPHILO'CHIA (to the memory of Amphilochus, an Athenian philosopher, and writer on agriculture). Mart. bras. 1. p. 127. D. C. prod. 3. p. 26.

Lin. syst. *Monándria, Monogýnia.* Calyx of 5 unequal coriaceous parts; upper part large, and drawn out into a short horn. Petal one, deeply obcordate. Fertile stamen one, alternate with the petal, usually without any rudiments of sterile ones. Anther 4-celled; cells in distinct pairs. Ovary free, with the cells containing few ovula. Capsule having the epicarp separable, corticate, 3-celled, 3-valved, opening at the dissepiments; the valves are bent inwards so much as to form the dissepiments to the capsule. Seeds 1-2 in each cell.—Trees, with opposite petiolate coriaceous, reticulately-veined leaves. Leaf-buds covered with white grains, which remain afterwards permanent at the base of the branches. Flowers terminal, disposed in somewhat interrupted spikes. Petal pubescent.

1 A. dichótoma (Mart. l. c. t. 77.) leaves roundish and somewhat cordate at the base, narrow-oblong, and bluntish, pubescent beneath. ♄. S. Native of Brazil, in the province of Minas Geraes. Petal sulphur-coloured, marked with a blue spot at the base.

Dichotomous Amphilochia. Tree.

2 A. corda'ta (Mart. l. c. p. 129.) leaves deeply cordate at the base, rather ovate-lanceolate, acutish, glabrous and glaucescent on both surfaces. ♄. S. Native of the south of Brazil. Quàlea cordàta, Spreng. syst. 2. p. 17. Flowers like the last.

Cordate-leaved Amphilochia. Tree.

Cult. See *Vochysia* for culture and propagation, p. 670.

III. VOCHY'SIA (*Vochy* is the Guiana name of one of the species). Juss. gen. p. 426. St. Hil. mem. mus. 6. p. 166. Mart. bras. 2. p. 139. D. C. prod. 3. p. 26.—Vòchy, Aubl. guian. 1. p. 18. t. 6.—Vòchya, Vand. fl. bras. in Rœm. scrip. t. 6.—Salmònia, Neck. elem. no. 808.—Cucullària, Schreb. gen. no. 11.

Lin. syst. *Monándria, Monogýnia.* Calyx coloured, 5-parted (f. 91. *a.*), with 4 of the lobes small (f. 91. *a.*), and the fifth or superior one large, and drawn out into a spur at the base (f. 91. *b.*). Petals 3 (f. 91. *c. d.*), unequal, inserted in the calyx, the 2 lateral ones not half the size of the middle one (f. 91. *d. c.*). Stamens 3, opposite the petals, 2 lateral ones sterile and small; and the middle one larger and fertile, bearing a continuous immoveable anther, which is cucullate at the apex. Stigma terminal, obtuse. Capsule trigonal (f. 91. *h.*), 3-celled; the valves opening in the middle. Seeds furnished with a wing, exalbuminous, solitary in the cells. Cotyledons large. Radicle superior.—South American trees, with opposite or verticillate, ovate, entire, feather-nerved, bistipulate leaves, standing on short footstalks. Flowers of all yellow, disposed in terminal racemes; pedicels 1-2-4-flowered, bibracteolate at the base.

1 V. Guiane'nsis (Lam. ill. no. 97. t. 11.) leaves opposite, obovate-oblong, ending in a short acumen each, glabrous on both surfaces; racemes simple, erect, terminal, dense-flowered; spur of flower spreading. ♄. S. Native of Guiana and Maranham, in woods. Vòchy Guianénsis, Aubl. guian. 1. p. 18. t. 6. Cucullària excélsa, Willd. spec. 1. p. 17. but not of Vahl.

Guiana Vochysia. Tree 20 to 40 feet.

2 V. tomentòsa (D. C. prod. 3. p. 26.) leaves opposite, oblong-oval, ending each in a long taper-point, attenuated at the base, glabrous above, but clothed with rusty tomentum beneath; racemes terminal, loose, nodding. ♄. S. Native of Guiana, in woods. Cucullària excélsa, Vahl. enum. 1. p. 4. exclusive of the synonymes. Cucullària tomentòsa, Meyer, esseq. p. 12.

Tomentose Vochysia. Tree 20 to 30 feet.

3 V. citrifòlia (Poir. suppl. 5. p. 491.) leaves opposite, ovate, bluntly acuminated, glabrous; racemes terminal, panicled. ♄. S. Native of Brazil. Cucullària citrifòlia, Rœm. et Schultes, mant. 1. p. 52.

Citron-leaved Vochysia. Tree 20 to 30 feet.

4 V. emargina'ta (Poir. dict. 8. p. 682.) leaves 4 in a whorl, petiolate, oblong, bluntly emarginate, attenuated at the base, rather coriaceous, glabrous on both surfaces; racemes numerous, ascending, elongated, terminal, erect; peduncles usually 3-flowered. ♄. S. Native of Brazil, about Rio Janeiro. Vòchya, Vand. fl. bras. in Rœm. script. 69. t. 6. f. 1. Cucullària emarginata, Vahl. enum. 1. p. 5.

Emarginate-leaved Vochysia. Tree 20 feet.

5 V. tetraphy'lla (D. C. prod. 3. p. 27.) leaves 4 in a whorl, linear-oblong, acuminated, coriaceous, glabrous on both surfaces; racemes axillary, very simple. ♄. S. Native of Guiana, in humid woods. Cucullària tetraphýlla, Meyer, esseq. p. 12. There is a variety of this species mentioned by Meyer in nov. act. bonn. 12. p. 813. with 3 leave[illegible] a whorl.

Four-leaved Vochysia. Tree 20 fe[illegible]

6 V. rotundifòlia (Mart. bras [illegible] p. 140. t. 83.) quite glabrous; leaves 3 or 4 in a whor[illegible]most sessile, cordate at the base, orbicular and emargina[illegible] glaucescent, coriaceous, firm; racemes terminal, solitary; p[illegible]ncles usually 2-flowered: ovaries glabrous. ♄. S. Nativ[illegible] Brazil, in the province of Minas Geraes, on mountains.

Round-leaved Vochysia. Tree 40 feet.

7 V. herba'cea (Pol[illegible] pl. bras. 2. p. 27. t. 118.) leaves obovate, mucronate, pilose, on[illegible]hort petioles, 5-6 in a whorl; racemes elongated; peduncles clothed with villous tomentum, usually 5-flowered. ♄. S. Native of Brazil, in the province of Goyaz.

Herbaceous Vochysia. Shrub 2 feet.

8 V. seri'cea (Pohl. pl. bras. 2. p. 28. t. 119.) leaves crowded, in cumulated whorles, usually 6 in each whorl, petiolate, obversely-oblong, emarginate at the apex; racemes clothed with silky tomentum; peduncles usually 3-flowered. ♄. S. Native of Brazil, in the province of Goyaz.

Silky Vochysia. Shrub 6 to 8 feet.

9 V. cinnamòmea (Pohl. pl. bras. 2. p. 29. t. 120.) leaves cumulated in whorles, 6 or 8 in each whorl, nearly sessile, oblong, obtuse, emarginate, clothed with brown tomentum beneath; racemes very long, whorled; peduncles tomentose. ♄. S. Native of Brazil, in the province of Goyaz.

Cinnamon-like Vochysia. Shrub 6 to 8 feet.

10 V. elli'ptica (Mart. bras. 1. p. 141. t. 84.) leaves opposite, or 3 or 4 in a whorl, almost sessile, rounded and emarginate at both ends, glabrous, coriaceous, finely veined, glaucescent; racemes terminal, solitary; peduncles 2-flowered, and are, as well as the calyxes, pubescent; ovaries villous. ♄. S. Native of Brazil, in the province of Minas Geraes, in the diamond district. (f. 91.)

Elliptic-leaved Vochysia. Tree 10 to 12 feet.

11 V. Tucanòrum (Mart. bras. 2. p. 142. t. 85.) leaves 3 to 8 in a whorl, lanceolate-oblong, or obovate-oblong, attenuated at the base, obtuse or rounded at the apex, and emarginate, glabrous on both surfaces; veins of leaves rather remote, combined a considerable way from the margin; racemes terminal, solitary; ovaries glabrous. ♄. S. Native of the south of Brazil.

Var. α, fastigiàta (D. C. prod. 3. p. 27.) leaves 3 or 4 in a whorl, approximate, lanceolate; racemes short, fastigiate, very simple, few-flowered; spur of flower bent downwards, and adpressed to the calyx.

Var. β, macrostàchya (D. C. l c.) leaves 4 in a whorl, oblong or obovate-oblong; racemes terminal, solitary, compound, tapering much to the apex; spur of flowers bent.

Var. λ, *hexaphýlla* (D. C. prod. l. c.) leaves 4-6 in a whorl, linear-oblong, tapering much to the base; racemes terminal, very long, straight; spur straightish, spreading downwards.

Var. ζ, *vulgàris* (D. C. l. c.) leaves 3-6 in a whorl, oblong-lanceolate, tapering to both ends, emarginate; racemes terminal, middle-sized, cylindrical, loose-flowered; spur of flower straightish, spreading downwards.

Toucan's Vochysia. Tree 15 to 20 feet.

12 V. ru'fa (Mart. bras. 1. p. 144. t. 86.) branches thickened, tomentose; leaves 4-8 in a whorl, petiolate, oblong, obtuse, clothed with rusty tomentum beneath, especially when young, reticulated with veins, coriaceous; racemes terminal, solitary, very long, loose-flowered; peduncles and calyxes tomentose; ovaries very hairy. ♄. S. Native of Brazil, in the province of Minas Geraes.

Rufous Vochysia. Tree 20 feet.

13 V. dive'rgens (Pohl. pl. bras. 2. p. 19. t. 111.) leaves 3 in a whorl, diverging; petiolate, oblong-elliptic, hardly emarginate at the apex; racemes very long; peduncles 3-flowered, rather pilose. ♄. S. Native of Brazil, in the province of Goyaz.

Diverging-leaved Vochysia. Tree.

14 V. micra'ntha (Pohl. pl. bras. 2. p. 20. t. 112.) leaves 3 in a whorl, petiolate, oblong, bluntish at the apex and a little emarginate, rather attenuated at the base; racemes elongated; pedicels simple. ♄. S. Native of Brazil, in the province of Goyaz.

Small-flowered Vochysia. Tree 12 feet.

15 V. pu'mila (Pohl. pl. bras. 2. p. [illegible]. t. 113.) leaves 3-4 in a whorl, on short petioles, oblong, narrow at the base, obtuse at the apex and mucronate, glaucous beneath; racemes very long; peduncles 2-flowered, rather pilose. ♄. S. Native of Brazil, in the province of Minas Geraes.

Dwarf Vochysia. Shrub 2 feet.

16 V. thyrsoi'dea (Pohl. pl. bras. 2. p. 24. t. 115.) leaves 4 in a whorl, on short petioles, oblong-elliptic, retuse, hardly attenuated at the base; racemes pyramidal; peduncles usually 4-flowered. ♄. S. Native of Brazil, in the province of Minas Geraes.

Thyrse-like-flowered Vochysia. Tree 20 to 30 feet.

17 V. alpe'stris (Mart. bras. 1. p. 145. t. 87.) leaves opposite, on short petioles, elliptic or oblong-elliptic, rounded, glabrous on both surfaces, finely veined; racemes terminal, solitary, long, cylindrical; ovaries glabrous. ♄. S. Native of Brazil, in the province of Minas Geraes, on the mountains.

Alp Vochysia. Tree 15 to 25 feet.

18 V. gra'ndis (Mart. bras. 1. p. 146. t. 88.) leaves 4 in a whorl, petiolate, ovate-oblong, rounded, or somewhat truncate, and rather emarginate at the apex, glabrous on both surfaces and finely veined, membranous; racemes terminal, long, cylindrical, aggregate; ovaries glabrous. ♄. S. Native of Brazil, in the province of Rio Negro, in woods.

Great Vochysia. Tree 80 to 100 feet.

19 V. Hænkea'na (Mart. bras. 1. p. 147. t. 89.) leaves 4 in a whorl, on long footstalks, oblong-lanceolate, rather cuspidate, bluntish and emarginate at the apex, glabrous on both surfaces and finely veined; racemes terminal, compound, aggregately panicled; ovaries tomentose. ♄. S. Native of Peru.

Hænke's Vochysia. Tree 20 feet.

20 V. pyramida'lis (Mart. bras. 1. p. 148. t. 90.) leaves opposite or 4 in a whorl, subcordate or rounded at the base, oblong-lanceolate, acuminated, costately veined beneath, and clothed with fine cinereous tomentum, as well as the branches, petioles, and peduncles; racemes terminal, solitary, pyramidal; ovaries glabrous. ♄. S. Native of Brazil, in the province of Minas Geraes.

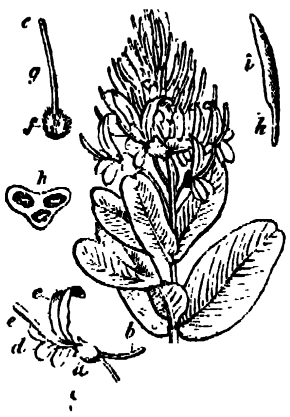
Pyramidal Vochysia. Tree 20 to 30 feet.

21 V. floribu'nda (Mart. l. c. p. 149. t. 91.) leaves opposite or 3-4 in a whorl, oblong, cuspidate, costately veined beneath, and strigose and roughish at the veins; racemes terminal, aggregate; spur of calyx short, straight, and conical; ovary glabrous. ♄. S. Native of Brazil at Ega, in the province of Rio Negro. Allied to *V. Guianénsis.*

Bundle-flowered Vochysia. Tr. 30 to 40 feet.

22 V. pruinòsa (Pohl. pl. bras. 2. p. 22. t. 114.) leaves 4 in a whorl, cumulated, nearly sessile, oval-elliptic, rather cordate at the base, emarginate at the apex, pruinose; racemes elongated, tomentose; peduncles usually 3-flowered, tomentose. ♄. S. Native of Brazil, in the province of Goyaz.

FIG. 91.



Frosted Vochysia. Shrub 6 to 12 feet.

23 V. cunea'ta (Pohl. pl. bras. 2. p. 26. t. 117.) leaves usually 5 in a whorl, on short petioles, rather cuneated or obversely oblong-ovate, obcordate at the apex; racemes pyramidal; peduncles usually 4-flowered. ♄. S. Native of Brazil, in the province of Minas Geraes.

Cuneated-leaved Vochysia. Tree 24 feet.

24 V. elonga'ta (Pohl. pl. bras. 2. p. 25. t. 116.) leaves 3 or 4 in a whorl, on short petioles, oblong or oblong-elliptic, rounded and emarginate at the apex, attenuated at the base, reticulated; racemes elongated, straight; peduncles 2-5-6-flowered. ♄. S. Native of Brazil, in the province of Minas Geraes.

Var. α, *nìtida* (Pohl. l. c.) leaves 4 in a whorl, elliptic, attenuated at the base; peduncles 5-6-flowered.

Var. β, *opàca* (Pohl. l. c.) leaves 4 in a whorl, oblong, attenuated at the base; peduncles 2-flowered.

Var. γ, *ternàta* (Pohl. l. c.) leaves 3 in a whorl.

Elongated Vochysia. Tree 24 feet.

25 V. ferrugi'nea (Mart. bras. 1. p. 151. t. 92.) leaves opposite, ovate-oblong or oblong, acuminated, glabrous above, and costately veined beneath; the middle nerve and veins clothed with white tomentum, as well as the branches; racemes terminal, erect, straight; peduncles usually 4-flowered; spur of calyx hooked; ovaries glabrous. ♄. S. Native of Brazil, in the province of Rio Negro, in woods.

Rusty Vochysia. Tree 20 to 30 feet.

† *A doubtful species.*

26 V.? racemòsa (Poir. dict. 8. p. 682.) leaves opposite, ovate-lanceolate, acute, glabrous, membranous; racemes axillary. ♄. S. Native of Cayenne. Cucullària racemòsa, Rœm. et Schultes, syst. 1. p. 36. Capsule glabrous, size of a pea, 1-valved, 3-celled; cells 2 from abortion. Flowers unknown.

Racemose-flowered Vochysia. Tree.

Cult. A mixture of peat and loam will suit the species of this genus, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them.

IV. SALVE'RTIA (Auguste St. Hilaire, does not say to whom he has dedicated this name, but it is evidently dedicated to some person of the name of Salvert or Salverti). St. Hil. mem. mus. 6. p. 266. and 9. p. 340. Mart. bras. 1. p. 152. D. C. prod. 3. p. 28.

Lin. syst. *Monándria, Monogýnia.* Calyx of 5 nearly equal obtuse elliptic lobes, the upper one furnished with a spur at the base. Petals 5, the 2 superior ones very narrow. Stamens 3, inserted in the calyx, opposite the 3 lower petals, the lateral 2 sterile, the middle one only antheriferous. Style clavate. Stigma saucer-shaped, obtuse, lateral, situated beneath the apex of the style. Capsule 3-celled, 3-valved, trigonal; cells 1-seeded; valves opening in the middle. Seeds exalbuminous, drawn out at one side into a woolly wing. Embryo with convolute cotyledons, and a superior radicle.—Trees, with oval, obtuse, exstipulate, feather-nerved leaves, which are crowded in whorles of 6 or 8. Flowers thyrsoid, sweet-scented, white, but at length becoming orange-coloured.

1 S. convallariodòra (St. Hil. l. c.) leaves in whorles, oval, obtuse; flowers thyrsoid. ♄. S. Native of Brazil, in fields, in the province of Minas Geraes.

Lily of the valley-scented Salvertia. Tree 30 feet.

2 S. thrysiflòra (Pohl. pl. bras. 2. p. 16. t. 110.) leaves in whorles, obversely oblong-oval or oblong, obtuse, mucronate; thyrse large, panicled; flowers small. ♄. S. Native of Brazil, in the province of Goyaz. Petals white, spotted with red.

Thryse-flowered Salvertia. Tree 20 feet.

Cult. See *Vochysia* for culture and propagation, p. 670.

V. QUA'LEA (a name given to one of the species by the Indians of Guiana). Aubl. guian. 1. p. 7. t. 1-2. Juss. gen. 424. Lam. ill. t. 4. St. Hil. mem. mus. 6. p. 265. and 269. Mart. bras. 1. p. 130. D. C. prod. 3. p. 28.

Lin. syst. *Monándria, Monogýnia.* Calyx 5-parted; lobes very unequal, rounded, the largest one petaloid, and furnished with a spur at the base. Petal 1, rarely 2, inserted in the bottom of the calyx, or perhaps inserted in the torus. Stamen 1, rarely 2, alternating with the petal; filament linear; anther oblong. Ovary free. Capsule woody, 3-celled, 3-valved; the valves opening in the middle. Seeds exalbuminous, furnished with a wing. Embryo with large convolute cotyledons, and a superior radicle.—South American trees, with opposite branches, opposite coriaceous glabrous entire ovate feather-nerved leaves. Stipulas deciduous. Cymes of flowers terminal, trichotomous, panicled, furnished with 2 bracteas at each ramification. Flowers sweet-scented, rose-coloured or blue. The lateral veins of the leaves are the same as in *Calophýllum*, parallel, and approximate, running into a marginal nerve.

1 Q. ròsea (Aubl. guian. 1. p. 5. t. 1.) leaves elliptic, acuminated, glabrous on both surfaces; lateral veins approximate; petal entire; spur shorter than the calyx. ♄. S. Native of Guiana, in woods. Petal, as well as the large segment of the calyx, white on the outside, and rose-coloured on the inside.

Rose-coloured-flowered Qualea. Tree 60 feet.

2 Q. cæru'lea (Aubl. guian. 1. p. 7. t. 2.) leaves oval, ending in a short taper-point each, glabrous on both surfaces; lateral veins approximate; petal emarginate; spur length of the calyx. ♄. S. Native of Guiana, in woods. Petal cinereous on the outside, and rather bluish on the inside.

Blue-petalled Qualea. Tree 60 to 80 feet.

3 Q. Gestasia'na (St. Hil. mem. mus. 6. p. 254.) leaves lanceolate, acuminated, glabrous; petioles and peduncles pubescent; calyx ciliated, the superior lobe emarginate; petal cordate. ♄. S. Native of Brazil, in the mountains near Rio Janeiro. Petal sulphur-coloured, with the veins purplish at the base.

Gestas's Qualea. Tree 100 feet.

4 Q. ecalcara'ta (Mart. bras. 1. p. 130. t. 78.) leaves oblong, acuminated, glabrous above, but costately veined and clothed with fulvous pubescence beneath; racemes lateral, subcorymbose, few-flowered; calyx without a spur. ♄. S. Native of Brazil, on mountains, in the province of Minas Geraes. Stamen 1 in the flowers, with 2 petals, and 2 in the flowers, with 1 petal. Petal cream-coloured, veined.

Spurless Qualea. Tree 20 feet.

5 Q. grandiflòra (Mart. bras. l. c. p. 133. t. 79.) leaves oblong, rather acuminated, glabrous above, tomentose and costately-veined beneath, but with the nerves and veins glabrous; flowers axillary or terminal, solitary or racemose; calyx clothed with silky pubescence on the outside, furnished with an elongated acutish spur. ♄. S. Native of Brazil, in the provinces of St. Paul and Minas Geraes. Petal 1, large, white, yellow at the base, orbicular, emarginate. Stamen 1.

Great-flowered Qualea. Tree 10 to 20 feet.

6 Q. multiflòra (Mart. l. c. p. 134. t. 80.) leaves opposite or 3 in a whorl, ovate or broad-lanceolate, or oblong, acuminated, glabrous on both surfaces, costately veined beneath; peduncles pilose; racemes axillary or terminal; whorles of flowers distant; upper lobe of calyx truncate and emarginate; spur and ovaries very hairy. ♄. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul. Petal 1, obcordate, cream-coloured. Stamen 1.

Var. β, *pubéscens* (Mart. l. c.) leaves pubescent beneath. ♄. S. Growing along with the species.

Many-flowered Qualea. Tree 10 to 20 feet.

7 Q. parviflòra (Mart. l. c. p. 135. t. 81.) plant clothed with powdery hoary tomentum; leaves opposite or alternate, oblong, bluntish, costately-veined beneath; racemes axillary or terminal; calyx canescent, with the spur spreading and obtuse. ♄. S. Native of the south of Brazil, in the Certao or Great Desert. Petal 1, obcordate, unguiculate, white, having the scent of violets.

Var. a, tomentòsa (D. C. prod. 3. p. 29.) leaves clothed with hoary tomentum on both surfaces, but in the adult state they are glabrous.

Var. β, *glabràta* (D. C. l. c.) leaves smoothish on both surfaces.

Var, γ, *discolor* (D. C. l. c.) leaves glabrous above and canescent beneath.

Small-flowered Qualea. Tree 12 to 20 feet.

† *Species not sufficiently known.*

8 Q. Pe'rrini (Spreng. syst. 1. p. 17.) leaves oblong, subcordate, veiny; racemes hairy; petal entire; spur equal in length to the calyx. ♄. S. Native of Guiana.

Perrin's Qualea. Tree.

9 Q. verticilla'ta (Spreng. l. c.) leaves oblong, emarginate, attenuated at the base; corolla somewhat dipetalous, unequal. ♄. S. Native of Brazil.

Whorled Qualea. Tree.

Cult. For culture and propagation see *Vochysia*, p. 670.

§ 2. *Ovary adnate to the calyx. Calyx 4-parted.*

VI. ERI'SMA (from ερισμα, *erisma*, strife; so named from the anomalous form of the genus, which is at so much variance with others). Rudge, pl. guian. 1. p. 7. t. 1. D. C. prod. 3. p. 29.—Debræ'a, Rœm. et Schult. syst. 1. p. 4.—Ditmària, Spreng. syst. 1. p. 4.

Lin. syst. *Monándria, Monogýnia.* Tube of calyx adnate to the ovary; limb 4-5-parted; the lobes unequal, the longest one parabolic, drawn out into a spur at the base, expanded into a large petaloid limb at the apex, which is bearded on the inside; it is convolute in æstivation, and incloses the genitals. Petal 1, opposite the petaloid limb of the calyx, inserted behind the filament. Stamens, 1 fertile and 4 sterile; these last are very short. Anther oblong, narrow, sagittate, 3-celled, ex Martius. Ovary 1-celled, oblong, biovulate. Style filiform. Fruit unknown.—Trees, with opposite, oval, acuminated, coriaceous, glabrous, quite entire, feather-nerved leaves; lateral nerves confluent before the margin. Stipulas 2, small, at the base of each leaf. Panicle terminal, with opposite branches and branchlets, furnished with 2 unequal membranous deciduous bracteas to each ramification.

1 E. floribu'ndum (Rudge, l. c.) leaves ovate, acutish, with 16-18 lateral nerves on each side, having the upper surfaces hardly shining; branches of panicle clothed with rusty velvety down. ♄. S. Native of French Guiana. Tratt. obs. bot. 3. p. 71. t. 105. Debræ'a floribúnda, Rœm. et Schultes, syst. 1. p. 34. Ditmària floribúnda, Spreng. syst. 1. p. 16. Petal violaceous.

Bundle-flowered Erisma. Tree 40 feet.

2 E. viola'ceum (Mart. bras. 1. p. 137. t. 82.) leaves oblong, cuspidate, with 10-12 lateral distant nerves on each side; branches of corymbose panicle smoothish. ♄. S. Native of Brazil, in moist woods in Para. Quàlea calcaràta, Link. jahrb. gew. 1. 3. p. [illegible] Schultes, mant. 1. p. 53. Petal violaceous.

Violaceous-petaled Erisma. Tree 30 to 40 feet.

3 E. ni'tidum (D. C. prod. 3. p. 30.) leaves oval, acute, with 7-9 lateral nerves on each side; shining on the upper surface; branches of panicle striated and glabrous. ♄. S. Native of Cayenne, on the mountains of Roura near Kaw. Quàlea lùtea, Martin in Desf. [illegible] Petal yellow.

Shining-leaved Erisma. Tree [illegible] to 40 feet.

Cult. See *Vochýsia* for culture and propagation, p. 670.

† *The following genera are hardly known, and very doubtful whether they belong to the present order.*

VII. LOZA'NIA (evidently a proper name, and perhaps the name of some botanist known to Mutis). Seb. Mut. in sem. nov. granad. 1810. p. 20. D. C. prod. 3. p. 30.

Lin. syst. *Monándria, Monogýnia.* Calyx with a somewhat ventricose tube, and a 4-parted limb; lobes ovate, acute, spreading, permanent. Petals wanting. Disk quadrangular, filling the bottom of the calyx. Stamen 1, small, inserted obliquely under the ovarium, and tapering to the apex; anther ovate, didymous. Ovary ovate. Stigmas 3, small, subcapitate. Capsule ovate, trigonal, acuminated, 3-celled, 3-valved. Seeds 6, with usually 3 of them abortive, angular, inserted in the bottom of the capsule.—A tree, with alternate oblong serrated leaves, and spikes of flowers; peduncles axillary, crowded; pedicels furnished each with a linear bracteole at the base.

1 L. nemora'lis (Seb. Mut. l. c.) ♄. S. Native of New Granada, in temperate parts.

Grove Lozania. Tree.

Cult. See *Vochýsia* for culture and propagation, p. 670.

VIII. AGA'RDHIA (in honour of Charles Agardh, a Swedish professor and writer upon Algæ; author of Synopsis Algarum Scandanaviæ, Lund. 1817. 8vo. and other works on the same subject). Spreng. syst. 1. p. 4. D. C. prod. 3. p. 30.

Lin. syst. *Monándria, Monogýnia.* Calyx of 3 sepals. Petals 5, convolute. Stamen 1, bearing a large, 2-celled anther. Drupe oval, 3-celled, 3-valved. The rest unknown. Perhaps more nearly allied to *Terebinthàceæ.* It is a very doubtful genus.

1 A. crypta'ntha (Spreng. syst. 1. p. 17.) leaves ovate, acute, glabrous on both surfaces; raceme terminal. ♄. S. Native of Brazil.

Hidden-flowered Agardhia. Tree.

2 A. grandiflòra (Spreng. l. c.) leaves cordate, oblong, coriaceous, with parallel veins, discoloured beneath and villously tomentose; racemes verticillate; flowers villous, as well as the petioles and peduncles, which are glandular at the base. ♄. S. Native of Brazil.

Great-flowered Agardhia. Tree.

Cult. See *Vochýsia* for culture and propagation, p. 670.

IX.? SCHWEIGGE'RIA (in honour of A. F. Schweigger, author of Flora Erlangensis). Spreng. syst. 1. p. 167. D. C. prod. 3. p. 30.

Lin. syst. *Monándria, Monogýnia.* Calyx of 3 corolline sepals. Petals 3, one of which is furnished with a spur, the other two erect and cartilaginous. Glands 5, ovate, surrounding the base of the stamen, which is columnar and triquetrous, and bearing an anther at the apex. Pistil none. Fruit unknown.—A little shrub, with the habit of *Bétula fruticòsa,* with scattered, sub-fascicled, obovate, crenulated, glabrous leaves; and axillary bibracteate pedicels. Flowers small, like those of a violet. This genus is hardly known.

1 S. fruticòsa (Spreng. l. c.) ♄. S. Native of Brazil.

Shrubby Schweiggeria. Shrub.

Cult. See *Vochýsia* for culture and propagation, p. 670.

Order XCI. RHIZOPHO'REÆ (plants agreeing with *Rhizophòra* or *Mangrove* in particular characters). R. Brown, gen. rem. p. 17. Cong. p. 18. D. C. prod. 3. p. 31.—Paletùviers, Savig. in Lam. dict. 4. p. 696.

Tube of calyx adhering to the ovarium (f. 92. *a. f.*), except in the genus *Cassipoùrea,* which is free; limb 4-13-lobed (f. 92. *e.*); lobes valvate in æstivation (but in *Olísbea* calyptriform). Petals inserted in the calyx (f. 92. *c.*), and alternating with its lobes, therefore equal to them in number. Stamens inserted with the petals (f. 92. *d.*), equal to them in number, or double or triple that number; filaments free, subulate, erect; anthers ovate, inserted by the base, erect, but somewhat incurved in the genus *Olisbea.* Ovary adnate to the calyx (f. 92. *a.*), 2-celled; cells 2 or many-ovulate; ovula pendulous. Fruit indehiscent (f. 92. *f.*), 1-celled, 1-seeded, crowned by the calyx (f. 92. *e.*). Seed pendulous, exalbuminous. Embryo with a very long radicle and 2 flat cotyledons.—Tropical trees or shrubs, with opposite, simple, entire, or toothed leaves, having the lateral nerves feathered when present. Stipulas interpetiolar. Peduncles axillary.

From a consideration of the structure of *Carállia* and *Légnotes,* Mr. Brown has been led to conclude, that we have a series of structures, connecting *Rhizophòreæ* on the one hand with certain genera of *Salicarièæ,* particularly with *Antherílium,* though that genus wants its intermediate stipulas, and on the other with *Cunoniàceæ,* especially with the simple-leaved species of *Ceratopétalum.* In the opposite leaves, interpetiolar stipulas, adnate ovarium, and polypetalous flowers, this order agrees with *Vochysièæ* and *Cunoniàceæ;* in the valvate calyx with *Lythrarièæ* and *Cunoniàceæ;* and in the pendulous ovulas with *Combretàceæ.* The genus *Olisbea* seems to come nearest to *Memecýleæ.* The species of *Rhizóphora* or *Mangrove* are remarkable in tropical countries for growing upon the shores of the sea and rivers, even as far as low water. The seeds have the singular property of germinating while inclosed within the capsule, and adhering to their parent, and pushing forth a long fusiform radicle, which lengthens till it reaches and fixes itself in the mud in which the parent grows, and forms a new individual. These young plants never separate from the parent until they are fairly fixed and rooted, as otherwise they would be washed away by the tide. Where *mangroves* grow in abundance, the situation is always considered unhealthy, from their collecting a vast quantity of filth about their roots, from the flowing and ebbing of the tide. The bark of *Rhizóphora*, which is very astringent, is used in India for dyeing black.

Synopsis of the genera.

§ 1. *A genus having its calyx in the form of a calyptra.*

1 **Oli'sbea.** Calyx undivided before the expansion of the flower, but afterwards separating transversely, in one piece. Petals 5. Stamens 10.

§ 2. *Rhizophòreæ veræ. Tube of calyx adhering to the ovarium* (f. 92. *a.*).

2 **Rhizo'phora.** Limb of calyx 4-13-lobed. Petals equal in number to the lobes of the calyx. Stamens double the number of the petals.

3 **Cara'llia.** Limb of calyx 6-7-lobed (f. 92. *e.*). Petals 6-7 (f. 92. *c.*). Stamens twice the number of the petals (f. 92. *d.*).

§ 3. *A genus with the calyx free from the ovarium.*

4 **Cassipou'rea.** Calyx campanulate, 5-cleft. Petals 3, fringed. Stamens 20-40.

§ 1. *An intermediate genus between the orders Memecyleæ and Rhizophòreæ, having a calyptriform calyx.*

I. OLI'SBEA (from ολισβος, *olisbos*, penis coriaceous; in reference to the consistence of the anthers). D. C. prod. 3. p. 31.

Lin. syst. *Decándria, Monogýnia.* Calyx closed, ovate, acute, undivided before the expansion of the flower, but afterwards bursting transversely, and falling off in one piece. Petals 5. Stamens 10; anthers rather incurved, opening by a longitudinal chink. Style filiform. Fruit and seeds unknown.—Shrub quite glabrous. Leaves oval, opposite, entire, acuminated, opaque, coriaceous, furnished with a longitudinal nerve, but without any lateral veins. Stipulas supra-axillary, connate at the base, and sheathing. Peduncles axillary, opposite, 1-flowered, articulated in the middle. This is a very doubtful but very singular genus, in the stipulas and habit being that of *Rhizóphora*, the form of the anthers that of *Mouriria*, and the calyx that of *Calyptránthis* or *Conostègia*, but from all very different.

1 O. RHIZOPORÆFÒLIA (D. C. l. c.). ♄. S. Native of the West Indies, particularly in St. Vincent, where it is probably cultivated only in the botanic garden.

Rhizophora-leaved Olisbea. Tree.

Cult. See *Carállia* for culture and propagation, p. 674.

§ 2. *Rhizophòreæ veræ. Tube of calyx adhering to the ovary.*

II. RHIZO'PHORA (ῥιζα, *rhiza*, a root, and φορεο, *phoreo*, to bear; the species of this genus throw out roots from the branches in great abundance, which lengthen out until they fix themselves in the mud, and consequently one tree may, by these supports, spread over a large space, as every branch is supported by its own roots). Lin. gen. no. 592. Gærtn. fruct. 1. p. 212. t. 45. D. C. prod. 3. p. 31.—Rhizóphora and Bruguièra, Lam. dict. et ill. t. 396. and 397.

Lin. syst. *Tetra-Icosándria, Monogýnia.* Tube of calyx obovate, adhering to the ovarium; limb with 4-13, oblong-linear, permanent lobes. Petals equal in number to the lobes of the calyx, oblong, furnished with 2 awns at the apex, convolute, and when young clasping the stamens, of which two are situated in the front of each petal, the stamens are therefore double the number of the petals. Anthers erect, ovate, inserted by the base. Ovarium 2-celled, when young containing many pendulous ovula. Style 1, bifid at the apex. Fruit indehiscent, 1-seeded, crowned by the calyx. Seed small. Embryo inverted, germinating in the seed, with the radicle gradually lengthening out until it fixes itself in the mud.—Glabrous shrubs, growing in great abundance on the shores of the sea and rivers within the tropics, throwing out numerous roots from every branch. Leaves opposite, coriaceous, quite entire. Peduncles axillary.

* *Flowers 4-petalled. Mangles, Plum. gen. t.* 15.

1 R. MA'NGLE (Lin. spec. 634.) leaves obovate-oblong, obtuse; peduncles 2-3-flowered, longer than the petioles; fruit subulately clavate. ♄. S. Native of Louisiana, Mexico, West Indies, Guiana, Brazil, and west coast of Africa, on the shores of the sea and rivers. Jacq. amer. p. 141. t. 89. ed. pict. t. 132. Catesb. car. 2. t. 63.—Plench. icon. t. 359. Flowers octandrous, pale yellow. P. Browne says the fruit germinates within the cup, and grows from the top downwards until it acquires a due degree of weight and perfection, when it falls off, and as the root is always the thickest, and hangs lowest, it drops in that direction, and is thus received into its natural position in the mud below, the leaves are immediately unfolded, and in a few minutes a perfect plant is seen, sometimes of 2 or 3 feet long, which soon begins to shoot its roots and push its growth like the parent plant. The lower branches frequently become the supporters of some species of oysters, which has given rise to the fabulous account of this shell-fish on trees as a fruit. The bark is most excellent for tanning leather. The decoction of it is a most powerful astringent. The wood is tough and durable.

Mangle or Common Mangrove. Clt. 1820. Tr. 12 to 15 ft.

2 R. CANDELA'RIA (D. C. prod. 3. p. 32.) leaves oval, acute; peduncles 1-3-flowered, very short and thickish; fruit subulately clavate. ♄. S. Native of Malabar and the Moluccas, on the shores of the sea and rivers. Pee-kandel, Rheed. mal. 6. t. 34. Mángium candalárium, Rumph. amb. 3. t. 71. and t. 72. The flowers are at first white, but at length changing to reddish, according to Rheede. Stamens 9-12. Perhaps this species is not different from *R. Mángle*.

Chandelier or Malabar Mangrove. Tree 12 to 15 feet.

3 R. RACEMÒSA (Meyer, prim. esseq. 185.) leaves obovate-oblong or obovate; racemes axillary, dichotomously panicled. ♄. S. Native on the shores of Guiana, near the Essequibo. Petals copper-coloured, pilose.

Racemose-flowered Mangrove. Tree 12 to 15 feet.

4 R. MUCRONA'TA (Lam. dict. 6. p. 169. ill. t. 396. f. 2.) leaves oval, abruptly acuminated; racemes nodding, dichotomous. ♄. S. Native of the Mauritius. Petals oblong, obtuse? Stamens 8. Ovary 4-sided, ex Poir.

Mucronate-leaved Mangrove. Tree 12 to 15 feet.

* * *Flowers of 5 petals. Kandèlia* (from *Tsjerou-Candel*, the Malabar name of R. Candel).

5 R. CA'NDEL (Lin. spec. 634.) leaves obovate-oblong, obtuse, on short petioles; peduncles twice bifid, much longer than the petioles. ♄. S. Native of Malabar, in muddy places on the sea-shore. Tsjerou-Candel, Rheed. mal. 6. t. 35. Flowers whitish. Sepals spreading, somewhat reflexed. Stamens 10-15, exserted. Fruit cylindrical, long, acute.

Candel Mangrove. Tree 10 to 15 feet.

6 R. TIMORIE'NSIS (D. C. prod. 3. p. 32.) leaves oval, obtuse, on long petioles; peduncles length of petioles, bearing 10-15 flowers in a head. ♄. S. Native of Timor. Leaves 2 to 2½ inches long. Petioles 6-12 lines long. Flowers crowded. Lobes of calyx 5, oblong, stiff. Petals 5, biaristate at the apex, when young convolute and clasping 2 stamens each.

Timor Mangrove. Tree 15 to 20 feet.

* *Flowers of* 8 *petals.—Kanìlia, (from Kanil-Kandel, the Malabar name of R. cylindrica).*

7 R. cyli'ndrica (Lin. spec. 634.) leaves oval, acuminated at both ends; peduncles axillary, 1-2-flowered; lobes of calyx at length reflexed. ♄. S. Native of Malabar, in muddy places by the sea-side. Kanil-Kandel, Rheed. mal. 6. t. 33. Flowers white. Anthers red. Fruit cylindrical, from reddish to blue, 2-3 inches long, ex Rheed.

Cylindrical-fruited Mangrove. Tree 12 to 15 feet.

8 R. caryophylloi'des (Jack, mal. misc. 1. no. 2. p. 34.) leaves ovate-lanceolate, acute at both ends; peduncles axillary, 3-flowered, rarely dichotomously 5-flowered; lobes of calyx at length spreading. ♄. S. Native of the Moluccas, Singapore, Pulo-penang. Radicle rather cylindrical, acutish.—Rumph. amb. 3. t. 78.

Clove-like Mangrove. Tree 12 to 15 feet.

* * * *Flowers of* [illegible]13 *petals.—Paletuvièra, Pet. Th.—Bruguièra, Lam. ill. t.* 397. [illegible] t. 4. *p.* 696. *but not of Pet. Th.*

9 R. sexa'ngula (Lour. coch. 297.) leaves ovate-lanceolate; pedicels 1-flowered, sub-terminal; fruit prismatic, hexagonal, obtuse. ♄. G. Native of Cochinchina, on the banks of rivers. Bruguièra sexángula, Steud. Bruguièra sexangulàris, Spreng. Flowers red, of 10 petals. Petals ciliated.

Hexagonal-fruited Mangrove. Tree 10 to 15 feet.

10 R. gymnorhi'za (Lin. spec. 634.) leaves ovate-oblong, acuminated at both ends, shining; pedicels 1-flowered, deflexed, about the length of the petioles; fruit terete, acute. ♄. S. Native of the Moluccas, East Indies, and Cochin-china.—Rheed. mal. 6. t. 31. 32.—Rumph. amb. 3. t. 63. 70, 71. Bruguièra, gymnorhìza, Lam. ill. t. 397. Flowers reddish-yellow, of 10-13 petals. Roots naked above the earth. The bark is very astringent, and is used in India for dyeing rufous or chesnut colour, which is easily changed into a fine permanent black.

Naked-rooted Mangrove. Tree 12 to 15 feet.

† *Species not sufficiently known.*

11 R. conjuga'ta (Lin. spec. 634.) leaves ovate-oblong, bluntish; flowers sessile; fruit cylindrically subulate. ♄. S. Native of Ceylon.

Conjugate Mangrove. Tree.

12 R. Pa'lun (D. C. prod. 3. p. 33.) leaves oval-oblong, acuminated at both ends, alternate; calyx 5-lobed; fruit cylindrical, striated. ♄. S. Native of the Moluccas, in marshes. —Rumph. amb. 3. t. 69.

Palun Mangrove. Tree.

13 R. deca'ndra (Roxb. hort. beng. p. 36.) Native of the East Indies, where it is called *Guran*. Not described.

Decandrous Mangrove. Tree.

14 R. ceratophylloìdes (Ræuch. nom.). Not described.

Buckhorn-leaved-like Mangrove. Shrub.

Cult. The species of *mangrove* are difficult, if not impossible, to cultivate in this country. They may be tried in a mixture of loam and sand, and kept moist with salted water.

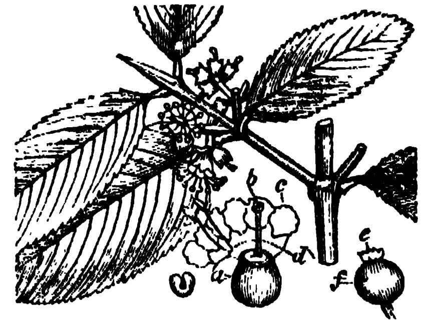
III. CARA'LLIA (*Carállie* is the name of *C. lùcida*, in the language of the Telingas). Roxb. hort. beng. p. 87. and cor. 3. t. 211. D. C. prod. 3. p. 33.

Lin. syst. *Dodecándria, Monogýnia.* Tube of calyx subglobose (f. 92. *a.*); limb 6-7-lobed (f. 92. *e.*); lobes triangular. Petals 6-7 (f. 92. *c.*), orbicular. Stamens 12-14 (f. 92. *d.*), equal in length with the petals. Ovary globose (f. 92. *a.*), adnate to the calyx. Style length of stamens, crowned by a sub-urceolate, 3-lobed stigma (f. 92. *b.*). Berry globose (f. 92. *f.*), 1-celled, crowned by the calyx (f. 92. *e.*). Seed 1, reniform, rarely 2.—Evergreen, glabrous, Indian trees, with opposite, serrated, stiffish leaves, which are shining on the upper surface. Peduncles axillary, trifid, many-flowered. The genus *Baraldèia* of Pet. Th. see vol. 1. p. 808. now inserted in *Rutàceæ*, is allied to this genus, according to R. Br. congo. p. 18.

1 C. lanceæfólia (Roxb. hort. beng. p. 87.) leaves oblong-lanceolate, acute, serrated, 3-times longer than broad. ♄. S. Native of Sumatra.

Lanceolate-leaved Cerallia. Tree 20 feet.

FIG. 92.



2 C. luci'da (Roxb. cor. 3. t. 211.) leaves oval, acuminated, serrated, twice the length of the breadth. ♄. S. Native of the East Indies, on the lower Circars. Petals yellow, rather undulated. Fruit the size of a large pea.

Lucid Carallia. Clt. 1820. Tree 20 feet.

3 C. intege'rrima (D. C. prod. 3. p. 33.) leaves oval, acuminated, quite entire, twice the length of the breadth. ♄. S. Native of the East Indies. Perhaps only a variety of *C. lucida.*

Quite-entire-leaved Carallia. Tree 20 feet.

Cult. See *Cassipoùrea* for culture and propagation, p. 675.

§ 3. *A genus with a free calyx, intermediate between Rhizophòreæ and Lythrarìeæ.*

IV. CASSIPOU'REA (Guiana name of *C. Guianénsis*). Aubl. guian. 1. p. 529. t. 211. (1775.)—Tìta, Scop. intr. p. 219. (1777.)—Legnòtis, Swartz, prod. p. 84. (1788.) fl. ind. occ. p. 968. t. 17.—Richæ'ia, Pet. Th. gen. nov. mad. no. 84. (1810.) but not of Lam. nor Browne.

Lin. syst. *Icosándria, Monogýnia.* Calyx campanulate, 5-lobed; lobes valvate in æstivation. Petals 3, inserted in the bottom of the calyx, attenuated at the base, fringed on the margins at the apex. Stamens 20-40, inserted in the bottom of the calyx and shorter than it, disposed in a single series. Ovary hemispherical. Style permanent, longer than the stamens. Stigma obtuse. Fruit 3-celled, 3-valved, girded by the calyx; cells 2-ovulate, but only 1-seeded from abortion. Seed hanging from the top of the cell, half arillate at the base. Albumen fleshy. Embryo inverted, with flat cotyledons and an oblong radicle.—Trees or shrubs, with opposite, oval, acute, feather-nerved, short-stalked, entire, or toothed leaves. Stipulas lanceolate, between the leaves. Flowers axillary, crowded; pedicels 1-flowered, bracteate at the base.—This genus agrees with *Rhizophòreæ* in the stipulas, and especially with the genus *Carállia.* It agrees with *Lythrarìeæ* in the free calyx; but from both orders it differs in the albuminous seeds. Perhaps a proper order.

1 C. macrophy'lla (D. C. prod. 3. p. 34.) leaves ovate, obtuse at the base, on short petioles, acuminated at the apex, and with the margins bluntly repand; flowers sessile; petals pinnatifidly jagged. ♄. S. Native of Brazil, in the province of Para. Legnòtis macrophýlla, Mart. herb. Leaves 6 inches long and 3 broad. Flowers larger than those of the following species, white.

Long-leaved Cassipourea. Tree or shrub.

2 C. Guiane'nsis (Aubl. guian. 1. p. 529. t. 211.) leaves ovate or oval, on short petioles, quite entire, acuminated at the apex; flowers almost sessile; petals pinnatifidly fringed. ♄. S. Native of French Guiana, in marshes, and of Brazil, in the

province of Para. Legnòtis Cassipoúrea, Swartz, fl. ind. 970. Petals white.

Guiana Cassipourea. Shrub 6 to 7 feet.

3 C. elli′ptica (Poir. suppl. 2. p. 131.) leaves elliptic, acuminated at both ends, quite entire, on short petioles; flowers distinctly pedicellate; petals rather palmately fringed. ♄. S. Native of Jamaica, on the higher mountains. Legnòtis ellíptica, Swartz, prod. 84. fl. ind. p. 969. t. 17. Petals white.

Elliptic-leaved Cassipourea. Tree 10 to 30 feet.

4 C. Madagascarie′nsis (D. C. prod. 3. p. 34.) leaves on short petioles, toothed; flowers pedicellate; pedicels rising from an urceolate bractea each; petals fringed at the apex. ♄. S. Native of Madagascar. Richæ′ia, Pet. Th. nov. gen. mad. p. 25. no. 84.

Madagascar Cassipourea. Shrub 6 to 10 feet.

† *A species not sufficiently known.*

5 C. Congoe′nsis (R. Br. congo, p. 58.). ♄. S. Native of the west coast of Africa, on the banks of the Congo. Petals less divided than the rest of the species.

Congo Cassipourea. Tree or shrub.

Cult. Loam and peat is a good soil for the species of *Cassipoúrea*, and cuttings root readily in sand, under a hand-glass, in heat.

Order XCII. ONAGRA′RIÆ (plants agreeing with *Onagros* or *Onager*, now *Œnothèra*, in important characters). Juss. ann. mus. 3. p. 315. exclusive of *Halorâgiæ*. D. C. prod. 3. p. 35.—Onàgræ, Juss. gen. 317. exclusive of numerous genera. —Epilobiàceæ, Vent. tabl. 3. p. 307.—Calecanthemàrum gen. Lin.

Tube of calyx adnate to the ovarium the whole length (f. 93. *a.*), or only adhering to it at the base (f. 94. *a.*), and drawn out beyond the ovarium at the apex (f. 94. *a.*); limb 2-4-lobed, but usually 4-lobed (f. 93. *a.* f. 94. *a.* f. 96. *a.* f. 98. *a.*); lobes valvate in æstivation. Petals equal in number to the lobes of the calyx (f. 95. *b.* f. 96. *b.* f. 97. *b.* f. 98. *d.*), and alternating with them, for the most part regular, twisted in æstivation, inserted in the top of the tube of the calyx (f. 95. *b.* f. 96. *b.* f. 97. *b.* f. 98. *d.*), rarely wanting. Stamens sometimes equal in number to the petals (f. 93. *d.* f. 99. *c.*), but usually twice that number (f. 95. *b.*); filaments free, filiform; anthers oblong or ovate. Ovary many-celled, usually crowned by a cup-shaped gland. Style filiform. Stigma capitate (f. 95. *c.*) or lobed (f. 96. *c.* f. 97. *a.*). Fruit capsular (f. 96. *d.* f. 99. *f.*), baccate or drupaceous, 2 or 4-celled. Seeds many in each cell, rarely solitary, fixed to the central placenta. Albumen wanting, but the endopleura is sometimes tumid, and appearing like albumen. Embryo straight, with a long terete radicle and 2 short cotyledons.—Herbs or shrubs. Leaves simple, alternate or opposite, entire, toothed, or pinnatifid, feather-nerved. Flowers axillary, and disposed in terminal spikes or racemes.

This order is distinguished from *Lythrarièæ* in the calyx being adnate to the ovarium, and from *Halorâgieæ* in the style being filiform, in the seeds being exalbuminous, and never pendulous in the cells. It is also distinguished from *Myrtàceæ* in the leaves being destitute of pellucid dots, in the stamens being definite in number, not indefinite; and from *Lodseæ* in the seeds being fixed to the central column, not parietal, as in that order. The order is generally known by its pollen cohering by a kind of filamentose substance, an inferior polyspermous ovarium, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and a single style; from this form, however, there are some anomalous variations, such as *Circæ′a* and *Lopèzia*, which are however easily reconciled to the usual structure of the order. Most of the genera are pre-eminently beautiful, as *Epilòbium*, *Œnothèra*, and *Fúchsia*, which are old favourites among gardeners.

The properties of *Onagràriæ* are but little known. The leaves of *Jussiæ′a Peruviàna* are used as an emollient poultice, and the root of *Œnothèra biénnis* as a sort of salad. The valves and dry capsule of *Œnothèra tetráptera* contract when the atmosphere is dry, but when moist they expand.

Synopsis of the genera.

Tribe I.

Montinie′æ. *Fruit capsular. Seeds imbricate, erect, furnished with a membranous wing. Trees or shrubs, with alternate leaves.*

1 Monti′nia. Flowers diœcious from abortion. Tube of calyx adhering to the ovarium (f. 93. *a.*), with a very short 4-toothed limb (f. 93. *b.*). Petals 4 (f. 93. *d.*). Stamens 4. Style bifid (f. 93. *c.*). Capsule 2-valved.

2 Hau′ya. Calyx adhering to the ovary at the base, and drawn out into a long tube at the apex, which is 4-lobed. Petals 4. Stamens 8. Capsule 4-valved.

Tribe II.

Fuchsie′æ. *Fruit baccate. Tube of calyx drawn out beyond the ovarium* (f. 94. *a.*). *Trees or shrubs, with opposite leaves.*

3 Gongyloca′rpus. Calyx adhering to the ovarium at the base, and drawn out into a long tube at the apex, which is 4-parted. Petals 4. Stamens 8. Fruit baccate, 2-celled, 2-seeded, indehiscent.

4 Fu′chsia. Calyx 4-lobed (f. 94. *a.*). Petals 4. Stamens 8. Ovary 4-valved, 4-celled.

Tribe III.

Ona′greæ. *Fruit capsular, many-seeded* (f. 95. *d.* f. 96. *d.*). *Seeds not winged. Tube of calyx drawn out beyond the ovarium* (f. 96. *a.*). *Stamens twice the number of the petals* (f. 94. *d.* f. 95. *b.*).

5 Epilòbium. Limb of calyx 4-parted. Petals 4. Capsule tetragonal, 4-celled. Seeds pappous.

6 Gau′ra. Limb of calyx 3-4-parted. Petals 3-4. Ovary 3-4-sided, 1-celled. Seeds naked.

7 Œnothe′ra. Limb of calyx 4-parted (f. 96. *a.*). Petals 4 (f. 96. *b.*). Capsule oblong-linear (f. 96. *d.*), bluntly tetragonal or clavate, 4-celled. Seeds naked.

8 Gayophy′tum. Limb of calyx 4-parted. Petals 4. The 4 stamens opposite the petals barren. Capsule 2-celled. Seeds naked.

9 Cla′rkia. Limb of calyx 4-parted. Petals 4, tripartite (f. 97. *b.*). Capsule 4-celled. Seeds not pappous.

TRIBE IV.

JUSSIE'Æ. *Fruit capsular* (f. 99. *f.*); *cells many-seeded. Tube of calyx permanent, not drawn out beyond the ovarium, but dividing immediately* (f. 98. *a.* f. 99. *e. b.*).

10 JUSSIÆ'A. Limb of calyx 4-6-parted (f. 98. *a.*). Petals 4-6 (f. 98. *d.*). Stamens 8-12. Capsule 4-6-celled (f. 98. *b.*). Seeds naked.

11 PRIEU'REA. Limb of calyx 3-parted. Petals 3. Stamens 3.

12 LUDWI'GIA. Limb of calyx 4-parted. Petals 4. Stamens 4. Capsule turbinate or elongated, 4-celled. Style pyramidal from the apex.

13 ISNA'RDIA. Limb of calyx 4-parted (f. 99. *a. e.*). Petals 4 (f. 99. *b.*). Stamens 4 (f. 99. *e.*). Style filiform from the base. Capsule obovate or almost cylindrical, tetragonal, 4-celled (f. 99. *f.*).

TRIBE V.

CIRCÆE'Æ. *Tube of calyx not drawn out beyond the ovarium, but immediately parted and deciduous. Fruit capsular, ovate-globose. Stamens 2, one of which is sometimes converted into a petal.*

14 LOPE'ZIA. Limb of calyx 4-parted (f. 100. *a.*). Petals 4 (f. 100. *h. b.*), irregular. Stamens 2 (f. 100. *c.*), one of which is only fertile. Capsule subglobose (f. 100. *e.*), 4-celled.

15 CIRCÆ'A. Limb of calyx 2-parted. Petals 2, obcordate. Stamens 2. Capsule hispid, 2-celled, 2-valved, 2-seeded.

† *Genera not well known.*

16 PLEUROSTE'MON. Tube of calyx drawn out beyond the ovarium, bifid at the apex. Petals 4. Stamens 8. Stigma 4-lobed. Capsule oval, 4-celled.

17 ONOSU'RIS. Tube of calyx adhering to the ovarium; limb 2-parted, with the lobes reflexed. Petals 4. Stigmas 4. Capsule 4-celled, 4-valved.

Tribe I.

MONTINIE'Æ (plants agreeing with *Montinia* in important characters). D. C. prod. 3. p. 35. Fruit capsular (f. 93. *a.*). Seeds imbricate, erect, furnished with a membranous wing.—Trees or shrubs, with alternate leaves. This tribe is formed from two genera that are not very well known.

I. MONTI'NIA (in honour of Laurence Montin, an acute Swedish botanist). Lin. gen. 1132. Gærtn. fruct. 1. p. 170. t. 33. Lam. ill. t. 808. D. C. prod. 3. p. 35.

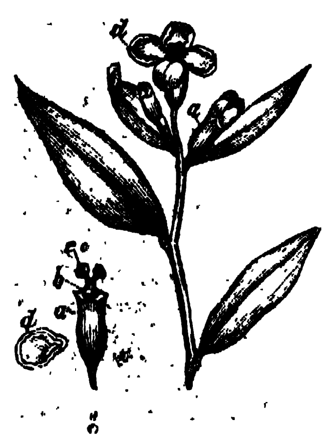
LIN. SYST. *Diœ'cia, Tetrándria.* Flowers dioecious from abortion. Tube of calyx adhering to the ovary (f. 93. *a.*); limb very short, 4-toothed (f. 93. *a.*). Petals 4 (f. 93. *d.*), roundish. Stamens 4 (f. 93. *d.*), alternating with the petals; in the female flowers barren. Anthers oblong, oscillatory. Ovary ovate; in the male flowers abortive. Style bifid (f. 93. *b.*). Capsule (f. 93. *a.*), 2-valved, 2-celled, crowned by the teeth of the calyx. Seeds 6-8 in each cell, fixed to the central placenta, which is somewhat tetragonal. Seeds girded by a wing. Albumen fleshy.—A smooth Cape shrub, with alternate leaves, and small white flowers. This genus differs from all the other genera in *Onagràriæ* in the seeds being albuminous.

1 M. A'CRIS (Lin. fil. suppl. 427.) ♄. G. Native of the Cape of Good Hope, on sandy hills.—Pluck. alm. t. 333.—Burm. afr. t. 90. f. 1-2. M. cariophyllàcea, Thunb. nov. gen. 1. p. 28. Smith, spicil. t. 15. M. frutéscens, Gærtn. fr. l. c. Leaves ovate-lanceolate, acute, glaucous, rather fleshy. Flowers terminal. Fruit with an acrid flavour. (f. 93.)

Acrid-fruited Montinia. Fl. July. Clt. 1774. Sh. 1 to 1½ ft.

Cult. *Montínia* thrives well in a mixture of loam and peat, and cuttings root readily if planted under a hand-glass.

FIG. 93.



II. HAU'YA (perhaps a name of Mexican origin). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 36.

LIN. SYST. *Octándria, Monogýnia.* Calyx adhering to the ovarium at the base, drawn out into a long cylindrical tube, which is cleft to the middle into 4 oblong-linear, acute, dependent lobes, which are coloured on the inside. Petals 4, oval, inserted in the top of the calycine tube. Stamens 8, exserted; anthers oblong, oscillatory. Style 1, filiform, exserted. Stigma thick, capitate. Capsule 4-valved, 4-celled. Seeds numerous, expanded into an oblong wing at the apex.—A shrub, with alternate petiolate ovate leaves. Flowers large, from white to rose-coloured, sessile in the axils of the upper leaves.

1 H. E'LEGANS (Moc. et Sesse, fl. mex. icon. ined.) ♄. S. Native of Mexico. Branchlets, young leaves, and calyxes clothed with down. Tube of calyx an inch and a half long.

Elegant Hauya. Shrub.

Cult. See *Montínia* for culture and propagation.

Tribe II.

FUCHSIE'Æ (plants agreeing with *Fúchsia* in important characters). D. C. prod. 3. p. 36. Fruit baccate. Tube of calyx drawn out beyond the ovarium (f. 94. *a.*).—Elegant South American shrubs, with opposite leaves.

III. GONGYLOCA'RPUS (from γογγυλος, *gongulos*, round, and καρπος, *karpos*; in reference to the shape of the fruit). Schlecht. et Cham. in Linnæa. 5. p. 557.

LIN. SYST. *Octándria, Monogýnia.* Calyx adhering to the ovarium at the base, with the tube drawn out a long way beyond the ovarium; limb 4-parted; throat crowned by a ring of glands below the stamens. Petals 4, entire. Stigma capitate. Fruit baccate, 2-celled, 2-seeded; putamen woody.—An annual herb, with alternate, glabrous, ovate-lanceolate, acuminated leaves. Petals obovate-cuneated, caducous, shorter than the calycine segments. Fruit turbinate, about the size of a grain of pepper.

1 G. RUBRICAU'LIS (Schlecht. et Cham. l. c.) ⊙. H. Native of Mexico, about Jalapa. Stems red, furnished with short axillary branches.

Red-stemmed Gongylocarpus. Pl. 1½ foot.

Cult. The seeds of this plant will require to be sown in a hot-bed in spring, and when the plants are about 2 or 3 inches high they may be planted out into the open border in a warm sheltered situation.

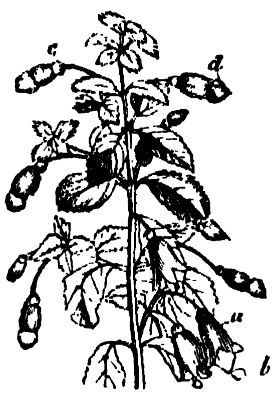
IV. FU'CHSIA (in honour of Leonard Fuchs, a celebrated German botanist, author of Historia Stirpium in 1542.) Plum. gen. 14. Lin. gen. 126. Lam. ill. t. 282. D. C. prod. 3. p. 36.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx adhering to the ovarium at the base, and drawn out at the apex into a cylindrical 4-cleft tube (f. 94. *a.*), whose lobes soon fall off. Petals 4, alternating with the lobes of the calyx, and inserted in the upper part of the tube, very rarely wanting. Stamens 8. Ovarium crowned by an urceolate gland. Style filiform, crowned by a capitate stigma (f. 94. *b.*). Berry oblong or ovate-globose, 4-valved, 4-celled, many-seeded.—Shrubs, usually with opposite leaves, and axillary 1-flowered pedicels, which are sometimes disposed in racemes at the tops of the branches. Flowers usually drooping, red, rarely white, sometimes 5-cleft and decandrous.

Sect. I. Quelu'sia (an insignificant name given by Vandeli. *Quelus* is the name of a country-house of the queen of Portugal, situated about 2 leagues from Lisbon). Vand. in Rœm. script. p. 101. t. 7. f. 10.—Dorvàlia, Comm. mss.—Nahùsia, Schnev. with a figure. Tube of calyx cylindrical or obconical, attenuated or constricted above the ovarium. Ovula numerous, 2 series in each cell. Leaves opposite or verticillate, rarely subalternate.—South American shrubs.

§ 1. *Breviflòræ* (from *brevis*, short, and *flos*, a flower; flowers short). *D. C. prod.* 3. *p.* 36. *The free part of the tube of the calyx shorter than its lobes, or about equal in length to them. Stamens inclosed.*

FIG. 94.



1 F. microphy'lla (H. B. et Kunth, nov. gen. amer. 6. p. 103. t. 534.) branches pubescent; leaves opposite, small, elliptic-oblong, acutish, toothed, glabrous, but a little ciliated; pedicels axillary, shorter than the flowers; calyx funnel-shaped, with ovate acuminated lobes; petals retuse, toothed. ♄. G. Native of Mexico, on the burning mount Jorullo. Lindl. bot. reg. t. 1269. Sweet, fl. gard. new ser. t. 16. Calyx scarlet. Petals deep red. Stigma 4-lobed. (f. 94.)

Small-leaved Fuchsia. Fl. Ju. Sept. Clt. 1828. Sh. 4 to 6 ft.

2 F. thymifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 104. t. 535.) branches puberulous; leaves about opposite, small, ovate or roundish-ovate, obtuse, nearly quite entire, hairy above and glabrous beneath; pedicels axillary, shorter than the flowers; calyx funnel-shaped, with oblong acute lobes; petals obovate-oblong, undulated. ♄. G. Native of Mexico, in temperate places near Pazcuaro. Lindl. bot. reg. 1284. Lopèzia thymifòlia, Bonpl. herb. Willd. ex Link, in Schultes, mant. 50. F. altérnans, Moc. et Sesse, fl. mex. ined. Flowers red. Stigma undivided.

Thyme-leaved Fuchsia. Fl. May, Oct. Clt. 1827. Shrub 4 to 6 feet.

3 F. ròsea (Ruiz et Pav. fl. per. 3. p. 88. t. 322.) stem beset with prominent pulvinate tubercles; branches glabrous; leaves opposite, petiolate, oval, quite entire; pedicels axillary, subaggregate, shorter than the flowers; calyx funnel-shaped, with oblong, acute, reflexed lobes, twice the length of the petals, which are obcordate. ♄. G. Native of Chili. T. lycioìdes, Andr. bot. rep. t. 120. Sims, bot. mag. 1024. Calyx red. Petals purple. Stigma 4-lobed.

Rose-coloured-flowered Fuchsia. Fl. April, Oct. Clt. 1796. Shrub 3 to 6 to 12 feet.

4 F. parviflòra (Lindl. bot. reg. 1048.) branches smoothish; leaves scattered and opposite, petiolate, ovate-cordate or oval, quite entire, glaucous, glabrous; pedicels sub-aggregate; lobes of calyx reflexed; stigma thick, 4-lobed. ♄. G. Native of Mexico. F. ovàta, Moc. et Sesse, fl. mex. icon. ined. but not of Ruiz et Pav. fl. per. The pedicels, according to the figure in the fl. mex., are pubescent, but according to that in bot. reg. glabrous. Calyx red. Petals purple. Very like *F. ròsea*.

Small-flowered Fuchsia. Fl. May, Oct. Clt. 1824. Shrub 3 to 6 feet.

§ 2. *Macrostemòneæ* (from *μακρος*, *makros*, long, and *στημον*, *stemon*, a stamen; in reference to the stamens which are exserted). *D. C. prod.* 3. *p.* 37. *The free part of the tube of the calyx shorter than the lobes, or equal in length to them. Stamens exserted.*

5 F. arbore'scens (Sims, bot. mag. 2620.) branches glabrous; leaves 3 in a whorl, oval-oblong, acuminated at both ends, petiolate, quite entire; panicle terminal, trichotomous, nearly naked; calyx funnel-shaped, with the lobes ovate, acute, and spreadingly reflexed; also the petals. ♄. G. Native of Mexico. Lindl. bot. reg. 943. F. amœ'na, Hort. Flowers small, red, 5-6 lines long, disposed in terminal panicles. Stamens but little exserted. F. hamellioìdes, Moc. et Sesse, fl. mex. icon. ined. F. racemòsa, Moc. et Sesse. Leaves broad.

Arborescent Fuchsia. Fl. Oct. Clt. 1824. Sh. 6 to 15 feet.

6 F. ova'lis (Ruiz et Pav. fl. per. 3. p. 87. t. 324. f. *a.*) branches pubescent; leaves opposite or 3 in a whorl, petiolate, oval, a little denticulated, acute, pubescent on both surfaces; pedicels axillary, sub-aggregate on the branchlets, erect, much shorter than the flowers; lobes of calyx villous, oblong, acute, twice the length of the petals, which are ovate and acute. ♄. G. Native of Peru, in groves about Muna. Calyx and corolla scarlet. Stamens hardly exserted.

Oval-leaved Fuchsia. Shrub 4 to 6 feet.

7 F. decussa'ta (Ruiz et Pav. fl. per. 3. p. 88. t. 323. f. b.) branches pubescent; leaves opposite or 3 in a whorl, petiolate, lanceolate, pubescent on both surfaces; pedicels axillary, pendulous, longer than the calyx; lobes of calyx oblong, acute, longer than the petals, which are also oblong and acute. ♄. G. Native of Peru, in subhumid groves about Muna. Calyx rose-coloured. Petals scarlet. Stamens not much exserted.

Decussate-leaved Fuchsia. Shrub 2 to 3 feet.

8 F. gra'cilis (Lindl. in bot. reg. t. 847.) branches finely pubescent; leaves opposite, glabrous, on long petioles, remotely denticulated; pedicels axillary, nodding, puberulous, length of the calyx; lobes of calyx oblong, acute, exceeding the petals, which are convolute and retuse; stigma undivided. ♄. G. Native of Mexico. F. decussàta, Graham in edinb. phil. journ. 11. p. 401. Sims, bot. mag. 2507. but not of Ruiz et Pav. Calyx scarlet. Petals purple. Stigma fusiform.

Var. β, multiflòra (Lindl. bot. reg. 1052.) leaves smaller, glaucous, on short petioles; stigma conical.

Slender Fuchsia. Fl. May, Oct. Clt. 1823. Sh. 6 to 10 ft.

9 F. macroste'mma (Ruiz et Pav. fl. per. 3. p. 88. t. 324. f. 6.) branches glabrous; leaves 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, nodding, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are obovate and spreading; stigma 4-lobed. ♄. G. Native of Chili, in marshes. Lodd. bot. cab. 1062. Thìleo, Feuill. obs. 3. p. 64. t. 47. This species differs from *F. coccinea* in the petals being blue and spreading, not convolute, in the stigma being 4-lobed, not undivided. Calyx scarlet.

Var. β, tenélla (D. C. prod. 3. p. 38.) flowers smaller; leaves opposite. ♄. G. F. gràcilis var. tenélla, Lindl. bot. reg. 1052.

Long-crowned Fuchsia. Fl. July, Oct. Clt. 1823. Shrub 6 to 12 feet.

10 F. co'nica (Lindl. bot. reg. 1062.) leaves 3 or 4 in a

whorl, ovate, flat, denticulated, glabrous; petioles pubescent; flowers pendulous, solitary; petals about equal in length to the calyx; tube of corolla conical. ♄. G. Native of Chili. Calyx scarlet. Corolla purple. Stigma ovate.

Conical-calyxed Fuchsia. Fl. June, Oct. Clt. 1824. Shrub 3 to 6 feet.

11 F. cocci'nea (Ait. hort. kew. 2. p. 8.) branches glabrous; leaves opposite or 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, drooping, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are obovate and convolute. ♄. G. Native of Chili, in marshes, and as far south as the Straits of Magellan. Curt. bot. mag. 97. Duham. arbr. ed. nov. 1. t. 13. F. péndula, Salisb. st. rar. t. 7. F. Magellánica, Lam. dict. Nahùsia coccínea, Schnevoogt, icon. no. 21. Skinnèra coccínea, Mœnch. Quelùsia, Vand. l. c. Calyx scarlet. Petals violaceous.

Scarlet Fuchsia. Fl. May, Oct. Clt. 1788. Sh. 3 to 6 feet.

12 F. monta'na (St. Hil. fl. bras. 2. p. 275. t. 135.) branches sulcate and puberulous at the apex; leaves 3 in a whorl, oblong, acute, obsoletely denticulated, glabrous, but when young puberulous; calycine tube funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit oblong. ♄. S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. Calyx scarlet. Corolla violaceous.

Mountain Fuchsia. Shrub 1 to 2 feet.

13 F. pube'scens (St. Hil. fl. bras. 2. p. 275. t. 134.) branches sulcate, puberulous; leaves 3-4 in a whorl, ovate-oblong, acute, denticulated, puberulous; tube of calyx (funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate-roundish. ♄. G. Native of Brazil, in the province of Minas Geraes, on the high mountain called Serra da Piedade, and in that part of the province of St. Paul called Campos Geraes. Calyx scarlet. Corolla violaceous.

Pubescent Fuchsia. Shrub 5 feet.

§ 3. *Longiflòræ* (from *longus*, long, and *flos*, a flower; in reference to the flowers, which are long). *D. C. prod.* 3. *p.* 38. *Free part of the tube of the calyx twice or thrice the length of its lobes. Stamens exserted.*

14 F. petiola'ris (H. B. et Kunth, nov. gen. amer. 8. p. 104.) branches glabrous; leaves 3 in a whorl, or the upper ones are opposite, on long petioles, lanceolate-oblong, acute, remotely denticulated, glabrous; pedicels axillary, shorter than the flowers; lobes of calyx ovate-oblong, acuminated, longer than the petals, which are nearly of the same shape. ♄. G. Native of South America, at Santa Fe de Bogota. Calyx downy, an inch and a half long.

Petiolar Fuchsia. Shrub 4 to 6 feet.

15 F. Quindiue'nsis (H. B. et Kunth, nov. gen. amer. l. c.) branches clothed with adpressed pili; leaves 3 in a whorl, small, approximate, oblong, acute, remotely denticulated, rather pilose above, and glabrous beneath; pedicels axillary, shorter than the flowers; lobes of calyx ovate, acuminately mucronate, a little longer than the petals, which are lanceolate and acute. ♄. G. Native of the Andes of Quindiu. Shrub probably procumbent. Pedicels and calyxes puberulous.

Quindiu Fuchsia. Shrub proc.?

16 F. venu'sta (H. B. et Kunth, l. c.) branches downy; leaves opposite and 3 in a whorl, elliptic, acute, entire, glabrous, and rather shining; pedicels axillary, a little shorter than the flowers, the upper ones disposed in a raceme; lobes of calyx ovate-lanceolate, acuminated, about equal in length to the petals, which are oblong-lanceolate, acute, with undulated margins. ♄. G. Native of New Granada, near Guayavalito. Calyx purple, glabrous. Petals scarlet. Perhaps the same as F. multiflòra, Lin. which is scarcely known.

Beautiful Fuchsia. Shrub 4 to 6 feet.

17 F. Loxe'nsis (H. B. et Kunth, nov. gen. amer. l. c. t. 536.) branches hairy; leaves 3 in a whorl, oblong-elliptic or lanceolate-oblong, acute, obsoletely and remotely denticulated, glabrous, but hairy on the veins beneath; pedicels axillary, a little shorter than the flowers; lobes of calyx ovate-oblong, acute, a little shorter than the petals, which are ovate-roundish. ♄. G. Native of New Granada, near Loxa. Calyx purplish, glabrous. Petals scarlet.

Loxa Fuchsia. Shrub 4 to 6 feet.

18 F. Ayavace'nsis (H. B. et Kunth, l. c.) branches hairy; leaves 3 in a whorl, oblong, acuminated, remotely denticulated, hairy on both surfaces; pedicels axillary, longer than the flowers; lobes of calyx ovate-lanceolate, ending in a narrow taper-point each, exceeding the petals, which are roundish-ovate. ♄. G. Native of Peru, near Ayavaca. Calyx smoothish and purplish.

Ayavaca Fuchsia. Shrub 3 to 6 feet.

19 F. hirtélla (H. B. et Kunth, l. c.) branches hairy; leaves 3-4 in a whorl, on short petioles, oblong-lanceolate, obsoletely and remotely denticulated, hairy on both surfaces; flowers sub-racemose; lobes of calyx lanceolate, acuminated, a little longer than the petals, which are lanceolate-oblong and acutish. ♄. G. Native of New Granada. Flowers nearly 2 inches long.

Hairy Fuchsia. Shrub 3 to 6 feet.

20 F. triphy'lla (H. B. et Kunth, l. c.) branches downy; leaves 3 in a whorl, oblong, acute, quite entire, stiffish, smooth except the veins beneath, which are pubescent; pedicels axillary, shorter than the flowers, upper ones forming a raceme; lobes of calyx ovate-lanceolate, acuminated, a little longer than the lanceolate-oblong cuspidate petals. ♄. G. Native of New Granada. F. triphýlla, Lin. spec. 159. ex Mutis, but exclusive of the synonyme.

Three-leaved Fuchsia. Shrub 3 to 6 feet.

21 F. integrifòlia (St. Hil. fl. bras. 2. p. 273.) branches glabrous; leaves 3-4 in a whorl, oblong, acute, almost quite entire, glabrous; tube of calyx cylindrical, 3 times shorter than the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit elliptic. ♄. G. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. This species differs from *F. macrostémma* in the leaves being entire, and in the tube of the calyx being short, compared with the lobes.

Entire-leaved Fuchsia. Shrub 3 to 4 feet.

22 F. affìnis (St. Hil. fl. bras. 2. p. 274.) branches glabrous; leaves 3 in a whorl, oblong or ovate-oblong, acute, nearly quite entire, glabrous; calycine tube funnel-shaped, twice the length of the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate oblong; stigma 4-toothed. ♄. G. Native of Brazil, in the province of Rio Janeiro, on the mountains called Serra da Boa Vista and Serra da Estrada Nova, and in the southern part of the province of St. Paul in the Distrito de Curityba. Calyx scarlet. Corolla violaceous. Nearly allied to *F. integrifòlia*, from which it differs in the calyx being more deeply cleft.

Allied Fuchsia. Shrub 6 feet.

23 F. racemòsa (Lam. dict. 2. p. 565. ill. t. 282. f. 1.) branches downy; leaves opposite or 3 in a whorl, on short petioles, oval, acute, denticulated, puberulous on both surfaces; pedicels axillary, about equal in length to the flowers, upper ones racemose; lobes of calyx lanceolate-oblong, acute; tube of calyx widened at the base. ♄. S. Native of St. Domingo.

Plum. ed. Burm. t. 133. f. 1. gen. p. 34. Flowers scarlet. Pedicels velvety. This species agrees with section second in the tube of the calyx being dilated at the base.

Racemose-flowered Fuchsia. Shrub 4 to 6 feet.

24 F. FU'LGENS (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 39.) branches glabrous; leaves opposite, petiolate, ovate-cordate, acute, denticulated, glàbrous; pedicels axillary, shorter than the flowers, upper ones racemose; lobes of calyx ovate-lanceolate, acute, exceeding the petals, which are acutish. ♄. G. Native of Mexico. Branches and pedicels red. Flowers reddish scarlet, 2 inches long. Racemes drooping at the apex.

Fulgent Fuchsia. Sh. 4 to 6 feet.

25 F. DENTICULA'TA (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. *b.*) branches trigonal; leaves 3 in a whorl, petiolate, oblong-lanceolate, acuminated at both ends, denticulated, having the middle nerve villous behind; pedicels axillary, rather shorter than the flowers; lobes of calyx lanceolate, acuminated, nearly twice the length of the obovate petals. ♄. G. Native of Peru, among rocks about Huassa-huassi and Cheuchin, where it is called *mollo-cantu*, which signifies a beautiful plant. Flowers purple, nodding.

Denticulated-leaved Fuchsia. Sh. 6 to 12 feet.

26 F. CORYMBIFLÒRA (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. *a.*) branches somewhat tetragonal; leaves opposite, petiolate, oblong-lanceolate, almost quite entire; pedicels 3, nearly terminal, nodding, shorter than the flowers; lobes of calyx lanceolate, acute, twice the length of the petals, which are oblong-lanceolate. ♄. G. Native of Peru, about Chincao and Muna, in shady groves. Flowers scarlet, nearly 2 inches long. Berry ovate-oblong, reddish-purple.

Corymb-flowered Fuchsia. Sh. 6 ft.

27 F. SERRATIFÒLIA (Ruiz et Pav. fl. per. 3. p. 86. t. 323. f. *a.*) branches furrowed; leaves opposite or verticillate, petiolate, oblong, serrated, pubescent beneath; pedicels axillary, shorter than the flowers, drooping; lobes of calyx lanceolate, acuminated, exceeding the petals, which are ovate-oblong. ♄. G. Native of Peru, in humid, rather shaded places at Muna. Calyx red, rather villous, an inch and a half long, somewhat tumid at the base. Petals scarlet.

Saw-leaved Fuchsia. Sh. 6 to 8 ft.

28 F. SIMPLICICAU'LIS (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. *a.*) stem simple, quite smooth; leaves 4 in a whorl, lanceolate-linear, on short petioles; pedicels 4 together, very short, terminal, sub-corymbose; lobes of calyx lanceolate, exceeding the petals. ♄. G. Native of Peru, in woods at Muna. Suffruticose. Whorles remote. Involucrum 4-leaved, rather downy. Flowers pendulous, with a rose-coloured calyx, and scarlet petals.

Simple-stemmed Fuchsia. Sh. 1 to 2 feet.

29 F. APE'TALA (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. *b.*) stem villous, climbing, rooting; branches warted; leaves alternate, petiolate, ovate, acuminated, quite entire; petioles, branches, pedicels, and young leaves rather villous; pedicels sub-corymbose, shorter than the flowers; lobes of calyx ovate; petals wanting. ♄. G. Native of Peru, about Huassa-huassi and Muna, in groves. Calyx red, but the lobes are pale yellow. Flowers drooping, an inch and a half long. Berry oblong.

Apetalous Fuchsia. Sh. 1 to 2 ft.

SECT. II. SKINNE'RA (named by Mr. Forster in honour of Mr. Skinner, an Oxfordshire gentleman, whom Forster terms an acute and clear-sighted botanist). Forst. gen. t. 29. D. C. prod. 3. p. 39. Tube of calyx strumose and ventricose at the base above the ovarium. Ovula very minute, crowded on the central placenta, without order. Leaves alternate.—A shrub from New Zealand.

30 F. EXCORTICA'TA (Lin. fil. suppl. 217.) branches smooth, at length excoriate; leaves alternate, petiolate, ovate-lanceolate, acuminated, denticulated, glabrous, whitish beneath; pedicels axillary, somewhat shorter than the flowers; lobes of calyx lanceolate, 3-nerved, longer than the tube and twice the length of the petals, which are ovate. ♄. G. Native of New Zealand. Lindl. bot. reg. 857. Link. et Otto. abb. t. 46. Skinnèra excorticàta, Forst. prod. p. 163. Calyx green and purple. Petals violaceous.

Excoriated Fuchsia. Fl. June, Oct. Clt. 1824. Sh. 2 to 3 ft.

Cult. The elegance of the flowers and foliage of all the species of *Fùchsia* are well known to every lover of plants. They all thrive well in rich light soil, and young cuttings of them strike root readily in the same kind of soil, with a hand-glass over them; the glass to be taken off occasionally, to give the cuttings air, so as to keep them free from damp. Most of the species only require to be protected from frost, and many of them will survive the winter in the open air, with a very slight protection. Some of them, as *F. gràcilis*, *F. microphýlla*, *F. thymifòlia*, *F. cónica*, and *F. coccinea* have a fine effect all the summer, when planted in clumps on lawns, or in borders; in this situation the plants only require to be mulched at the root to preserve them through the winter, and in spring the ground is cleared, and the stems of the preceding year, which are generally dead, are cut off quite close to the ground, to allow the young shoots to spring from the root.

Tribe III.

ONA'GREÆ (plants agreeing in important characters with *Onagros* or *Onager*, now *Œnothèra*. D. C. prod. 3. p. 40. Fruit capsular (f. 95. *d.* f. 96. *d.*); cells many-seeded. Seeds not winged. Tube of calyx drawn out beyond the ovarium (f. 96. *a.*). Stamens twice the number of the petals.—Herbs usually suffruticose at the base.

V. EPILO'BIUM (*επι*, *epi*, upon, and λοβος, *lobos*, a pod; the flower is seated as if it were on the top of the pod). Lin. gen. 471. Gærtn. fr. 1. p. 157. t. 31. f. 6. D. C. prod. 3. p. 40.—Chamænèrion, Tourn. inst. p. 302. t. 157. f. A, B, C.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx of 4 sepals; sepals connected into a long tetragonal tube; the limb falling off when the flower begins to decay. Petals 4. Stamens 8; pollen not clammy. Capsule linear, bluntly tetragonal, 4-celled, 4-valved, many-seeded, inseparable from the calyx. Seeds pendulous, pappous.—Herbs, with opposite or alternate leaves. Flowers axillary, solitary, or disposed in terminal spikes, each flower furnished with a bractea. Corolla purple, rose-coloured, flesh-coloured, very rarely yellow.

SECT. I. CHAMÆNE'RION (from *χαμαι*, *chamai*, on the ground; and *νεριον*, *nerion*, the Oleander; similar leaves but dwarfer habit). Tauch. hort. canal. fasc. 1. D. C. prod. 3. p. 40. Flowers irregular. Petals entire. Genitals declinate. Filaments dilated at the base. Leaves alternate.

1 E. ANGUSTIFÒLIUM (Lin. spec. 493.) root creeping; stems erect, nearly simple; leaves nearly sessile, lanceolate, undulated, glabrous, with the veins pellucid; flowers disposed in spicate racemes, bracteate; style reflexed, pilose at the base, shorter than the stamens. ♃. H. Native of Europe and Siberia, in mountain woods and meadows. In Britain in moist shady places, particularly in the north of England and south of Scotland. Smith, engl. t. 1947. fl. dan. 289. E. Gesnèri, Vill. dauph. 3. p. 507. E. intermèdium, Wormsk. ex herb. Puerari. Chamænèrion spicàtum, Gray, brit. 2. p. 559. Flowers crimson, inodorous; pollen blue. A very ornamental plant, but hardly fit to be introduced to a garden, on account of its increasing so rapidly by the roots, which it is almost impossible

again to eradicate. The young shoots are said to be eatable, although a decoction of the plant stupifies. The pith, when dried, is boiled, and becoming sweet, is, by a proper process, made into ale, and this into vinegar, by the Kamtschatdales; it is also added to the cow-parsnet to enrich the spirit that is prepared from that plant.

Var. β, àlbum; flowers white. ♃. H.

Var. γ, làtum (Ser. in D. C. prod. 3. p. 40.) leaves broader. ♃. H. E. angustifòlium *β, Lin. spec. 494. E. spicàtum β, D. C. fl. fr. 4. p. 420. E. latifòlium, Schmidt. fl. bohem. no. 372. but not of Lin.

Narrow-leaved Willow-herb or French Willow. Fl. Jul. Aug. Britain. Pl. 3 to 6 feet.

2 E. SPICA'TUM (Lam. dict. 2. p. 378.) leaves lanceolate, entire, scattered, glabrous; flowers disposed in terminal spicate racemes; flowers unequal. ♃. H. Native of North America, in meadows and moist places; United States, Canada, Newfoundland, [illegible]-west coast, &c. Root creeping. Flowers about half the size of those of *E. angustifòlium*, but the habit is almost the same.

Spicate Willow-herb. Fl. July, Aug. Clt. ? Pl. 2 to 3 ft.

3 E. OPA'CUM (Lehm. ex Hook, fl. bor. amer. p. 205.) stem erect, pubescent; leaves nearly sessile, narrow, lanceolate, almost quite entire, opaque, veiny; flowers axillary, solitary, pedunculate; style reflexed, glabrous, shorter than the stamens. ♃. H. Native of North America, on the banks of the Columbia, particularly about Fort Vancouver. Flowers red; petals entire or erose. An intermediate plant between [illegible] *angustifòlium* and *E. latifòlium.*

Opaque Willow-herb. Pl. 1 to 2 feet.

4 E. ROSMARINIFÒLIUM (Hænke, in Jacq. coll. 2. p. 50. but not of Pursh) downy; stem erect, branched towards the middle; leaves linear, obsoletely denticulated, cinereous, veinless; pedicels connected with the bracteas, crowded near the tops of the branches. ♃. H. Native of Europe, in woods and on the banks of rivers. Rchb. icon. bot. 4. t. 341.—Moris. hist. sect. 3. t. 11. f. 2. Lob. icon. 343. f. 2. E. angustissimum, Curt. bot. mag. t. 76. E. angustifòlium, Lam. dict. 2. p. 374. Stem woody at the base. An elegant plant with red flowers.

Rosemary-leaved Willow-herb. Fl. July, Aug. Clt. 1775. Pl. 2 feet.

5 E. DODONÆ'I (All. pedem. 1016. Vill. dauph. 3. p. 507.) stem almost glabrous, erect, branched at the apex; leaves linear, obsoletely denticulated, glabrous; pedicels connected with the bracteas, crowded near the tops of the branches. ♃. H. Native of Piedmont and Dauphiny. E. Hallèri, Retz. E. rosmarinifòlium β, D. C. fl. fr. 4. p. 421. E. rosmarinifòlium β, alpinum, Ser. in D. C. prod. 3. p. 40.—Rchb. icon. bot. 4. t. 342. An elegant plant, much resembling the preceding, but smoother, smaller, and the flowers are large, and of a more deep rose colour.

Dodoneus's Willow-herb. Fl. July, Aug. Clt. 1700. Pl. 1 ft.

6 E. CRASSIFÒLIUM (Lehm. in nov. act. bonn. 14.) stem suffruticose; branches twiggy; leaves alternate, thickish, linear, having the margins denticulated with blunt glands; genitals declinate. ♃. H. Native of Siberia. Leaves deep green. Petals crenulated, rose-coloured. Stigma 4-cleft.

Thick-leaved Willow-herb. Pl. 1 foot.

7 E. LATIFÒLIUM (Lin. spec. 494.) stems erectish, firm, branched; leaves ovate-lanceolate, acuminated, almost quite entire, stiff, veinless, glaucous; flowers axillary, pedicellate; style nearly erect, glabrous, shorter than the stamens; bracteas free from the pedicels. ♃. H. Native of Greenland, Siberia; North America, on the banks of rivers on the Rocky Mountains, between lat. 52° and 56°, to the shores and islands of the Arctic sea, Labrador, and Behring's Straits. Fl. dan. t. 565. Salisb. par. lond. t. 58. E. frìgidum, Retz, fl. scand. ed. 2. no. 459. E. corymbòsum, Act. hafn. 10. p. 440. t. 8. f. 23. The North American plant differs from the Siberian one only in the less copious pubescence of its leaves. Flowers large, rose-coloured, or purple.

Var. β, venùstum (Dougl. mss.) plant smaller in every part. ♃. H. North America.

Broad-leaved Willow-herb. Fl. Jul. Aug. Clt. 1779. Pl. 2 ft.

8 E. HU'MILE (Willd. herb. ex Stev. in litt. D. C. prod. 3. p. 40.) leaves lanceolate, quite entire, glabrous, veiny; branches opposite; corolla unequal. ♃. H. Native of Siberia. Perhaps a variety of *E. latifòlium.*

Humble Willow-herb. Fl. July, Aug. Pl. $\frac{1}{2}$ foot.

SECT. II. LYSIMA'CHION (containing plants agreeing in habit with the genus *Lysimàchia*). Tauch, hort. canal. fasc. 1. Ser. in D. C. prod. 3. p. 41. Flowers regular. Petals obcordate. Genitals ascending. Lower leaves opposite, upper ones alternate.

9 E. ALPI'NUM (Lin. spec. 495.) stems creeping at the base, bifariously pubescent, few-flowered; leaves nearly sessile, elliptic-lanceolate, obtuse, mostly entire, glabrous; stigma undivided; capsules sessile, glabrous. ♃. H. Native of the alps of Europe and the Pyrenees. In Scotland, by the sides of alpine rivulets, on Ben Lomond, about two-thirds of the way up, and on all the highland mountains; of North America, in the alpine rivulets of the Rocky Mountains. Smith, engl. bot. 2001. Lightf. fl. scot. p. 199. t. 10. f. 1. Fl. dan. 322. E. anagallidifòlium, Lam. dict. 2. p. 376. Plant small. Flowers very small, bright red.

Var. β, pùmilum (Pers. ench. 2. p. 410.) stem rather pubescent at the base; leaves ovate-lanceolate, acutely serrated, wrinkled.

Alpine Willow-herb. Fl. June, July. Scotland. Pl. $\frac{1}{4}$ foot.

10 E. HORNEMA'NNI (Rchb. icon. bot. p. 73. t. 180.) stems creeping at the base, angular, few-flowered, nodding at the apex; leaves oblong or lanceolate, denticulated; stigma clavate, undivided. ♃. H. Native of Finland, in alpine rivulets; and north-west coast of America. E. nùtans, Horn. fl. dan. 1387. but not of Schmidt. E. alpínum β, nùtans Hook, fl. bor. amer. p. 205. Flowers bright red. Very like *E. alpìrium.*

Hornemann's Willow-herb. Fl. June, Aug. Clt.? Pl. $\frac{1}{2}$ ft.

11 E. ORIGANIFÒLIUM (Lam. dict. 2. p. 376. Rchb. icon. bot. 2. t. 180.) stems creeping at the base, smoothish, nodding at the apex, bluntly quadrangular; leaves ovate, acutely denticulated, glabrous, on short petioles; stigma undivided, clavate; capsule pedicellate, glabrous. ♃. H. Native of the alps of Europe and the Pyrenees, in rivulets and fountains; on many of the highland mountains of Scotland, in alpine rivulets, common; in rivulets on the sides of the Cheviot hills, as mentioned by Ray; in North America, in alpine woods, sides of rivulets, and shady elevated spots on the Rocky Mountains, and of the island of Unalaschka. E. alsinifòlium, Vill. dauph. 3. p. 511. Smith, engl. bot. t. 2000. Flowers small, rose-coloured. A much more robust plant than *E. alpìnum.*

Marjoram-leaved Willow-herb. Fl. June, Aug. Scotland. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

12 E. GLANDULÒSUM (Lehm. pug. 2. p. 14. Hook, fl. bor. amer. p. 206.) stem simple, creeping at the base, angular, glabrous; leaves sessile, ovate-lanceolate, rather decurrent, acute, glandularly denticulated; flowers erect; stigma clavate; capsule sessile, with the angles slightly pubescent. ♃. H. Native of North America, at Cumberland House Fort, on the Saskatchawana. Petals white. An intermediate plant between *E. origanifòlium* and *E. tetragònum.*

Glandular Willow-herb. Pl. 1 foot.

13 E. MINU'TUM (Lindl. mss. ex Hook. fl. bor. amer. p. 207.) root annual; stem erectish, terete, puberulous, branched; leaves alternate, elliptic-lanceolate, obtuse, usually entire, full of pellucid dots; flowers drooping, minute; stigma clavate; capsules on short pedicels, circinately reflexed, smoothish. ⊙. H. Native of the north-west coast of America, at Fort Vancouver, and near the Grand Rapids of the Columbia, and on moist rocks near springs on the high mountains. Flowers minute, pale red.

Minute Willow-herb. Fl. June, July. Clt. 1826. Pl. ½ ft.

14 E. OLIGA'NTHUM (Michx. fl. bor. àmer. 1. p. 233.) plant small; stems very simple, bearing only 1 flower at the apex; leaves opposite, linear, quite entire. ♃. H. Native of Hudson's Bay, near Lake Mistissiny. Probably referrible to *E. alpìnum.*

Few-flowered Willow-herb. Fl. July, Aug. Shrub ½ foot.

15 E. RÒSEUM (Schreb. lips. 147.) stems erect, with 4 obsolete angles; leaves opposite, upper ones alternate, smooth, ovate, toothed, stalked; stigma clavate, undivided. ♃. H. Native of Europe, in waste boggy ground and watery places. In England, in Lambeth Marsh; at Moreton, near Ongar, Essex; and near Witham, Sussex. Smith, engl. bot. t. 693. E. montànum γ, Willd. spec. 2. p. 316. Flowers pale red.

Red Willow-herb. Fl. July. Britain. Pl. 1 foot.

16 E. ALPE'STRE (Schmid. fl. bohem. cent. 4. p. 81.) leaves opposite, or 3 in a whorl, glabrous, ovate, acuminated, denticulately serrated, stem-clasping, with the nerves sometimes hairy; stems obsoletely tetragonal, 2-edged: flowers almost sessile; fruit pedicel nearly the length of the capsule; petals much longer than the calyx; stigma undivided. ♃. H. Native of Europe, on the Alps and the Pyrenees. E. ròseum, D. C. fl. fr. 4. p. 442. but not of Schreb. nor Smith. Rchb. icon. bot. 2. t. 190. Flowers pale red. E. trigònum, Schrank, bav. no. 594. E. alpéstre, Jacq. and Rchb. icon. bot. t. 200.

Alp Willow-herb. Fl. June, July. Clt. 1820. Pl. 1 foot.

17 E. BILLARDIERIA'NUM (Ser. mss. ex D. C. prod. 3. p. 41.) stem straight, terete, leafy, pubescent; leaves ovate, obtuse, regularly serrulated, short, sessile, stem-clasping; pedicels short. ♃. H. Native of New Holland.

La Billardier's Willow-herb. Pl. 1 foot.

18 E. STRI'CTUM (Muhl. ex Spreng. syst. 2. p. 233.) stem straight; leaves quite entire, veiny; flowers axillary; capsules slender, clothed with hoary villi.—Native of Pennsylvania.

Straight Willow-herb. Fl. July, Aug. Clt. 1817. Pl. 1 to 2 feet.

19 E. MONTA'NUM (Lin. spec. 494.) stem leafy, terete, glabrous; lower leaves opposite, upper ones alternate, ovate-lanceolate, irregularly toothed, all stalked; flowers on short pedicels, disposed in a terminal, leafy, corymbose cluster; stigma of 4 deep segments. ♃. H. Native of Europe, in groves. In Britain, in dry, shady, hilly, and stony places; on old walls or cottage roofs, frequent. Smith, engl. bot. 1177. Curt. lond. 3. t. 24. Fl. dan. 922. Rchb. icon. bot. 189. E. lanceolàtum, Seb. et Maur. fl. rom. p. 138. t. 1. f. 2. Chamænèrion montànum, Scop. carn. ed. 2. no. 453. E. virgàtum, Lam. Flowers pale purple.

Var. β, *origanoìdes* (Ser. in D. C. prod. 3. p. 41.) leaves very minute, hardly denticulated, nearly all opposite; stem weak, dwarf.

Mountain Willow-herb. Fl. July. Brit. Pl. 1 to 2 feet.

20 E. MEXICA'NUM (Moc. et Sesse, fl. mex. icon. ined. t. 379. D. C. prod. 3. p. 41.) glabrous, herbaceous, erect; leaves oblong, sessile, somewhat denticulated, lower ones opposite, upper ones alternate. ♃. H. Native of Mexico. Habit of *E. montànum.*

Mexican Willow-herb. Pl. 1 foot.

21 E. BREVIFÒLIUM (D. Don, prod. fl. nep. p. 222.) leaves ovate, acute, serrated, pubescent on both surfaces, and lined on the upper surface; flowers axillary, on short pedicels; lobes of calyx linear-lanceolate, shorter than the corolla. ♃. H. Native of Upper Nipaul. Stem branched. Flowers small, lilac.

Short-leaved Willow-herb. Pl. 1 foot.

22 E. NU'TANS (Schmidt, fl. bohem. no. 380. Schultes, œstr. fl. 1. p. 595.) stem terete, branched, many-flowered; leaves opposite, almost sessile, ovate-lanceolate, obtuse, quite entire; petals obcordate; stigma quadrifid. ♃. H. Native of Bohemia, in bogs at Isera. Rchb. icon. bot. 2. p. 87. t. 197. E. hypericifòlium, Tauch, hort. canal. fasc. 1. no. 7. This plant comes very near to *E. montànum*, from which it differs in the leaves being remote and quite entire, in the flowers being smaller and changeable in colour, at first white but afterwards changing to a flesh colour.

Nodding-flowered Willow-herb. Pl. 1 foot.

23 E. A'LGIDUM (Bieb. fl. taur. 1. p. 296.) leaves opposite and alternate, ovate, glandularly toothed; calyx obtuse-angled; stigma undivided. ♃. H. Native of Caucasus. This species differs from *E. montànum* in the undivided stigma, in the stem being angled, from the margins of the petioles being decurrent, in the leaves being firmer, and in the flowers being nearly twice the size. Perhaps only a variety of *E. origanifòlium.*

Var. β, *hùmile* (Bieb. l. c.) leaves toothed all round.

Algid Willow-herb. Pl. ½ to 1 foot.

24 E. COLORA'TUM (Muhl. in Willd. enum. 411.) stems terete, pubescent; lea[illegible] lanceolate, serrulated, stalked, opposite, superior ones alternate, glabrous. ♃. H. Native of Pennsylvania. This plant differs from *E. ròseum* in the stems being branched at the apex, in the leaves being nearly sessile and narrower, and in the flowers being smaller, ex Link. enum. 1. p. 379.

Coloured Willow-herb. Fl. Jul. Aug. Clt. 1805. Pl. 2 to 3 ft.

25 E. DAHU'RICUM (Fisch. in Horn. hort. hafn. suppl. 44. and Link. enum. 1. p. 379.) stem erect, very simple; leaves usually toothed, pubescent, opposite and alternate, nearly sessile; petals obcordate; fruit pilose. ⊙. H. Native of Dahuria. Flowers very minute. Calyx reddish.

Dahurian Willow-herb. Fl. Ju. Jul. Clt. 1822. Pl. ½ to 1 ft.

26 E. GERMA'SCENS (Meyer, verz. pfl. p. 193.) smoothish; stem rather angular, branched; leaves stalked, opposite, or alternate, ovate-oblong, repandly denticulated, bearing bulbs in their axils; petals rather longer than the calyx; stigma clavate. ♃. H. Native of Caucasus, on the margins of rivulets, near Kaischaur, at the height of 2400 feet above the level of the sea. This is a singular species, from its bearing bulbs in the axils of the leaves.

Budding Willow-herb. Pl. 1 foot.

27 E. DE'NSUM (Rafin. prec. dec. 42. and in Desv. journ. bot. 1814. 2. p. 271.) plant pubescent; leaves scattered, approximate, sessile, linear-lanceolate, bluntish, nerved; flowers panicled, pedunculate; bracteas oblong.—Native of North America.

Dense-flowered Willow-herb. Pl. 1 foot?

28 E. DENTICULA'TUM (Ruiz, et Pav. fl. per. 3. p. 78. t. 314.) stems suffruticose; leaves somewhat lanceolate, denticulated; lower ones opposite; petals equal, bifid. ♃. G. Native of Peru and Chili. E. júnceum, Forst. ex Spreng. syst. 2. p. 233. Petals rose-coloured.

Denticulated-leaved Willow-herb. Pl. ½ to 1 foot.

29 E. LEPTOPHY'LLUM (Rafin. prec. dec. 41. and Desv. journ. bot. 1814. p. 271.) stem branched, rather scabrous; leaves alternate, nearly sessile, linear, narrow, entire, glabrous, 1-nerved, acute, tapering to the base; flowers axillary, solitary, pedunculate. ♃. H. Native of North America, especially in Pennsylvania and Maryland, in humid woods.

Slender-leaved Willow-herb. Pl. 1 foot.

30 E. DIVARICA'TUM (Rafin. prec. dec. p. 42. and in Desv. journ. bot. 1814. 2. p, 271.) stem branched, glabrous; branches spreading; leaves opposite, petiolate; petals lanceolate, acute, glabrous, unequally denticulated. ♃. H. Native of North America.

Divaricate-branched Willow-herb. Pl. 1 to 2 feet?

31 E. HIRSU'TUM (Lin. spec. 494.) roots creeping; stems branched, hairy; lower leaves opposite, upper ones alternate, ovate-lanceolate, hairy, toothed, half stem-clasping; stigma deeply 4-cleft; the segments deflexed. ♃. H. Native of Europe and Siberia, in wet places. In Britain, in watery places, ditches, and margins of rivers, among reeds, coarse grasses, and willows. Smith, engl. bot. 838. Curt. lond. 2. t. 21. Fl. dan. t. 326. E. ramòsum, Huds. p. 162. E. amplexicaúle, Lam. dict. 2. p. 374. E. grandiflòrum, All. pedem. no. 1018. Flowers in a leafy, corymbose cluster, large, of a delicate, pale pink, with cloven, regular petals. The whole herb is downy, soft, and clammy, exhaling a peculiar, acidulous scent, justly compared to the flavour of boiled codlings and cream. The plant varies with white flowers and variegated leaves.

Var. β, intermèdium (Ser. in D. C. prod. 3. p. 42.) stem, branches, and leaves clothed with hoary villi; fruit covered with very long pili. ♃. H. Native about Paris, and of Siberia. E. intermèdium, Mer. fl. par. 147. but not of Wormsk. E. hirsùtum Sibíricum, Deless. herb.

Hairy Willow-herb or Codlings and cream. Fl. July. Brit. Pl. 3 to 5 feet.

32 E. VILLÒSUM (Thunb. prod. 75.) leaves alternate, lanceolate, serrated, hairy. ♃. G. Native of the Cape of Good Hope. This species hardly differs from *E. hirsùtum*, unless in the lobes of the stigma being thicker and more convolute. Flowers red.

Villous Willow-herb. Pl. 2 to 3 feet.

33 E. TOMENTÒSUM (Vent. hort. cels. t. 90.) plant clothed with hoary tomentum; stems much branched; leaves half stem-clasping, lanceolate, bluntish, serrulated; stigmas quadrifid, with the lobes horizontal. ♃. H. Native of the Levant, between Julpha and Hispahan, on the borders of rivulets. Perhaps only a variety of *E. hirsùtum*. Flowers red.

Tomentose Willow-herb. Fl. July, Aug. Clt. 1818. Pl. 3 to 4 feet.

34 E. CYLI'NDRICUM (D. Don, prod. fl. nep. p. 222.) leaves lanceolate-linear, serrulated, stalked, lower ones opposite, upper ones alternate; stems terete, pubescent. ♃. H. Native of Nipaul. Flowers small, red. Habit of *E. palústre*.

Cylindrical-stemmed Willow-herb. Pl. 1½ foot.

35 E. PALU'STRE (Lin. spec. 495.) stems terete, branched, pubescent; leaves sessile, linear-lanceolate, slightly toothed, glabrous, lower ones opposite, upper ones alternate; stigma linear, obtuse, undivided. ♃. H. Native of Europe, Siberia, and Labrador; in boggy turfy ground, near ditches and rivulets. Smith, engl. bot. t. 346. Fl. dan. 1574. Flowers pale purple, in leafy clusters. Herb extremely variable in luxuriance.

Var. β, verticillàtum (Ram. ex D. C. fl. fr. 4. p. 422.) leaves 3 in a whorl. ♄. ♃. H. Native of the Pyrenees.

Var. γ, albiflòrum (Hook, fl. bor. amer. p. 207.) stem terete, simple, smoothish; leaves sessile, linear, somewhat denticulated; flowers drooping; capsules pedicellate, elongated, canescent; stigma undivided. ♃. H. Native throughout Canada, and as far north as lat. 64°, and among the prairies of the Rocky Mountains. E. palústre, var. albéscens, Wahl. fl. suec. 1. p. 234. Richards. in Frankl. journ. ed. 2. append. p. 12. E. lineàre, Muhl. Flowers white. Perhaps the same as *E. Dahùricum* of Fischer.

Marsh Willow-herb. Fl. June, July. Brit. Pl. ½ to 1½ ft.

36 R. RIVULA'RE (Wahl. fl. ups. p. 126.) puberulous; leaves sessile, long-lanceolate, denticulated, lower ones opposite, upper ones alternate; petals oval, emarginate; stigma 4-lobed. ♃. H. Native of Sweden, on the banks of rivulets and fountains. Rchb. icon. bot. 2. p. 61. t. 170. Flowers red. Habit of *E. palústre*.

Rivulet Willow-herb. Fl. July. Pl. 1 foot.

37 E. PARVIFLÒRUM (Schreb. lips. 146.) stem nearly simple, woolly, terete; leaves sessile, lanceolate, minutely toothed, soft, and downy on both surfaces; flowers in leafy clusters; root fibrous; stigma 4-cleft, spreading. ♃. H. Native of Britain; frequent in watery places and about the banks of rivers. Smith, engl. bot. t. 795. E. pubéscens, Willd. spec. 2. p. 315. E. hirsùtum, Huds. 161. Lin. spec. p. 494. var. β. E. villòsum, Curt. fl. lond. 2. t. 22.—Fl. dan. 347. Flowers not a quarter the size of those of *E. hirsùtum*.

Small-flowered Willow-herb. Fl. July. Brit. Pl. 2 to 3 ft.

38 E. SI'MPLEX (Tratt. arch. 1. p. 37. with a figure.) stems simple, striated, pubescent; leaves decussate, linear-lanceolate, quite entire, sessile, pubescent; petals emarginate; stigma quadrifid; ♃. H. Native on Mount Scheiblingstein. According to Trattineck, this plant differs from *E. parviflòrum*, in the leaves being quite entire, sessile, and linear, and in the flowers being smaller.

Simple-stemmed Willow-herb. Fl. July. Pl. 2 feet.

39 E. ROTUNDIFÒLIUM (Forst. prod. no. 161.) leaves opposite, roundish, denticulated. ♃.? H. Native of New Zealand.

Round-leaved Willow-herb. Pl. ?

40 E. SQUAMMA'TUM (Nutt. gen. amer. 1. p. 250.) pubescent; roots scaly, bulbous; stems cylindrical, branched; cauline leaves opposite, rameal ones alternate, all linear, and quite entire, with revolute margins; flowers pedicellate; petals bifid; stigma clavate, undivided. ♃. H. Native of North America, about Philadelphia. E. rosmarinifòlium, Pursh, fl. amer. sept. 1. p. 259. Petals white. E. lineàre, Bigel. in litt. Perhaps the same as *E. palústre, var. albiflòrum*. The scaly bulbous roots are by no means peculiar to this species.

Scaly-rooted Willow-herb. Fl. July. Clt. 1800. Pl. 1½ ft.

41 E. TENE'LLUM (Rafin. prec. dec. p. 41. and in Desv. journ. bot. 1814. p. 271.) stem filiform, simple, pubescent above; leaves opposite, sessile, linear, elongated, usually entire, full of pellucid lines, glabrous except the margins, which are finely ciliated; flowers erect; stigma undivided; capsule pedicellate, slender, canescent. ♃. H. Native of North America.

Slender Willow-herb. Pl. 1 foot.

42 E. TETRAGÒNUM (Lin. spec. 494.) stem erect, usually quadrangular, sometimes rather downy; leaves lanceolate, sessile, minutely toothed, decurrent; flowers erect; stigma clavate, undivided; capsules puberulous, on short pedicels. ♃. H. Native of Europe, Siberia, and North America, in ditches, and watery, marshy places; plentiful in Britain. Smith, engl. bot. 1948. Curt. lond. fasc. 2. t. 23. Fl. dan. 1029. Rchb. icon. bot. 2. p. 88. t. 198. Flowers small, purple, in leafy clusters. A very variable plant in luxuriance, sometimes rather pubescent and sometimes quite smooth.

Var. β, obscùrum (Pers. ench. 2. p. 410.) leaves opposite and alternate, lanceolate, glabrous, and serrated, decurrent at the base; stigma clavate. ♃. H. Chamænèrion obscùrum, Schreb. E. obscùrum, Schmidt, fl. bohem. cent. 4. p. 81. Rchb. icon. bot. 2. p. 89. t. 199.

Var. γ, virgàtum (Wahl. fl. succ. 1. p. 233.) narrower and rather pubescent; leaves less decurrent. ♃. H. Native of Sweden and Siberia.

Tetragonal-stemmed Willow-herb. Fl. July. Britain. Pl. 1 to 1½ foot.

43 E. FLA'CCIDUM (Brot. fl. lus. 2. p. 18.) stem weak, tetra-

gonal below, flaccid, creeping at the base; leaves lanceolate, denticulated, glabrous, almost sessile, lower ones opposite. ♃. H. Native of Portugal, about Coimbra and elsewhere in Beira. Flowers red. This plant is usually taken for a variety of *E. tetragònum*, but is a perfectly distinct species.

Flaccid-stemmed Willow-herb. Fl. July. Pl. 1 foot.

44 E. BONPLANDIA'NUM (H. B. et Kunth, nov. gen. amer. 6. p. 95.) plant rather woody; stem simple or branched, usually erect; leaves opposite, lanceolate, sessile, a little toothed; flowers axillary, solitary, almost sessile; stigma capitate? ♃. F. Native of South America, on the Andes, about Popayan, in humid places, at the height of 5000 feet above the level of the sea. Petals nearly orbicular, rose-coloured, twice the length of the calyx. Capsule 2 to 3 inches long.

Bonpland's Willow-herb. Pl. ½ to 1 foot.

45 E. LU'TEUM (Pursh, fl. sept. amer. 1. p. 259.) stem tetragonal, rather pilose; leaves opposite, serrulated; peduncles axillary, alternate, elongated; lobes of calyx narrow, length of petals; style exserted; stigma thick, 4-lobed. ♃. H. Native of the north-west coast of America, and in the grassy valleys of Unalaschka. Flowers yellow, as large as those of the *French-willow*.

Yellow-flowered Willow-herb. Pl. 1 foot.

Cult. All the species of the *Willow-herb* are of the easiest culture and propagation; they will grow in any common garden soil, and are easily increased by dividing at the roots or by seeds. Those species belonging to the first section of the genus being the most shewy, are the most worthy of cultivation, as border flowers.

VI. GAU'RA (from γαυρος, *gauros*, superb; in reference to the elegance of the flowers of some of the species). Lin. spec. 205. Gærtn. fruct. 2. p. 205. t 127. f. 2. D. C. prod. 3. p. 44.

LIN. SYST. *Octándria, Monogýnia.* Calyx of 3-4 sepals; sepals connected into a long tube; limb 3-4-parted, deciduous. Petals 3-4. Stamens 6-8. Stigma 3-4-lobed. Fruit 1-celled, closely adhering to the calyx, 3-4-sided, 1-4-seeded. Seeds naked. Flowers terminal, spiral, sessile, bracteate, white, red, rarely yellow, all becoming reddish as they fade.

1 G. BIE'NNIS (Lin. spec. 493.) stem herbaceous; leaves lanceolate-oblong, acute, denticulated; flowers irregular; petals obovate, ascending, spreading, naked; genitals deflexed; style longer than the stamens; fruit obovate, tetraquetrous, sessile, pilose, acute, bluntish, marked with thick depressed nerves, and with transverse wrinkles below. ♂. H. Native of Virginia and Pennsylvania, and about Montreal. Curt. bot. mag. 389. Limb of calyx length of tube. Sepals purple at the apex. Petals at first white, then reddish. Floriferous branches subcapitate, at length becoming a somewhat whorlèd spike.

Biennial Gaura. Fl. Aug. Oct. Clt. 1762. Pl. 4 to 6 feet.

2 G. ANGUSTIFÒLIA (Michx. fl. bor. amer. 1. p. 226.) leaves linear, crowded, repandly undulated; fruit ovate, triquetrous, acute at both ends, whitish, having the angles acute. ♂. H. Native of Lower Carolina. G. undulàta, Desf. cat. hort. par. p. 196. G. fruticòsa, Jacq. coll. 1. p. 142. icon. rar. 3. p. 457. Flowers not half the size of those of *G. biénnis;* petals secund; genitals not deflexed. Fruit disposed in long loose spikes, ovate, triquetrous, sessile; angles not winged.

Narrow-leaved Gaura. Pl. 2 to 3 feet.

3 G. SINUA'TA (Nutt. in litt. ex D. C. prod. 3. p. 44.) branches and leaves rather pilose; pili adpressed; leaves numerous, linear, sinuated; flowers disposed in long spikes; fruit distant, clavate, tetragonal at the apex, attenuated at the base, and terete, on short pedicels; the angles tumid. ♂. H. Native of North America, in the territory of the Arkansa and Red rivers. A very distinct species.

Sinuated-leaved Gaura. Pl. 2 to 3 feet.

4 G. EPILOBIOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 93.) herbaceous; branches and leaves pubescent, approximate; leaves linear, quite entire, or remotely toothed; petals ovate-roundish, obtuse; stamens straight; fruit pubescent, oblong-linear, tetragonal, 4-ribbed; ribs thick, alternating with the angles. ♂. H. Native of Mexico, near Actopan, at the height of 3120 feet above the level of the sea. This species hardly differs from *G. angustifòlia,* unless in the stem being more branched, in the leaves being flat, not curled on the margins, and in the flowers being much larger. The habit approaches that of *Epilòbium rosmarinifòlium* in habit and colour of flowers.

Willow-herb-like Gaura. Pl. 2 to 3 feet.

5 G. TRIPE'TALA (Cav. icon. 4. p. 66. t. 396. f. 1. good) herbaceous; branches pilose; leaves lanceolate-linear, a little toothed, puberulous; flowers hexandrous; sepals 3, deflexed; petals 3, rose-coloured, obovate-oblong, unilateral, ascending; fruit ovate, triquetrous, acute, with transverse plicate stripes, and turgid angles. ⊙. H. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 94. G. hexándra Ortega. Flowers white, but at length becoming red.

Three-petalled Gaura. Fl. Aug. Clt. 1804. Pl. 1½ foot.

6 G. ODORA'TA (Sesse, ex Lagas. gen. et spec. p. 14.) leaves linear-lanceolate, repandly toothed; petals 4, ovate, ascending. ♂. H. Native of New Spain.

Sweet-scented Gaura. Pl. 2 to 3 feet.

7 G. BRACTEA'TA (Ser. mss. in D. C. prod. 3. p. 45.) leaves linear-lanceolate, deep[illegible] and irregularly serrated; bracteas linear, entire, acute; flowers pedicellate; petals obovate, spreading, length of the limb of the calyx. ♂. F. Native of Mexico, in the garden of St. Angeli. G. sinuàta and G. spicàta, Moc. et Sesse, fl. mex. icon. ined. t. 373. Flower-bud obtuse. Style clavate at the apex. Stamens 8.

Bracteate-flowered Gaura. Pl. 2 to 3 feet.

8 G. LINIFÒLIA (Nutt. in James' exped. rock. mount. 2. p. 355.) stems much branched; leaves linear, acute, entire, glabrous; flowers racemose, dense, numerous; bracteas linear-subulate, puberulous; tube of calyx long, pilose; the lobes oblong-linear; petals 4, obovate-oblong; fruit very minute, ovate, triquetrous, pilose. ♂. H. Native of North America, about the Arkansa. Flowers octandrous. Calyx of a brownish-purple colour. Petals white.

Flax-leaved Gaura. Pl. 1 to 2 feet.

9 G. PARVIFLÒRA (Doug. ex Lehm. pug. 2. p. 15. and Hook, fl. bor. amer. p. 208.) stems herbaceous, erect, pilose; leaves oblong, acuminated, remotely denticulated, and ciliated on the margins, rather velvety when young; spikes elongated; flowers minute, crowded; fruit distant, tetragonal, smoothish, tapering to both ends. ♂. H. Native of the north-west coast of America, on the sandy banks of the Wallawallah river.

Small-flowered Gaura. Pl. 1 to 1½ foot.

10 G. COCCI'NEA (Fras. cat. 1813. Pursh, fl. amer. sept. 2. p. 733.) stems herbaceous, decumbent; leaves linear-lanceolate, repandly denticulated, but when young quite entire, canescent; spikes loose; flowers alternate; bracteas linear, permanent; fruit elliptic, terete at the base, but tetragonal at the apex, canescent. ♃. F. Native of North America, at Fort Mandan, also on the plains of the Saskatchawan and Red rivers. Petals scarlet.

Scarlet-flowered Gaura. Fl. Aug. Oct. Clt. 1811. Pl. proc.

11 G. MARGINA'TA (Lehm. pug. 2. p. 16. Hook, fl. amer. bor. p. 208.) stems ascending, suffruticose at the base; leaves lanceolate, repandly toothed, rather revolute, white on both surfaces from adpressed down; flowers in terminal, verticillate spikes; bracteas linear, deciduous; fruit white. ♃. H. Native of North America, on the plains of the Saskatchawan. Petals obovate, red. Ovary tetragonal.

Marginate Gaura. Pl. ascending.

12 G. GLA'BRA (Lehm. pug. 2. p. 16. Hook, fl. bor. amer. p. 209.) stems ascending, suffruticose at the base, quite glabrous; leaves narrow-lanceolate, undulated, glabrous; spikes elongated; flowers alternate; ovaries linear, tetragonal, glabrous. ♃. H. Native of North America, about Carlton House, on the Saskatchawan. Petals spatulate, red.

Glabrous Gaura. Pl. ascending.

13 G.? MÓLLIS (H. B. et Kunth, nov. gen. amer. 6. p. 93.) plant suffruticose? branches clothed with silky hairs; leaves lanceolate-oblong, remotely denticulated, pubescent; petals ovate, obtuse, cruciately opposite, pale yellow; stamens straight; fruit oblong, arcuately incurved, nearly as in *Œnothèra*. ♃. H. Native of Mexico. Perhaps a species of *Œnothèra*.

Soft Gaura. Pl. 1 foot?

14 G. MUTA'BILIS (Cav. icon. rar. 3. p. 30. t. 258.) leaves ovate, sessile, remotely toothed; petals broadly ovate, acute, cruciately disposed, spreading; styles and stamens straight; stem shrubby. ♃. H. Native of New Spain. Œnothèra anómala, Curt. bot. mag. t. 388. Petals yellow, but becoming red as they fade.

Changeable-flowered Gaura. Fl. July, Aug. Clt. 1795. Pl. 2 feet.

15 G. ŒNOTHERIFLÒRA (Zuccagni, obs. bot. tent. 2. no. 65.) leaves ovate-lanceolate, running down the petiole at the base, remotely toothed, villous; flowers sessile. ♂. H. Native country unknown. Habit of *Œnothèra longiflòra*. Flowers at first yellow, but becoming red as they fade. Fruit elliptic, quadrangular. Perhaps a variety of *G. mutábilis*.

Evening primrose-flowered Gaura. Fl. Jul. Aug. Clt. 1816. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

16 G. CHINE'NSIS (Lour. coch. p. 225.) leaves lanceolate, serrated, opposite, sessile; spikes terminal; stigma sessile. ♃.? F. Native of China, about Canton.—Pluk. alm. t. 428. Flowers yellow. Stem tetragonal.

China Gaura. Pl. 1 foot.

17 G. SUFFRUTE'SCENS (Moc. et Sesse. fl. mex. icon. ined. t. 374.) stems shrubby at the base; leaves oblong-linear, undulated, glaucescent; young branches drooping; flowers loose, spreading; bracteas lanceolate, acute; limb of calyx deflexed; petals somewhat secund, spatulate, on long claws; stamens 8, and are as well as the style ascending; fruit unknown. ♄. G. Native of Mexico. Flowers large, red. Stigma capitate.

Suffruticose Gaura. Shrub.

18 G.? EPILÒBIA (Moc. et Sesse, fl. mex. icon. ined. t. 375.) stem glabrous; leaves oval-oblong, denticulately sinuated; racemes few-flowered; flowers nearly sessile; petals almost orbicular, incumbent, hardly unguiculate; fruit unknown. ♃. F. Native of Mexico. Flowers red. Stamens shorter than the petals.

Epilobium-like Gaura. Pl. 1 to 2 feet.

Cult. The most part of the species of *Gaura* are little better than biennials, although some are marked perennial. A light soil suits them best, and they are only to be propagated by seeds, which should be sown early in spring in the open ground. Those species natives of Mexico will require a little protection in winter the first year from seed.

VII. ŒNOTHE'RA (from *οινος*, *oinos*, wine, and *θηρα*, *thera*, a catching; the roots of *Œ. biénnis* were formerly eaten after meals, as incentives to wine-drinking, as olives are). Lin. gen. 469. D. C. prod. 3. p. 45.

LIN. SYST. *Octándria, Monogýnia.* Calyx of 4 sepals (f. 95. *a.* f. 96. *a.*); sepals connected into a long, tetragonal, or 8-ribbed tube; segments of the limb deciduous, as well as the free part of the tube. Petals 4 (f. 95. *b.* f. 96. *b.*). Stamens 8, erect, or declinate; pollen triangular, clammy. Stigma 4-cleft or capitate. Capsule 4-celled, 4-valved, cylindrical or prismatic, clavate, or tetragonal, inseparable from the base of the calyx. Seeds fixed to the central placenta, naked. Flowers opening at sun-set and closing at sun-rise.

SECT. I. SPHÆROSTI'GMA (from *σπαιρα*, *sphaira*, a sphere, and *ςτιγμα*, *stigma*, a stigma; in reference to the form of the stigma, which is globose). Ser. in D. C. prod. 3. p. 46. Stigma globose (f. 95. *c.*). Fruit oblong, cylindrical or tetragonal; valves linear. Anthers short, retuse at the apex.

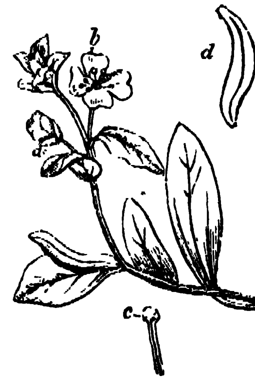
1 Œ. DENTA'TA (Cav. icon. 4. p. 67. t. 398.) leaves linear, denticulated, glabrous; capsule cylindrical, very narrow. ⊙. H. Native of Peru and Chili. Œ. dentàta, Ruiz. et Pav. fl. per. 3. p. 81. t. 317. Lindl. coll. 10. Œ. Chamisònis, Link. enum. 1. p. 378. Plant prostrate. Petals longer than the calyx, yellow. Stigma slightly 4-lobed.

Toothed-leaved Evening Primrose. Fl. Ju. Aug. Clt. 1818. Pl. prostrate.

2 Œ. HI'RTA (Link. enum. 1. p. 378.) hairy; stem branched, erect; leaves lanceolate, denticulated; flowers sessile, minute; capsules curved, terete. ⊙. H. Native of California. Œ. micrántha, Horn. ex Spreng. syst. 2. p. 228. Plant hairy. Flowers small, yellow. Petals not so long as the sepals. Stigma capitate, slightly 4-lobed.

Hairy Evening Primrose. Fl. June, Aug. Clt. 1823. Pl. ¼ to ½ foot.

FIG. 95.



3 Œ. CHEIRANTHIIFÒLIA (Horn. ex Spreng. syst. 2. p. 223.) stems branched; branches ascending, hairy; leaves sessile, spatulate, obtuse, quite entire, villous, canescent; flowers sessile; capsule subulate, curved, angular, acute, hairy. ♄. F. Native of Chili. Lindl. bot. reg. 1040. Flowers middle-sized, pale yellow. (f. 95.)

Wall-flower-leaved Evening Primrose. Fl. June, Aug. Clt. 1823. Sh. 1 foot.

4 Œ. ALA'TA (Rafin. fl. lud. p. 95.) branches winged; leaves sessile, oval-lanceolate, entire, glabrous; flowers sessile; petals unguiculate; stigma globose; capsule 4-winged.—Native of Louisiana.

Winged-stemmed Evening Primrose. Pl.

5 Œ. QUADRIVU'LNERA (Dougl. in bot. reg. 1119.) stem declinate, branched, weak, puberulous; leaves linear-lanceolate, somewhat denticulated, puberulous; petals with crenulated margins; capsule tetragonal, attenuated at the apex, villous. ⊙. H. Native of the north-west coast of America, on the banks of streams, as well as in the open elevated country west of the Rocky Mountains. Petals lilac, each marked with a more intense spot. Stigma globular, entire.

Four-spotted-flowered Evening Primrose. Fl. July, Sep. Clt. 1826. Pl. 1 to 2 feet.

6 Œ. BOÒTHII (Dougl. mss. ex Hook. fl. bor. amer. p. 213.) stem branched; leaves ovate, toothed, glabrous above, hairy beneath, lower ones stalked; flowers secund, in spikes; petals small, obovate, entire, equal in length to the stamens; style exserted; capsule cylindrical, furrowed, twisted, pubescent. ⊙. H. Native of North America, on low exposed gravelly hills, near the branches of Lewis's and Clarke's rivers, in lat. 46°. N. Flowers white, sweet-scented. Stigma capitate.

Booth's Evening Primrose. Pl. ½ foot.

7 Œ. PYGMÆ'A (Dougl. mss. ex Hook. fl. bor. amer. 213.) stem ascending, branched; lower leaves stalked, rhomboid, superior ones sessile, lanceolate, all toothed and pubescent; capsules somewhat secund, cylindrical, attenuated at the apex, torulose. ⊙.? H. Native of North-west America, in barren sands near the Utalla river. Habit of the preceding species.

Pygmy Evening Primrose. Pl. ¼ to ½ foot.

8 Œ. SPIRA'LIS (Hook. fl. bor. amer. p. 213.) stem nearly simple, decumbent, hoary; leaves lanceolate, obtuse, quite entire, hoary, and beset with strigose pili, attenuated at the base; spikes leafy; petals twice the length of the stamens; capsule acutely tetragonal, acuminated, hoary, somewhat spirally twisted. ⊙.? H. Native of the north-west coast of America. Allied to *Œ. Boòthii*, but larger in all parts, and very easily distinguished by its entire hoary leaves and capsules.

Spiral-capsuled Evening Primrose. Pl. ½ foot.

9 Œ. VIRIDE'SCENS (Hook. fl. bor. amer. p. 214.) plant densely clothed with hoary tomentum; stem erect, simple; leaves ovate, acute, sessile, coarsely toothed; spikes leafy; petals deep green in the dried state, twice the length of the stamens; capsule acutely tetragonal, rather hairy, twisted. ⊙.? H. Native of the north-west coast of America.

Greenish-petalled Evening Primrose. Pl. ½ foot.

10 Œ. CONTÓRTA (Dougl. mss. ex Hook. fl. bor. amer. p. 214.) stem weak, branched, glabrous; leaves linear, quite entire, glabrous; flowers small; capsule cylindrical, twisted, curved, elongated, torulose. ⊙.? H. Native of North America, in sandy barren soil on the interior banks of the Columbia river. Although the specimens examined by Dr. Hooker of this, as well as those of *Œ. pygmæ'a*, are too imperfect to determine exactly the form of the stigmas, he thinks it not improbable from the habit of these plants that they should be ranged in the present section.

Twisted-podded Evening Primrose. Pl. ¼ to ½ foot.

SECT. II. ONA'GRA (a name given by Tournefort to the genus *Œnothèra*). Ser. in D. C. prod. 3. p. 46.—Onàgra species, Tourn. inst. p. 302. t. 156. Gærtn. fruct. 1. p. 159. t. 32. f. 1. Stigma quadrifid. Anthers oblong-linear, usually emarginate at the base. Capsule cylindrical, prismatic, or obsoletely tetragonal, sometimes thickened at the base, but never at the apex.

Flowers yellow.

11 Œ. BIE'NNIS (Lin. spec. 492.) stem erect, branched; radical leaves oblong-lanceolate, cauline ones ovate-lanceolate, toothed, pubescent; petals hardly obcordate, exceeding the stamens; lobes of stigma linear and thickish; capsule nearly cylindrical, thickest at the base; valves either entire or bifid, opening at the apex. ♂. H. Native of North America, in Virginia, Canada, and on the north-west coast, from whence it has migrated to Europe in the year 1614, and now found apparently wild in England; particularly between the first and second ranges of sand banks on the coast of Lancashire, a few miles north of Liverpool, in the greatest abundance. It covers several acres of ground near Woodbridge, Suffolk. This plant is common in gardens, and often escapes from thence into rich waste ground. But on the dreary sand of our Lancashire coast it is truly wild, being planted there by the hand of nature, though perhaps transported by natural means from the other side of the Atlantic. Fl. dan. 446. Smith, engl. bot. 1534. Flowers large, pale yellow, delicately fragrant. Roots eatable.

Biennial or Common Evening Primrose. Fl. July, Sep. Brit. Pl. 2 to 4 feet.

12 Œ. MURICA'TA (Lin. syst. veg. 296. Murr. nov. comm. gœtt. 6. p. 24. t. 1.) stem erect, branched, purplish, muricated with strigæ; leaves oblong-lanceolate, glabrous, remotely denticulated; petals obcordate, length of the stamens; capsule nearly cylindrical, rather hairy. ♂. H. Native of Canada, and on the plains of the Saskatchawan, and of the Straits of Fuca. Fl. dan. t. 1752. Flowers yellow. Upper leaves downy. Sepals lanceolate, acuminated, hairy, longer than the petals. Strigæ red at the base.

Muricated-stemmed Evening Primrose. Fl. July, Sep. Clt. 1789. Pl. 3 to 4 feet.

13 Œ. ELA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 90.) leaves lanceolate, acute, clothed with silky canescent pubescence, obsoletely and remotely denticulated; petals roundish-obovate, retuse, pale yellow; stamens declinate, about the length of the petals; capsules sessile, cylindrical, slightly angular, clothed with silky villi. ♂. H. Native of Mexico. Flowers pale yellow.

Tall Evening Primrose. Fl. July. Clt. 1826. Pl. 6 feet.

14 Œ. PUBE'SCENS (Willd. herb. ex Spreng. syst. 2. p. 229.) stem simple, erect; leaves oblong-lanceolate, obsoletely toothed, pubescent; capsule curved, cylindrical, clothed with silky villi. ♂. H. Native of South America. Flowers yellow.

Pubescent Evening Primrose. Pl. 2 to 3 feet.

15 Œ. GRANDIFLÒRA (Ait. hort. kew. ed. 1. vol. 2. p. 2. (1789.) ed. 2. vol. 2. p. 341. but not of Ruiz et Pav.) pubescent; stem simple; leaves lanceolate, remotely toothed; genitals deflexed; petals large, obcordate; capsule sessile, cylindrical, and slightly angular. ♂. H. Native of North America. Flowers large, pale yellow, solitary and sessile in the axils of the leaves.

Var. α, pubéscens ([illegible]ims, bot. mag. t. 2068.) stems, leaves, and capsules pubescent; [illegible]alyx villous. ♂. H.

Var. β, glàbra (Sims, bot. mag. 2068.) stem, leaves, and capsules glabrous. ♂. H.

Great-flowered Evening Primrose. Fl. June, Aug. Clt. 1778. Pl. 2 feet.

16 Œ. SUAVE'OLENS (Desf. tabl. ed. 1804. p. 169. et Pers. ench. 1. p. 408.) stems, calyxes, and capsules pilose; leaves ovate-lanceolate, obsoletely toothed; petals large, emarginate; capsule elongated, about equal in thickness from base to apex. ♂. H. Native of North America. This plant is cultivated for the scent and size of the flowers, which are yellow.

Sweet-scented Evening Primrose. Fl. June, Aug. Pl. 2 ft.

17 Œ. SIMSIA'NA (Ser. in D. C. prod. 3. p. 47.) stem straight, hispid, furrowed; leaves lanceolate, repandly toothed; tube of calyx 3 times the length of the ovarium; sepals very narrow, length of the petals; petals obovate, rather truncate, denticulated at the apex; stamens arched, shorter than the corolla; lobes of stigma linear, thickish; capsule sessile, cylindrical, slightly angular, with the valves reflexed at the apex. ♂. H. Native of Mexico. Œ. corymbòsa, Sims, bot. mag. t. 1974. but not of Lam. Flowers yellow.

Sims's Evening Primrose. Fl. July, Aug. Clt. 1816. Pl. 3 ft.

18 Œ. LAMARKIA'NA (Ser. in D. C. prod. 3. p. 47.) stem branched; leaves quite entire; petals large, entire; capsules glabrous, cylindrically tetragonal, short. ♂. H. Native of North America. Œ. grandiflòra, Lam. dict. 4. p. 554. but not of Ait. Flowers yellow.

Lamark's Evening Primrose. Pl. 2 to 3 feet.

19 Œ. SALICIFÒLIA (Desf. cat. 1815. p. 271.) stem tall, simple, angular; leaves oblong-lanceolate, acute, nearly entire, rather pilose, thickish; genitals about equal in length to the corolla; lobes of stigma oblong-linear, large, thickish; capsule oblong, tetragonal; valves linear, with red nerves. ♂. H. Native country unknown. Flowers yellow.

Willow-leaved Evening Primrose. Fl. July, Aug. Clt. 1824. Pl. 2 to 3 feet.

20 Œ. PARVIFLÒRA (Lin. spec. 492.) stem even, reddish, rather villous; leaves ovate-lanceolate, denticulated; stamens erect, longer than the petals; capsule ovate-cylindrical. ♂. H.

Native of North America. Mill. fig. 189. f. 1. Flowers small, yellow. Capsule sessile, 8-cleft at the apex.

Small-flowered Evening Primrose. Fl. July, Sep. Clt. 1757. Pl. 3 to 5 feet.

21 Œ. CRUCIA'TA (Nutt. mss.) stem reddish, rather hairy; leaves lanceolate, acuminated, denticulated, glabrous, but the upper ones are rather downy; flowers sessile; petals linear, rather shorter than the anthers; calycine segments reflexed, linear, mucronate, longer than the petals, but about equal in length to the stamens; lobes of stigma thick, conniving, or spreading a little; capsule cylindrical, hairy. ♂. H. Native of North America. Flowers small, yellow.

Cross-petalled Evening Primrose. Fl. July, Aug. Clt. 1824. Pl. 2 to 4 feet.

22 Œ. GAUROÌDES (Horn. hort. hafn. 1 p. 362.) stem erect, pubescent, red, branched at the apex; leaves ovate-lanceolate, toothed, nearly sessile, spotted with red at the apex; capsules elongated, length of the bracteas. ♂. H. Native of North America, near Baltimore. Flowers small, yellow.

Gaura-like Evening Primrose. Fl. July, Aug. Clt. 1810. Pl. 4 to 5 feet.

23 Œ. ME'DIA (Link, enum. 1. p. 377.) stem erect, pubescent; leaves lanceolate-linear, acute, toothed, clothed with soft pubescence; tube of calyx long, pubescent; petals emarginate. ♂. H. Native of North America. Flowers yellow.

Intermediate Evening Primrose. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

24 Œ. CORYMBÒSA (Lam. dict. 4. p. 5[illegible] . but not of Sims,) stems twisted, furrowed; leaves numerous, lanceolate, glabrous, a little toothed, green; flowers sub-corymbose, terminal, pedunculate?; tube of calyx short, length of the ovarium, with the segments ovate and concave, unguiculate on the back; capsule ovate-oblong, villous. ♂. H. Native of North America. Cultivated in gardens. Œ. spectábilis, Horn. ex Spreng. syst. 2. p. 227.

Corymbose-flowered Evening Primrose. Fl. Ju. Aug. Clt. 1820. Pl. 2 to 3 feet.

25 Œ. A'LBICANS (Lam. dict. 4. p. 552. ill. t. 270. f. 2.) plant clothed with glaucous pubescence; leaves lanceolate, toothed, white; petals obovate, toothed at the apex; filaments and anthers red; capsule pubescent, cylindrical, rather gibbous at the base, 8-lobed at the apex. ♃.? G. Native of Peru. Flowers yellow?

Whitened Evening Primrose. Pl. 1 foot.

26 Œ. NOCTU'RNA (Jacq. coll. 3. p. 205. icon. rar. 3. t. 455.) stems branched, terete, pubescent; leaves lanceolate, remotely toothed, flat, glabrous? petals obovate, obtuse; fruit ovate-oblong, somewhat revolute at the apex. ♂. H. Native of the Cape of Good Hope. Leaves almost like those of *Chenopòdium ambrosioìdes*. Petals at first yellow, but at length changing to red.

Night-smelling Evening Primrose. Fl. Apr. Aug. Clt. 1790. Pl. 1 to 2 feet.

27 Œ. LONGIFLÒRA (Jacq. hort. t. 172. Willd. spec. 2. p. 307.) stems simple, pilose; leaves lanceolate, denticulated, hairy; petals obcordate; tube of calyx very long; segments of the stigma very long and linear; genitals shorter than the petals; capsules long, thickened at the base, and narrow at the apex, somewhat tetragonal, hairy. ♂. H. Native of Buenos Ayres and Brazil. Curt. bot. mag. 365. Flowers large, pale yellow. Leaves like those of *Picris echioìdes*.

Long-flowered Evening Primrose. Fl. July, Sep. Clt. 1776. Pl. 1 to 1½ foot.

28 Œ. VILLÒSA (Thunb. prod. p. 75.) stems rather angular, very villous; leaves lanceolate, toothed, undulated, very villous; capsules nearly terete. ♂. H. Native of the Cape of Good Hope. According to Sprengel this species is allied to *Œ. mollissima* and *Œ. odoràta*. Flowers yellow.

Villous Evening Primrose. Fl. July. Clt. 1791. Pl. 1 to 2 ft.

29 Œ. MOLLÍSSIMA (Lin. spec. 492.) stem branched; leaves lanceolate, a little undulated, repandly toothed, clothed with soft down; petals obovate, entire, shorter than the calyx; genitals hardly the length of the petals; lobes of stigma filiform; capsule cylindrical, striated, very long, downy, somewhat tetragonal, a little thickened at the apex. ♂. H. Native of Buenos Ayres, Monte Video, and Chili, in fields. Schkuhr, handb. 1. t. 105. Œ. noctúrna, Willd. herb. ex Spreng.—Dill. hort. elth. 286. Flowers at first yellow, but afterwards changing to a reddish colour as they fade.

Very-soft Evening Primrose. Fl. July, Oct. Clt. 1732. Pl. 1 to 2 feet.

30 Œ. AFFÌNIS (St. Hil. fl. bras. 2. p. 269.) stem branched, suffruticose at the base, tomentose; leaves lanceolate, acute, sinuately denticulated, tomentose; petals quite entire, longer than the calyx; genitals shorter than the petals; lobes of stigma linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, tomentose. ♃. G. Native of Brazil, in the province of Rio Grande de St. Pedro do Sul, on the margins of woods near the town of Rio Pardo. Flowers yellow. Nearly allied to *Œ. mollissima*.

Allied Evening Primrose. Pl. 1 to 1½ foot.

31 Œ. CATHARINE'NSIS (St. Hil. fl. bras. 2. p. 270.) stems trailing or ascending, simple or branched, puberulous; leaves lanceolate, acute, sinuately denticulated, puberulous; petals exceeding the calyx, emarginate at the apex; genitals shorter than the petals; lobes of the calyx linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, pubescent. ♃. G. Native of Brazil, in the island of St. Catharine, at the entrance to Rio Janeiro. Flowers yellow. Very nearly allied to *Œ. mollíssima*, from which it may be distinguished by the greater size of the flowers, by the petals being emarginate at the apex, by the stigmas being short in proportion to the length of the style, and by the leaves being less velvety.

St. Catharine Evening Primrose. Pl. ascending.

32 Œ. ODORA'TA (Jacq. coll. 3. p. 107.) pubescent; stems branched, suffruticose at the base; leaves lanceolate, a little toothed, undulately curled; genitals length of the corolla; sepals unguiculate on the back; petals deeply obcordate; stigmas downy; capsule elongated, cylindrical, villous. ♂. H. Native of Patagonia. Jacq. icon. rar. t. 456. Œ. undulàta, Ait. hort. kew. ed. 2. vol. 2. p. 342. Onàgra undulàta, Mœnch. Leaves stiffish. Flowers at first yellow, but afterwards becoming reddish as they fade, about the size of those of *Œ. longiflòra*. Plant rather clammy.

Var. α, glaucéscens (Ser. mss. in D. C. prod. 3. p. 48.) leaves glaucous; peduncles and calyxes purplish; genitals erect.—Jacq. icon. rar. 3. t. 456.

Var. β, viréscens (Ser. mss. in D. C. prod. 3. p. 48.) leaves green; nerves of leaves, calyx, and germs usually red; genitals inclinate. Ker. bot. reg. t. 147. Sims, bot. mag. 2403. Hook. exot. fl. t. 183.

Sweet-scented Evening Primrose. Fl. April, May. Clt. 1790. Pl. 1 to 2 feet.

33 Œ. STRIA'TA (Ledeb. in Link, enum. 1. p. 377.) stem muricated, greenish; lower leaves linear, very long, denticulated, cauline ones lanceolate. ♂. H. Native country unknown. Flowers yellow. Capsule cylindrical, but at length becoming clavate, having the nerves thick and coloured. Seeds irregularly òval-oblong, bay-coloured, striated longitudinally.

Striated-calyxed Evening Primrose. Fl. July, Aug. Clt. 1822. Pl. 2 feet.

34 Œ. SINUA'TA (Michx. fl. bor. amer. 1. p. 224.) plant decumbent, clothed with soft pubescence; leaves lanceolate, sinuately toothed or cut; flowers small; sepals unguiculate towards the apex; capsules cylindrically tetragonal, somewhat incurved, pilose, length of the bracteas. ⊙. H. Native of Virginia.

Murr. nov. comm. gœtt. 5. p. 44. t. 9. ex Willd. spec. 2. p. 309. Petals obcordate, about the length of the sepals.

Sinuated-leaved Evening Primrose. Fl. Jul. Aug. Clt. 1770. Pl. 1 foot.

35 Œ. ERÒSA (Lehm. in sem. hort. hamb. 1821. and in nov. act. bonn. 14. p. 813.) stem terete, pilose, fistular; leaves lanceolate, pubescent, veiny, erosely toothed at the base, somewhat sinuated, toothed to about the middle, but quite entire at the apex; flowers small; capsule cylindrical, 4-furrowed, thickened a little in the middle. ♂. H. Native of the Cape of Good Hope. Petals obcordate, citron-coloured, finely crenulated. Lobes of stigma cylindrical, thick, obtuse.

Erose-toothed-leaved Evening Primrose. Fl. July, Aug. Clt. 1828. Pl. 2 to 3 feet.

36 Œ. VISCÒSA (Rafin. fl. lud. p. 96.) stem branched, decumbent, terete, villous, and clammy; leaves sessile, lanceolate, nerved, sinuately toothed; flowers axillary, sessile; petals obcordate; stigma 4-lobed; capsule cylindrical, channelled. ♂. ? H. Native of Louisiana. Flowers yellow.

Clammy Evening Primrose. Pl. dec.

. 37 Œ. INDE′CORA (St. Hil. fl. bras. 2. p. 268.) stems many from the same root, nearly simple, pubescent; leaves lanceolate, acute, obsoletely and sinuately denticulated, pubescent; petals shorter than the calyx, emarginate; genitals equal in length to the petals; lobes of stigma linear, papillose; capsule cylindrical, pubescent. ⊙. H. Native of Brazil, not far from the town of Rio Grande de St. Pedro do Sul. Flowers small, yellow.

Indecorous Evening Primrose. Fl. May. Pl. ½ ft.

38 Œ. PROSTRA′TA (Ruiz et Pav. fl. per. p. 79. t. 315.) leaves somewhat lanceolate, acute, sinuately toothed; sepals longer than the corolla; petals obcordate; capsule linear, bluntly tetragonal, crowned, curved. ⊙. H. Native of Peru, in corn-fields.—Pluk. alm. t. 203. f. 3. Flowers at first yellow, but afterwards changing to purplish as they fade.

Prostrate Evening Primrose. Pl. prostrate.

39 Œ. MI′NIMA (Pursh, fl. amer. sept. 1. p. 262. t. 15. f. 1.) stem simple, 1-flowered; leaves small, lanceolate, quite entire, pilose; flowers sessile, hairy; ovary prismatic. ⊙. H. Native of Georgia and New Jersey. Flowers yellow. Perhaps Œ. sinuàta minima of Nutt. gen. amer. 1. p. 245.

Least Evening Primrose. Fl. Ju. July. Clt. 1825. Pl. ¼ ft.

40 Œ. SERRULA′TA (Nutt. gen. amer. 1. p. 246. journ. acad. philad. 1821. p. 120.) stem branched, and is, as well as the under side of leaves and capsules, rather pubescent; leaves oblong-linear, irregularly serrulated, ending in a hard acute point; flowers remote, sessile; calyx angular; capsule prismatic; petals entire; stamens and style very short. ♃. H. Native of North America, on the mountains about the rivers Platte and Missouri. Lindl. in Hook. exot. fl. 140. Sweet, fl. gard. t. 133. Flowers small, deep yellow. Corolla salver-shaped. Stigma capitate, slightly 4-lobed.

Serrulated-leaved Evening Primrose. Fl. June, July. Clt. 1824. Pl. 1 foot.

41 Œ. LEUCOCA′RPA (Comien, mss. in Hook. fl. bor. amer. p. 210.) stem branched; leaves stiff, serrulated, spatulate-lanceolate, upper ones lanceolate, when young rather silky; petals emarginate, crenulated at the apex; tube of calyx shorter than the petals and segments; segments of stigma linear-oblong; anthers adnate; capsule cylindrical, clothed with hoary silky down. ♃. H. Native of North America, on the dry banks of the Saskatchawan, and common upon limestone rocks on the Red and Assinaboyne rivers. Flowers yellow. Plant with the habit of a species of *Heliánthemum.*

White-fruited Evening Primrose. Pl. ½ ft.

** *Flowers white.*

42 Œ. CŒSPITÒSA (Sims, bot. mag. t. 1593.) plant almost stemless; leaves lanceolate, deeply toothed; tube of calyx very long; petals deeply obcordate; genitals shorter than the corolla; segments of stigma thickish, elongated, spreading; capsules sessile, somewhat obconically-oblong, with the margins of the valves crestedly muricated. ♃. H. Native of North America, on hills about the Missouri. Nutt. gen. 1. p. 346. Œ. scapìgera, Pursh, fl. bor. amer. 1. p. 263. ex Link, enum. 1. p. 377. Flowers large, white, but afterwards changing to purplish as they fade.

Tufted Evening Primrose. Fl. Ju. July. Clt. 1811. Pl. ½ ft.

43 Œ. ALBICAU′LIS (Fras. cat. 1813. Nutt. gen. amer. 1. p. 245.) stem erect, branched at the apex, white, quite glabrous; leaves linear-lanceolate, almost quite entire, pubescent beneath; petals roundish, entire, about equal in length to the stamens; capsule cylindrically prismatic, truncate. ♃. H. Native of North America, on the banks of the Saskatchawan and Missouri. Flowers white, large.

White-stemmed Evening Primrose. Pl. 2 to 3 feet.

44 Œ. PA′LLIDA (Lindl. bot. reg. 1142.) roots creeping; stems ascending, branched, glabrous; leaves linear-lanceolate, acuminated, quite entire or toothed, glabrous; petals retuse, crenulated, exceeding the stamens; capsules cylindrical, twisted. ♃. H. Native of North America, common over all the dry sandy soil to the west of the Rocky Mountains. Petals white, yellow at the base, becoming reddish as they fade.

Pale-flowered Evening Primrose. Fl. June, Sep. Clt. 1826. Pl. 1½ foot.

*** *Flower[illegible]ed or purple. Anthers innate.*

45 Œ. HUMIFU′SA (Nutt. gen. amer. 1. p. 245.) plant prostrate; stems branched, villous; leaves linear-lanceolate, somewhat denticulated, or entire and setaceous; tube of calyx rather longer than the ovarium; petals obcordate; capsule prismatic. ⊙. H. Native of Florida, on the sea shore. Flowers purple?

Trailing Evening Primrose. Fl. June, Aug. Clt. 1824. Pl. trailing.

46 Œ. TENE′LLA (Cav. icon. 4. p. 68. t. 396. f. 2.) stem branched, erect; leaves linear-spatulate; petals obovate, rather retuse, violaceous; style longer than the stamens, which are erect, but much shorter than the petals; segments of stigma narrow, short; capsule sulcate, cylindrical, curved, tomentose, longer than the bracteas. ⊙. H. Native of Chili, about Coquimbo and elsewhere. Ruiz et Pav. fl. per. 3. t. 316. Sims, bot. mag. t. 2424. Plant rather glaucous. Flowers purple; petals crenulated at the apex. Lobes of stigma as well as anthers dark purple.

Delicate Evening Primrose. Fl. June, Aug. Clt. 1823. Pl. ½ to ¾ ft.

47 Œ. TENUIFÒLIA (Cav. icon. 4. p. 67. t. 397.) stem branched; branches ascending; leaves lanceolate; petals obovate, somewhat truncate, crenated at the apex; style longer than the stamens, which are erect, but shorter than the petals; lobes of stigma narrow, short; capsule cylindrical. ⊙. H. Native of Chili, about Coquimbo, where it is commonly called *serena.* Sweet, fl. gard. new. ser. t. 19. Ruiz et Pav. fl. per. 81. t. 317. Flowers purple. Very like *Œ. ténella.*

Fine-leaved Evening Primrose. Fl. June, July. Clt. 1828. Pl. 1 ft.

48 Œ. AMŒ′NA (Lehm. in nov. act. bonn. 14. p. 811. t. 45. and in ind. sem. hort. hamb. 1821.) pubescent; stem terete; leaves lanceolate, bluntish, slightly toothed, glaucous; petals 3 times longer than the calyx, obovate, slightly emarginate, undulately crenated; capsule cylindrically tetragonal; lobes of stigma semi-cylindrical. ⊙. H. Native of North America. Œ. ròseo-álba, Bernh. in sched. hort. elf. 1824. Sweet, fl. gard. 268. Petals whitish, but rose-coloured at the base, and below that marked by a triangular, purple, striated blotch.

Pleasing Evening Primrose. Fl. Ju. July. Clt. 1825. Pl. 1 ft.

49 Œ. VIMI'NEA (Dougl. in bot. mag. t. 2873.) stem erect, branched, glaucous, glabrous; leaves lanceolate, nearly quite entire, glaucous, and glabrous; tube of calyx about equal in length to the segments; petals entire, denticulated, twice the length of the genitals; stigmas purple; capsule cylindrical, attenuated at the apex, furrowed, pubescent. ⊙. H. Native of North California, near the river Aquilar, in dry prairies in lat. 43° north. Lindl. bot. reg. 1220. Flowers lilac.

Twiggy Evening Primrose. Fl. June, Sep. Clt. 1826. Pl. 2 to 3 ft.

50 Œ. LINDLE'YII (Dougl. in bot. mag. 2832.) stem ascending, diffuse, branched; leaves linear-lanceolate, quite entire, glabrous; tube of calyx 3 times shorter than the segments; petals entire, denticulated, twice the length of the genitals; stigmas yellow; capsule cylindrical, elongated, tapering to both ends, puberulous. ⊙. H. Native of the north-west coast of America, about Fort Vancouver, and at the Mulnomak river. Petals lilac, each marked with a purple spot; claws yellow.

Lindley's Evening Primrose. Fl. June, Nov. Clt. 1826. Pl. 1 to 2 feet.

51 Œ. DECU'MBENS (Dougl. in bot. mag. 2889.) stem ascending; leaves glaucous, quite entire, pubescent, lower ones broadly ovate, upper ones ovate-lanceolate; petals emarginate, crenulated; stigmas purple, with reflexed segments; capsule bluntly tetragonal, tapering from the base, villous. ⊙. H. Native of California, in dry mountain valleys. Lindl. bot. reg. 1221. Petals lilac, obcordate. From all its nearest allies this plant differs in the form of the stigmas.

Decumbent Evening Primrose. Fl. June, Nov. Clt. 1827. Pl. 1 to 2 ft. long, ascending.

52 Œ. PURPU'REA (Curt. bot. mag. 352.) plant glaucescent; leaves lanceolate, attenuated at both ends, bluntish; tube of calyx short; petals obovate, crenulated; genitals exserted, much shorter than the corolla; lobes of stigma thick, short, dark purple; anthers yellow; capsule ovate, triquetrous, sessile, angular, pilose; seeds irregularly angular, and covered with dots when examined by a lens. ⊙. H. Native of the north-west coast of America. Œ. hùmilis, Donn, hort. cantab. p. 41. Flowers purple.

Purple Evening Primrose. Fl. May, Aug. Clt. 1794. Pl. 1 ft.

53 Œ. ROMANZÒVII (Ledeb. in Horn. hort. hafn. suppl. 133.) glaucous; stem erect; leaves lanceolate-oblong, mucronate, tapering into the petiole; tube of calyx very short; limb one-half shorter than the corolla; petals broad-obovate, crenulated; stamens much shorter than the corolla; anthers green; stigmas nearly sessile, inclosed, dark purple; capsule oblong-cylindrical, somewhat tetragonal, pilose; seeds hoary, and rather scaly when examined by a lens. ⊙. H. Native of North America, on the western coast. D. Don in Ker. bot. reg. t. 662. Flowers violaceous.

Romanzov's Evening Primrose. Fl. July, Aug. Clt. 1817. Pl. ¾ to 1 ft.

SECT. III. ŒNOTHE'RIUM (an alteration from the generic name). Ser. in D. C. prod. 3. p. 49. Stigma quadrifid (f. 96. *c.*). Tube of calyx cylindrical, dilated at the apex. Anthers oblong. Capsule oblong or obovate, tetragonal; the angles prominent; valves obovate.

* *Flowers white.*

54 Œ. ACAU'LIS (Cav. icon. 4. p. 68. t. 399.) leaves rosulate, pinnatifid; the terminal lobe large and denticulated; tube and flowers large; calycine segments free, reflexed; petals obovate, rather retuse, entire; anthers and stigmas narrow, shorter than the corolla; capsule obovate, tetragonal, a little winged, sessile. ♃. F. Native of Chili. Ker. bot. reg. 763. Petals large, white, but becoming red as they fade.

Stemless Evening Primrose. Fl. May, Sep. Clt. 1821. Pl. ½ ft.

55 Œ. TARAXACIFÒLIA (Hort. and Sweet, fl. gard. t. 294.) stem branched, elongated, procumbent; leaves pubescent, alternate, interruptedly pinnatifid, sinuately toothed, but the apex entire; tube of flower very long; petals large, obovate, entire, 5-nerved; anthers and stigmas shorter than the corolla; capsules sessile, obovate, pubescent, tetragonal; angles winged. ♃. H. Native of Chili, about Conception. Œ. grandiflòra, Ruiz. et Pav. fl. per. 3. t. 318. f. 6. Œ. acaùlis β, màjor, Ser. in D. C. prod. 3. p. 49. Flowers large, white, but becoming reddish as they fade.

Dandelion-leaved Evening Primrose. Fl. May, Aug. Clt. 1825. Pl. ½ foot.

56 Œ. ANISÓLOBA (Sweet, fl. gard. new. ser. 105.) stem suffruticose, tall, straight, branched, downy; radical leaves elliptic, entire, or few-toothed; middle ones elliptic, sharply toothed, with the segments at the base variable, linear, acute, and divaricating; upper ones unequal, pinnatifid, with the segments divaricate, with the terminal lobes large; tube of flower very long; ovary tetragonal; petals large, imbricate, with crenulated margins. ♃. H. Native of Chiloe. Flowers large, white, becoming red as they fade. Lindl. bot. reg. t. 1479. Leaves downy. Lobes of stigma linear.

Unequal-lobed-leaved Evening Primrose. Fl. May, Oct. Clt. 1828. Pl. 3 feet.

57 Œ. PU'RSHII; pubescent; stem decumbent, white; radical leaves nearly entire; cauline ones pinnatifid, with linear acute divaricate segments; nerves of leaves white like the stem; flowers few, disposed in a kind of spike; petals obcordate, white, large, longer than the stamens; style filiform; ovaries sessile, prismatic, furrowed. ⊙. H. Native of North America, on the plains of the Missouri. Œ. albicaùlis, Pursh, fl. amer. sept. 2. p. 733. but not of Nutt. Œ. pinnatífida, Nutt. gen. amer. 1. p. 245. but not of Kunth. Flowers large, white.

Pursh's Evening Primrose. Fl. May, Aug. Clt. 1811. Pl. dec.

58 Œ. SPECIÒSA (Nutt. in mem. acad. soc. hist. nat. phil. 1821. p. 119.) plant puberulous; stem suffruticose; leaves oblong-lanceolate, attenuated at both ends, serrated, and somewhat pinnatifid, nerved, pubescent beneath; flowers subracemose; raceme naked, at first drooping; petals obcordate, equal in length to the stamens; capsule obovate, angular. ♃. H. Native of North America, on the banks of the Red river. Hook. exot. fl. t. 80. Sweet, fl. gard. 253. Flowers large, white, but becoming reddish as they fade.

Showy Evening Primrose. Fl. Mar. Sept. Clt. 1821. Pl. 2 to 3 ft.

59 Œ. TETRA'PTERA (Cav. icon. 3. p. 40. t. 279.) stem branched, pilose; leaves lanceolate, pinnatifid, or toothed, somewhat ciliated, hardly petiolate; tube of calyx almost wanting; petals obcordate, entire; genitals shorter than the corolla; anthers and stigmas narrow and long; capsule obovate, 4-winged, ribbed, pilose, tapering into a pedicel at the base; seeds ovate, acute, smooth, pale. ⊙. H. Native of New Spain. Sims, bot. mag. 468. Petals white, but becoming red as they fade.

Four-winged-capsuled Evening Primrose. Fl. June, Sept. Clt. 1796. Pl. 1 foot.

60 Œ. LATIFLÒRA (Moc. et Sesse, fl. mex. icon. ined. t. 376.) root fusiform; stem terete, hairy, branched at the apex; leaves lanceolate-linear, acute, deeply toothed, alternate, opposite, or in whorles; flowers on short pedicels. ⊙. H. Native of Mexico. Flowers large, white, but becoming reddish as they fade. Fruit unknown.

Broad-flowered Evening Primrose. Pl. 1 foot.

* * *Flowers red or purple.*

61 Œ. VIRGATA (Ruiz, et Pav. fl. per. 29. t. 315.) stem prostrate or erect, branched; leaves lyrate and lanceolate, toothed;

flowers disposed in a kind of raceme; petals obovate, hardly longer than the limb of the calyx; capsule clavate, 10-angled, the alternate angles broadest. ⊙. H. Native of Peru, in fields, and among rubbish. Flowers purple. There is a variety of this with nearly entire leaves.

Twiggy Evening Primrose. Fl. Ju. Jul. Clt. 1823. Pl. pr.

62 Œ. SUBULA´TA (Ruiz, et Pav. fl. per. p. 82. t. 316.) leaves subulate, long, villous; petals bifid; capsule clavate, tetragonal, winged above, mucronate; valves broad, somewhat 3-winged at the apex. ⊙. H. Native of Chili, in dry fields. Flowers purplish-red.

Subulate-leaved Evening Primrose. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

63 Œ. RÒSEA (Ait. hort. kew. ed. 1. vol. 2. p. 3. ed. 2. vol. 2. p. 343.) shrubby; stem branched; branches twiggy; leaves elliptic, attenuated at both ends, toothed, lower ones lyrate; tube of calyx short; petals obovate-roundish; genitals shorter than the corolla; capsule clavate, 8-angled. ♄. F. Native of Mexico. Curt. bot. mag. 347. Œ. purpùrea, Lam. dict. 4. p. 564. Œ. rùbra, Cav. icon. 4. p. 68. t. 400. Flowers red, about the size of those of *Epilòbium angustíssimum.*

Rose-coloured-flowered Evening Primrose. Fl. May, Aug. Clt. 1783. Shrub 1 to 2 feet.

64 Œ. TUBIFLÒRA (Moc. et Sesse, fl. mex. icon. ined. t. 377.) root rather fusiform; stems depressed; leaves linear-oblong, acute, somewhat denticulated; tube of calyx very long: petals obcordate; stamens longer than the stigmas; fruit unknown. ♃. F. Native of Mexico. Flowers rose-coloured. This is a very distinct species, but from the fruit being unknown it is doubtful whether it belongs to the present section.

Tube-flowered Evening Primrose. Pl. $\frac{1}{2}$ foot.

* * * *Flowers yellow.*

65 Œ. TRI´LOBA (Nutt. in journ. acad. philad. 1821. p. 118.) stemless; leaves interruptedly pinnatifid, toothed, glabrous; petals obovate, slightly 3-lobed at the apex, the middle lobe mucronate; capsules almost 4-winged, large, sessile at the root. ⊙. H. Native of North America, in arid fields on the banks of the Red River, and of Louisiana. Sims, bot. mag. 2566. Œ. rhizocárpa, Spreng. syst. 2. p. 230. Flowers radical, pale yellow, sweet-scented in the evening. Tube of calyx very long.

Three-lobed-petalled Evening Primrose. Fl. May, Sept. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

66 Œ. PINNATI´FIDA (H. B. et Kunth, nov. gen. amer. 6. p. 91.) stem erect, branched at the base; leaves pinnatifid, pubescent; capsule 8-angled, somewhat 4-winged, on short pedicels. ♃. F. Native of Mexico, about Actopan. Flowers yellow, about the size of those of *Epilòbium hirsùtum,* axillary at the tops of the stem and branches.

Pinnatifid-leaved Evening Primrose. Pl. 1 foot.

67 Œ. MACROCA´RPA (Pursh. fl. amer. sept. 2. p. 734.) stem simple, prostrate, downy; leaves lanceolate, quite entire, or glandularly denticulated, with the margins and nerves covered with white silky down; petals broad, obcordate; stamens arched, shorter than the corolla; lobes of stigma cylindrical, blunt; capsule large, sessile, oblong, 4-winged. ♃. H. Native of North America, on the banks of the Mississippi, near St. Louis. Sweet, fl. gard. t. 5. Stem purplish. Corolla large, yellow. Calyx spotted with red; tube long.

Large-fruited Evening Primrose. Fl. June, Aug. Clt. 1811. Pl. prostrate.

68 Œ. MISSOURIE´NSIS (Sims, bot. mag. t. 1592.) stems simple, downy, decumbent; leaves lanceolate, tapering to both ends, marginate and slightly ciliated; petals broad, obcordate, with a notch in the recess; capsule 4-winged, slightly pedicellate. ♃. H. Native of North America. Œ. alàta, Nutt. gen. amer. 1. p. 346. Corolla large, yellow. Calyx spotted as in *Œ. macrocárpa.* Leaves sometimes glandularly denticulated.

Missouri Evening Primrose. Fl. Ju. Sep. Clt. 1818. Pl. $\frac{1}{2}$ ft.

69 Œ. GLAU´CA (Michx. fl. bor. amer. 1. p. 224.) plant quite glabrous, decumbent, glaucous; leaves ovate, repandly denticulated; limb of calyx longer than the tube; petals large, obcordate, erose; genitals shorter than the corolla; capsules ovate, tetragonal, thick, short. ♃. H. Native of North America, in woods west of the Mississippi. Sims, bot. mag. 1606. Flowers pale yellow.

Glaucous Evening Primrose. Fl. June, Oct. Clt. 1812. Pl. 1 to 2 feet. .

70 Œ. HY´BRIDA (Michx. fl. bor. amer. 1. p. 225.) stem erect, villous; leaves pubescent on both surfaces, lanceolate, remotely toothed; flowers on short pedicels; bracteas wanting or subulate; capsules ovate, tetragonal, disposed in something like spikes. ♃. H. Native of Upper Carolina. Flowers yellow. There is a variety of this plant with glabrous leaves.

Hybrid Evening Primrose. Fl. Ju. Oct. Clt. 1813. Pl. 1 ft.

71 Œ. FRUTICÒSA (Lin. spec. 492.) stems erect, brownish, glabrous, or pilose; leaves ovate-lanceolate, denticulated, pilose, or glabrous; racemes spicate, leafy, nakedish at the base; petals broadly obcordate, erose, twice the length of the stamens; capsule clavate, pilose, 8-angled, 4 of the angles winged. ♃. H. Native of Virginia and Canada. Curt. bot. mag. t. 332. Œ. Canadénsis, Goldie, in edin. phil. journ. 1821. p. 7. Flowers large, deep yellow. Stem branched at the apex.

Shrubby Evening [illegible]mrose. Fl. June, Sept. Clt. 1737. Pl. 2 to 3 feet.

72 Œ. SERÓTINA (Hort. ex Sweet, fl. gard. 184.) stems ascending, branched, pubescent; leaves lanceolate, acute, denticulated, glabrous, attenuated at the base; petals wrinkled or plaited; capsule pedicellate, 4-winged, oblong, pubescent; segments of stigma blunt, spreading. ♃. H. Native of North America. Flowers yellow. Habit procumbent and branching.

Late-flowering Evening Primrose. Fl. Aug. Sept. Clt. 1820. Pl. procumbent.

73 Œ. AMBI´GUA (Spreng. syst. 2. p. 229.) stem simple, pilose; leaves ovate-lanceolate, acute, denticulated, dotted; calycine segments short; capsule sessile, clavate, 4-winged. ♃. H. Native of Pennsylvania. Œ. fruticòsa β, ambígua, Nutt. gen. amer. 1. p. 247. Flowers yellow.

Ambiguous Evening Primrose. Fl. June, Aug. Clt. 1818. Pl. 1 to $1\frac{1}{2}$ foot.

74 Œ. FRASE´RI (Pursh, fl. amer. sept. 2. p. 734.) smoothish; stems simple at the base; leaves ovate, glandularly denticulated; tube of calyx longer than the ovarium; petals obcordate, broad, erosely undulated; capsule obovate, thick, tetragonal. ♃. H. Native of South Carolina. Sims, bot. mag. 1674. Flowers yellow.

Fraser's Evening Primrose. Fl. Ju. Oct. Clt. 1811. Pl. 1 ft.

75 Œ. TARQUE´NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 91.) procumbent; leaves lanceolate-oblong, acute, narrowed at the base, nearly quite entire, puberulous; petals obovate-roundish, retuse? genitals shorter than the corolla; capsules very nearly sessile, 4-winged, bluntly truncate at the apex. ♃. F. Native of South America, near the town of Quito, in the valley of Tarquo, at the height of 4000 feet above the level of the sea. Flowers yellow. Like *Œ. pùmila,* but differs in the leaves being broader and puberulous, and in the calyxes, capsules, and ovaries being clothed with silky down.

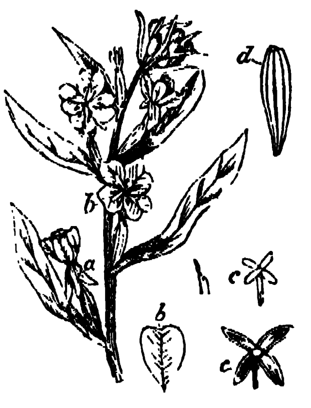
Tarquo Evening Primrose. Pl. procumbent.

76 Œ. PU´MILA (Lin. spec. 493.) stems usually simplish, ascending, rather pilose; leaves lanceolate, quite entire, obtuse, a little ciliated; flowers subspicate, on short pedicels; petals obcordate, rather longer than the genitals; capsule clavate, 8-

angled, 4 of the angles winged. ♃. H. Native of North America, in most parts. Curt. bot. mag. t. 335. Mill. ill. 188. Flowers yellow, about the size of those of *Potentilla vèrna*. Leaves small. (f. 97.)

Dwarf Evening Primrose. Fl. May, Sept. Clt. 1757. Pl. ½ ft.

FIG. 96.



77 Œ. ripa'ria (Nutt. gen. amer. 1. p. 247.) stem erect, nearly glabrous; leaves lanceolate, denticulated, glabrous; flowers subspicate, on short pedicels; petals emarginate, a little longer than the genitals; capsules 8-furrowed, the 4 alternate ribs more prominent than the rest. ♂. H. Native of North America, in North Carolina, near Wilmington; and on the plains of the Saskatchawan. Flowers small, yellow.

River-bank Evening Primrose. Pl. 1 to 1½ foot.

78 Œ. chrysa'ntha (Michx. fl. bor. amer. 1. p. 225.) stems weak, minutely pubescent; leaves lanceolate, bluntish, entire; flowers small; tube of calyx not half so long as the segments; capsule sessile, clavate, 8-angled, the 4 alternate angles more prominent than the others. ♃. H. Native of North America, from Quebec to Hudson's Bay. Flowers yellow, the size of those of *Epilòbium palústre*. Dr. Hooker considers this identical with *Œ. pùmila*, see fl. bor. amer. p. 212.

Golden-flowered Evening Primrose. Fl. May, Sept. Pl. ½ to 1 foot.

79 Œ. pusi'lla (Michx. fl. bor. amer. 1. p. 225.) plant minutely pubescent; stems humble, simple; leaves lanceolate-oblong, bluntish, entire; capsule sessile, clavate, almost equally 8-angled. ♃. H. Native of North America, on rocks at Lake Mistassiny. Lam. dict. 4. p. 144. Flowers small, yellow. Œ. pùmila β, mínima, Hook. fl. bor. amer. p. 212.

Small Evening Primrose. Fl. May, Sept. Clt. 1817. Pl. ¼ ft.

80 Œ. multicau'lis (Ruiz, et Pav. fl. per. 3. p. 80. t. 317. f. 6.) stems tufted, depressed; radical leaves lanceolate-oblong, denticulated, cauline ones ovate; flowers sessile, secund; petals hardly exceeding the calyx in length; capsules secund, clavate, 8-angled, the 4 alternate angles more prominent than the others; seeds obovate, angular, fucescent. ⊙. ? H. Native of Peru, on the Andes, in the provinces of Tarma and Canta. Flowers yellow.

Many-stemmed Evening Primrose. Pl. depressed.

81 Œ. linifòlia (Nutt. in journ. acad. philad. 1821. p. 120.) stem straight; leaves linear, very narrow, obtuse, entire; flowers spicate; calyxes hispid, obovate-oblong; angles bluntish; petals obcordate, 1-nerved; nerve thick, coloured. ⊙. H. Native of North America, on rocks along the Akanza river. Flowers 2 lines broad, yellow.

Flax-leaved Evening Primrose. Fl. June, Aug. Pl. ¼ to ¾ ft.

82 Œ. linea'ris (Michx. fl. bor. amer. 1. p. 225.) plant slender, pubescent; leaves linear, entire; capsules on longish stipes, roundish-tetragonal, villous. ⊙.? H. Native of Upper Carolina. This species is hardly known. Flowers yellow.

Linear-leaved Evening Primrose. Fl. June, July. Clt. 1822. Pl. ½ to 1 foot.

83 Œ. epilobifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 92.) stem branched; leaves oblong or ovate-oblong, acute, narrowed at the base, remotely and obsoletely denticulated, puberulous; capsules pedicellate, clavate, 4-winged. ♃. ♄. F. Native of New Granada. Flowers orange-coloured.

Willow-herb-leaved Evening Primrose. Pl. 1 foot?

84? Œ. tetrago'na (Roth, cat. 2. ex Horn. hort. hafn. suppl. 44.) leaves ovate, obtuse, entire; flowers somewhat fastigiate; capsules pedicellate, truncate, 4-valved. ♃. H. Native of North America. Link. enum. 1. p. 377. Flowers yellow.

Tetragonal-podded Evening Primrose. Pl. 1 foot.

85? Œ. adsce'ndens (Willd. herb. ex Spreng. syst. 2. p. 230:) stems weak, ascending, branched; leaves lanceolate, toothed, pubescent; capsule sessile, clavate, curved. ♃.? H. Native of South America.

Ascending Evening Primrose. Pl. ascending.

† *Species not sufficiently known.*

86 Œ. inca'na (Nutt. gen. amer. 1. p. 247.) stem humble, slender, erect; leaves clothed with hoary tomentum, quite entire, elliptic-ovate, acute; racemes few-flowered, naked; capsules almost sessile, oblong, 4-angled. ♂. H. Native of Maryland. Flowers golden yellow.

Hoary Evening Primrose. Pl. ½ foot.

87 Œ. austra'lis (Sal. prod. p. 278.) leaves linear-lanceolate, denticulated, undulated, minutely pubescent; capsule sessile, cylindrical, obsoletely 8-angled.—Native about Port Desire.

Southern Evening Primrose. Pl. 1 foot.

Cult. All the species of *Œnothèra* are handsome border flowers, and deserve to be cultivated. They will grow in any common garden soil. The perennial kinds are easily increased by seeds, by dividing the plants at the root, and some of them by cuttings. The seeds of annual and biennial kinds only require to be sown where the plants are intended to remain.

VIII. GAYOPHY'TUM

(a name peculiarly composed from M. Gay, the discoverer of the plant, and φυτον, *phyton*, a plant; signifying Gay's plant). Adr. Juss. in ann. sc. nat. 25. p. 18.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-parted. Petals 4. Stamens 8, the 4 opposite the petals small and barren. Style short. Stigma capitate, obscurely 2-lobed from a transverse furrow. Ovarium oblong-elliptic, compressed, 2-celled. Capsule linear, 4-valved, 2-celled; lateral valves revolute; cells many-seeded. Seeds fixed to the longitudinal placenta, 1 row in each cell, ascending, naked.—A small, glabrous herb. Leaves linear-falcate, lower ones nearly opposite, upper ones alternate. Flowers solitary, axillary, shorter than the leaves, yellowish. Pollen trigonal.

1 G. hu'mile (Adr. Juss. l. c.). ⊙. H. Native of Santiago, in Chili.

Humble Gayophytum. Pl. 1 to 3 inches.

Cult. The seeds of this plant only require to be sown in the open border, in a warm sheltered situation.

IX. CLA'RKIA

(in honour of Capt. Clarke, the companion of Capt. Lewis, in his journey to the Rocky Mountains of North America). Pursh, fl. amer. sept. 1. p. 260. t. 11. D. C. prod. 3. p. 52. Hook, fl. bor. amer. p. 214.

Lin. syst. *Octándria, Monogýnia.* Calyx tubular, 4-cleft, nearly as in *Œnothèra*. Petals 4, unguiculate, cruciate, 3-lobed (f. 97. *b.*), convolute in æstivation. Stamens 8, the 4 alternate ones sterile. Stigma 4-lobed (f. 97. *a.*); lobes petaloid. Capsule cylindrical, furrowed, 4-celled, 4-valved. Seeds ascending, naked.—Smooth, annual herbs, with alternate, lanceolate, or linear, entire leaves; and axillary, sessile, solitary, showy flowers.

1 C. pulche'lla (Pursh, l. c.) petals deeply 3-lobed; leaves linear. ⊙. H. Native of North-west America, on the banks of the Kooskoosky and Clarke's rivers, and from the great falls of the Columbia, to the Rocky Mountains. Hook. bot. mag.

2918. Lindl. bot. reg. 1100. Flowers large, of a beautiful rose-purplish colour, rarely white.

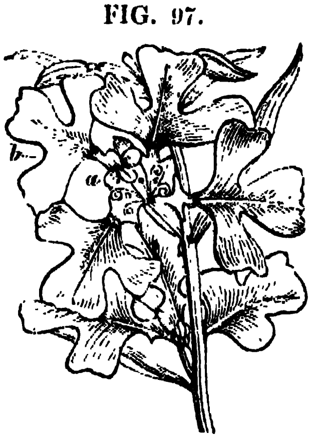
Var. β; petals less deeply lobed, but more denticulated. Hook. bot. mag. t. 2918.

Neat Clarkia. Fl. June, Aug. Clt. 1826. Pl. 1½ foot.

2 C. RHOMBOI'DEA (Dougl. mss. ex Hook. fl. bor. amer. p. 214.) petals entire, rhomboid; leaves lanceolate. ⊙. H. Native along with the preceding species. Flowers of a beautiful rose-purple colour.

Rhomboid-petalled Clarkia. Fl. June, Aug. Pl. 1 foot.

FIG. 97.



Cult. The *C. pulchélla* is one of the most showy border annuals ever introduced to the gardens, and is on that account to be seen in every flower-garden and nursery, although but a few years since its first introduction. Both species will grow in any common garden soil, in which the seeds may be sown.

Tribe IV.

JUSSIE'Æ (plants agreeing in character with the genus *Jussiæ'a*). D. C. prod. 3. p. 52. Fruit capsular; cells many-seeded. Tube of calyx permanent, not drawn out beyond the ovarium, but dividing immediately into segments (f. 98. *a.*).—Usually herbs, rarely shrubs.

X. JUSSIÆ'A (so named by Linnæus, in memory of Antoine de Jussieu, Demonstrator of Plants in the Royal Garden at Paris, uncle of the celebrated Antoine Laurent de Jussieu). Lin. gen. no. 538. Gærtn. fruct. 1. p. 154. t. 31. Lam. ill. t. 28. D. C. prod. 3. p. 52.—Jussieùa, Pers. ench. no. 1069.

LIN. SYST. *Octo-Decándria, Monogýnia.* Tube of calyx prismatic or cylindrical, adhering in its whole length to the ovarium; limb 4 (f. 98. *a.*) -5-6-parted; the lobes acute and permanent, valvate in æstivation. Petals spreading, equal in number to the lobes of the calyx (f. 98. *d.*). Stamens double the number of the petals, deciduous like them. Ovarium sometimes flattish at the apex, sometimes elevated into a furrowed cone (f. 98. *b.*). Style filiform, short, crowned by a capitate 4-6-furrowed stigma. Capsule 4-6-celled, oblong, usually ribbed and opening between the ribs, always crowned by the calyx. Seeds numerous, naked.—Herbs, rarely shrubs, natives of marshes. Leaves alternate, for the most part quite entire. Flowers axillary, solitary, sessile, or on very short petioles, usually bibracteate at the base, generally yellow, rarely white.

* *Flowers with* 5 *petals and* 10 *anthers, very rarely with* 6 *petals and* 12 *anthers.*

1 J. PERUVIA'NA (Lin. spec. 555.) stem suffruticose, erect; leaves oblong, attenuated at both ends, pubescent beneath; pedicel bearing 2 foliaceous bracteoles at the apex, twice the length of the tube of the calyx, which is pentagonal and turbinate; calycine lobes 5, lanceolate, one half shorter than the petals, which are roundly obovate. ♄. B. S. Native of Peru, near rivulets about Lima. Feuill. obs. 2. p. 716. t. 9. Flowers large, yellow. An emollient poultice is formed of the leaves of this plant in Peru.

Peruvian Jussiæa. Shrub 1 to 2 feet.

2 J. VARIA'BILIS (Meyer. prim. esseq. 174.) stem shrubby, ascending, glabrous; leaves lanceolate, acuminated at both ends, crenate-serrated, glabrous; flowers on short pedicels, bibracteolate at the base; tube of calyx angular; calycine lobes 5-6, lanceolate, shorter than the petals, which are ovate. ♂. B. S. Native of Guiana, about Essequibo, in marshes. Flowers yellow. This species is said to be nearly related to *J. Peruviàna*, but the leaves are narrower and the flowers are on shorter pedicels.

Variable Jussiæa. Fl. Aug. Sept. Clt. 1826. Pl. 1 to 2 ft.

3 J. DODECA'NDRA (D. C. prod. 3. p. 53.) herbaceous, erect, glabrous; leaves oval, acute at both ends, on short petioles; flowers sessile; tube of calyx elongated, cylindrical; calycine lobes 5-6, linear-oblong, acuminated; petals ovate, emarginate, equal in length to the calycine lobes. ⊙. B. S. Native about Demerara. Stem terete, below; branches compressed, angular. Flowers yellow.

Dodecandrous Jussiæa. Pl. 1 foot.

4 J. LEPTOCA'RPA (Nutt. gen. amer. 1. p. 279.) herbaceous, erect, smoothish; stem and calyx partly hairy; leaves lanceolate, smoothish, attenuated at both ends; flowers sessile, 5-6-petalled; tube of calyx very slender, cylindrical; petals hardly longer than the calycine lobes. ⊙. B. H. Native of North America, on the banks of the Mississippi and Missouri; very plentiful. Stem usually simple, irregularly angled. Petals yellow.

Slender-fruited Jussiæa. Fl. Jul. Sept. Clt. 1817. Pl. 1 ft.

5 J. PILÒSA (H. B. et Kunth, nov. gen. amer. 6. p. 101. t. 532. a and b.) herbaceous, erect, hispid; leaves oblong-lanceolate, narrowed at the base, hairy on both surfaces; flowers on very short pedicels, bractless; tube of calyx cylindrical, elongated; calycine lobes 5-6, rarely 4, oblong-lanceolate, acuminated; petals roundly [illegible]ovate, shorter than the calycine lobes. ♃. B. S. Native of [illegible] Caraccas, on the banks of the river Apures, near St. Fernando. Flowers yellow. Nearly allied to *J. villòsa*.

Pilose Jussiæa. Pl. 1 foot.

6 J. AFFI'NIS (D. C. prod. 3. p. 53.) herbaceous, erect, pilose; leaves oblong-lanceolate, acuminated at both ends, smoothish, ciliated on the nerve and margins; flowers on very short pedicels, bractless; calyx pilose, with a cylindrical elongated tube, and 5 linear-lanceolate acuminated lobes; petals oblong-obovate, equal in length to the calycine lobes. ⊙. B. S. Native of Guiana, about Demerara. Flowers yellow. Nearly allied to *J. pilòsa*.

Allied Jussiæa. Pl. 1 foot.

7 J. GRANDIFLÒRA (Michx. fl. bor. amer. 1. p. 267.) plant floating; stems herbaceous, villous; leaves pubescent, oblong-lanceolate, lower ones rather spatulate, the rest tapering to both ends; pedicels bractless, and are as well as the calyxes villous; flowers drooping before expansion; calycine lobes 5, acute; petals obovate, emarginate, twice the length of the calycine segments. ♃. W. H. Native of Georgia and Lower Carolina, in ponds. Sims, bot. mag. 2122. Flowers large, yellow.

Great-flowered Jussiæa. Fl. Jul. Oct. Clt. 1812. Pl. fl.

8 J. MONTEVIDE'NSIS (Spreng. syst. 2. p. 232.) stem ascending, smooth at the base, but hairy above; lower leaves spatulate, glabrous, upper ones lanceolate, acute, quite entire, and hairy; calyx with a narrow tube and 5 lanceolate acute lobes; petals 5, obovate, emarginate. ♃. W. S. Native of Brazil, in marshes and rivulets in the province of Cisplatine, near the town of Monte-Video. J. grandiflòra, St. Hil. fl. bras. 2. p. 265. Pedicels bibracteolate. Flowers yellow.

Var. β; flowers 3-times smaller than those of the species; leaves smoothish above, but with a few scattered hairs beneath. St. Hil. l. c.

Monte-Video Jussiæa. Pl. floating.

9 J. DIFFU'SA (Forsk. descr. p. 210.) stems creeping; leaves lanceolate; flowers sessile, 5-petalled, decandrous. ♃. W. S. Native of Egypt, in the Delta at the Nile, on the edges of fields. This plant is hardly known, but evidently distinct from *J. erécta*,

as may be seen from the short description of Forskael, and is admitted by Delile, in his fl. ægyp. ill. p. 14. without any description.

Diffuse Jussiæa. Fl. diffuse.

10 J. PEPLOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 97.) plant shrubby, creeping, glabrous: leaves oblong-spatulate, obtuse, thickish; flowers on short pedicels, bractless; tube of calyx slender, somewhat pentagonal; calycine lobes 5, lanceolate. ♄. B. S. Native of New Granada, near Ibague, in humid valleys. Petals not known.

Peplus-like Jussiæa. Pl. creeping.

11 J. PATIBILCE'NSIS (H. B. et Kunth, l. c.) herbaceous, creeping, glabrous; leaves oblong, or obovate-oblong, acutish, cuneated at the base; flowers pedicellate, bibracteolate; tube of calyx slender and angular; calycine lobes 5, lanceolate, acuminated; petals roundish-ovate, twice the length of the calycine lobes. ♃. B. S. Native on the shores of the Pacific, near Patibilca. Flowers yellow. Capsule linear.

Patibilca Jussiæa. Pl. creeping.

12 J. POLYGONOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 97.) herbaceous, creeping, glabrous; leaves lanceolate-oblong, acute, cuneately narrowed at the base; flowers pedicellate, tube of calyx slender, furnished with 2 bracteoles in the middle; calycine lobes oblong-lanceolate, acute. ♃. W. H. Native of New Granada, in marshes and bogs; and of Mexico, near Hacienda la Laguna, in running waters. Flowers yellow. Capsule linear.

Polygonum-like Jussiæa. Pl. creeping.

13 J. FLUVIA'TILIS (Blume, bijdr. p. [illegible] 32.) stems herbaceous, terete, glabrous, floating; leaves obovate-oblong, rounded, sometimes retuse; pedicels bibracteolate; calycine lobes lanceolate, acuminated, pubescent; tube of calyx and capsule cylindrical. ♃. W. S. Native of Java, in mountain rivulets. Allied to *J. rèpens.*

River Jussiæa. Pl. floating.

14 J. RE'PENS (Lin. mant. p. 381.) plant herbaceous, creeping, glabrous; leaves oblong-obovate, retuse, petiolate; flowers on longish pedicels, somewhat bicallous at the base; calyx villous, with a short terete tube, which is attenuated at the base, and 5 lanceolate acute lobes; petals obovate, twice the length of the calycine segments. ♃. W. S. Native of the East Indies, floating in water; in Java, Malabar, Timor, &c. Lin. fl. zeyl. 169. Willd. spec. 2. p. 574. exclusive of Swartz's and Browne's synonymes.—Rheed. mal 2. t. 51. Cubospérmum palústre, Lour. coch. p. 275. J. adscéndens, Lin. mant. 69. does not differ from this unless in the pedicels being a little shorter, as will be seen by comparing the descriptions in Rees' cycl. by Smith. Capsule terete, an inch long. Flowers white, yellow at the base.

Creeping Jussiæa. Fl. Aug. Sep. Clt. 1817. Pl. fl. and cr.

15 J. SWARTZIA'NA (D. C. prod. 3. p. 54.) plant herbaceous, creeping, smooth in every part; leaves oblong, obtuse, petiolate; flowers pedicellate, furnished with 2 little scales at the base; tube of calyx terete, attenuated at the base; calycine lobes 5, lanceolate, acute, about equal in length to the petals, which are ovate. ♃. B. S. Native of the West Indies and Brazil, in marshes, bogs, and water. J. rèpens, Swartz, obs. p. 172. Oldenlándia, P. Browne, jam. 208. no. 3. Petals yellow. Very like *J. rèpens*, but differs in the leaves being oblong, not obovate, in the calyx being glabrous, not villous, and in the petals being smaller.

Swartz's Jussiæa. Pl. fl. and cr.

16 J. URUGUAYE'NSIS (St. Hil. fl. bras. 2. p. 264.) suffruticose, hairy; leaves linear-lanceolate, acute, mucronulate, quite entire, hairy; the mucrone glandular at the apex; calyx hairy; tube of calyx linear; calycine lobes 5, lanceolate, acute; capsule cylindrical, 5-ribbed; seeds subtriangular. ♃. B. S. Native of Brazil, in the province of Cisplatine, in the mud cast out by the river Uruguay, in that part of the province called Saltogrande. Petals yellow, obovate, emarginate.

Uraguay Jussiæa. Pl. 1½ foot.

17 J. RAMULÒSA (D. C. prod. 3. p. 54.) plant herbaceous, creeping; stem puberulous, much branched; branches pubescent, leafy; leaves linear-oblong, obtuse, glabrous; flowers on short pedicels, somewhat bicallous at the base; tube of calyx cylindrical, glabrous; calycine lobes 5, lanceolate, acute, about equal in length to the petals. ♃. B. S. Native of Cuba. Flowers of a shining yellow. Capsules twice the length of the leaves, terete, tapering to the base.

Branched Jussiæa. Pl. cr.

18 J. FLUI'TANS; leaves roundish-spatulate; peduncles axillary, very long, solitary, 1-flowered; flowers decandrous? ♃. W. S. Native of Maranham, floating in rivulets. Flowers yellow.

Floating Jussiæa. Pl. fl.

** *Flowers with a 4-cleft* (f. 98. *a.*) *calyx*, 4 *petals* (f. 98. *d.*), *and* 8 *stamens.*

19 J. INCLINA'TA (Lin. fil. suppl. p. 577.) erect, glabrous, rooting at the base; leaves petiolate, obovate, obtuse; peduncles 1-flowered, a little longer than the petioles; calycine lobes ovate, smaller than the petals. ⊙. B. S. Native of Surinam, in marshes. J. erécta, Lin. amœn. 8. p. 256. but not of his spec. Lam. dict. 3. p. 330. Petals yellow. Perhaps only an octandrous variety of *J. rèpens* or *J. Swartziàna.*

Inclinate-stemmed Jussiæa. Pl. 1 ft.

20 J. NA'TANS (Humb. et Bonpl. pl. equin. 1. p. 16. t. 3. β.) herbaceous, glabrous, floating, supported in the water by a bladder and large white spongy roots, which issue from the ramifications; leaves petiolate, nearly orbicular, quite entire or toothed; flowers pedunculate; lobes of calyx 4-5 acute, shorter than the petals, which are ovate. ♃. W. S. Native of New Granada, near Mompox, in pools near the river Magdalena. H. B. et Kunth, nov. gen. amer. 6. p. 99. Flowers white, yellow at the base, octandrous, and decandrous. Capsule cuneated.

Natant Jussiæa. Pl. fl.

21 J. SEDOÌDES (Humb. et Bonpl. pl. equin. 1. p. 13. t 3.) herbaceous, floating, rooting; leaves on long petioles, disposed in stellate tufts, ovate-rhomboid, obtuse, dentately crenated, clothed with adpressed down beneath; flowers pedicellate, almost bractless; lobes of calyx ovate-oblong, acute; petals roundish-obovate, longer than the lobes of the calyx. ♃. W. S. Native of New Granada, in stagnant water between Guadua and Ibague. H. B. et Kunth, nov. gen. amer. 6. p. 98. Flowers yellow. Capsule linear-clavate.

Stonecrop-like Jussiæa. Pl. floating.

22 J. SUBACAU'LIS (Pursh, fl. amer. sept. 1. p. 304.) herbaceous, creeping, glabrous; leaves linear-lanceolate, repandly toothed; flowers pedicellate; petals obovate; alternate filaments very short. ♃. B. F. Native of North America, on the banks of the Missouri. Flowers small, yellow, octandrous, solitary in the axils of the leaves.

Stemless Jussiæa. Pl. creeping.

23 J. ACUMINA'TA (Swartz, fl. ind. occ. p. 745.) plants herbaceous, ascending, erectish, nearly simple, glabrous; leaves on short peticles, broad-lanceolate, acuminated at both ends; flowers on short pedicels, bractless; lobes of calyx ovate-lanceolate; petals acute, spreading. ⊙. B. H. Native of the south of Jamaica, in low places, and in the island of Arowabisch, ex Meyer, prim. esseq. 173. Flowers small, yellow, octandrous, solitary in the axils of the leaves. Capsule elongated, tetragonal.

Acuminated-leaved Jussiæa. Pl. ascending.

24 J. LINIFO'LIA (Vahl. eclog. 2. p. 32.) herbaceous, erect,

glabrous; branches spreading, compressed, angular; leaves almost sessile, linear-lanceolate, acuminated at both ends; flowers almost sessile; lobes of calyx lanceolate, attenuated. ⊙. B. S. Native of South America. Flowers yellow. Specimens gathered about Demerara, in marshes, agree with the description of Vahl, except in the leaves being more lanceolate, in the capsule being 8-10 lines long, not an inch, and in the petals being obovate-oblong, length of the calyx. The specimens we have collected ourselves in Trinidad, Jamaica, Grand Cayman, and about the Havannah, as also in Brazil, agree perfectly with the plant described by Vahl.

Fax-leaved Jussiæa. Fl. July, Aug. Clt. 1824. Pl. 1 ft.

25 J. ERE'CTA (Lin. spec. 556. exclusive of syn. of Rumph. and fl. zeyl.) herbaceous, erect, glabrous, branched; stems nearly terete; branches rather angular; leaves on short petioles, lanceolate, acuminated at both ends; flowers sessile, bractless; lobes of calyx acuminated, about equal in length to the petals, which are obovate; capsule cylindrically tetragonal, constricted under the limb of the calyx. ♂. B. S. Native of South America, and all the West India islands, common. Gærtn. fruct. 159. t. 31. Smith in Rees' cycl. no. 8. exclusive of the synonyme of Rheede. Perhaps two plants are confused under the name of *J. erécta.* Perhaps J. ramòsa of Jacq. in Rchb. hort. bot. 1. t. 75. is distinct from this.

Var. α, Sebàna (D. C. prod. 3. p. 55.) leaves broad-lanceolate, much longer than the capsules.—Native about Demerara.—Seb. thes. 1. t. 26. f. 3.

Var. β, Plumeriàna (D. C. l. c.) leaves narrow-lanceolate, twice the length of the capsules. Native of the West Indies. J. sessiliflòra, Moc. et Sesse, fl. mex. icon. ined. is probably referrible to this plant. J. Onàgra, Mill. dict. no. 4. J. erécta, Swartz, obs. 173. Lam. ill. t. 280. f. 2.—Plum. ed. Burm. t. 175. f. 2.

Erect Jussiæa. Fl. July, Sept. Clt. 1739. Pl. 2 to 3 ft.

26 J. BLUMEA'NA (D. C. prod. 3. p. 55.) stem suffruticose, erect, striated, puberulous; leaves linear-lanceolate, rather puberulous; flowers almost sessile; calycine lobes oblong-lanceolate, ciliated; capsule cuneate-oblong, puberulous, about equal in length to the leaves. ♂. B. S. Native of Java. J. angustifòlia, Blum. bijdr. p. 1132. but not of Lam. Flowers yellow. Said to be nearly allied to *J. erécta.* There is also a variety of this plant with narrow leaves, which are crowded at the tops of the branches.

Blume's Jussiæa. Pl. 1 to 2 ft.

27 J. ALTI'SSIMA (Perr. in litt. ex D. C. prod. 3. p. 55.) herbaceous, erect, glabrous, branched; stem angular under the branches; leaves sessile, linear-lanceolate, tapering to both ends; flowers almost sessile, bractless; lobes of calyx acuminated, 3-nerved, exceeding the petals. ♂. B. S. Native of Senegal. Capsule tetragonal, 7-9 lines long.

Tallest Jussiæa. Pl. 3 to 4 feet.

28 J. TENUIFÒLIA (Nutt. in Sillim. journ. amer. 1822. p. 294.) leaves sessile, linear, glabrous, remote, few; flowers sessile, octandrous; capsule 4-angled. ⊙. B. F. Native of Eastern Florida.

Fine-leaved Jussiæa. Pl. 1 ft.

29 J. LINEA'RIS (Willd. spec. 2. p. 575.) stem erect, branched, smoothish; leaves linear, sessile, and are, as well as the branchlets, rather hispid; flowers sessile; lobes of calyx linear, acutish; tube cylindrical, slender and elongated. ⊙. B. S. Native of Guinea. Flowers small. Stem hard, woody, slender. Hairs on leaves short, scattered. Capsule puberulous when examined under a lens, 8-9 lines long, one-half shorter than the leaves.

Linear-leaved Jussiæa. Pl. 1 ft.

30 J. HYSSOPIFÒLIA ! herbaceous, erect; stems and branches angular, glabrous; leaves narrow-lanceolate, almost entire, membranous, glabrous; flowers solitary, axillary, pedicellate; lobes of calyx acute, longer than the petals. ⊙. B. S. Native of Guinea, in the Island of St. Thomas, in bogs and by the sides of rivers. Petals small, yellow. Sepals 4 or 5.

Hyssop-leaved Jussiæa. Pl. 1 ft.

31 J. TETRAGÒNA (Spreng. syst. 2. p. 231.) stem herbaceous, erect, simple, tetragonal; leaves alternate, almost sessile, linear-lanceolate, quite entire, glabrous; stigma quadrifid; capsule subcylindrical. ⊙. W. S. Native of China and Cochin-china, in water. Epilòbium tetragònum, Lour. coch. p. 225. exclusive of the synonymes. The seeds being naked, and the flowers yellow, indicate that it is not a species of *Epilòbium*, and the stigma being quadrifid indicates its being a species of *Œnothèra* according to Jussieu.

Tetragonal-stemmed Jussiæa. Pl. 2 feet.

32 J. ALA'TA; stem erect, branched, quadrangular; angles winged; leaves lanceolate; flowers pedicellate; lobes of calyx 4. ⊙. B. S. Native of Maranham, in boggy places. Flowers yellow.

Winged-stamened Jussiæa. Pl. 1 ft.

33 J. ANGUSTIFÒLIA (Lam. dict. 3. p. 331. ill. t. 280. f. 3.) herbaceous, erect, glabrous; leaves nearly sessile, linear-lanceolate, tapering to both ends; flowers on very short pedicels; lobes of calyx acuminated; tube cylindrical and elongated. ⊙. B. S. Native of Java and the Moluccas.—Rumph. amb. 6. t. 21. f. 1. Petals yellow, obovate, hardly longer than the calyx. There is a species which we have gathered in bogs in Maranham, and in the province of Bahia, which agrees in almost every particular with this [illegible]nt, unless that the leaves are more linear, and the flowers perfectly sessile.

Narrow-leaved Jussiæa. Pl. 1 ft.

34 J. SALICIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 99. t. 530.) herbaceous, erect, glabrous; leaves on short petioles, linear, elongated, acuminated, glabrous, puberulous on the nerve beneath; flowers on short pedicels; lobes of calyx ovate; tube elongated, cylindrical, rather angular. ♃. B. S. Native of New Spain, about Guadua. Flowers yellow, octandrous, and decandrous.

Willow-leaved Jussiæa. Pl. 1½ ft.

35 J. FRUTE'SCENS (Jacq. fil. sem. hort. vind. 1821.) erect, glabrous, suffrutescent at the base; branches and nerves of leaves clothed with adpressed pubescence; leaves almost sessile, lanceolate-linear, glandularly subcrenated; flowers on short pedicels; lobes of calyx ovate, acute, pubescent on the outside; tube cylindrical, 8-furrowed. ♄. B. S. Native country unknown. At the base of the leaves there are sessile glands in place of stipulas. Flowers yellow.

Shrubby Jussiæa. Fl. April, Aug. Clt. 1824. Sh. 1½ ft.

36 J. LONGIFÒLIA (D. C. rapp. pl. rar. 1822. in mem. soc. gen. 2. p. 2. p. 141. pl. rar. hort. gen. 1. p. 12. t. 4.) suffruticose, twiggy, glabrous; stems 3-4-angled; leaves nearly sessile, linear-lanceolate, very long and acute, smoothish, furnished with small glands at the margins beneath; flowers solitary, pedicellate, bibracteate at the base; calyx smoothish, with acute lobes, and a triangular tube; petals obovate, exceeding the lobes of the calyx; capsule clavate, 4-ribbed; seeds 1-celled. ♄. B. S. Native of Brazil, in the province of Rio Janeiro, on the banks of the river Parahyba; and in the province of St. Paul near Fauxina, in marshes. Rchb. hort. bot. 1. t. 57. Flowers yellow.

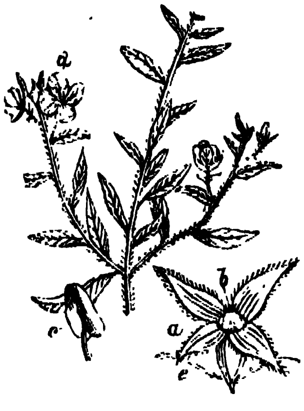
Long-leaved Jussiæa. Fl. June, July. Sh. 3 to 4 ft.

37 J. PALMITE'NSIS (St. Hil. fl. bras. 2. p. 261. t. 133.) shrubby; branches terete, glabrous; leaves lanceolate, acute, quite entire, glabrous above, but pubescent on the nerves beneath; flowers pedicellate; calyx puberulous, with acute lanceolate lobes, and a triangular tube; petals obovate, 3 times the length of the calyx; capsule clavate; seeds oblong, 1-celled.

♄. B. S. Native of Brazil, in the province of Minas Novas, in humid valleys near Piedade, and in the province of Minas Geraes in meadows, near Palmita. Petals yellow.

Palmita Jussiæa. Fl. June. Sh. 3 to 5 ft.

FIG. 98.



38 J. MYRTIFÒLIA (St. Hil. fl. bras. 2. p. 260.) shrubby, much branched; branches hairy, angularly furrowed at the apex; leaves lanceolate, acute, quite entire, glabrous above, but puberulous beneath; flowers pedicellate; calyx hairy, with an obconical tube and lanceolate acute lobes; petals obovate, slightly emarginate. ♄. B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitinhonha. Petals yellow.

Myrtle-leaved Jussiæa. Fl. May. Sh. 4 ft.

39 J. LANCEOLA'TA (St. Hil. fl. bras. 2. p. 259.) suffruticose; branches red, sulcately angular, puberulous above; leaves lanceolate, acute, quite entire, glabrous; flowers pedicellate; calyx pubescent, with an obconically quadrangular tube, and lanceolate acute lobes; petals obovate, exceeding the calyx; capsule obovate, 4-ribbed; seeds elliptic, 1-celled. ♄. B. S. Native of Brazil, near Salto Grande, not far from the town of St. Paul. Petals yellow.

Lanceolate-leaved Jussiæa. Sh. 1 ft.

40 J. CAPARÒSA (St. Hil. fl. bras. 2. p. 258.) shrubby; branches furrowed at the apex, beset with brownish pili; leaves oblong, ending in a short acumen, quite entire, hairy; flowers pedicellate; calyx hairy, with an obconical 4-ribbed tube, and lanceolate acute segments; petals obovate, slightly emarginate, exceeding the calyx; capsule obconical, obsoletely tetragonal; seeds elliptic, 1-celled. ♄. B. S. Native of the province of Minas Geraes, near the village of Sucuriu, where it is called *caparosa*. Petals yellow.

Caparosa Jussiæa. Sh.

41 J. E'LEGANS (St. Hil. fl. bras. 2. p. 257.) shrubby; branches pubescent and furrowed at the apex; leaves lanceolate, acuminated, obsoletely sinuated, hispid; flowers pedicellate; calyx pubescent, with an obconical 8-ribbed tube, and lanceolate acute lobes; petals obovate, exceeding the calyx. ♄. B. S. Native of Brazil, in the province of Rio Janeiro, at the river Parahyba, near the village of Uba. Flowers yellow.

Elegant Jussiæa. Fl. Oct. Sh. 1 to 2 ft.

42 J. LARUOTTEA'NA (St. Hil. fl. bras. 2. p. 256.) shrubby; branches angular, reddish, smoothish; leaves oblong-lanceolate, acute or rounded at the apex and ending in a short point, tapering to the base, obsoletely toothed, smoothish; calyx pubescent, with an obconical quadrangular 4-ribbed tube, and lanceolate acute ciliated lobes; petals obovate, exceeding the calyx; capsule obconical, 8-ribbed; seeds elliptic, 1-celled. ♄. B. S. Native of Brazil, in the province of Minas Geraes, near Padre-Bento, where it was collected by one Laruotte.

Laruotte's Jussiæa. Sh. 1 to 2 ft.

43 J. DECU'RRENS (D. C. prod. 3. p. 56.) herbaceous, erect, branched, glabrous; stems winged from the leaves running down them; leaves lanceolate; flowers rather pedicellate; pedicel furnished with 2 glands in the middle; lobes of calyx 3-5-nerved, acute; petals obovate, longer than the calyx; capsule turbinate, winged at the angles. ♃. W. F. Native of Georgia and Carolina, and probably of Virginia, in watery shady places. J. érecta, Abbot. insect. georg. t. 40. ex Pursh, fl. amer. sept. 1. p. 304. but not of Lin. Ludwígia Jussiæoìdes, Michx. fl. bor. amer. 1. p. 89. but not of Lam. Ludwígia decúrrens, Walt. car. 89. Ell. sketch. 1. p. 217. Flowers yellow. There are varieties of this species with ovate and linear-lanceolate leaves, and sessile and pedicellate flowers.

Decurrent-leaved Jussiæa. Pl. 1 ft.

44 J. PALU'STRIS (Meyer, prim. esseq. 173.) stem erect, suffruticose, winged; upper leaves lanceolate, lower ones rather spatulate, glabrous; pedicels short; lobes of calyx lanceolate, veined, about equal in length to the petals, which are oval; tube of calyx bluntly tetragonal. ♂. B. S. Native of marshes about Essequibo. Flowers yellow.

Marsh Jussiæa. Pl. 1 ft.

45 J. ANASTOMÒSANS (D. C. prod. 3. p. 56.) arboreous; branches deflexed, red, smoothish, angular towards the apex; leaves lanceolate, acute, quite entire, shining, smoothish; lateral nerves running into a parallel marginal one; flowers pedicellate; calyx smoothish, with an obconical quadrangular tube, and lanceolate acute lobes, furnished with 2 bracteas at the base; petals obovate, rounded, about equal in length to the calycine lobes. ♄. S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra de Nssa Snra Mui dos Uomens. Stem as thick as a man's arm. St. Hil. fl. bras. 2. p. 255. Flowers yellow.

Anastomosing-leaved Jussiæa. Sh. 10 to 12 ft.

46 J. NERVÒSA (Poir. suppl. 3. p. 199.) branches angular, and are, as well as the nerves of the leaves, beset with short velvety down; leaves sessile, lanceolate, acute, glabrous, with the nerves rather prominent beneath; pedicels 1-flowered, longer than the ovarium, furnished with 2 scales at the apex; lobes of calyx 5-nerved, acuminated, about equal in length to the tube, which is rather turbinate and angular. ♄. B. S. Native of Cayenne. Top of ovarium protruding into an 8-furrowed truncate cone.

Nerved-calyxed Jussiæa. Sh. 2 feet.

47 J. LIGUSTRIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 100.) herbaceous, erect, smoothish; leaves on short petioles, oblong, acute; pedicels 1-flowered, bibracteolate at the apex; lobes of calyx ovate, acute, 5-nerved; tube quadrangular, attenuated at the base; petals roundish, longer than the calyx. ♃.? B. S. Native of Mexico. Plum. ed. Burm. t. 175. f. 1. ex Kunth. Flowers yellow.

Privet-leaved Jussiæa. Pl. 1 to 2 ft.

48 J. MAYPURE'NSIS (H. B. et Kunth, nov. gen. amer. 6. p. 100. t. 531.) stem shrubby, glabrous; leaves on short petioles, oblong-lanceolate, acute, stiffish, puberulous on the nerves and veins beneath; pedicels 1-flowered, bibracteolate at the apex; lobes of calyx ovate, acute, somewhat 5-nerved, about equal in length to the petals, which are ovate; tube tetragonal, obconical. ♄. B. S. Native in humid places, on the banks of the Orinoco near Maypures. Petals yellow. Anthers twisted. Bracteoles linear.

Maypures Jussiæa. Pl. 1 to 2 ft.

49 J. OVALIFÒLIA (Sims, bot. mag. t. 2530.) plant erect, branched, clothed with villous pubescence; branches tetragonal, a little winged; leaves nearly sessile, elliptic, acuminated, nerved; flowers sessile; lobes of calyx ovate, acuminated, 3-nerved, about equal in length to the petals, which are orbicular; tube elongated, tetragonal. ♂. B. S. Native of Madagascar. Flowers yellow. Genitals very short.

Oval-leaved Jussiæa. Fl. Aug. Sep. Clt. 1810. Pl. 1 to 2 ft.

50 J. BURMA'NNI (D. C. prod. 3. p. 57.) stem erect, nearly terete; when young rather villous, but at length glabrous; leaves lanceolate, acuminated at both ends; flowers on short pedicels, bibracteolate; lobes of calyx ovate, acute, 3-nerved; tube and

capsule cylindrical, pubescent, slender.—Native of the East Indies. Ludwígia perénnis, Burm. fl. ind. 37. J. suffruticòsa, Lin. spec. 553.? Blume, bijdr. p. 1133. Upper leaves alternate. Petals obovate, emarginate, flabellately pinnate, a little longer than the calyx. Filaments villous at the base. Allied to *J. villòsa*.

Burmann's Jussiæa. Pl. 1 ft.

51 J. villòsa (Lam. dict. 3. p. 331.) stem suffruticose, villous; leaves almost sessile, lanceolate, rather villous on both surfaces; flowers sessile; calyx villous; lobes lanceolate; tube cylindrical. ♄. B. S. Native of the East Indies and the Island of Timor. J. exaltàta, Roxb. hort. beng. 33. Hamilt. in Lin. trans. 14. p. 303. Andr. bot. rep. 621.—Rheed. mal. 2. t. 50. but the capsule is dilated at the apex in the figure of Rheede, not cylindrical. The nerves of the capsule are 8, filiform and permanent, as well as in the two following species.

Villous Jussiæa. Pl. 1½ ft.

52 J. octone'rvia (Lam. dict. 3. p. 332.) herbaceous, erect, glabrous; leaves narrow-lanceolate, acuminated; flowers sessile; lobes of calyx lanceolate, acute; tube cylindrical, 8-nerved, striated, shorter than the floral leaves; petals obovate, emarginate, exceeding the calycine lobes. ♂. B. S. Native of the West Indies, in humid or watery places. Œnothèra octovàlvis, Jacq. amer. 102. t. 70. exclusive of the synonyme of Plum. Lam. ill. t. 280. f. 1. Flowers yellow.

Eight-nerved-calyxed Jussiæa. Pl. 2 to 3 ft.

53 J. octofìla (D. C. prod. 3. p. 57.) herbaceous, erect, downy; leaves lanceolate, acuminated; flowers on short pedicels, furnished with 2 bracteoles at the top of the pedicel, or on the tube; lobes of calyx ovate-lanceolate, 5-nerved; tube cylindrically obconical, 8-nerved, attenuated at the base.—Native of the West Indies and Mexico, in watery places. Plum. ed. Burm. t. 175. f. 1. J. octovàlvis, Swartz, obs. 142. The 8 nerves of the capsule are permanent and filiform. This species differs from the preceding in being downy, not glabrous, in the capsule being attenuated at the base, not cylindrical, in the flowers being pedicellate, not sessile, and furnished with two bracteas, not naked. Petals obovate, longer than the calyx.

Eight-threaded Jussiæa. Pl. 1½ ft.

54 J. scabra (Willd. enum. 1. p. 449.) stem suffruticose at the base, hairy; branches angular at the apex; leaves oblong, acute, quite entire, hairy; flowers almost sessile; calyx hairy, with a linear tetragonal tube, and lanceolate acute lobes; petals obovate, 3 times the length of the calyx; capsule linear, 8-ribbed; seeds roundish, 2-celled. ♄. B. S. Native of Brazil, in the province of Rio Janeiro, at the river Parahyba near Uba. J. hírta, Lam. dict. 3. p. 331. but not of Vahl.—J. Marcgràvii, D. C. prod. 3. p. 58.—Camaranbàia, Marcgr. bras. p. 30. with a figure.

Scabrous Jussiæa. Fl. Oct. Clt. 1816. Sh. 2 to 3 ft.

55 J. hi'rta (Vahl. eclog. 2. p. 31.) shrubby, erect, hairy; leaves on very short petioles, lanceolate, attenuated, hairy beneath; pedicels bractless, shorter than the ovarium; lobes of calyx ovate, acute, 5-7-nerved at the base; tube obconical, 4-nerved; petals obovate, longer than the calyx. ♄. B. S. Native of South America. Œnothèra hírta, Lin. spec. 491.—Plum. ed. Burm. t. 174. f. 2. Flowers yellow.

Hairy Jussiæa. Fl. July, Aug. Clt. 1816. Sh. 1 to 2 ft.

56 J. macroca'rpa (H. B. et Kunth, nov. gen. amer. 6. p. 102. t. 533.) suffruticose, erect; stem and branches villous; leaves oblong, acuminated, narrowed at the base, clothed with adpressed hairs on both surfaces; pedicels length of the ovarium, bibracteolate at the apex; lobes of calyx ovate, acute, 5-7-nerved; tube cylindrically oblong, attenuated at the base, obconical; petals obovate, longer than the calyx. ♄. B. S. Native of New Granada, in humid places near Guadua. This species differs from the preceding in the pedicels being furnished with two caducous foliaceous linear bracteas, but perhaps only a variety.

Long-fruited Jussiæa. Shrub 1 to 2 feet.

57 J. parviflòra (St. Hil. fl. bras. 2. p. 263.) suffruticose; branches downy, and rather angular at the apex; leaves linear-lanceolate, acute, quite entire, rather scabrous; flowers almost sessile; calyx puberulous, with a narrow tetragonal tube, and lanceolate acute lobes; petals obovate, equal in length to the lobes of the calyx, pale yellow; capsule linear, 8-ribbed; seeds roundish, bilocular. ♄. B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitinhonha, also in marshes. Petals pale yellow.

Small-flowered Jussiæa. Sh. 2 ft.

58 J. seri'cea (St. Hil. fl. bras. 2. p. 560.) suffruticose, branched; branches angular at the apex, and densely clothed with yellowish pili; leaves lanceolate, acute, quite entire, clothed with silky tomentum on both surfaces; flowers pedicellate; calyx clothed with silky pili, with an obconical 4-ribbed tube, and lanceolate acute lobes; petals obcordate. ♄. B. S. Native of Brazil, in the province of Minas Geraes. Petals yellow.

Silky Jussiæa. Sh. 1 to 2 ft.

59 J. tomentòsa (St. Hil. fl. bras. 2. p. 254.) shrubby, a little branched; branches angular at the apex, and densely clothed with brownish tomentum; leaves obovate or elliptic, mucronulate, dentately serrated, pilose above, but densely clothed with grey tomentum beneath; flowers pedicellate; calyx hairy, with an obconical obsoletely 5-furrowed tube, and lanceolate acute segments; petals obovate, slightly emarginate; capsule obconical; seeds elliptic, 1-celled. ♄. B. S. Native of Brazil, in the province of Minas Geraes, near the town of Paracatu. Flowers yellow, crowded at the tops of the branches. In the character the calyx is said to be 4-cleft, but in the description 5-cleft; the last is most probably correct, as the stamens are said to be 10; if such be the case the plant should have been ranged in the first section.

Tomentose Jussiæa. Sh. 3 ft.

60 J. móllis (H. B. et Kunth, nov. gen. amer. 6. p. 102.) herbaceous? erect; branches villous; leaves ovate, acute at the base and apex, hairy on both surfaces, soft beneath; pedicels villous; calyx villous; lobes ovate, acute; tube obovate. ♃. B. S. Native of Cumana, in humid places. Petals and stamens unknown.

Soft Jussiæa. Pl. 1 ft.

61 J. velutìna; herbaceous, erect, branched, downy; leaves elliptic-lanceolate, attenuated at both ends; flowers on short pedicels, almost sessile. ♃. B. S. Native of Guinea, in the Island of St. Thomas, in marshes and on rivers' banks. Flowers yellow, middle-sized.

Velvety Jussiæa. Pl. 1½ ft.

62 J. fruticòsa (D. C. prod. 3. p. 57.) stem shrubby, much branched; leaves lanceolate, quite entire, alternate, hairy; flowers pedicellate. ♄. B. S. Native of Cochin-china, in cultivated fields. Œnothèra fruticòsa, Lour. coch. p. 226. Flowers yellow. Calyx columnar, crowned by the calyx. Seed naked. This plant is referred by Sprengel to J. suffruticòsa of Lin. but that species is hardly known.

Shrubby Jussiæa. Sh. 6 feet.

63 J. suffruticòsa (Lin. spec. 555.) erect, villous; flowers pedicellate, octandrous. ♃. B. S. Native of the East Indies. The synonymes attached to this species by Linnæus are perfectly erroneous.

Suffruticose Jussiæa. Fl. Aug. Sep. Clt. 1808. Pl. 1½ ft.

† *Species hardly known.*

64 J. hirsu'ta (Mill. dict. no. 5.) stem erect, simple, hairy;

leaves lanceolate; flowers large, sessile, yellow, decandrous. ♄. B. S. Native about Campeachy.

Hairy Jussiæa. Sh. 3 ft.

65 J. PUBE'SCENS (Lin. spec. 555.) erect, villous; flowers sessile, decandrous, pentapetalous.—Native of South America.

Pubescent Jussiæa. Pl. 2 ft.

66 J. TENE'LLA (Burm. fl. ind. p. 103. t. 35. f. 5.) glabrous; leaves opposite, linear-lanceolate; flowers pedicellate, decandrous, pentapetalous.—Native of Java.

Weak Jussiæa. Pl. 1 ft.

Cult. All the species of this genus are either water or bog plants, and therefore require to be kept moist. The species, natives of bogs, may be grown in pots, under which may be placed pans of water. The floating aquatic kinds should be grown in tubs, filled with water, with a layer of mould in the bottom, in which the plants may root. All the species, natives of warm climates, require a great degree of heat to bring them to flower. The *J. grandiflòra* is the only hardy aquatic kind; it grows best when planted in a shallow pond or rivulet.

XI. PRIEU'REA (this genus is dedicated to M. Le Prieur, the discoverer of the plant at Senegal). D. C. prod. 3. p. 58.

LIN. SYST. *Triándria, Monogýnia.* Tube of calyx cylindrical, elongated, adhering to the ovarium; limb 3-parted; segments lanceolate, acute, permanent. Petals 3, small. Stamens 3, alternating with the lobes of the calyx; filaments filiform, short. Style short. Seeds small.—Herb glabrous, dwarf, branched, of an obscure green colour. Leaves alternate, oblong-linear, acute, entire. Flowers axillary, solitary, on very short pedicels.

1 P. SENEGALE'NSIS (D. C. l. c.). Native of Senegal, in bogs. Habit almost of *Jussiæ̀a ramulòsa.*

Senegal Prieurea. Pl. dwarf.

Cult. For culture and propagation see *Jussiæ̀a.*

XII. LUDWI'GIA (so named by Linnæus in honour of Christian Gottlieb Ludwig, once Professor of Medicine at Leipsic, author of Definitiones Plantarum, 1 vol. 8vo. Leipsic, 1737, and numerous other botanical works). Roxb. fl. ind. 1. p. 440. D. C. prod. 3. p. 58.—Ludwígia species of Lin. and others.

LIN. SYST. *Tetrándria, Monogýnia.* Tube of calyx cylindrical, adhering to the ovarium; limb 4-parted, the lobes almost permanent. Petals 4, alternating with the lobes of the calyx. Stamens 4, opposite the lobes of the calyx. Apex of ovarium or base of style pyramidal, tetragonal, 4-furrowed, glabrous in the furrows, and villous on the angles; the stamens lying in the furrows. Style filiform, pyramidal from the apex. Stigma capitate, 4-furrowed, or 4-lobed. Capsule turbinate, or very much elongated, 4-celled, 4-valved, crowned by a cone-formed pyramid. Seeds numerous.—Branched Indian herbs. Leaves alternate, linear, on very short petioles, quite entire. Flowers axillary, almost sessile, yellow, furnished with two bracteoles at the base of the calyx. This genus is intermediate between *Jussiæ̀a* and *Isnárdia;* from the former, it is distinguished in the stamens being equal in number to the petals, not double that number; from the latter, in the capsule being elongated and ending in a cone-formed pyramid at the base of the style. The genus *Ludwígia* of Linnæus is the same as *Isnárdia.*

1 L. JUSSIÆOIDES (Lam. dict. 3. p. 588. but not of Michx.) erect, glabrous; leaves lanceolate-linear, acuminated at both ends; flowers pedicellate, almost bractless; capsule elongated, nearly terete.—Native of the Mauritius and the East Indies. Stems terete, branched. Branches and leaves puberulous, when examined under a lens. Flower-bud ovate, acuminated. Capsule an inch long, but hardly a line in breadth. Perhaps the same as *L. alternifòlia* of Burm. exclusive of the synonymes.

Jussiæa-like Ludwigia. Pl. 1 foot.

2 L. FRUTICÒSA (Blume, bijdr. p. 1133.) stem erect, glabrous, shrubby, pentagonal; leaves lanceolate, bluntly acuminated, with finely ciliated margins; flowers twin or crowded, axillary, sessile; capsule linear, tetragonal. ♄. B. S. Native of Java, near rivers and rivulets. There is a variety with narrow leaves. Allied to *L. Jussiæoìdes.*

Shrubby Ludwigia. Shrub 1 foot?

3 L. LEUCORHI'ZA (Blume, l. c.) stem erect, glabrous, herbaceous, pentagonal; leaves alternate, linear-lanceolate, bluntish, with the margins finely ciliated; flowers at first capitate, but at length axillary, solitary, and sessile; capsule elongated, clavate, tetragonal.—Native of Java, about Buitenzorg at the river Tjelinong. Root white, fusiform. Allied to *L. fruticòsa.*

White-rooted Ludwigia. Pl. ½ foot.

4 L. LYTHROÌDES (Blum. bijdr. 1134.) stems erect, glabrous, pentagonal; leaves linear, bluntish; flowers pedicellate, furnished with 2 bracteas at the top of the pedicels; capsule tetragonal, rather turbinate, short.—Native of the East Indies. Branches angular. Leaves oblong-linear, acute at the base. Bracteas one half shorter than the capsule. Pyramid of ovarium depressed at the base of the style. Stigma large, 4-lobed.

Lythrum-like Ludwigia. Pl. ½ foot.

5 L. ERIGA'TA (Lin. mant. p. 40.) stem erect, smooth; leaves alternate, lanceolate; pedicels usually tern, 1-flowered; capsule subcubical, 4-angled; petals small. ⊙. W. H. Native of the East Indies. L. triflòra, Lam. dict. 3. p. 613. L. alternifòlia, Burm. fl. ind. p. 36. exclusive of the synonymes. There are two plants in Burmann's herbarium under this name, one referrible to *L. Jussiæoìdes* and the other *L. erigàta.*

Erigated Ludwigia. Pl. 1 foot.

6 L. PARVIFLÒRA (Roxb. fl. ind. 1. p. 440.) diffuse, glabrous; flowers sessile or on short pedicels, bibracteolate at the base; capsule linear, somewhat tetragonal. ⊙. B. H. Native of Bengal. Plant small, branched. Petals oblong, length of the calycine lobes. Bracteoles small.

Small-flowered Ludwigia. Fl. July, Aug. Clt. 1825. Pl. ½ foot.

7 L. DIFFU'SA (Hamilt. in Lin. trans. 14. p. 301.) diffuse, glabrous; leaves lanceolate; flowers almost sessile; capsule prismatic, tetragonal; angles blunt; peduncles one half shorter than the leaves. ⊙. W. H. Native of the East Indies, in water. Rheed. mal. 2. t. 49. Jussiæ'a caryophyllæ'a, var. *α*. Lam. dict. 3. p. 331.

Diffuse Ludwigia. Pl. diffuse.

8 L. PROSTRA'TA (Roxb. fl. ind. 1. p. 440.) lower branches prostrate and rooting; flowers sessile, solitary, or numerous in the axils of the leaves; capsules filiform; seeds disposed in one series in each cell. ⊙. H. Native of Pegu.

Prostrate Ludwigia. Fl. Jul. Aug. Clt. 1816. Pl. 1 to 2 ft.

† *Species hardly known.*

9 L. PERE'NNIS (Lin. spec. ed. 2. p. 173.) flowers pedicellate; capsule cylindrical; stems diffuse; leaves lanceolate. ♃. W. S. Native of the East Indies, and Ceylon. Ludwígia, Lin. fl. zeyl. no. 66. Ludw. oppositifòlia, Lin. syst. veg. p. 135. This species is hardly known, as Linnæus, in his spec. pl. says the leaves are opposite, and in his fl. zeyl. alternate, and cites the figure in Rheed. mal. 2. t. 49. for his plant, and at the same time excludes it from his mant.

Perennial Ludwigia. Pl. prostrate.

10 L. TRIFLÒRA (Burm. fl. ind. p. 37.) erect, herbaceous,

smooth; leaves opposite or tern, petiolate, ovate-lanceolate; flowers nearly terminal, pedicellate. ⊙.? H. Native of Java. Isnárdia trifòlia, Poir. suppl. 3. p. 188. There is no specimen of this plant in the herbarium of Burmann, and therefore the plant is truly doubtful.

Three-flowered Ludwigia. Pl. 1 foot.

Cult. None of the species of *Ludwígia* are worth cultivating, unless in botanic gardens. The perennial species should be grown in small pots, placed in pans of water. The seeds of annual species may be reared in a hot-bed, and afterwards planted out in the open border, in a moist situation.

XIII. ISNA'RDIA (so named by Linnæus in memory of M. Antoine Dante Isnard, member of the Academy of Sciences, and who published descriptions of some plants in their memoirs for 1716. &c.). D. C. prod. 3. p. 59.—Isnárdia and Ludwígia, Lin. gen. no. 156. and 153. Juss. gen. p. 333. and p. 319. Lam. ill. t. 77.—Ludwígia, Ell. sketch. 1. p. 214. Spreng. syst. 1. p. 444. but not of Roxb.—Dántia, Du Pet. Th. gen. p. 49.

Lin. syst. *Tetrándria, Monogýnia.* Tube of calyx ovate or subcylindrical (f. 99. *a. d.*), short, adhering to the ovarium; limb 4-parted, permanent (f. 99. *b.*). Petals sometimes 4, alternating with the lobes of the calyx, sometimes only rudiments of petals, and sometimes wanting altogether. Stamens 4 (f. 99. *c.*) in front of the calycine lobes. Style filiform from the base, deciduous; stigma capitate. Capsule obovate or nearly cylindrical (f. 69. *f.*), tetragonal, 4-valved, 4-celled, many-seeded, opening at the cells.—Aquatic or marsh herbs. Leaves entire, alternate, or opposite. Flowers axillary, sessile.

Sect. I. Ludwigia'ria (see *Ludwígia* for derivation). D. C. prod. 3. p. 60.—Ludwígia, Lin. Petals 4, sometimes larger than the calycine lobes, or equal in length to them, and sometimes smaller.

Leaves alternate.

1 I. ALTERNIFÒLIA (D. C. prod. 3. p. 66.) **stem erect, branched, smoothish; leaves alternate, lanceolate, rather scabrous on the margins, and hoary beneath; capsule obovate-globose, tetragonal, with the angles winged; calycine lobes large, coloured; petals a little longer than the calyx. ♃. B. H. Native of Virginia and Carolina, in marshes.** Pluk. alm. t. 203. f. 2. amalth. t. 412. f. 1. **Ludwígia alternifòlia, Lin. spec. 173. Lam. ill. t. 77. Gærtn. fr. 1. p. 31. f. 8.** Ludwígia macrocárpa, Michx. fl. bor. amer. 1. p. 89. Ludwígia ramosíssima, Walt. Ludwígia microcárpa, Link. enum. p. 141. Habit of *Jussiæ̀a octándra.* Petals oval, yellow. Root emetic, and is called *Bowman's root.*

Var. β, *salicifòlia* (D. C. l. c.) **flowers on very short pedicels. ♃. B. H. Native of Carolina. Ludwígia salicifòlia, Poir. suppl. 3. p. 512.** Lateral nerves of leaves confluent near the margins, giving the leaves the appearance of being 3-nerved.

Var. γ, *uniflòra* (D. C. l. c.) **stem simple; flower terminal.—Native of New Jersey. Ludwígia uniflòra, Rafin. in Desv. journ. bot. 1. p. 224.**

Alternate-leaved Isnardia. Fl. June, Jul. Clt. 1752. Pl. 2 ft.

2 I. LINEA'RIS (D. C. prod. l. c.) **stem erect, branched, glabrous, angular above; leaves alternate, linear, acute, glabrous; capsule oblong-turbinate, somewhat tetragonal, longer than the lobes of the calyx, which are linear-lanceolate; petals longer than the calyx. ⊙. W. H. Native of Carolina, in ditches and marshes. Ludwígia lineàris, Walt. car. p. 89. Pursh, fl. amer. sept. 1. p. 110. Ell. sketch. 1. p. 215. Ludwígia angustifòlia, Michx. fl. bor. amer. 1. p. 88. Ludwígia angustifòlia β, Poir. suppl. 3. p. 513.** Flowers sessile, solitary, axillary. Petals obovate, yellow.

Linear-leaved Isnardia. Pl. 2 to 5 feet.

3 I. VIRGA'TA (D. C. l. c.) **stem erect, twiggy, rather pubescent; leaves linear, obtuse, glabrous; flowers pedicellate, disposed in an elongated, spicate, nearly naked, raceme; capsule globose, tetragonal; petals length of calyx. ♃. H. Native of Lower Carolina, in dry sandy woods. Ludwígia virgàta, Michx. fl. bor. amer. 1. p. 89.** Ludwígia lùtea, Bosc. ined. Ludwígia virgàta, Ell. sketch. 1. p. 216. is perhaps different. Petals yellow. Lobes of calyx, when in flower, longer than the tube.

Twiggy Isnardia. Pl. 1 foot.

4 I. HIRSU'TA (Rœm. et Schultes, syst. 3. p. 477.) **stem erect, branched, rather diffuse, hairy; leaves alternate, lanceolate, rather hairy on both surfaces; capsule globose, tetragonal; petals rather longer than the calyx. ♃. B. H. Native from New Jersey to Carolina, in swamps. Ludwígia pilòsa, Walt. car. 89. Ell. sketch. 1. p. 216.** Lam. dict. 3. p. 587. Flowers axillary, pedicellate, yellow.

Var. β, *permóllis* (D. C. prod. 3. p. 60.) leaves obtuse; flowers on short pedicels. ♃. B. H. Ludwígia permóllis, Bart. fl. p. 52.

Hairy Isnardia. Pl. 2 feet.

5 I. MÓLLIS (Poir. suppl. 3. p. 188.) **stem erect, much branched, villous; leaves lanceolate-oblong; flowers rather crowded; petals small, shorter than the calyx; capsule globose. ♃. B. H. Native of Carolina; frequent in bogs. Ludwígia móllis, Michx. fl. b[illegible] amer. 1. p. 90. Ell. sketch. 1. p. 214.** Ludwígia rùdis, W[illegible] car. p. 89. Ludwígia hirtélla, Rafin. med. rap. 5. p. 356.

Soft Isnardia. Pl. 1 to 2 feet.

6 I. CAPITA'TA (D. C. prod. 3. p. 60.) **stem erect, twiggy, glabrous, but the stolons are creeping and pubescent; leaves alternate, linear-lanceolate, glabrous, acute at the apex and rounded at the base; heads spicate, terminal; petals shorter than the calyx; capsule nearly globose; calycine lobes short. ♃. B. H. Native of Lower Carolina, in swamps. Ludwígia capitàta, Michx. fl. bor. amer. 1. p. 90.** Ludwígia suffruticòsa, Walt. car. p. 90. Petals yellow. Roots creeping.

Capitate-flowered Isnardia. Pl. ½ to 1 foot.

* * *Leaves opposite.*

7 I. PEDUNCULÒSA (D. C. prod. 3. p. 60.) **stems procumbent, rooting, pubescent; leaves opposite, lanceolate; pedicels axillary, very long; capsule oblong-clavate; petals exceeding the calycine lobes, which are lanceolate. ♃. B. H. Native of Virginia and Lower Carolina, in swamps near the sea. Ludwígia pedunculòsa, Michx. fl. bor. amer. 1. p. 88. Ell. sketch. 1. p. 215.** Ludwígia acuàta, Walt. fl. car. 86. Petals yellow.

Stalked-flowered Isnardia. Pl. procumbent.

8 I. RE'PENS (D. C. l. c.) **stems creeping, glabrous; leaves opposite, obovate; pedicels axillary, shorter than the leaves; petals ovate, much smaller than the calyx; capsule oblong, tetragonal. ♃. B. S. Native of Jamaica, among stones on the banks of rivers.** Habit of *I. palústris.* **Ludwígia rèpens, Swartz, fl. ind. occ. 1. p. 273. icon. t. 8.**

Creeping Isnardia. Pl. creeping.

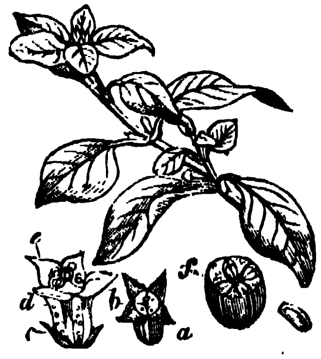
Sect. II. Da'ntia (see genus for the derivation). D. C. prod. 3. p. 61.—Dántia, Pet. Th. gen. 49.—Isnárdia, Lin. gen. 156. Petals wanting.

* *Leaves opposite.*

9 I. PALU'STRIS (Lin. spec. 175.) **stems procumbent, rooting, glabrous; leaves opposite, ovate, acute; flowers axillary, soli-**

tary, sessile, apetalous. ⊙. W. H. Native of Europe, Siberia, and Persia, in marshes and slow running water; in England, in a pool at Buxstead, Sussex. Schkuhr, handb. 1. t. 25. Hook. in engl. bot. suppl. t. 2593. Dántia palústris, Pet. Th. l.c. (f. 99.)

FIG. 99.



Var, β, *Americàna* (D.C. l. c.) leaves more acuminated at both ends. ⊙.W. H. Native of North America, in marshes and water, from Canada to Georgia; and of Mexico. Ludwígia apétala, Walt. car. 89. Ludwígia nítida, Michx. L. palústris, Torrey.

Marsh Isnardia. Fl. July. Britain. Pl. creeping.

* * *Leaves alternate.*

10 I. alа'ta (D. C. prod. 3. p. 61.) stems diffuse, branched, glabrous, distinctly angular and winged; leaves lanceolate-cuneated, decurrent, glabrous; flowers sessile, axillary, apetalous; capsule cubical, a little winged. ♃. B. H. Native of North America, in Sullivan Island. Ludwígia alàta, Ell. sketch. 1. p. 212.

Winged-stemmed Isnardia. Pl. diffuse.

11 I. microca'rpa (Poir. suppl. 3. p. 188.) stems procumbent, a little winged, quite smooth; leaves alternate, obovate-spatulate, obscurely glandular-toothed on the margins; flowers axillary, sessile, apetalous; capsule small, rather square. ⊙. B. H. Native of Lower Carolina, in swamps. Ludwígia microcárpa, Michx. fl. bor. amer. 1. p. 88. Ludwígia glandulòsa, Pursh. fl. bor. amer. 1. p. 111. Habit almost of a species of *Ammània.*

Small-fruited Isnardia. Pl. procumbent.

12 I. sphæroca'rpa (D. C. prod. 3. p. 61.) stem erect, branched, glabrous, hardly angular; leaves alternate, linear-lanceolate, acute at both ends, when young rather downy; flowers axillary, sessile, apetalous; capsule globose, small, pubescent. ♃. B. H. Native of South Carolina, about Orangeburgh. Ludwígia sphærocárpa, Ell. sketch. 1. p. 213.

Round-fruited Isnardia. Pl. ½ foot.

13 I. cyli'ndrica (D. C. l. c.) stem erect, branched, glabrous, subangular; leaves alternate, lanceolate, hardly denticulated; flowers axillary, sessile; lobes of calyx subserrated; capsule cylindrical. ♃. B. H. Native of Georgia, and perhaps of South Carolina. Ludwígia cylíndrica, Ell. sketch. 1. p. 13. Jussiæ'a brachycárpa, Lam. dict. 3. p. 331. Ludwígia heterophy'lla, Poir. suppl. 3. p. 512.?

Cylindrical-fruited Isnardia. Pl. 1 foot.

14 I. lanceola'ta (D. C. prod. 3. p. 61.) stem erect, twiggy, angular, glabrous; leaves narrow-lanceolate, glabrous, rather decurrent; flowers sessile, axillary, apetalous; capsule cubical, winged. ♃. B. H. Native of Georgia and Carolina, in marshes. Ludwígia lanceolàta, Ell. sketch. 1. p. 213.

Lanceolate-leaved Isnardia. Pl. 1 foot.

† *Species hardly known.*

15 I.? ramósa (D. C. prod. 3. p. 61.) stems procumbent, rooting, branched, glabrous; leaves opposite, linear-lanceolate; flowers nearly sessile, axillary. ♃. B. H. Native country unknown. Ludwígia ramosíssima, Roth. cat. 3. p. 24.? but not of Walt. Petals white, ex Willd. one half shorter than the calyx, ex Roth. Capsule elliptic, ex Willd. tetragonal, ex Roth. Stipulas joined to the leaves, ex Roth. Perhaps the plant of Willd. is the same as that of Roth.

Branched Isnardia. Pl. creeping.

16 I. auranti'aca (D. C. l. c.) stem erect, branched; leaves sessile, ovate-lanceolate, alternate, acute, glabrous; flowers axillary; petals length of calyx.—Native of Newcastle, Delaware, Chester, and Pennsylvania, in North America. Ludwígia aurantíaca, Rafin. in Desv. journ. 1. p. 224. Flowers orange-coloured. The rest unknown.

Orange-coloured-flowered Isnardia. Pl. 1 to 2 feet.

Cult. None of the species are worth cultivating, except in botanical gardens. Their culture and propagation is the same as that for *Ludwigia*, see p. 697.

Tribe V.

CIRCÆ'EÆ (plants agreeing with *Circæ'a* in important characters). D. C. prod. 3. p. 61. Tube of calyx not drawn out beyond the ovarium, but dividing immediately (f. 100. *a.*), deciduous. Fruit capsular, ovate-globose (f. 100. *e.*). Stamens 2, one of which is usually converted into a petal (f. 100. *b.*).—Herbs or subshrubs. Leaves opposite, petiolate, cordate, or ovate. Flowers racemose.

XIV. LOPE'ZIA (in honour of Thomas Lopez, a Spanish botanist, who is said to have directed his attention to the natural history of the New World). Cav. icon. 1. p. 12. t. 18. Juss. gen. 3. p. 30. t. 30. f. 4. Schrank, pl. rar. hort. mon. t. 20. nov. act. bonn. 9. p. 90. D. C. prod. 3. p. 62.—Pisaùra, Bonat. mon. 1793.

Lin. syst. *Monándria, Monogýnia.* Limb of calyx 4-parted (f. 100. *g.*), deciduous. Petals 4, irregular (f. 100. *h.*). Stamens 2, only 1 of which bears an anther (f. 100. *c.*), the other opposite, sterile, petal-formed (f. 100. *b.*), usually of a different colour from the true petals. Stigma capitate (f. 100. *d.*). Capsule naked, subglobose (f. 100. *e.*), 4-celled, divided into 4 valves at the apex of the cells; valves adnate to the central placenta by the dissepiments. Seeds small, numerous.—Erect herbs or subshrubs. Leaves toothed, alternate, rarely opposite. Racemes terminating the stem and branches. Flowers small, pedicellate, purple, or red.

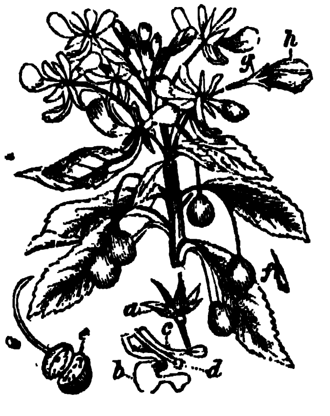
1 L. racemòsa (Cav. icon. 1. p. 12. t. 18.) herbaceous, nearly glabrous; leaves alternate, ovate-lanceolate, serrated, tapering to the base; racemes terminating the branches; bracteas much shorter than the pedicels. ⊙. H. Native of Mexico. Curt. bot. mag. 254. Bonpl. nav. t. 25. L. Mexicàna, Jacq. icon. rar. t. 203. Pisaùra automórpha, Bonato, mon. 1793. with a figure. Sterile stamen white. Petioles ciliated.

Racemose-flowered Lopezia. Fl. Aug. Oct. Clt. 1792. Pl. 1 to 1½ foot.

2 L. corda'ta (Horn. hort. hafn. add. p. 949.) plant glabrous; branches sulcately angular; leaves alternate, roundish-ovate, cordate, rather ciliated. ⊙. H. Native of Mexico?

Cordate-leaved Lopezia. Fl. Jul. Sept. Clt. 1821. Pl. 1½ ft.

FIG. 100.



3 L. corona'ta (Andr. bot. rep. 551.) plant glabrous; branches angular; leaves alternate, ovate, serrated, attenuated at the base; racemes terminating the branches; lower bracteas exceeding the pedicels. ⊙. H. Native of Mexico. Jacq. fil. eclog. t. 110. L. axillàris, Schweigger, in Kœnigsb. arch. nat. 1812. p. 236. L. minùta, Lag. gen. et spec. 1. no. 1. L. Mexicàna β, coronàta, D. C. hort. monsp. 1813. p. 39. Sterile stamen white.

Crown-flowered Lopezia. Fl. July, Sept. Clt. 1804. Pl. 1½ ft.

4 L. mi'nima (Lag. ex Schrank,

nov. act. bonn. 9. p. 192.) plant glabrous; stem tetragonal, nearly simple; leaves ovate, acute, sharply denticulated, somewhat acuminated, for the most part opposite, but the upper ones are alternate; racemes short. ⊙. H. Native of Mexico. Sterile stamen white.

Small Lopezia. Pl. ½ foot.

5 L. OPPOSITIFÒLIA (Lag. nov. gen. et spec. p. 1.) plant glabrous; leaves ovate, dentately serrated, for the most part opposite, but the upper ones are scattered; racemes terminating the branches; upper flowers nearly leafless. ⊙. H. Native of New Spain. Schrank, nov. act. bonn. 9. p. 91. L. ánnua, Hort.

Opposite-leaved Lopezia. Pl. 1 foot.

6 L. INTEGRIFÒLIA (D. C. prod. 3. p. 62.) plant glabrous; leaves alternate, ovate-lanceolate, acuminated at both ends, quite entire; racemes leafy, terminating the branches. ⊙. H. Native of Mexico. Stem angular. Petioles of lower leaves more than an inch long. Sterile stamen white. Leaves quite entire or hardly sinuated, never serrated.

Entire-leaved Lopezia. Pl. 1 to 1½ foot.

7 L. MINIA'TA (D. C. cat. hort. monsp. 1813. p. 121.) stem shrubby, glabrous, terete; leaves alternate, ovate-lanceolate, serrated; racemes terminating the branches. ♄. S. Native of New Spain. Lag. nov. gen. et spec. 1814. p. 1. Jacq. fil. eclog. t. 109. L. frutéscens, Rœm. et Schult. syst. 1. (1817.) p. 34. L. fruticòsa, Schrank, nov. act. bonn. 9. p. 91. Sterile stamen the same colour as the petals.

Vermilion-flowered Lopezia. Shrub 1 to 2 feet.

8 L. HIRSU'TA (Jacq. coll. 5. p. 5. t. 15. f. 4.) stem suffrutescent, hairy, terete; leaves ovate-lanceolate, hairy, subserrated; racemes terminating the branches. ⊙. H. Native of Mexico. Sterile stamen the same colour as the petals.

Hairy Lopezia. Fl. Sept. Nov. Pl. 1 to 2 feet.

9 L. PUBE'SCENS (H. B. et Kunth, nov. gen. amer. 6. p. 92.) stem branched, glabrous, terete, as well as the downy branches; leaves oval-oblong, acute, pubescent. ⊙. H. Native of Mexico?

Pubescent Lopezia. Pl. 1 foot.

10 L. PU'MILA (Bonpl. nav. p. 57.) stem simple, hairy, terete; leaves on short petioles, ovate, acute, toothed, upper ones lanceolate, pilose on both surfaces; racemes terminal; flowers on long pedicels. ⊙. H. Native of Mexico, on hills between Guanaxuato and Santa Rosa. Bracteas shorter than the pedicels. Calyx glabrous.

Dwarf Lopezia. Fl. July, Sept. Clt. 1824. Pl. ½ foot.

Cult. All the species are elegant border annuals, when in flower, and most of them will live through many winters, and become suffrutescent, if sheltered from the frost. They are of easy culture, the seeds only requiring to be sown in the border early in spring, or sown on a hot-bed to forward the plants, which may afterwards be planted out in the open border. A light soil and warm situation suit them best.

XV. CIRCÆ'A (*Circe*, in mythology, the famous enchantress; in reference to the fruit, which lays hold of the clothes of passengers, from being covered with hooked prickles, as Circe is fabled to have done by her enchantments). Tourn. inst. t. 155. Lin. gen. no. 24. Lam. ill. t. 16. Gærtn. fruct. 1. p. 114. t. 24. D. C. prod. 3. p. 63.

LIN. SYST. *Diándria, Monogýnia.* Calyx deciduous, tubular, with a 2-parted limb. Petals 2, alternating with the lobes of the calyx. Stamens 2, alternating with the petals, inserted into the calyx. Disk large, cup-shaped, filling up the whole of the tube of the calyx, and projecting beyond it. Ovarium 2-celled, with an erect ovulum in each cell. Style simple, arising out of the disk. Stigma emarginate. Capsule 2-celled, 2-valved, 2-seeded. Seeds solitary, erect, without albumen. Embryo erect, with a short inferior radicle.—Herbaceous plants. Roots creeping. Leaves opposite, stalked, toothed. Flowers in terminal and lateral racemes, covered with uncinate hairs. This genus differs from the rest of *Onagràriæ*, in its large fleshy disk, in its solitary, erect ovula, and in the binary division of the flower; it is connected with this order through *Lopèzia*, with which it cannot, however, be absolutely associated, and bears about the same relation to *Onagràriæ*, as is borne by *Haloràgeæ*.

1 C. LUTETIA'NA (Lin. spec. 12.) stem erect, pubescent; leaves ovate, acuminated, toothed, opaque and downy, longer than the petioles. ♃. H. Native of Europe, in moist shady places; plentiful in some parts of Britain. Fl. dan. t. 210. Schkuhr, handb. t. 2. Smith, engl. bot. t. 1026. C. vulgàris, Mœnch. C. pubéscens, Pohl. C. ovalifòlia, Gray. The roots are creeping; and have been considered detersive. Flowers pale red. Anthers and style whitish. Stigma red.

Var. β, Canadénsis (Lin. l. c.) stem glabrous. ♃. H. Native of North America, particularly in Canada, about Lake Huron and Montreal, as well as in the United States. C. Canadénsis, Muhl. cat. p. 2. C. Lutetiàna, Bigel. fl. bost. p. 8.

Parisian or Common Enchantress Nightshade. Fl. June, Jul. Britain. Pl. 1 to 1½ foot.

2 C. ALPI'NA (Lin. spec. 12.) stems ascending, smoothish; leaves cordate, toothed, shining, length of petioles, membranous. ♃. H. Native of Europe, in moist, shady, stony places; plentiful in some parts of the north of England and Scotland, and almo[illegible]hroughout all North America. Smith, engl. bot. t. 1057. Lam. ill. t. 16. f. 2. C. cordifòlia, Stok. mat. med. 26. Flowers pale red. Fruit less hispid than those of the preceding species. Plant 4 or 6 inches high.

Var. β, intermèdia (Ehrh. beitr. 4. p. 42.) stem erect, simple, smoothish; leaves repandly denticulated, acuminated. ♃. H. Native of Europe, in mountainous and shady places. Sturm, fl. germ. with a figure. This plant grows to the height of *C. Lutetiàna* but it differs from it in the leaves being cordate, as in *C. alpìna*.

Alpine Enchantress Nightshade. Fl. July, Aug. Britain. Pl. ½ to 1 foot.

Cult. The species of *Circæ'a* will grow under any circumstance, and are easily increased by the running roots, which render them a great pest in gardens, unless confined by some means.

† *Genera belonging to Onagràriæ, but are not sufficiently known.*

XVI. PLEUROSTE'MON (from πλευρον, *pleuron*, a side, and στημον, *stemon*, a stamen; in reference to the stamens being all at one side of the flower). Rafin. adn. 1820. D. C. prod. 3. p. 64.—Pleurándra, Rafin. fl. lud. 1817. p. 95. but not of Labill.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx drawn out beyond the ovarium, bifid at the apex. Petals 4, spatulate, all on one side. Stamens 8, and are as well as the style at that side of the flower opposite the petals. Stigma 4-lobed. Capsule oval, 4-celled, many-seeded. Seeds unknown. This genus appears to come very near *Œnothèra*, from the calycine tube being drawn out beyond the ovarium.

1 P. A'LBUM (Rafin. l. c.). ♄. F. Native of Louisiana. Œnothèra, no. 2. Robin. louis. p. 490. Stem shrubby, 7 feet high. Branches terete, twiggy. Leaves sessile, narrow, entire, acute. Flowers white, on short pedicels; genitals exserted.

White-flowered Pleurostemon. Pl. 7 feet.

Cult. The seeds of this plant may be sown in the open border.

XVII. ONOSU'RUS (meaning unknown to us, but appears to be derived from *ονος*, *onos*, an ass, and *ουρα*, *oura*, a tail; but the application is not evident). Rafin. lud. p. 96. D. C. prod. 3. p. 64.—Chamissònia, Link. in jarb. der gewasch. 1818. p. 186. but not of Humb. and Kunth.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx adhering to the ovarium; limb 2-parted; lobes reflexed, deciduous, ex Rafin. Petals 4, inserted at the base of the limb of the calyx. Stamens 8. Stigma quadrifid. Capsule 4-celled, 4-valved. This genus is hardly known. It is probably not distinct from *Œnothèra.*

1 O. acumina'ta (Rafin. l, c.) petals obcordate. ☉. H. Native of Louisiana. Œnothèra, no. 8. Robin. louis. p. 490. Stem thick, 7 feet high, hairy. Leaves crowded, sessile, lanceolate, acuminated, somewhat bluntly and remotely toothed.

Acuminated-leaved Onosurus. Pl. 7 feet.

Cult. The seeds of this plant should be sown in the open border.

Order XCIII. HYDROCA'RYES (from *ὑδωρ*, *hydor*, water, and *καρυον*, *caryon*, a nut; water nuts). Link, enum. 1. p. 141. Lindl. introd. nat. syst. p. 58. Onagràriæ, Tribe vi.? Hydrocaryes, D. C. prod. 3. p. 63.

Calyx superior, 4-parted (f. 101. c.), with the tube adhering to the ovarium. Petals 4 (f. 101. *b.*), arising from the throat of the calyx. Stamens 4, alternating with the petals. Ovarium (f. 101. *a.*) 2-celled. Ovulas solitary, pendulous. Style filiform, thickened at the base. Stigma capitate. Fruit hard, indehiscent, 1-celled, 1-seeded, crowned by the indurated segments of the calyx. Seed large, solitary, pendulous, exalbuminous. Cotyledons 2, very unequal.—Floating herbs. Lower leaves opposite, upper ones alternate; those under water cut into capillary segments; petioles tumid in the middle (f. 101. c.). Flowers small, axillary.

This order is closely allied to *Onagràriæ*, from which it is distinguished by its solitary pendulous ovules; more closely allied to *Halorágeæ*, from which it is distinguished only by the very large seeds, unequal cotyledons, developed calyx, and want of albumen. Seeds of all eatable.

I. TRA'PA (abridged from *calcitrapa*, the Latin name of an instrument called *caltrops*, furnished with four spines, formerly used in war to impede the progress of cavalry; in reference to the fruit of some of the species being furnished with 4 spines). Lin. gen. no. 157. Lam. ill. t. 73. Gærtn. fruct. 1. p. 127. t. 26. D. C. prod. 3. p. 63.—Tribuloìdes, Tourn. inst. t. 431.

Lin. syst. *Tetrándria, Monogýnia.* Being no other genus, the character is therefore the same as that of the order. The lower leaves of all the species are capillaceously multifid, as in *Myriophýllum*, the upper or floating ones are deltoid and toothed, and disposed in a rosulate manner.

* *Fruit furnished with 4 horns.*

1 T. na'tans (Lin. spec. 175. exclusive of the synonyme of Rheede,) horns of fruit disposed in a cross-like manner, acute, and furnished with a small retrograde beard at the apex, 2 upper ones spreading horizontally, 2 lower ones somewhat ascending. ☉. W. H. Native of the temperate parts of Europe and Siberia, in stagnant and slow running water. Schkuhr, handb. t. 25. Mirb. ann. mus. 16. p. 447. t. 19. D. C. org. veg. t. 55. Ker. bot. reg. 88.—Cam. epit. 715. with a figure. Flowers white, the claws of the petals short and purplish. The nuts are esteemed farinaceous, nourishing, and pectoral. The calyx with its spines or indurated lobes being removed, there is a white sweet kernel within, somewhat like a chestnut in taste; they are sold in the markets at Venice under the name of Jesuits' nuts. At Vercelli they are called galarin, and are much eaten there by the common people and children. Pliny says that the Thracians made them into bread. According to Thunberg the roots of this or some other species are commonly boiled in broth in Japan, though the taste is by no means pleasant.

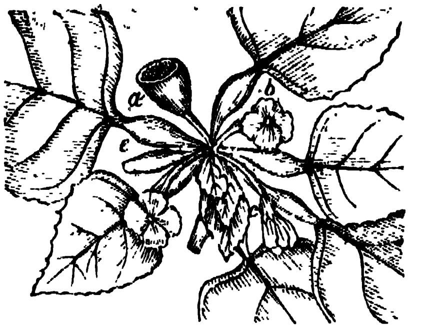
Floating Water-caltrops. Fl. June, Aug. Clt. 1781. Pl. fl.

2 T. quadrispinòsa (Roxb. fl. ind. 1. p. 451.) horns of fruit stiff, acute, spinose, disposed in a cross-like manner. ♃. W. S. Native of Silhet, floating in lakes. Flowers white. The rest unknown. Nuts eatable.

Four-spined Water-caltrops. Fl. June, Aug. Clt. 1823. Pl. fl.

** *Fruit furnished with 2 horns only.*

FIG. 101.



3 T. bispinòsa (Roxb. cor. t. 234. fl. ind. 1. p. 449.) horns of fruit opposite, stiff, acute, spinose, and bearded; floating leaves rather quadrate, serrulately toothed, tomentose beneath. ☉. W. S. Native of the East Indies, floating in water. —Rheed. mal. 11. p. 64. t. 33. Shringàta, Jones in asiat. res. 2. p. 350. and 4. p. 253. Petioles furnished with a large bladder in the middle. Petals white. Nectary cupulate, curled. The nuts are sold in the markets in many parts of the East Indies, the kernels being much esteemed by the Hindoos.

Two-spined-fruited Water-caltrops. Fl. June, Aug. Clt. 1822. Pl. fl.

4 T. bico'rnis (Lin. fil. suppl. 128.) horns of fruit opposite, thick, very blunt, somewhat recurved at the apex; floating leaves quadrate, entire, or a little toothed. ☉. W. G. Native of China, about Canton, floating in water; it is also cultivated by the Chinese for the sake of its fruit. Gærtn. fruct. 2. t. 89. T. Chinénsis, Lour. coch. p. 86. Braam, icon. chin. 1821. t. 22. Burm. in Plum. icon. fasc. 3. p. 56. t. 67. the lower figure. Flowers white.

Two-horned-fruited Water-caltrops. Fl. June, Aug. Clt. 1790. Pl. fl.

5 T. cochinchine'nsis (Lour. coch. p. 86.) horns of fruit thick, obtuse, opposite, somewhat recurved at the apex; leaves oblong, cut at the apex, tomentose beneath. ☉. W. H. Native of Cochin-china, floating in stagnant water. Flowers white, on long peduncles. The seeds are eatable, and taste like chestnuts.

Cochin-china Water-caltrops. Fl. June, Aug. Pl. fl.

Cult. The seeds of the species of *Tràpa* require to be sown or thrown into a cistern, or pond, or large pan of water, with rich loamy soil in the bottom. They all grow best in a strong heat. *T. nàtans* grows well in a pond in the open air.

Order XCIV. HALORA'GEÆ (plants agreeing with *Halorágis* in important characters). R. Br. gen. rem. (1814.) p. 17. D. C. prod. 3. p. 65.

Tube of calyx adhering the whole length of the ovarium (f.

102. c. a.); limb minute, 4-parted (f. 102. *c.*), or almost wanting (f. 103. *a.*). Petals minute, inserted in the summit of the calyx, opposite the calycine lobes, and equal in number to them, or wanting. Stamens inserted with the petals, equal in number to them or occasionally fewer. Ovarium adhering to the calyx, with 1 or more cells (f. 102. *d.*). Style none. Stigmas equal in number to the cells of the ovarium, papulose or pencil-formed, sessile. Fruit dry, indehiscent, membranous (f. 103. *c.*), or bony (f. 102. *d.*), with 1 or more cells. Seeds solitary in the cells; pendulous; albumen fleshy. Embryo straight in the axis, with a superior, terete, elongated radicle, and 2 short minute cotyledons.—Herbaceous or suffruticose plants, the greater part of which are inhabitants of water and moist places. Leaves alternate, opposite, or in whorls. Flowers axillary, sessile, or disposed in terminal spikes, occasionally monoecious or dioecious. The plants contained in this order are not known to possess any medical properties.

Synopsis of the genera.

TRIBE I.

CERCODIA'NÆ. *Limb of calyx evidently parted* (f. 102. *c.*). *Stamens equal, or double the number of the calycine lobes* (f. 102. *a.*) *Petals and cells of fruit equal in number to the lobes of the calyx.*

1 SERPI'CULA. Flowers monoecious. Calyx 4-parted. Petals and stamens 4. Nut 1-celled, 1-seeded.

2 GONIOCA'RPUS. Limb of calyx 4-parted (f. 102. *c.*). Petals 4 (f. 102. *a.*). Stamens 8 (f. 102. *b.*). Fruit 8-angled, 4-celled, 4-seeded (f. 102. *d.*).

3 HALORA'GIS. Limb of calyx 4-parted. Petals 4. Stamens 8. Fruit globose, 2-4-celled, 2-4-seeded.

4 CERCÒDIA. Limb of calyx 4-parted. Petals 4. Stamens 8. Fruit nucumentaceous, 4-winged, 4-celled, 4-seeded.

5 PROSERPINA'CA. Limb of calyx 3-parted. Petals wanting. Stamens 3. Fruit trigonal, 1-celled, 1-seeded.

6 MYRIOPHY'LLUM. Flowers monoecious, rarely hermaphrodite. Calyx 4-parted. Petals 4. Stamens 4-6, or usually 8. Fruit separable, in 4 hard nuts.

TRIBE II.

CALLITRICHI'NEÆ. *Limb of calyx not conspicuous* (f. 103. *a.*). *Petals wanting. Stamen* 1, *rarely* 2. *Fruit* 4-*celled*, 4-*seeded* (f. 103. *c.*).

7 CALLI'TRICHE. Flowers polygamous, hermaphrodite, or dioecious, or often monoecious. Bracteas 2, petaloid, at the base of the flowers.

TRIBE III.

HIPPURI'DEÆ. *Limb of calyx small, entire. Petals wanting. Stamen* 1 (f. 104. *e.*). *Fruit nucumentaceous* (f. 104. *d.*), 1-*celled*, 1-*seeded.*

8 HIPPU'RIS. Character the same as that of the tribe.

Tribe I.

CERCODIA'NÆ (plant agreeing with *Cercòdia* in important characters). Juss. dict. sci. nat. (1817.) 7. p. 441. D. C. prod. 3. p. 65. Hygrobièæ, Rich. anal. fru. p. 34. Limb of calyx evidently parted (f. 102. *c.*). Stamens equal in number to the calycine lobes, or double that number (f. 102. *b.*). Petals and cells of fruit usually equal in number to the calycine lobes (f. 102. *d.*).

I. SERPI'CULA (from *serpo*, to creep; this genus is composed of small creeping plants). Lin. mant. 16. Lam. ill. t. 758. Kœn. ann. bot. 1. p. 544. but not of Roxb. nor Pursh.—Laurembérgia, Berg. cap. p. 350.

LIN. SYST. *Monœ'cia, Tetrándria.* Flowers monoecious. Male. Calyx small, 4-parted. Petals 4. Stamens 4. Rudimentary styles 4 (ex Kön.). Female. Tube of calyx adnate to the ovarium; limb small, 4-parted. Petals wanting (ex Berg. et Thunb.) Nut globose, 8-nerved, 1-celled, 1-seeded, probably from abortion.---Creeping branched herbs. Leaves opposite or alternate, entire or toothed. Flowers axillary; male ones small, pedicellate; the female ones are hardly known.

1 S. RE'PENS (Lin. mant. 124.) leaves alternate, linear-lanceolate, quite entire, and rather scabrous. ♃. G. Native of the Cape of Good Hope, on the Table Mountains near rivulets. Thunb. fl. cap. p. 142. S. Capénsis, Ræusch. S. serpyllifòlia, Burm. cap. 26. Laurembérgia rèpens, Berg. cap. p. 350. t. 5. f. 10. Laurembérgia Capénsis, Gmel. Habit of *Verónica serpyllifòlia.*

Creeping Serpicula. Fl. July, Aug. Clt. 1789. Pl. cr.

2 S. VERONICÆFÒLIA (Bory. voy. 3. p. 174.) leaves oval, opposite, glabrous, toothed at the apex. ♃. S. Native of the Island of Bourbon, and Caffraria, among moist rocks. Willd. spec. 4. p. 330. L[illegible]es almost like those of *Verónica agréstis.* Stems red or reddis[illegible] creeping.

Speedwell-leaved Serpicula. Pl. creeping.

3 S. RÚBICU'NDA (Burch. cat. geogr. no. 404. trav. 1. p. 37.) leaves opposite, linear, quite entire, glabrous. ♃. G. Native of the Cape of Good Hope. Plant weak, much smaller and slenderer than the first.

Reddish Serpicula. Pl. creeping.

† *A very doubtful species.*

4 S. THYMIFÒLIA (Burm. cap. p. 26.)—Native of the Cape of Good Hope. Stem much branched. Leaves alternate, deflexed, ovate, acute, 1-nerved. Flowers rising from the axils of the upper leaves, rather pedicellate, nearly terminal, 5-parted. Perhaps a species of *Ionidium.*

Thyme-leaved Serpicula. Pl.

Cult. Any common soil will suit the species of *Serpícula*, and they are easily increased by separating the creeping shoots.

II. GONIOCA'RPUS (from *γονια*, *gonia*, an angle, and *καρπος*, *karpos*, a fruit; in reference to the angular fruit). Kön. ann. bot. 1. p. 546. D. C. prod. 3. p. 66.—Gonocárpus, Thunb. fl. jap. 5. but not of Hamilt.—Gonatocárpus, Willd. spec. 1. p. 690.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx adhering to the ovarium, which is ovate (f. 102. *c.*); limb 4-parted (f. 102. *c.*). Petals 4 (f. 102. *a.*), alternating with the calycine lobes. Stamens 8 (f. 102. *b.*). Stigmas 4. Fruit nucumentaceous (f. 102. *d.*), indehiscent, 8-angled, 8-nerved, 4-celled, 4-seeded. Seeds pendulous.—Herbs. Leaves opposite, toothed. Flowers sessile in the axils of the upper leaves.

SECT. I. APODO'GYNUS (from *α*, priv. and *πους ποδος*, *pous podos*, a foot, and *γυνη*, *gyne*, a female; in reference to the stigmas being sessile, without any foot or style). D. C. prod. 3. p. 66. Stigmas sessile on the top of the ovarium, wart-formed.

1 G. MICRA'NTHUS (Thunb. jap. p. 69. t. 15.) leaves ovate, serrate-toothed, smooth; spikes elongated, branched; flowers on short pedicels, pendulous. ⊙. H. Native of Japan. Pe-

tals 4, white, ex Kön. ann. bot. p. 546. t. 12. f. 5. Stamens 8, ex Brown, gen. rem. p. 18. Stem tetragonal.

Small-flowered Goniocarpus. Pl. decumbent.

2 G. SCA'BER (Kœn. ánn. bot. 1. p. 547. t. 12. f. 6.) leaves lanceolate, deeply serrated, scabrous; spikes compound; branches nearly opposite. ⊙. H. Native of China, about Macao, where it is cultivated. Ludwígia octándra, Banks, herb.

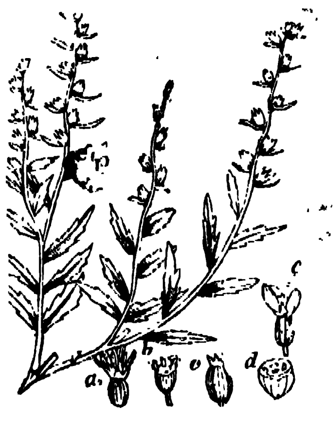
Scabrous Goniocarpus. Pl. decumbent.

3 G. MICROCA'RPUS (Thibaud, herb. ex D. C. prod. 3. p. 66.) leaves ovate, acute, serrated, glabrous on both surfaces, as well as the branches and petioles; panicle loose; flowers on short pedicels, spreading. ⊙. H. Native of New Holland. Habit of *G. micránthus*, but differs in the leaves being quite glabrous.

Small-fruited Goniocarpus. Pl. proc.

SECT. II. PTERÓGYNUS (from *πτερον*, *pteron*, a wing, and *γυνη*, *gyne*, a female; in reference to the stigmas being plumose at the apex). D. C. prod. 3. p. 66. Styles 4, ending each in a plumose pencil-formed stigma.

FIG. 102.



4 G. TETRA'GYNUS (Labill. nov. holl. t. 53.) leaves ovate, serrated, acute, rather scabrous, pilose when young, as well as the petioles and branches; spikes elongated; flowers sessile, erect. ⊙. H. Native of Van Dieman's Land (f. 102.).

Four-styled Goniocarpus. Pl. ½ foot.

5 G. TENE'LLUS (D. C. prod. 3. p. 66.) leaves oblong-lanceolate, acute, scabrous, pilose when young, as well as the petioles; stem beset with adpressed bristles; spikes elongated; flowers sessile, erect, upper ones male, the rest female. ⊙. H. Native of New Holland. Very like *G. tetrágynus*, but the stems are much more slender, the leaves much narrower, and the flowers are monoecious from abortion.

Weak Goniocarpus. Pl. ½ foot.

6 G. TEUCRIOÌDES (D. C. prod. 3. p. 66.) leaves ovate, serrated, acute, scabrous; stem hispid from spreading hairs; flowers in the axils of the upper leaves on short petioles, constituting a leafy loose raceme.—Native of New Holland. Sieb. pl. ex sic. no. 544. Stems tetragonal, much branched; branches opposite. Leaves and habit those of a species of *Teùcrium*. Flowers larger than those of any other species. Petals pilose on the back. Stamens 8. Stigmas 4, short, a little bearded. Fruit bluntly tetragonal, rather globose.

Teucrium-like Goniocarpus. Pl. decumbent.

Cult. The seeds of the species of *Goniocárpus* should be sown in the open border, in a warm sheltered situation.

III. HALORA'GIS

(from ἁλς ἁλος, *hals halos*, the sea, and ραξ ραγις, *rax ragis*, the berry of a bunch of grapes; because it grows on the sea coast, and the fruit resemble grapes in being round). Forst. gen. t. 31. D. C. prod. 3. p. 66.—Haloràgis spec. Lher. Labill.

LIN. SYST. *Octándria, Di-Tetragýnia.* Tube of calyx adnate to the ovarium; limb 4-parted. Petals 4, alternating with the lobes of the calyx. Stamens 8. Stigmas 2-4, short, sessile, papulose. Fruit nucumentaceous, dehiscent, globose, smooth, 2-4-celled, 2-4-seeded.—Smooth Australian shrubs. Leaves quite entire. Flowers axillary. *Goniocárpus* and *Cercòdia* are probably only sections of *Haloràgis*.

1 H. PROSTRA'TA (Forst. l. c. et prod. no. 179.) stems prostrate; leaves opposite, oblong, undulated; flowers solitary in the axils of the leaves; stigmas and seeds 4. ♄. G. Native of Botany Bay, New Caledonia, and the Island of Pines. Lher. stirp. nov. 1. p. 82. Willd. spec. 2. p. 474.

Prostrate Haloragis. Fl. May, Sept. Clt. 1820. Sh. pros.

2 H. DI'GYNA (Labill. nov. holl. 1. p. 100. t. 129.) stem erect; leaves alternate, linear; flowers fasciculate in the axils of the leaves; stigmas and seeds 2. ♄. G. Native of New Holland, in Van Leuwin's Land. Fruit sometimes 1-seeded from abortion.

Digynous Haloragis. Sh. 2 ft.

† *A species not sufficiently known.*

3 H. CAPE'NSIS (Nois. et Cels. ex Colla, hort. ripul. p. 63.) stem erect; leaves alternate, petiolate, elliptic, dotted beneath. ♄. G. Native of the Cape of Good Hope, ex Hort. Flowers unknown.

Cape Haloragis. Sh. 2 to 3 ft.

Cult. The species of this genus thrive well in any light rich soil, and young cuttings root freely if planted under a hand-glass.

IV. CERCO'DIA

(from κερκος, *kerkos*, a tail, and ειδος, *eidos*, like; in reference to the long narrow petals). Murr. comm. gœtt. 3. p. 1780. p. 3. t. 1. D. C. prod. 3. p. 67.—Cercòdea, Lam. ill. t. 319.—Haloràgis spec. Lher. Jacq.

LIN. SYST. *Octándria, Tetragýnia.* Tube of calyx adnate to the ovarium, which is 4-sided; limb 4-parted. Petals 4. Stamens 8. Stigmas 4, sessile. Fruit nucumentaceous, indehiscent, 4-celled, 4-seeded, 4-sided; angles winged.—Smooth Australian shrubs. Leaves opposite, toothed. Flowers in fascicles or racemose. Petals 3 times the length of the lobes of the calyx. This genus is intermediate between *Haloràgis* and *Proserpinàca*.

1 C. E'RECTA (Murr. l. c.) leaves petiolate, ovate-lanceolate, coarsely toothed; flowers sessile, aggregate in the axils of the upper leaves. ♄. G. Native of New Zealand. Tetragònia ivæfòlia, Lin. fil. suppl. 257. Haloràgis alàta, Jacq. icon. rar. 1. t. 69. exclusive of the country. Haloràgis Tetragònia, Lher. stirp. nov. 1. p. 82. Haloràgis Cercòdia, Ait. hort. kew. 2. p. 37.

Erect Cercodia. Fl. April, Sept. Clt. 1772. Sh. 1 to 2 ft.

2 C. RACEMÒSA (D. C. prod. 3. p. 67.) leaves sessile, linear-lanceolate, serrated; racemes terminal and axillary. ♄. G. Native of New Holland, in Van Leuwin's Land. Haloràgis racemòsa, Labill. nov. holl. 1. p. 100. t. 128.

Racemose Cercodia. Sh. 2 to 3 ft.

Cult. For culture and propagation see *Haloràgis*.

V. PROSERPINA'CA

(from *proserpo*, to creep; creeping rooting plants). Lin. gen. 102. Lam. ill. t. 50. Juss. ann. mus. 3. p. 320. t. 30. f. 1. D. C. prod. 3. p. 67.—Tríxis, Mitch. eph. nat. car. 1748. no. 23. Gærtn. fr. 1. p. 115. t. 24. but not of Browne.

LIN. SYST. *Triándria, Trigýnia.* Tube of calyx adhering to the ovarium, which is triquetrous; limb 3-parted. Petals none. Stamens 3. Stigmas 3, sessile on the top of the ovarium. Carpels 3, joined together into a dry indehiscent trigonal 1-seeded fruit. Seed pendulous. Albumen fleshy, or only perhaps a tumid endopleura.—Smooth aquatic North American herbs, with creeping roots. Leaves opposite. Flowers axillary, glomerate, sessile, sometimes 4-cleft and tetrandrous.

1 P. PALU'STRIS (Lin. in act. ups. 1741. p. 81.) leaves linear-lanceolate, lower ones usually pinnatifid; angles of nut acute. ♃. W. H. Native of North America, from Canada to Carolina

in ditches and ponds; and of Mexico in slow running water. Ell. sketch. 1. p. 181. Torr. fl. unit. st. 1. p. 161. P. palùstris var. α, Michx. fl. bor. amer. 1. p. 76. Tríxis, Mitch. l. c. with a figure. Tríxis palústris, Gærtn. fr. 1. p. 115.

Marsh Proserpinaca. Fl. July. Clt. 1818. Pl. cr.

2 P. PECTINA'TA (Lam. ill. 1. p. 214. t. 50. f. 1.) leaves all pinnatifidly pectinated; angles of nut blunt. ♃. W. H. Native of South Carolina, Georgia, New Jersey, and Pennsylvania. Ell. sketch. 1. p. 182. Torrey, fl. unit. st. 1. p. 162. P. palústris β, Michx. l. c. Only a variety of the preceding according to Michx, but according to Lamarck, Elliott, and Torrey it is a proper species.

Pectinate-leaved Proserpinaca. Fl. July, Aug. Clt. 1822. Pl. cr.

Cult. These plants should either be grown in large pans of water, with an inch or two of mould in the bottom for the roots to run in, or in pots set in pans of water, or they may be grown in ponds. They require some care and shelter to preserve them through the winter in Britain.

. VI. MYRIOPHY'LLUM (from μυριος, *myrios*, a myriad, and φυλλον, *phyllon*, a leaf; in reference to the numerous divisions of the leaves). Vaill. act. acad. par. 179. t. 2. Lin. gen. no. 1066. Gærtn. fr. 1. t. 68. Lam. ill. t. 775. D. C. prod. 3. p. 68.—Pentapterophýllum, Dill. nov. gen. 7.—Pentápteris, Hall. helv. 1. p. 454.

LIN. SYST. *Monœ'cia*, *Tetrándria*, and *Octándria*, *Tetragýnia*. Flowers monoecious, rarely hermaphrodite. Male. Calyx 4-parted. Petals 4, caducous, ovate, alternating with the calycine lobes. Stamens 4-6 or 8. Female. Calyx adhering to the ovarium; limb 4-lobed. Petals none. Fruit separable into 4 hard, 1-seeded, indehiscent nuts. Albumen almost absent.—Floating aquatic herbs, rising above the water to flower. Leaves finely cut, opposite or verticillate. Flowers small, disposed in axillary whorls; or in whorled spikes, in consequence of the upper leaves being almost abortive; upper ones male, lower ones female.

SECT. I. PENTA'PTERIS (from πεντη, *pente*, five, and πτερον, *pteron*, a wing; application not evident). D. C. prod. 3. p. 68. Flowers usually monoecious. Anthers oblong. Leaves opposite or often in whorls.

* *Male flowers octandrous.*

1 M. SPICA'TUM (Lin. spec. 1409.) leaves finely cut into capillary segments, disposed in whorls; flowers in whorled interrupted, almost leafless spikes; floral leaves shorter than the flowers, lower ones a little serrated, the rest quite entire. ♃. W. H. Native of Europe and North America, in ditches, lakes, and pools, never in flowing water; plentiful in Britain. Fl. dan. 681. Smith, engl. bot. t. 83. Schkuhr, handb. t. 296. Petals reddish.

Spiked Water-milfoil. Fl. June, Aug. Britain. Pl. fl.

2 M. PECTINA'TUM (D. C. fl. fr. suppl. 529.) leaves finely cut into capillary segments, disposed in whorls; flowers in whorled, interrupted, almost leafless spikes; floral leaves a little longer than the flowers, all pectinately serrated. ♃. W. H. Native about Montpelier, in still water, and Denmark, and probably through the whole of Europe. Habit of the preceding species, but differing in the floral leaves. It appears to be intermediate between *M. spicàtum* and *M. verticillàtum*.

Pectinate-leaved Water-milfoil. Pl. fl.

3 M. ALTERNIFÒLIUM (D. C. fl. fr. suppl. p. 529.) leaves finely cut, disposed in whorls; flowers in nearly leafless spikes, alternate, lower ones in fascicles, the rest solitary; lower floral leaves pinnatifid, exceeding the flowers, upper ones entire, short. ♃. W. H. Native of the west of France, in still water about Nantes, and in Vascony. M. alternifòlium, Steud. nom.

Alternate-leaved Water-milfoil. Pl. fl.

4 M. VERTICILLA'TUM (Lin. spec. 1410.) leaves finely cut into capillary opposite segments; flowers in axillary whorls; floral leaves all pinnatifid, much longer than the flowers, and hardly distinguishable from the other leaves. ♃. W. H. Native of Europe and North America, in pools, lakes, and ditches, but never in running water. Smith, engl. bot. 218.—Clus. hist. 2. p. 252.

Var. β, *limòsum* (Heet. in litt.) lobes of leaves linear, acute, and regular. ♃. H. Native of Europe, in almost dry places.

Whorled-flowered Water-milfoil. Fl. Ju. Aug. Brit. Pl. fl.

5 M. QUITE'NSE (H. B. et Kunth, nov. gen. amer. 6. p. 89.) leaves finely cut into filiform lobes, about 15 lobes on each side. ♃. W. S. Native of the Andes about Quito, in the river Guancabamba.

Quito Water-milfoil. Pl. fl.

6 M. I'NDICUM (Willd. spec. 4. p. 407.) leaves in whorls, lower ones finely cut into capillary segments, upper ones lanceolate, cuneated, rather cut at the apex; flowers axillary, verticillate. ♃. W. S. Native of Ceylon and Coromandel. The flowers are said to be hermaphrodite.

Indian Water-milfoil. Pl. fl.

7 M. ELATINOÌDES (Gaud. fl. mal. p. 17. ann. sc. nat. 5. p. 105.) leaves 4 in a whorl, lower ones cut into capillary segments, upper ones pinnatifid, toothed or entire, oblong-lanceolate; flowers dioecious, female ones axillary. ♃. W. F. Native of the Maclove and F[illegible]nd Islands. Male flowers unknown.

Elatine-like Wat[illegible]ilfoil. Pl. fl.

8 M. TERNA'TUM (Gaud. l. c.) leaves 3 in a whorl, lower ones cut into capillary lobes, upper ones oblong, quite entire; flowers axillary, upper ones male, octandrous, lower ones female. ♃. W. F. Native of the Falkland Islands.

Ternate-leaved Water-milfoil. Pl. fl.

9 M. AMPHI'BIUM (Labill. nov. holl. 2. p. 70. t. 220.) leaves opposite, obovate, entire; flowers axillary, solitary. ♃. B. G. Native of Van Dieman's Land, in marshes. A creeping herb, with the habit of *Callitriche*. Flowers monoecious, male ones octandrous.

Amphibious Water-milfoil. Pl. cr.

* * *Male flowers hexandrous.*

10 M. HETEROPHY'LLUM (Michx. fl. bor. amer. 2. p. 191.) leaves in whorls, cut into capillary segments; spikes terminal, almost naked; floral leaves opposite, ovate, acute, sharply serrated, exceeding the flowers. ♃. W. H. Native of Carolina and Georgia, in still water. Potamogèton verticillàtum, Walt. car. p. 90.

Variable-leaved Water-milfoil. Pl. fl.

* * * *Male flowers tetrandrous.*

11 M. TUBERCULA'TUM (Roxb. fl. ind. 1. p. 471.) leaves in whorls, lower ones pinnatifid; spikes almost naked; bracteas oblong, a little toothed at the apex; carpels tubercular, acute on the back. ♃. B. S. Native of humid places and on the shores of lakes, near Calcutta. Flowers pink.

Tubercled-fruited Water-milfoil. Pl. fl.

12 M. INTERME'DIUM (D. C. prod. 3. p. 69.) leaves in whorls, lower ones cut into filiform lobes; floral ones oblong-linear, serrated, acuminated at both ends; carpels rather tubercular, blunt on the back. ♃. W. S. Native of the East Indies. Ammánnia pinnatífida, Lin. fil. suppl. 127.? Hottònia sessiliflòra, Vahl. symb. 2. p. 36. Willd. spec. 1. p. 813.?

Intermediate Water-milfoil. Pl. fl.

13 M. TETRA'NDRUM (Roxb. fl. ind. 1. p. 470.) leaves dis-

posed in whorls, cut into capillary segments; spikes almost leafless; bracteas pinnatified; carpels smoothish, blunt on the back. ♃. W. S. Native of the East Indies, in pools filled by the rain, and where it is called *Neerla-pamarum* by the Telingas. Flowers white.

Tetrandrous Water-milfoil. Pl. fl.

14 M. SCABRA'TUM (Michx. fl. bor. amer. 2. p. 190.) leaves in whorls, cut into linear distant lobes; flowers in axillary whorls; bracteas much like the leaves; fruit 8-angled; angles tubercular. ♃. W. H. Native of Carolina, Georgia, and North California, in stagnant water. Potamogèton pinnàtum, Walt. fl. car. 90. Carpels more closely connected than in any of the other species.

Scabrous-fruited Water-milfoil. Pl. fl.

15 M. TENE'LLUM (Bigel. fl. bost. ed. 2. p. 346. D. C. prod. 3. p. 69.) stem simple, almost leafless, erect, rooting at the base; leaves scale-formed, alternate, entire; flowers in the axils of the upper leaves, as well as disposed in interrupted spikes, having the flowers alternate. ♃. W. H. Native of North America, in watery places about New Cambridge, and in Newfoundland. Hýlas aphýllus, Bigel. mss. M. nùdum, Lapylaie, mss.

Slender Water-milfoil. Pl. fl.

SECT. II. PTILOPHY'LLUM (from πτιλον, ptilon, a soft feather, and φυλλον, *phyllon*, a leaf; in reference to the narrow segments of the leaves.). Nutt. gen. amer. 2. p. 211.—Púrshia, Rafin. but not of D. C. Flowers all hermaphrodite, tetrandrous. Petals wanting. Anthers roundish. Stig[illegible] minute, pubescent. Leaves alternate.

16 M. AMBI'GUUM (Nutt. l. c.) leaves alternate, petiolate, lower ones cut into capillary lobes, upper ones into linear lobes, uppermost ones almost entire or serrated. ♃. W. H. Native of North America, in ponds in New Jersey.

Var. α, *nàtans* (D. C. prod. 3. p. 70.) stems floating, dichotomous. ♃. W. H. Native of Jersey, New York, floating in water.

Var. β, *limòsum* (Nutt. l. c.) stem rooting, erect; leaves stiff, almost entire or trifid; lobes setaceous, acute. ♃. B. H. Native on the banks of the Delaware, and in New Jersey.

Ambiguous Water-milfoil. Pl. fl.

Cult. All the species of *Myriophýllum* being aquatic plants if cultivated should be grown in ponds, in which they may be either planted or the seeds thrown in. Small parts of the tropical species should be taken up in the autumn, planted in a pan of water, and then to be placed in the stove, in order to preserve them in a living state during the winter; and in the course of the April or May next season may again be returned to the pond in the open air, where they will thrive much better than if grown all the year round in pans of water or cisterns in a hot-house. None of the species are, however, worth growing except in botanical gardens.

Tribe II.

CALLITRICHI'NEÆ (plants agreeing with *Callitriche* in important characters). Link, enum. hort. berol. 1. p. 7. D. C. prod. 3. p. 70. Limb of calyx hardly discernible. Petals wanting. Stamen 1, rarely 2. Fruit 4-celled, 4-seeded (f. 103. *c*.).—Aquatic herbs, with opposite leaves, and insignificant axillary solitary flowers.

VII. CALLI'TRICHE (a name given by Pliny to a plant which had the colour of beautiful hair, from καλλος, *kallos*, beautiful, and θριξ τριχος, *thrix trichos*, a hair, but the present genus has nothing to do with the plant of Pliny). Lin. gen. 13. Lam. ill. t. 5. Gærtn. fruct. 1. p. 330. t. 68. A. Richard, dict. class. 3. p. 59. D. C. prod. 3. p. 70.—Stellària, Dill. gen. p. 119. t. 6. but not of Lin.

LIN. GEN. *Monándria*, *Monogýnia*, or *Polygàmia*, *Monœ'cia*. Flowers usually bisexual, monoecious, with 2 opposite petaloid bracteas at the base of each flower. Styles 2 (f. 103. *a*.), subulate.—Smooth annual aquatic herbs.

1 C. VE'RNA (Lin. spec. 2.) leaves triple-ribbed, the uppermost crowded and obovate; margin of fruit obtuse; fruit sessile. ⊙. W. H. Native throughout the whole of Europe, and of North America, in ditches and slow running streams; plentiful in Britain. Smith, engl. bot. t. 722. Wahl. fl. lapp. 2. Wallr. ann. bot. p. 1. C. aquática var. Smith, fl. brit. 1. p. 8. C. séssilis, Vahl. var. D. C. fl. fr. ed. 3. no. 3655. C. pállens, Goldb. act. mosc. 5. p. 118. Gray, brit. pl. 2. p. 555.

Var. α, *vulgàris* (D. C. prod. 3. p. 70.) leaves all obovate. C. vérna, Fl. dan. t. 129. C. aquática, Huds. fl. ang. p. 397.

Var. β, *intermèdia* (Hoffm. fl. germ. 1791. p. 2.) lower leaves linear, obtuse or emarginate, upper ones oval. Schkuhr, handb. t. 1. Pursh, fl. amer. sept. 1. p. 3. C. aquática, Bigel. fl. bost. p. 2.

Var. γ, *lineàris* (D. C. l. c.) leaves all linear, upper ones scarcely obovate, 3-nerved. In ditches about Moscow. Stems short, creeping.

Var. δ, *stellàta* (Hopp. bot. tasch. 1792. p. 758.) leaves all oval; stems short. C. æstivàlis, Thuill. fl. par. p. 2.

Var. ε, *cæspitòsa* (Schultz, prod. starg. p. 3.) leaves all oval, stiffish, small; stems short, stellately spreading. In very shallow water or among mud. C. vérna mínima, Wallr. ann. bot. p. 1.

Var. ζ, *rigídula* (Wallr. in litt. D. C. prod. 3. p. 70.) leaves all ovate-oblong, opaque, stiffish; stems rooting. Native of Thuringia.

Var. ϑ, *tenuifòlia* (Pers. ench. 1. p. 5.) leaves all linear, upper ones 3-nerved. In humid, hardly inundated places.

To this polymorphous species the following names probably appertain, viz. *C. dioíça*, Pentag. inst. bot. 2. p. 10. *C. Brùtia*, Pentag. l. c. *C. andrógyna* or *C. hermaphrodìta*. Schum; but these are extremely doubtful.

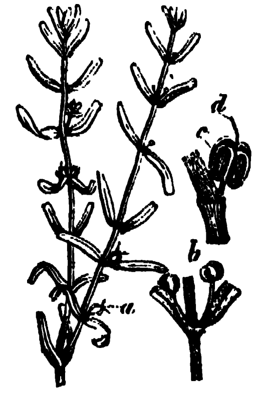
Spring Water-starwort. Fl. April, Oct. Britain. Pl. fl.

2 C. PEDUNCULA'TA (D. C. fl. fr. ed. 3. no. 3656.) lower leaves linear, upper ones oblong, 3-nerved; fruit pedicellate; margin of carpels obtuse. ⊙. W. H. Native of France, in stagnant water; also of Scotland, in ditches. Hook, in engl. bot. suppl. 2606. Stalk of fruit from 1 to 3 lines long, upper ones the shortest.

Stalked-fruited Water-starwort. Fl. Apr. Oct. Scotl. Pl. fl.

3 C. AUTUMNA'LIS (Lin. spec. p. 2.) leaves linear, abrupt, single ribbed, uniform; fruit sessile; margin of fruit membranous. ⊙. W. H. Native throughout Europe and North America, in clear pools, lakes, and slow running streams. Smith, engl. bot. t. 722. f. 2. C. aquática, var. Smith, fl. brit. 1. p. 8. C. séssilis var. D. C. fl. fr. C. angustifòlia, Hoppe, bot. tasch. 1792. p. 155. C. lineàris, Pursh, fl. amer. sept. 1. p. 3. C. vìrens, Goldb. act. mosc. 5. p. 119. Gray. brit. pl. 2. p. 556.—Gmel. sib. 3. t. 1. Flowers often hermaphrodite. Cells of leaves very fine. This plant is distinguished by its narrower leaves and deeper green colour at first sight.

FIG. 103.



Autumnal Water-starwort. Fl. June, Oct. Britain. Pl. fl.

4 C. TERRE'STRIS (Rafin. med. spec. xi. p. 358.) leaves approximate, short, oblong, obtuse, rather succulent; fruit sessile,

broad, short, emarginate. ⊙. W. H. Native of North America, in marshes and on the borders of rivers, especially in New Jersey. Torrey, fl. un. st. 1. p. 4. C. brevifòlia, Pursh, fl. amer. sept. 1. p. 3. Plant procumbent, diffuse.

Ground Water-starwort. Pl. proc.

Cult. The species of *Callítriche* are not worth cultivating. The seeds only require to be thrown in a pond of water, or the plants may be planted in it.

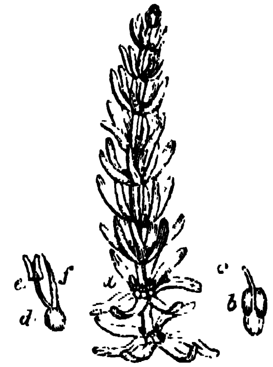
Tribe III.

HIPPURI'DEÆ (plants agreeing with *Hippùris* in important characters). Link, enum. hort. berl. 1. p. 5. Limb of calyx small, entire. Petals wanting. Stamen 1 (f. 104. *c*.). Fruit nucamentaceous (f. 104. *d*.), 1-celled, 1-seeded. Aquatic herbs, with whorls of narrow leaves and whorls of axillary sessile flowers.

VIII. HIPPU'RIS (from ιππος, *hippos*, a horse, and ουρα, *oura*, a tail; resemblance in stem from the crowded whorls of very narrow hair-like leaves). Lin. gen. no. 11. Lam. ill. t. 5. Gærtn. fruct. 2. t. 84. Juss. ann. mus. 3. t. 30. f. 3. D. C. prod. 3. p. 71.—Pinastélla, Dill. nov. gen. 168.

Lin. syst. *Monándria, Monogýnia.* Style filiform (f. 104. *f*.), received into the furrow of the anther (f. 104. *e*.). Fruit crowned by the limb of the calyx. Flowers usually hermaphrodite, but sometimes are found female and neuter from abortion.

FIG. 104.



1 H. vulga'ris (Lin. spec. p. 3.) leaves linear, many in a whorl, usually from 6-12. ♃. W. H. Native throughout Europe and North America, in ditches and lakes, in muddy places among grass and weeds. Œder. fl. dan. t. 87. Smith, engl. bot. t. 763. Drev. et Heyne, pl. cur. t. 93. Poit. fl. par. 1. t. 1. According to Torrey in fl. un. st. 1. p. 2. the Pennsylvanian and Canadian plant does not differ from the European, but the Hudson's Bay one is probably distinct according to Pursh, fl. amer. sept. 2. p. 774. and is probably the H. polyphýlla of Rafin. fl. lud. p. 13. Root creeping much.

Var. β, *fluviátilis* (Hoffm. fl. germ. 3. p. 1.) leaves longer, and membranous. ♃. W. H. Native of deep water, from which it hardly emerges. H. alopecùrus, Brouss. cat. hort. monsp. 1804. Compare D. C. fl. fr. 4. p. 415.

Common Marestail. Fl. May, June. Britain. Pl. 1 foot.

2 H. monta'na (Ledeb. in Rchb. icon. bot. 1. t. 86. no. 181.) plant weak; leaves 7 in a whorl, linear, acute. ♃. W. H. Native of the island of Unalaschka, in ditches and lakes. H. Eschòlzii, Cham. in litt. Habit of a species of *Gàlium*. Perhaps only a variety of *H. vulgàris*.

Mountain Marestail. Pl. ½ foot.

3 H. mari'tima (Hellen. diss. with a figure,) leaves linear, obtuse, 4 in the lower whorls, and 5-7 in the upper whorls. ♃. W. H. Native of Sweden and Finland, &c. in salt water. Horn. fl. dan. t. 1261. Rchb. t. 86. f. 182. H. lanceolàta, Retz, obs. 3. p. 7. t. 1. H. tetraphýlla, Lin. fil. suppl. 81. The leaves are much shorter and a little broader than those of *H. vulgàris*.

Maritime Marestail. Pl. 1 foot.

Cult. Not worth cultivating unless in botanical gardens. The species should be grown in ponds or cisterns of water, if cultivated.

Order XCV. CERATOPHY'LLEÆ (plants agreeing with *Ceratophýllum* in important characters). Gray. brit. pl. 2. p. 554. D. C. prod. 3. p. 73.

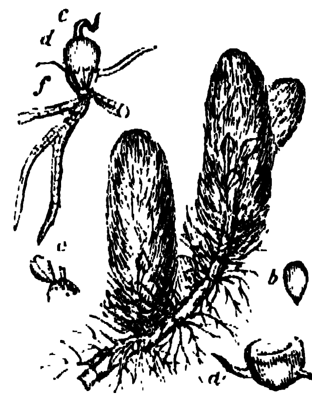
Flowers monoecious. Calyx or perigone free, many-parted (10-12); lobes equal. Petals none. Male. Stamens 12-20; filaments wanting; anthers ovate-oblong, 2-celled, sessile, and crowded in the centre of the calyx, furnished each with 2 (f. 105. *d*.) -3 points. Female. Ovary free, ovate, 1-celled. Stigma sessile, filiform, incurved, oblique (f. 105. *e*.). Nut 1-celled, 1-seeded (f. 105. *b*.), indehiscent, terminated by the hardened style. Seeds pendulous. Albumen none. Embryo straight, with a superior radicle, 4 cotyledons in a whorl, which are alternately smaller, and a many-leaved plumule.—Floating herbs, with whorls of multifid cellular leaves (f. 105. *f*.); the segments filiform, and serrated along the edges.

This is a very distinct order, but whose proper station in the natural system is not well known. It agrees with *Coníferæ* in the many-whorled cotyledons, but the habit is wholly different. In habit it agrees with *Myriophýllum* on the one hand, and on the other with *Hippùris*, and in many characters with the last, especially in the want of petals, in the 1-celled ovary, in the nucamentaceous fruit, in the solitary pendulous seed, as well as in habit, from the leaves being in whorls, from the axillary sessile, usually unisexual flowers, and in its habitat, but differs in the free ovarium an[illegible] many cotyledons.

I. CERATOPHY'LLUM (from κερας, *keras*, a horn, and φυλλον, *phyllon*, a leaf; in reference to the leaves being branched, like a stag's horn). Lin. gen. no. 1055. Gærtn. fruct. 1. p. 211. t. 44. Lam. ill. t. 775. Schkuhr, handb. 3. p. 254. t. 297.—Hydroceratophy'llum, Vaill. act. par. 1719. t. 2. f. 2. Dichotophýllum, Dill. gen. p. 91. t. 3.

Lin. syst. *Monœ̀cia, Polyándria.* The character is the same as that of the order, being the only genus.

FIG. 105.



1 C. deme'rsum (Lin. spec. 1409.) fruit armed with 3 spines, which are unequal, 1 terminal, and 2 lateral (f. 105. *c. d*.); segments of the calyx notched at the extremity. ♃. W. H. Native of Europe, in ditches and ponds, and all still water; plentiful in some parts of Brítain. Smith, engl. bot. t. 947. C. cornùtum, Rich. l. c. Gray. brit. pl. 2. p. 554. Dichotophy'llum demérsum, Mœnch. meth. 345. Vaill. l. c. t. 2. f. 1. Loes. pruss. t. 12. Leaves dichotomous, somewhat trifid, a little toothed along the lobes, when young crowded. (f. 105.)

Demersed Hornwort. Fl. Aug. Sept. Britain. Pl. fl.

2 C. subme'rsum (Lin. spec. 1409.) fruit destitute of spines, but furnished with 2 tubercles at the sides, and the base of the style at the apex; segments of the calyx acute, entire. ♃. W. H. Native of Europe, in ditches, ponds, and all still water with a muddy bottom; and of Porto Rico in the West Indies; plentiful in Britain. Oed. fl. dan. 510. Smith, engl. bot. t. 679. Schkuhr, handb. t. 297. C. verrucòsum, Rich. l. c. Gray, l. c. Leaves rather more divided than those of the first species, and the young ones are less crowded.

Submersed Hornwort. Fl. Sept. Britain. Pl. fl.

3 C. platyca'nthum (Cham. in Linnæa. 4. p. 504. t. 5. f. 6. a.) fruit obovate, winged, armed with 3 spines, with a few teeth between the spines; spines elongated, lateral ones flat. ♃. W. H. Native of California. C. demérsum, Schlecht. fl. berol. 1. p. 486.

Broad-spined Hornwort. Pl. fl.

4 C. oxyaca'nthum (Cham. in Linnæa. 4. p. 504. t. 5. f. 6. b.) fruit elliptic, compressed, armed with 3 spines; spines terete, elongated. ♃. W. H. Native of California?

Sharp-spined Hornwort. Pl. fl.

5 C. murica'tum (Cham. in Linnæa. 4. p. 504. t. 5. f. 6. c.) fruit elliptic, compressed, winged, muricated, armed with 3 spines; spines slender, weak; wing narrow, many-toothed. ♃. W. H. Native of Egypt and California? C. demérsum, Sieb. pl. ægypt.

Muricated-fruited Hornwort. Pl. fl.

6 C. tubercula'tum (Cham. in Linnæa. 4. p. 504. t. 5. f. 6. d.) fruit elliptic, rather compressed, finely tubercled, armed with 3 spines; spines slender, weak; wing none. ♃. W. S. Native of the East Indies. C. I'ndicum, Willd. herb. no. 17546. C. demérsum, Klein.

Tubercled-fruited Hornwort. Pl. fl.

7 C. apicula'tum (Cham. in Linnæa. 4. p. 504. t. 5. f. 6. e.) fruit elliptic, compressed, armed with one spine, and furnished with a tubercle on each side; spine weak; wing none. ♃. W. H. Native of Europe. C. submérsum, D. C. and Schkuhr handb. t. 297.

Apiculated Hornwort. Pl. fl.

Cult. The plants of this genus grow in ponds, pools, or ditches, but are not worth cultivating except in botanical gardens.

Order XCVI. LYTHRARIE'Æ (plants agreeing with *Lýthrum* in important characters). Juss. dict. sc. nat. 27. p. 453. D. C. mem. soc. gen. 3. pt. 2. p. 65. prod. 3. p. 75.—Salicarièæ, Juss. gen. 330.—Calycanthèmæ, Vent. tabl. 3. p. 298.—Salicarinæ, Link, enum. 1. p. 142.

Calyx monosepalous (f. 106. *a.* f. 107. *a.*), with a tubular (f. 107. *a.*) or campanulate tube; lobes valvate or separate in æstivation, their sinuses sometimes lengthened into other lobes (f. 106. *b.*), which are produced on the outside. Petals variable in number (f. 106. *c.*), inserted between the lobes of the calyx, very deciduous; sometimes wanting altogether. Stamens inserted into the tube of the calyx below the petals, to which they are sometimes equal in number; sometimes they are twice, thrice, or even 4-times as numerous, but they are very seldom fewer; anthers oval, 2-celled, inserted by the back (f. 106.). Ovarium free, 2 or 4-celled. Style filiform; stigma usually capitate (f. 106. *c.*). Capsule membranous, covered by the calyx (f. 106. *a.*), 1-celled, opening either longitudinally or in an irregular manner. Seeds numerous, small, exalbuminous, adhering to the central placenta. Embryo straight, with the radicle turned towards the hylum, and the cotyledons flat and foliaceous.—Herbs, rarely shrubs. Branches terete, but most frequently tetragonal. Leaves opposite, seldom alternate, entire, feather-nerved, without either stipulas or glands. Flowers axillary, or in spikes or racemes at the tops of the branches. This order is nearly allied to *Onagràriæ*, from which it is distinguished by the free, ribbed calyx. It is also separated from *Melastomàceæ* in the ovary being free and in the different position of the veins of the leaves. Astringency is the property of *Lýthrum Salicària*, which is reputed to have been found useful in inveterate diarrhœas; another species of the same genus is reputed, in Mexico, to be astringent and vulnerary. The flowers of *Lýthrum Hunteri* are employed in India, mixed with *Morínda*, for dyeing, under the name of *Dhawry*. The Mexicans consider *Heimia salicifòlia* a potent remedy in venereal diseases, and call it *Hauchinol;* its expressed juice, taken in doses of 4 ounces, excites violent perspiration. *Lawsònia inérmis* is the plant from which the henna of Egypt is obtained. Women of that country stain the nails of their fingers and feet with it. It is also used for dyeing skins and maroquins reddish-yellow, and for many other purposes. It contains no tannin. (Edinb. phil. journ. 12. p. 416.) The leaves of *Ammánnia vesicatòria* have a strong muriatic smell, they are extremely acrid, and are used by the native practitioners of India to raise blisters in rheumatisms, &c.; bruised and applied to the part intended to be blistered, they perform their office in half an hour, and most effectually. (Ainly 2. p. 93.)

Synopsis of the genera.

Tribe I.

Salicarie'æ. *Lobes of calyx separate or somewhat valvate in æstivation. Petals numerous* (f. 106. *c.*). *Alternate lobes of calyx at the sinuses formed from the other lobes. Seeds wingless.*

1 Rota'la. Calyx tubular, 3-toothed. Petals none. Stamens 3, inserted in the middle of the tube. Capsule 3-celled.

2 Chrytothe'ca. Calyx funnel-shaped, 4-cleft. Petals 4, small, or wanting. Stamens 2, inserted in the bottom of the calyx. Capsule 1-celled.

3 Suffre'nia. Calyx campanulate, 4-lobed, and furnished with a little tooth at each recess. Petals wanting. Stamens 2, inclosed. Capsule 2-valved, hardly 2-celled.

4 Amele'tia. Calyx campanulate, 8-lobed, the 4 at the sinuses tooth-formed. Petals wanting. Stamens 4. Capsule 1-celled, 2-valved.

5 Pe'plis. Calyx campanulate, 12-lobed, the 6 that rise from the sinuses smaller. Petals 6, small. Stamens 6. Capsule 2-celled.

6 Amma'nnia. Calyx campanulate, 8-14-toothed, those rising from the sinuses the smallest. Petals 4-7, but sometimes wanting. Stamens equal in number to the petals, rarely twice that number. Capsule 4-celled, or when mature only 1-celled.

7 Ly'thrum. Calyx 8-12-toothed, the alternate ones at the sinuses smaller and spreading. Petals 4-6, equal, inserted in the orifice of the calyx. Stamens equal in number, or twice the number of the petals, inserted in the middle or at the base of the calyx. Capsule 2-celled.

8 Cu'phea. Calyx tubular, 12-toothed. Petals 6-7, unequal. Stamens 11-14, rarely 6-7, unequal, inserted in the orifice of the calyx. Capsule 1-2-celled.

9 Acisanthe'ra. Calyx ventricose, 5-cleft. Petals 5. Stamens 12. Capsule round, covered, and crowned by the calyx, 2-celled.

10 Fatio'a. Calyx campanulate, 6-cleft, valvate in æstivation. Petals 6. Stamens 24, inserted in the bottom of the tube. Ovary 3-celled.

11 PE'MPHIS. Calyx turbinate, 12-lobed, the 6 at the sinuses the smallest. Petals 6. Stamens 12. Capsule 6-valved, 3-celled at the base.

12 HEI'MIA. Calyx bibracteolate at the base, campanulate, 12-lobed, those at the sinuses horn-formed. Petals 6. Stamens 12., nearly equal. Ovarium 4-celled.

13 DIPLU'SODON. Calyx bibracteate at the base (f. 106. *a.*), 12-lobed (f. 106. *b.*), those at the sinuses narrowest, the rest triangular. Petals 6 (f. 106. *c.*). Stamens 6-12-18-24-30-36. Capsule 2-valved, 2-celled, but at maturity only 1-celled.

14 PHYSOCALY'MNA. Calyx campanulate, 8-toothed, without any at the sinuses. Petals 8, rising from the sinuses of the calyx. Stamens 24. Capsule globose, 1-celled.

15 DE'CADON. Calyx campanulate, with 5 erect lobes, and 5 horn-formed ones at the sinuses. Petals 5. Stamens 10, 5 of which are very long. Ovary 3-celled.

16 NESÆ'A. Calyx campanulate, with 4-6 erect lobes, and as many horn-formed ones at the sinuses. Petals 4-6. Stamens 8-12, nearly equal. Ovarium 4-celled.

17 CRE'NEA. Calyx urceolate, 4-cleft. Petals 4. Stamens 8. Capsule 1-5-celled.

18 LAWSÒNIA. Calyx 4-parted. Petals 4. Stamens 8. Capsule 4-celled, globose.

19 ABA'TIA. Calyx subturbinate; limb 4-parted. Petals wanting. Stamens about 20, inserted near the base of the calycine tube. Capsule 1-celled, 2-valved, opening at the apex.

20 ANTHERY'LIUM. Calyx 4-parted, equal. Petals 4. Stamens 12-16. Capsule 3-4-valved, and probably 3-4-celled, when young.

21 DODE'CAS. Calyx with an urceolate tube and a 4-cleft limb. Petals 4. Stamens 12. Capsule 4-valved, 1-celled.

22 GINÒRIA. Calyx campanulate, 6-cleft. Petals 6. Stamens 12. Capsule 4-valved, 1-celled, dehiscent at the apex.

23 ADENA'RIA. Calyx campanulate, 4-5-cleft. Petals 4-5. Stamens 8-10. Ovary 2-celled. Fruit globose.

24 GRI'SLEA. Calyx tubular (f. 107. *a.*), with 4-6 erect teeth, and as many horn-formed, spreading ones at the sinuses. Petals 4-6. Stamens 8-12. Ovary 2-celled. Capsule globose (f. 107. *d.*).

TRIBE II.

LAGERSTRŒMIE'Æ. *Lobes of calyx valvate in the bud. Petals the same number as the lobes of the calyx, and inserted at its divisions at the top of the tube. Stamens inserted lower down in the calyx than the petals, twice or thrice the number of the petals. Seeds expanded into a membranous wing.—Shrubs or trees.*

25 LAGERSTRŒ'MIA. Calyx bibracteolate at the base, 6-cleft. Petals 6. Stamens 18-30. Capsule 3-6-valved, 3-6-celled.

26 LAFOE'NSIA. Calyx bibracteate at the base, campanulate, 8-10-toothed. Petals 10-12. Stamens 20-24. Ovary 2-celled. Berry spherical.

† *Genera belonging to Lythrarièæ, but are not sufficiently known.*

27 PHYSOPÒDIUM. Calyx turbinate, 5-toothed. Petals 5. Stamens 10. Ovary oblong.

28 SYMME'TRIA. Calyx campanulate, 6-cleft. Petals 6. Stamens 12. Ovarium 4-celled; cells biovulate. Drupe baccate, 1-3-celled; cells containing a one 1-seeded reniform nut each.

Tribe I.

SALICARIE'Æ (so named from the plants agreeing in habit and character with *Lythrum Salicària*, which has received its specific name from its resemblance to *Sàlix* in its leaves). D. C. mem. soc. h. n. gen. 3. pt. 2. p. 71. D. C. prod. 3. p. 75. Lobes of calyx more or less separate in æstivation, or somewhat valvate. Petals many, alternating with the lobes of the calyx, and inserted at the top of the tube at the divisions; sometimes wanting. Stamens inserted in the tube of the calyx below the petals. Seeds wingless.—Herbs or shrubs.

I. ROTA'LA (from *rota*, a wheel; in reference to the whorled leaves of the species). Lin. mant. 175. St. Hil. mem. mus. 2. p. 381. D. C. prod. 3. p. 75.

LIN. SYST. *Triándria, Monogýnia.* Calyx membranous, tubular, 3-toothed. Petals wanting. Stamens 3, inserted in the middle of the tube of the calyx. Capsule covered by the calyx, 3-valved, 3-celled, many seeded.—Small herbs. Leaves sessile, spreading. Flowers minute, axillary, solitary.

1 R. VERTICILLA'RIS (Lin. l. c.) leaves 4-8 in a whorl, linear, acute. ⊙. B. H. Native of the East Indies. En-epael, Rheed. mal. 9. t. 81. ex Lin. Capsule 3-valved, 3-celled.

Whorled-leaved Rotala. Pl. ½ foot.

2 R. DECUSSA'TA (D. C. prod. 3. p. 76.) leaves opposite, oval-oblong. ⊙. B. H. Native of New Holland, at Endeavour River. Ortegioìdes decussàta, Sol. mss. Entèlia ammannioìdes, R. Br. ex Salisb. in litt. Capsule 3-valved, many-seeded. Calyx 3-5? toothed? Stamens 3? Habit of *Pèplis* or *Ammánnia*.

Decussate-leaved Rotala. Pl. ½ foot.

3 R. MEXICA'NA (Schlecht. et Cham. in Linnæa. 5. p. 567.) leaves 3-4 in a whorl, usually opposite towards the tops of the branches, linear, a little dilated at the base; flowers in whorls; capsule 3-valved, 1-celled. ⊙. W. H. Native of Mexico, in slow running water, near Hacienda de la Laguna.

Mexican Rotala. Pl. 1½ inch.

Cult. Sow the seeds in a warm moist sheltered place in the open border.

II. CRYPTOTHE'CA (κρυπτος, *cryptos*, hidden, and θηκα, *theca*, a cover; capsule hidden by the calyx). Blum. bijdr. p. 1128. D. C. prod. 3. p. 76.

LIN. SYST. *Diándria, Monogýnia.* Calyx funnel-shaped, 4-cleft. Petals 4, small, or wanting. Stamens 2, opposite, inserted in the bottom of the calyx; anthers roundish. Style 1, lateral, obtuse. Capsule girded by the calyx, 1-celled, irregularly circumcised at the apex. Seeds numerous.—Suffruticose, branched herbs from Java, with angular stems. Leaves opposite. Peduncles axillary, many-flowered. This genus agrees with *Suffrènia* in the number of the stamens, and in the inflorescence with *Ammánnia.*

1 C. DICHÓTOMA (Blum. l. c.) leaves linear-lanceolate, broadest at the base, half stem-clasping; corymbs dichotomous; flowers 4-petalled. ♄. B. S. Native of Java, in bogs about Batavia, and on the margins of rivers about Buitenzorg.

Dichotomous Cryptotheca. Shrub 1 foot.

2 C. APE'TALA (Blum. l. c.) leaves on short petioles, lanceolate; peduncles many-flowered; flowers apetalous. ♄. B. S. Native of Java, on the banks of the river Tjidanie, in the province of Tjanjor.

Apetalous Cryptotheca. Shrub 1 foot.

Cult. These plants will do well in a mixture of loam, peat, and sand, and cuttings will root in sand under a bell-glass. The pots in which the plants are grown should be always kept in pans of water.

III. **SUFFRE'NIA** (in honour of De Suffren, a French botanist, author of Principes de Botanique, suivis d'un catalogue des plantes de Frioul et de Carnia, 1 vol. 8vo. Venice, 1802). Bell. act. taur. 7. t. 1. f. 1. D. C. prod. 3. p. 76.

Lin. syst. *Decándria, Monogýnia.* Calyx tubularly-campanulate; lobes 4, erect, ovate, acute; teeth 4, small at the sinuses. Petals wanting. Stamens 2, inclosed, inserted in the tube of the calyx. Style filiform; stigma capitate. Capsule oblong, 2-valved, when young 2-celled, but in the adult state only 1-celled, the dissepiment having vanished at the apex, many-seeded.—A nearly simple, erect herb. Leaves opposite, quite entire. Flowers small, sessile, solitary, axillary.

1 S. filifórmis (Bell. l. c.). ⊙. B. H. Native of Ticin, about Vercelli in rice-fields. D. C. fl. fr. no. 3651. exclusive of the synonyme of Lobel. Herb weak, 3-6 inches long. Flowers yellowish.

Filiform Suffrenia. Pl. ½ to 1½ foot.

Cult. The seed to be sown in wet or marshy ground in the open air.

IV. **AMELE'TIA** (from αμελητος, *ameletos*, neglected. The present genus was formerly included in the genus *Péplis*, from its characters having been overlooked). [illegible] C. mem. soc. hist. nat. gen. 3. pt. 2. p. 82. prod. 3. p. 76. Péplis species of Willd.

Lin. syst. *Tetrándria, Monogýnia.* Calyx campanulately-tubular; larger lobes 4, erect, ovate, acuminated, connivent, smaller ones 4, tooth-formed at the sinuses. Petals none. Stamens 4, inserted in the tube of the calyx. Ovarium ovate. Style filiform; stigma capitate. Capsule ovate, when young 2-celled, but in the adult state only 1-celled, from the dissepiment having vanished, 2-valved, many-seeded.—An herb with opposite, entire leaves. Spikes axillary, sessile, bracteate. Flowers small, bibracteolate at the base, sessile along the rachis, rising from the axils of the elongated bracteas. This genus is intermediate between *Ammánnia* and *Péplis.* The habit is peculiar.

1 A. I'ndica (D. C. l. c. t. 3. f. A.).—Native of the East Indies. Péplis I'ndica, Willd. spec. 2. p. 244. Ammánnia peploìdes, Spreng. syst. 1. p. 444. Branches nearly tetragonal. Leaves obovate-oblong, feather-nerved, bluntish. Spikes rather longer than the leaves. Bracteas linear-oblong, acute, longer than the flowers.

Indian Ameletia. Pl. ½ foot.

Cult. The seeds of this plant should be sown thinly in a pot, which should be placed in a hot-bed, and when the plants are about 2 inches high, the pot may be removed to the stove or greenhouse, where the plants will flower and ripen their seed.

V. **PE'PLIS** (πεπλις, *peplis*, the Greek name for the purslane; similar habit). Lin. gen. no. 446. Lam. ill. t. 262. D. C. prod. 3. p. 76.—Pórtula, Dill. gen. 7.—Glaucoìdes, Mich. gen. 18.—Chabræ'a, Adans. fam. 2. p. 234. but not of D. C. - Glaux, Vaill. bot. p. 80. t. 15. f. 5.

Lin. syst. *Hexándria, Monogýnia.* Calyx campanulate, with 12 lobes, of which 6 are broader than the rest and erect, the others spreading, subulate, and rising from the sinuses. Petals 6, minute, fugaceous, sometimes wanting. Stamens 6, alternating with the petals in front of the broader calycine lobes. Style hardly any; stigma capitate. Capsule 2-celled, many-seeded. Branched herbs, with opposite or alternate, entire leaves; and sessile, axillary, solitary, insignificant flowers.

1 P. Po'rtula (Lin. spec. 474.) leaves opposite, obovate, stalked; petals hardly visible; flowers axillary, solitary. ⊙. B. H. Native of Europe, in watery places, on a sandy, gravelly, or heathy soil, frequent; plentiful in some parts of England. Schkuhr, handb. t. 99. Fl. dan. t. 64. Curt. lond. t. 27. Smith, engl. bot. t. 1211. Pórtula diffùsa, Mœnch. Calyx reddish. Petals white, very minute, or wanting.

Common Water *Purslane.* Fl. June, Sept. Brit. Pl. cr.

2 P. biflòra (Saltzm. pl. exsic. 1825.) leaves opposite or alternate, obovate, cuneated at the base, on short petioles; flowers twin, axillary. ⊙. B. H. Native in humid places about Tangiers. Flowers rather larger than those of *P. pórtula.*

Two-flowered Water Purslane. Pl. creeping.

3 P. alternifòlia (Bieb. suppl. 277.) leaves alternate, linear, somewhat spatulate. ⊙. B. H. Native of Caucasus, about the Volga. P. Volgénsis, Fisch. in litt. 1810.

Alternate-leaved Water Purslane. Fl. Ju. Sept. Clt. 1816. Pl. creeping.

4 P.? dia'ndra (Nutt. in litt. ex D. C. prod. 3. p. 77.) leaves opposite, linear, upper ones somewhat alternate. ⊙. B. H. Native of North America, in marshes and bogs about the Arkansa. Leaves 8-9 lines long and hardly a line broad. Flowers axillary, sessile. Stigmas 2. Capsule globose. Stamens 2, according to Nuttall. Calyx 4-6-cleft. Perhaps a proper genus.

Diandrous Water Purslane. Pl. creeping.

Cult. The species of *Water Purslane* grow in any soil that is moist, where the seeds may be sown.

VI. **AMMA'NNIA** (in honour of John Ammann, once professor of botany at Petersburgh; author of Stirpium rariorum in imperio Rutheno sponte provenientium icones et descriptiones, 1 vol. 4to. Petersburgh, 1739). Houst. in Lin. gen. no. 155. Lam. ill. t. 77. D. C. mem. soc. gen. 3. pt. 2. p. 79. D. C. prod. 3. p. 77.—Cornèlia, Hard. spec. 2. p. 1. t. 1.

Lin. syst. *Tetra-Heptándria, Monogýnia.* Calyx campanulate, with 4-7, erect, flat teeth, and 4-7 horn-formed, spreading, smaller ones rising from the sinuses. Petals 4-7, alternating with the erect teeth of the calyx. Stamens equal in number to the petals, rarely double that number. Capsule oval-globose, membranous, 4-celled, or only 1-celled when mature. Seeds numerous, fixed to the central placenta, which is tetragonal.—Smooth aquatic plants. Stems usually tetragonal. Leaves opposite, quite entire. Flowers small, axillary, sessile, or on short pedicels, usually pink or red.

§ 1. *Flowers apetalous. Stamens 4. Some of the species are probably placed in this division from the petals being very caducous.*

1 A. parviflòra (D. C. prod. 2. p. 77.) stem erect, tetragonal, glabrous; leaves oblong, sessile; cymes axillary, many-flowered, longer than the leaves; calyx 4-toothed; capsule globose, hardly longer than the calyx. ⊙. B. F. Native of the East Indies. Herb slender.

Small-flowered Ammannia. Pl. ½ foot.

2 A. filifórmis (D. C. mem. soc. gen. 3. p. 95.) stem erectish, branched from the base; branches diffuse, filiform, tetragonal; leaves linear; umbels axillary, many-flowered, rather loose, pedunculate; flowers apetalous, tetrandrous; capsule globose, exceeding the calyx. ⊙. B. F. Native of Senegal. Lýthrum filifórme, Perr. in litt. Herb weak. 3-4 inches long.

Filiform Ammannia. Pl. ascending.

3 A. Senegale'nsis (Lam. ill. no. 155. t. 77. f. 2.) stem erect, terete, branched, and floriferous from the base, tetragonal at the apex; leaves linear-lanceolate, sessile, dilated at the base, cordate; umbels axillary, many-flowered, on short peduncles; flowers apetalous, tetrandrous; capsule globose, twice the

length of the calyx. ⊙. B. F. Native of Senegal. Lỳthrum multiflòrum, Perr. in litt.

Senegal Ammannia. Pl. ½ foot.

4 A. I'ndica (Lam. ill. no. 1555.) stem erect, branched, terete; branches rather tetragonal, erectish; leaves lanceolate, attenuated at the base; corymbs axillary, many-flowered, on short peduncles; flowers apetalous, tetrandrous. ⊙. B. F. Native of the East Indies, and the Island of Timor.

Indian Ammannia. Pl. ⅓ foot.

5 A. microca'rpa (D. C. mem. soc. gen. p. 93.) plant erect, branched, terete; branches rather tetragonal; leaves lanceolate-linear, sessile, somewhat dilated and cordate at the base; umbels axillary, many-flowered, on short peduncles; flowers apetalous, tetrandrous; capsule obovate, length of calyx. ⊙. B. F. Native of the Island of Timor. Intermediate between the preceding and the following species.

Small-fruited Ammannia. Pl. ½ foot.

6 A. Egypti'aca (Willd. hort. berol. t. 6.) stem erect, branched, terete at the base and tetragonal at the apex; branches spreading; leaves lanceolate, sessile, attenuated at the base, spreading; flowers sessile, axillary, crowded, apetalous, tetrandrous, disposed in something like whorls. ⊙. B. F. Native of Egypt, in rice-fields. Del. fl. ægypt. 37. t. 15. f. 3. Calyx acutely 8-toothed. Capsule spherical, when mature 1-celled.

Egyptian Ammannia. Fl. Jul. Aug. Clt. 1820. Pl. ½ to 1 ft.

7 A. vesicatòria (Roxb. fl. ind. 1. p. 447.) stems erect, branched; branches undivided; leaves sessile, lanceolate, attenuated at the base; flowers sessile, axillary, disposed in something like whorls, apetalous, tetrandrous. ⊙. B. F. Native of the East Indies, in humid cultivated fields. Pluk. alm. t. 136. f. 22. Burm. ind. t. 15. f. 3.? A. baccífera, Lin. spec. 175.? Capsule 1-celled. The leaves have a strong muriatic smell; they are extremely acrid, and are used by the native practitioners of India to raise blisters in rheumatism, &c., bruised and applied to the part of the body intended to be blistered; they perform their office in half an hour most effectually.

Blistering Ammannia. Pl. ½ to 1⅓ foot.

8 A. hasta'ta (D. C. prod. 3. p. 78.) stem branched, diffuse, rooting at the base, somewhat tetragonal, glabrous; leaves stem-clasping, and bluntly hastate at the base, linear-lanceolate; flowers axillary, sessile, solitary, apetalous, tetrandrous. ♄. B.? S. Native of Peru, in marshes. Isnárdia hastàta, Ruiz, et Pav. fl. per. 1. p. 66. t. 85. f. 6. Isnárdia subhastàta, Dietr. gart. 5. p. 137. ex Rœm. et Schultes, syst. 3. p. 477.

Hastate-leaved Ammannia. Shrub 1 foot.

9 A. elatinoìdes (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 92. t. 3. f. B.) stems decumbent at the base; branches erect, filiform, somewhat tetragonal, simple; leaves sessile, all opposite, lower ones oblong, upper ones ovate; flowers sessile, apetalous, tetrandrous, nearly all solitary. ⊙. B. F. Native of Senegal. Lỳthrum uniflòrum, Perr. in litt. Capsule ovate, 4-celled. Calyx cylindrical, 4-toothed, with the sinuses scarcely exserted into teeth.

Elatine-like Ammannia. Pl. decumbent.

10 A. Borysthe'nica (D. C. prod. 3. p. 78.) stem branched, diffuse; leaves oblong, or obovate-lanceolate, lower ones opposite, upper ones alternate; flowers axillary, sessile, apetalous, and tetrandrous, almost always solitary. ⊙. B. F. Native at the Bosphorus, near Kiew and Krementschug. Péplis Borysthènica, Bess. ex Spreng. syst. 1. p. 135. Calyx 8-cleft, and the capsule is that of *Ammánnia*.

Bosphorus Ammannia. Pl. diffuse.

11 A. occidenta'lis (D. C. prod. 3. p. 78.) stems ascending, rooting at the base; leaves lanceolate, tapering into the petiole at the base; flowers axillary, sessile, apetalous, tetrandrous, nearly all solitary. ⊙. B. H. Native of Porto Rico. Péplis occidentàlis, Spreng. syst. 2. p. 135. Calyx 8-toothed. Young capsule 4-celled, but the mature capsule is nearly 1-celled, as in *Ammánnia*. Habit of *Péplis*.

Western Ammannia. Fl. July. Clt. 1829. Pl. creeping.

§ 2. *Tetrapétalæ* (from τετρα, *tetra*, 4, and πεταλον, *petalon*, petal; petals 4). *Calyx 8-toothed. Petals and stamens 4.*

12 A. Ca'spica (Bieb. fl. taur. 2. p. 457. suppl. p. 111.) stem tetragonal, erect, branched; leaves lanceolate, attenuated at the base; flowers axillary, glomerate, sessile, tetrandrous; petals 4, small, or wanting. ⊙. B. H. Native at the river Cyrus, towards the Caspian Sea. Habit of *A. Ægyptìaca*, but the petals are 4, ex Bieb. Like *A. sanguinolénta*, but the teeth of the calyx are more stiff and acute. Flowers purple.

Caspian Ammannia. Fl. June, Aug. Clt. 1818. Pl. ¾ ft.

13 A. ramòsior (Lin. spec. 174.) stems tetragonal, erect, branched; leaves linear-lanceolate, dilated at the base, and rather stem-clasping; lower flowers disposed in compact whorls, upper ones solitary, opposite; petals 4, obovate-roundish; stamens 4. ⊙. B. H. Native of Virginia and Carolina, in bogs. A. purpùrea, Lam. dict. 1. p. 131. Petals and filaments purple.

More-branched Ammannia. Fl. Jul. Aug. Clt. 1759. Pl. 1 ft.

14 A. latifòlia (Lin. spec. 174.) stems tetragonal, erect, branched; leaves linear-lanceolate, bluntly and auriculately cordate at the base; flowers axillary, 1-3-together, sessile; petals and stamens 4. ⊙. B. F. Native of Jamaica, and probably of South Carolina. Sloane, hist. 1. t. 7. f. 4. Lam. ill. t. 77. f. 1. Petals are said to be white. Perhaps the plant is apetalous.

Broad-leaved Ammannia. Fl. July, Aug. Clt. 1733. Pl. 1 to 2 feet.

15 A. hu'milis (Michx. fl. bor. amer. 1. p. 99.) stem procumbent at the base, slender, tetragonal, branched; leaves linear-lanceolate, attenuated at the base; flowers axillary, solitary, sessile; petals 4, orbicular; stamens 4. ⊙. B. H. Native from Carolina to Virginia, along the banks of the rivers in marshes. Torr. fl. un. st. 1. p. 189. A. ramòsior, Walt. car. 88. Petals white or pale-purple. Capsule 4-celled.

Humble Ammannia. Fl. July, Aug. Clt. 1823. Pl. proc.

16 A. verticilla'ta (Lam. ill. 1. no. 1554. t. 77. f. 3.) stem erect, tetragonal, branched; leaves lanceolate, nearly sessile, attenuated at the base; flowers crowded in whorls in the axils of the leaves; petals 4, obovate; stamens 4. ⊙. B. H. Native of marshy places about Padua, and in rice grounds near Florence, and probably also of the East Indies and China. Cornèlia verticillàta, Hardw. spec. 2. p. 9. t. 1. A. I'ndica, Lam. dict. 9. p. 328. A. baccífera, Lin. spec. 175? A. víridis, Willd. in Horn. hort. hafn. 1. p. 146. Habit of *A. Ægyptiaca* and *A. vesicatòria*, but differs in the flowers being 4-petalled, not apetalous. Calyx 4-toothed. Capsule roundish, equal in length to the tube of the calyx, 1-celled, of an obscure purple colour, ex Hardw.

Whorled-flowered Ammannia. Fl. July, Aug. Clt. 1819. Pl. ½ foot.

17 A. densiflòra (Roth, nov. spec. 99.) stems ascending, branched, creeping at the base; leaves sessile, linear-lanceolate, rather cordate at the base; branches all densely beset with flowers from the base, so much so as to appear spike-formed; bracteas spreadingly recurved; flowers axillary, sessile; petals 4, obovate; stamens 4. ⊙. B. F. Native of the East Indies. Petals whitish. Capsule subglobose, smaller than the calyx.

Dense-flowered Ammannia. Pl. ¾ foot.

18 A. multiflòra (Roxb. fl. ind. 1. p. 447.) stem straight, tetragonal; angles acute; leaves linear, dilated and cordately sagittate at the base, stem-clasping; peduncles axillary, 3-7-flowered; petals 4, roundish. ⊙. B. F. Native about Calcutta, in fields. Petals red. Capsule 1-celled.

Many-flowered Ammannia. Pl. ½ to 1 foot.

19 A. DE′BILIS (Ait. hort. kew. ed. 1. vol. 1. p. 163.) stems angular, branched; leaves lanceolate, attenuated at the base; flowers in axillary fascicles; petals 4, obovate; stamens 4; capsule bilocular? ⊙. B. F. Native of the East Indies. Petals pale purple.

Weak Ammannia. Fl. Jul. Aug. Clt. 1778. Pl. ½ foot.

20 A. DIFFU′SA (Willd. enum. 1. p. 167.) stems ascending, branched, tetragonal at the apex; branches diffuse; leaves lanceolate, bluntish, narrowed at the base, upper ones cordate; corymbs axillary, 3-7-flowered, pedunculate; petals and stamens 4. ⊙. B. F. Native country and fruit unknown. Petals white.

Diffuse Ammannia. Fl. July, Aug. Clt. 1820. Pl. ascend.

21 A. CATHÓLICA (Schlecht. et Cham. in Linnæa. 2. p. 378.) flowers solitary, sessile, tetrandrous; calyx 8-toothed, outer teeth narrower, longer, erect, about equal in length to the petals, which are fugaceous; capsule ovoid, inclosed, 4, rarely 3-celled; leaves lanceolate, tapering to the base. ⊙. B. F.

Var. α, *Philippénsis* (Schlecht. et Cham. l. c.) stem weak, rooting at the base. Native of the Island of Lucon, in moist sandy places.

Var. β, *Brasiliénsis* (Schlecht. et Cham. l. c.) stem firm, erect.

Universal Ammannia. Pl. ½ foot

22 A. ROTUNDIFÒLIA (Roxb. fl. ind. 1. p. 446.) stems diffuse, creeping at the base, but ascending at the apex; leaves almost sessile, nearly orbicular; flowers nearly sessile, crowded in the axils of the upper leaves, and constitut[illegible]rminal spikes; petals 4, ovate; stamens 4. ⊙. B. H. [illegible]ive of Nipaul, near Katmandu; and of Bengal. D. Don, prod. fl. nep. p. 220. This plant has the appearance of a species of *Goniocárpus*. Stems 2-3 inches high. Capsule 4-lobed, girded by the permanent calyx and corolla. Petals pink.

Round-leaved Ammannia. Fl. July, Aug. Clt. 1819. Pl. ¼ to ½ foot.

§ 3. *Pentándræ* (in reference to the flowers being pentandrous). *Petals and stamens* 5. *Calyx* 10-*toothed*.

23 A. PENTA′NDRA (Roxb. fl. ind. 1. p. 448.) stems creeping at the base, simple, but erect and branched at the apex; branches simple; leaves sessile, lanceolate; flowers axillary, sessile, solitary, 5-petalled, and pentandrous. ⊙. B. F. Native of the East Indies, in humid places, and of Java, in rice-fields. Blum. bijdr. p. 1130. Petals purple. Capsule 4-celled, but when mature, almost 1-celled, longer than the calyx.

Pentandrous Ammannia. Fl. Jul. Aug. Clt. 1823. Pl. ½ ft.

24 A. NA′NA (Roxb. fl. ind. 1. p. 418.) stems creeping at the base, but erect at the apex and branched; branches branched again; leaves sessile, wedge-shaped; flowers solitary, 5-petalled, and pentandrous. ⊙. B. F. Native of the East Indies, in marshes. Petals purple. Very like the *A. pentándra*, but much smaller. Capsule 1-celled.

Dwarf Ammannia. Pl. ¼ to ½ foot.

§ 4. *Dyplostèmoneæ* (from δυπλοος, *double*, and στημον, *stemon*, a stamen). *D. C. prod.* 3. *p.* 80. *Petals* 4-7. *Stamens twice the number of the petals.*

25 A. DODECA′NDRA (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 89. t. 2.) leaves linear-lanceolate, acute, sessile, bluntly somewhat auricled at the base; flowers axillary, almost sessile, 1-3-together; petals 6-7; stamens 12-14. ⊙. B. H. Native of Senegal. Lýthrum grandiflòrum, Perr. in litt. Herb greenish-glaucous, erect. Petals violaceous. Capsule 4-5-celled, 4-5-valved, length of calyx.

Dodecandrous Ammannia. Pl. ½ to 1 foot.

26 A. SANGUINOLE′NTA (Swartz, fl. ind. occid. 1. p. 272.) leaves linear-lanceolate, acutish, but bluntly and auriculately cordate at the base, half stem-clasping; flowers almost sessile, axillary, 3-5 together; petals 4; stamens 8. ⊙. B. F. Native of Jamaica, in bogs and ditches; and of Hispaniola and Mexico. Petals blood-coloured. Capsule 4-celled. A. octándra β, Poir. suppl. 1. p. 328.

Bloody-flowered Ammannia. Fl. Jul. Aug. Clt. 1803. Pl. ½ ft.

27 A. OCTA′NDRA (Lin. fil. suppl. 127.) leaves linear-lanceolate, sessile, acutely and auriculately cordate at the base; flowers axillary, almost sessile, 1-3-together; petals 4; stamens 8. ⊙. B. F. Native of the East Indies, in boggy places. Roxb. cor. 2. t. 133. A. coccínea, Pers. ench. 1. p. 147. Capsule 4-celled. Flowers red.

Octandrous Ammannia. Fl. Jul, Aug. Clt. 1820. Pl. 2 ft.

28 A. AURICULA′TA (Willd. hort. berol. 1. p. 7. t. 7.) leaves linear-lanceolate, sessile, bluntly and auriculately cordate at the base; corymbs axillary, many-flowered, on short peduncles; petals 4; stamens 8. ⊙. B. F. Native of Egypt and Senegal, in rice fields. Del. fl. eg. p. 36. t. 15. f. 2. A. racemòsa, Poir. suppl. 1. p. 329. Lýthrum ramòsum, Perr. in litt. Stems tetragonal.

Auriculate-leaved Ammannia. Pl. 1 foot.

† *Species not sufficiently known.*

29 A. RU′BRA (Hamilt. in D. Don, prod. fl. nep. p. 220.) stem erect, almost simple, tetragonal, rooting at the base; leaves oblong, obtuse, sessile; flowers sessile, solitary; floriferous branchlets opposite, hardly longer than the leaves. ⊙. B. H. Native of Nipaul. Stem 3-4 inches high. Petals red.

Red-flowered Ammannia. Fl. Jul. Aug. Clt. 1818. Pl. ¼ ft.

30 A. RÒSEA (Poir. suppl. 1. p. 329.) stems weak; branches filiform; leaves linear, sessile, acutish, floral ones small; flowers usually solitary, sessile; capsule globose. ⊙. B. F. Native of the East Indies. Flowers small, rose-coloured. Plant small.

Rose-coloured-flowered Ammannia. Pl. ½ foot.

31 A. RE′PENS (Rottl. ex Mart. acad. munch. phil. 6. p. 150.) stems rooting, tetragonal; leaves on short petioles, oblong, bluntish; flowers axillary, solitary, sessile. ⊙. B. H. Native of the East Indies.

Creeping Ammannia. Pl. creeping.

32 A. PA′LLIDA (Lehm. sem. hort. hamb. 1823. p. 3.) stem erect, tetragonal; leaves lanceolate, acuminated, dilated and cordate at the base; flowers in glomerate whorls. ⊙. B. F. Native country unknown. Perhaps the same as *A. latifòlia.*

Pale Ammannia. Pl. 1 foot.

33 A.? SAGITTA′TA (D. C. prod. 3. p. 80.) branches somewhat tetragonal, glabrous, herbaceous; leaves linear, sessile, bluntly sagittate at the base; capsules globose, somewhat tetragonal, in glomerate whorls, 4-toothed at the apex? ⊙. B. F. Native of St. Domingo. Jussiæ′a sagittàta, Poir. suppl. 3. p. 198.

Sagittate-leaved Ammannia. Pl. ½ foot.

34 A.? PINNATI′FIDA (Lin. fil. suppl. 127.) stems procumbent, rooting, compressed; leaves scattered, linear, pinnatifid; lobes filiform; flowers axillary; capsule tetragonal. ⊙.? B. F. Native of Java. From the capsule being 4-cornered it is probable that this plant ought to be excluded from the genus. It is perhaps a species of *Myriophýllum*, but differs from that genus in the leaves being scattered.

Pinnatifid-leaved Ammannia. Pl. procumbent.

Cult. The species of *Ammánnia* being all annuals, and for the most part natives within the tropics, the seeds of them must be sown in pots, which should be placed in a hot-bed frame or in a stove, and when the plants have grown to the height of 2 inches, they may be transplanted into other pots, 3 or 4 plants in each; these pots should be placed in the stove or warm part of a green-house, placing each in a pan of water. Some of the plants may also be planted out in the open ground, in a sheltered moist situation. None of the species are worth growing, unless in botanic gardens.

VII. LY'THRUM (λυθρον, *lythron*, black-blood; from the purple colour of the flowers). Juss. gen. p. 332. D. C. prod. 3. p. 80.—Salicària, Tourn. inst. 253.—Lýthrum species of Lin. and Lam.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx cylindrical, striated, with 8-12 teeth, of which from 4-6 are broader than the rest, and erect; the others smaller and spreading. Petals 4-6, inserted in the orifice of the calyx, alternating with its erect teeth. Stamens inserted in the middle, or at the base of the tube of the calyx, twice as numerous as the petals, or occasionally fewer. Style filiform; stigma capitate. Capsule oblong, included in the calyx, 2-celled, many-seeded. Placentas thick, adnate to the dissepiment.—Herbs, seldom subshrubs. Leaves entire. Flowers axillary, purple or white. Stems square.

SECT. I. AMMANNIOÌDES (containing plants with the habit of *Ammánnia*). D. C. in mem. soc. gen. and prod. 3. p. 81. Stamens 4-6. Petals wanting? Calyx tubularly campanulate.

1 L.? NUMMULARIÆFÒLIUM (Lois. not. p. 74 but not of Pers.) glabrous; stem herbaceous, branched; leaves obovate-roundish, obtuse, opposite, but some of the rameal ones are alternate; flowers axillary, solitary, apetalous. ⊙. H. Native of Corsica. Calyx nearly of *Ammánnia*, 8-16-toothed, the alternate teeth small and horn-formed. Petals wanting, or falling off very early. Stamens 4-8, inclosed. Capsule ovate, 2-celled. This plant is an *Ammánnia* in flower, but a *Lýthrum* in fruit.

Money-wort-leaved Purple Loosestrife. Pl.

SECT. II. HYSSOPIFÒLIA (plants agreeing in character with *L. hyssopifòlium*). D. C. mem. soc. gen. 3. part 2. p. 78. prod. 3. p. 81.—Hyssopifòlia, C. Bauh. pinn. p. 218.—Pythagòrea, Rafin. journ. phys. aug. 1819. p. 96. but not of Lour. Stamens equal in number to the petals, rarely double that number. Flowers solitary in the axils of the leaves, never disposed in spikes. Plants nearly all glabrous in every part.

* *Stamens usually equal in number to the petals.*

2 L. THYMIFÒLIUM (Lin. spec. 642.) leaves alternate, linear, acutish; flowers almost sessile, shorter than the leaves; bracteas foliaceous, linear, usually longer than the calyx; petals 4-5; stamens 2. ⊙. B. H. Native of Egypt, Mauritania, and many parts of the south of Europe, in salt marshes by the sea side; and a plant very much resembling the present species, if not the same, was collected about Conception in Chili, by Captain Dumont D'Urville.—J. Bauh. hist. 3. p. 792. Barrel. icon. t. 773. f. 2. Pentaglóssum linifòlium, Forsk. descrip. no. 11. Salicària thymifòlia, Lam. fl. fr. Stems erect. Flowers small, pale lilac.

Var. β, *màjor* (D. C. prod. 3. p. 81.) stems more branched, elongated; leaves linear-lanceolate. ⊙. B. H. Native about Montpelier. L. bibracteàtum, Salzm. in litt. Habit of *L. hyssopifòlium*, but the character is that of *L. thymifòlium.*

Thyme-leaved Purple-Loosestrife. Fl. July, Aug. Clt. 1816. Pl. ½ to 1 foot.

3 L. THESIOÌDES (Bieb. fl. taur. 1. p. 367.) leaves alternate, linear-lanceolate; capsule nearly globose, 4-toothed, pedicellate. ⊙. B. H. Native of Caucasus. Flowers the size of those of *L. thymifòlium*, but the fruit is globose, and the plant is probably generically distinct.

Thesium-like Purple-Loosestrife. Fl. July, Sept. Clt. 1828. Pl. 1 foot.

4 L. LINEA'RE (Lin. spec. 641.) leaves linear, for the most part opposite, acute; flowers on short pedicels, about the length of the leaves, bibracteate at the base; petals and stamens 6. ♃. H. Native of Virginia and Carolina, by the sea side. Pursh, fl. amer. sept. 1. p. 334. Pythagòrea lineàris, Rafin. l. c. Stem erect, angular. Calyx 10-striped. Corolla white.

Linear-leaved Purple-Loosestrife. Fl. July, Aug Clt. 1812. Pl. 3 to 4 feet.

5 L. ALA'TUM (Pursh, fl. amer. sept. 1. p. 334. but not of Presl.) leaves opposite, ovate-oblong, acute, rather cordate at the base, sessile, or on very short petioles; branches twiggy, tetragonally winged; flowers almost sessile, erect, 6-petalled, hexandrous, furnished with two minute bracteas. ♃. F. Native of North America, in a part of Lower Georgia, and of Mexico. Sims, bot. mag. 1812. L. vulnerària, Schrank, hort. mon. t. 27. L. acinacifòlium, Moc. et Sesse, fl. mex. icon. ined. L. Kennedyànum, H. B. et Kunth, nov. gen. amer. 6. p. 194. L. Virgínicum, Kenn. ex Kunth. Pythagòrea alàta, Rafin. l. c. Flowers beautiful purple. An elegant half-shrubby plant.

Winged-stemmed Purple-Loosestrife. Fl. May, Nov. Clt. 1812. Pl. 1 to 4 feet.

6 HYSSOPIFÒLIUM (Lin. spec. 642.) leaves linear-lanceolate, bluntish; lower ones opposite, upper ones alternate; flowers axillary, solitary, nearly sessile, each with a pair of small bracteas at the base; stamens 6. ⊙. B. H. Native throughout the whole of Europe, also to be found in North and South America, New Holland, and the Cape of Good Hope, where it has probably been introduced; in partially dried up pits or ditches, or places where wa[illegible]as stagnated during winter. In England, on Hounslow [illegible]h; in several parts of Cambridgeshire, Huntingdonshire, Bedfordshire, Oxfordshire, Suffolk, and Worcestershire, but by no means common. Jacq. fl. austr. t. 133. L. hyssopifòlium, Smith, engl. bot. t. 292. Hyssopifòlia, Bauh. pin. 218. Salicària hyssopifòlium, Lam. Mœnch. Flowers small, light purple. The L. hyssopifòlium, Brot. fl. lus. 2. p. 214. is said by Link to be a distinct species, which he calls L. meonánthum, but the character given by Brotero is too imperfect to decide this point.

Var. β, *acutifòlium* (D. C. prod. 3. p. 82.) leaves acutish. ⊙. H. Native of temperate parts of Europe. L. thymifòlium, Hoffm. fl. germ. 1800. p. 213. but not of Lin.

Var. β, *virgultòsum* (D. C. prod. 3. p. 82.) stems suffruticose; flowers on long pedicels. ⊙. H. Native of St. Domingo. L. lineàre, Bertero, ined. L. virgàtum, Spreng. in herb. Balb. Perhaps a proper species.

Var. δ? *tenéllum* (D. C. l. c.) leaves oblong. Native of the Cape of Good Hope. L. tenéllum, Thunb fl. cap. Perhaps a proper species.

Hyssop-leaved Purple-Loosestrife. Fl. May. Britain. Pl. 1 foot, straggling and recumbent.

7 L. TRIBRACTEA'TUM (Salzm ex Schlecht. et Cham. in Linnæa. 2. p. 356.) stem branched to the apex; branches alternate; leaves lanceolate, obtuse, and as if they were roundly truncate; flowers axillary, each furnished with a pair of bracteas at the base; petals 5; stamens 5; calyx 10-toothed. ⊙. H. Native of the south of Europe. Barrel. icon. 773. f. 2.? Petals purple. Less glaucous than *L. hyssopifòlium.* Parts of flowers quinary.

Three-bracteated Purple-Loosestrife. Pl. 1 foot.

8 L. LANCEOLA'TUM (Ell. sketch. 1. p. 544.) stem branched, suffruticose at the base, quadrangular, winged; branches diffuse, rather pubescent; leaves opposite, almost sessile, oblong-lanceolate, acutish, glabrous, rounded at the base, with the margins a little ciliated; pedicels axillary, 3-4-together; flowers verticillate, dodecandrous; style inclosed; petals 5-6-7. ♃. H. Native of Carolina, and probably of Mexico, in marshes and humid places. L. virgàtum, Walt. car. 120. Pursh, fl. amer. sept. 1

p. 334. exclusive of the synonyme of Willd. L. setureiæfòlium, Moc. et Sesse, fl. mex. icon. ined. L. diffùsum, Sweet, fl. gard. 149. Flowers purple, as large as those of *L. salicària.*

Lanceolate-leaved Purple-Loosestrife. Fl. July, Aug. Clt. 1800. Pl. 2 to 3 feet.

9 L. a'lbum (H. B. et Kunth, nov. gen. amer. 6. p. 193.) stems suffruticose; leaves scattered, linear, acute; flowers on short pedicels, each furnished with 2 bracteoles at the base; petals 6-7; stamens 6-7. ♄. G. Native of Mexico, about Salimanca. Petals white, obovate-oblong.

White-flowered Purple-Loosestrife. Shrub 1 to 2 feet.

10 L. mari'timum (H. B. et Kunth, l. c.) stem shrubby; leaves opposite and scattered, lanceolate, acute, obtuse at the base, glaucescent beneath; flowers on short pedicels, erect, each furnished with 2 bracteoles at the base; petals 6; stamens 6. ♄. G. Native of Peru, on the shores of the Pacific Ocean near Patibilca; of the Sandwich islands; and of Mexico, in humid places near Jalapa, and other parts of South America. L. lycioìdes, herb. Willd. Petals purple, obovate-oblong.

Maritime Purple-Loosestrife. Shrub 1 to 2 feet.

* * *Stamens twice the number of the petals, and therefore* 12 *or* 14 *in number.*

11 L. quintupline'rvium (Neuw. reis. vol. 2. ex flora, 1821. p. 302.) shrubby, much branched; leaves opposite, ovate, sessile, 5-6-nerved; flowers opposite, sessile, 5-petalled, and dodecandrous; bracteoles ovate, 3-nerved. ♄. S. Native of Brazil. Nees et Mart. nov. act. bonn. p. 23. [illegible]ers pale blue. Habit of *Rhèxia.*

Quintuple-nerved-leaved Purple-Loosestrife. Sh. 3 to 4 feet.

12 L. punicifòlium (Schlecht. et Cham. in Linnæa. 2. p. 356.) plant glaucous; leaves elliptic, rather cordate at the base, obtuse at the apex, with scabrous margins; flowers on short pedicels; calyx 12-toothed; petals 6; stamens 12, alternate ones exserted. ♃. H. Native of Crete and Sicily. L. thymifòlium, Sieb. fl. cret. exsic.—Barrel. icon. t. 773. f. 1. Differs from *L. hyssopifòlium* in the root being perennial, in the leaves being cordate, with scabrous edges, in the flowers being twice the size, and in the alternate stamens being exserted.

Pomegranate-leaved Purple Loosestrife. Pl. 1 foot?

13 L. Græffe'ri (Tenore, prod. fl. nep. suppl. 2. p. 28. cat. 1819. p. 45.) herbaceous; leaves alternate, elliptic-oblong, obtuse, upper ones linear-lanceolate; stems diffuse, branched, angular; flowers solitary, axillary, on short pedicels; bracteoles small, acute; petals 6, oblong-obovate; stamens 12, twice the length of the calyx. ⊙. B. H. Native of Naples, near Caresta; in the marshes of western Liguria; in the Balearic Islands; in the Island of Cos; in the bogs of Murcia; and about Tangiers. L. acutàngulum, Lag. cat. hort. madr. 1814. p. 16. L. hyssopifòlium, d'Urv. enum. p. 52. L. Græffe'ri, Cambess. mem. mus. 14. p. 16. Perhaps the same as L. nummulariæfòlium, Pers. ench. 2. p. 8.? but not of Lois. L. Gussòni, Presl. del. prag. p. 55.—Cup. pamph. sic. 1. t. 62. Flowers purple.

Græffer's Purple-Loosestrife. Fl. June, July. Clt. 1800. Pl. ½ foot.

14 L. Pre'slii (Guss. pl. rar. p. 188.) stem nearly simple, erectish, quadrangular; angles winged; leaves alternate, oblong, cordate; flowers axillary, solitary, 6-petalled, dodecandrous; stamens longer than the calyx. ⊙. or ♂. B. H. Native of Calabria, in boggy inundated places. L. alàtum, Presl. del. prag. p. 55.—Barrel. obs. p. 140. icon. t. 773. f. 1.?

Presl's Purple-Loosestrife. Pl. 1 ft.

15 L. flexuòsum (Lag. cat. hort. madr. 1814. p. 16.) leaves oblong, somewhat cordate at the base; flowers pedicellate, erect, fruit horizontal; calyx striated; petals 6, ovate, somewhat cordate; stamens 12. ⊙. B. H. Native of Spain, in the province of Murcia; also of Liguria and Mauritania. Flowers rose-coloured. Branches flexuous. Perhaps sufficiently distinct from *L. Græffèri.*

Flexuous-stemmed Purple-Loosestrife. Pl. ½ to 1 foot.

Sect. III. Salica'ria (from *Salix*, a willow; willow-like leaves). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 77. prod. 3. p. 82. Stamens twice the number of the petals. Flowers numerous in the axils of the upper leaves, which are degenerated into the form of small bracteas, therefore the flowers appear as if they were in whorls, and racemose spikes.

16 L. Salica'ria (Lin. spec. 640.) leaves opposite, lanceolate, cordate at the base; flowers in whorled leafy spikes, almost sessile. ♃. H. Native of Europe, in ditches and watery places, especially about the margins of ponds and rivers; plentiful in Britain. Smith, engl. bot. 1061. Curt. lond. fasc. 3. t. 28. Fl. dan. 671. Flowers of a variable crimson or purple. Leaves opposite, or 3 or even 4 in a whorl. Stamens 12-14. Petals 6-7. Plant variable with regard to smoothness or pubescence. It is astringent, and is useful in inveterate diarrhœas.

Var. β, *gràcile* (D. C. cat. hort. monsp. 123.) spikes numerous, very slender; flowers alternate, solitary or twin; leaves, stems, and calyxes velvety. ♃. H. Native in humid places.

Var. γ, *bracteòsum* (D. C. prod. 3. p. 83.) spikes elongated at the tops of the branches and stem; bracteas deflexed after flowering, longer than the flowers. ♃. H. Native country unknown.

Var. δ, *pubéscens* (Pursh, fl. bor. amer. 1. p. 334.) ♃. H. Native of North America, from Canada to New England, but according to Torrey, fl. un. st. 1. p. 471. its native country is doubtful.

Willowy or Common Purple-Loosestrife. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

17 L. tomentòsum (Mill. dict. no. 2.) leaves opposite, ovate, cordate at the base, clothed with white tomentum, as well as the stem and calyxes; flowers numerous, in axillary whorls, forming an interrupted leafy spike. ♃. H. Native of North America. Flowers fine purple. Leaves sometimes 3 in a whorl.

Tomentose Purple-Loosestrife. Fl. July, Aug. Clt. 1700. Pl. 1 to 2 feet.

18 L. virga'tum (Lin. spec. 642. but not of Walt.) leaves lanceolate, attenuated at the base; panicle twiggy; flowers 3 together, axillary, distinctly pedicellate. ♃. H. Native of Tauria, Siberia, Russia, Austria, Germany, and Belgium. Sims, bot. mag. t. 1003. Jacq. austr. 1. t. 7. Salicària virgàta, Mœnch. L. Austrìacum, Jacq. vind. 243. Flowers purple. Plant more loose and glabrous than *L. Salicària.*

Var. β, *acuminàtum* (Willd. spec. 2. p. 866.) racemes terminal, elongated, crowded with flowers. ♃. H. Native of Iberia.

Twiggy Purple-Loosestrife. Fl. June, Sept. Clt. 1776. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

19 L. Hunte'ri (D. C. prod. 3. p. 83.) leaves opposite; calyx tubular, 6-lobed; petals 6, lanceolate, erect; stamens 12; style subulate; capsule 2-celled, 4-valved. ♄. S. Native of the East Indies, where it is called *Dhawry.* W. Hunt, asiat. res. 4. p. 42. Petals of a beautiful red. The flowers, mixed with those of *Morinda,* are used for dyeing in India.

Hunter's Purple-Loosestrife. Shrub.

20 L.? ape'talum (Spreng. syst. 2. p. 454.) stem shrubby; leaves linear, acute, alternate; flowers in whorls, apetalous, hexandrous. ♄. S. Native of Brazil. Perhaps a species of *Ammánnia.*

Apetalous Purple-Loosestrife. Pl. 1 foot.

21 L. dipe'talum (Lin. fil. suppl. 250.) shrubby, hispid and clammy; leaves sessile, ovate, opposite or 3 in a whorl; flowers axillary, pedicellate, nodding. ♄. S. Native of South America. Petals purple. Perhaps a species of *Cùphea.*

Dipetalous Purple-Loosestrife. Shrub.

Cult. The hardy perennial kinds of *Lythrum* are handsome border flowers; they grow in any common soil, and are easily increased by dividing the plants at the root. The seeds of the annual kinds require to be sown in a moist situation in spring.

VIII. CU'PHEA (from *κυφος, cuphos*, curved; in reference to the curved form of the capsule). Jacq. hort. vind. 2. p. 83. St. Hil. mem. mus. 1. p. 29. H. B. et Kunth, nov. gen. amer. 6. p. 196. D. C. prod. 3. p. 83.—Cùphea, Melànium, and Parsónsia, P. Browne, l. c.—Melanium and Cùphea, Spreng.—Balsamòna, Vand. fasc. in Rœm. script. p. 110. t. 4.—Melvílla, Anders.—Bánksia, Domb. herb. but not of Lin. fil.

Lin. syst. *Dodecándria, Monogýnia.* Calyx tubular, gibbous at the base on the upper side; limb wide, 12-toothed, with 6 of the teeth erect, and the other 6 small or nearly obsolete, rising from the sinuses of the inner teeth. Petals 6-7, unequal. Stamens 11-14, rarely 6-7, unequal, inserted in the throat of the calyx. Gland under the ovarium thick. Style filiform; stigma simple or rather bifid. Capsule membranous, covered by the calyx, 1-2-celled, at length cleft by the deflexed placenta as well as the calyx. Seeds nearly orbicular, compressed, wingless.—Herbs or subshrubs. Leaves opposite, rarely in whorls, quite entire. Peduncles interpetiolar, 1-flowered, rarely many-flowered. Flowers usually drooping. Calyx coloured. Petals violaceous or white.

§ 1. *Circæoideæ* (containing plants whose habit is like that of *Circæ'a*). *D. C. prod.* 3. *p.* 83. *Stems herbaceous, erect. Racemes somewhat spicate, terminal. Flowers small.*

1 C. micra'ntha (H. B. et Kunth, l. c. p. 196.) stem herbaceous, erect, branched, rather pilose; leaves on short petioles, oblong, acute, rounded at the base, scabrous on the margins, rather pilose on both surfaces; pedicels solitary or twin, upper ones disposed in spicate racemes; calyxes rather hispid; petals nearly equal. ⊙. F. Native of South America, on the banks of the river Orinoco near St. Barbara, and at San Carlos de Rio Negro. Petals small, violaceous. Stamens 11. Ovary 3-seeded.

Small-flowered Cuphea. Pl. ½ ft.

2 C. circæoìdes (Smith ex Sims, bot. mag. t. 2201.) stem herbaceous, erect, branched, rather pilose; leaves petiolate, ovate, acute, pubescent; racemes terminal; pedicels scattered; calyxes hispid; petals nearly equal. ⊙. F. Native of Brazil, in shady places about Pernambuco. Petals small, violaceous. Petioles nearly an inch long. Bracteoles linear.

Circæa-like Cuphea. Fl. Sept. Clt. 1821. Pl. ¾ ft.

3 C. spica'ta (Cav. icon. 4. p. 56. t. 381.) stem herbaceous, erect, branched, rather pilose; leaves petiolate, ovate-oblong, acute at both ends, glabrous, with scabrous margins; racemes spicate, axillary, and terminal; pedicels opposite; calyxes hairy; petals unequal. ⊙. F. Native of South America, in many parts. Petals small, pale red. Stamens 12. Dorsal tooth of calyx large. Style villous. Ovarium 40-75-ovulate.

Var. α, tròpica (Schlecht. et Cham. in Linnæa. 2. p. 358.) hind tooth of calyx large; stem hairy.

Var. β, extratròpica (Schlecht. et Cham. l. c.) hind tooth of calyx a little larger than the rest; stem pubescent.

Spicate-flowered Cuphea. Pl. 1 ft.

4 C. origanifòlia (Cham. et Schlecht. in Linnæa, 2. p. 372.) root creeping; stem simple, slender, beset with viscid pubescence and glandular pili; leaves ovate, petiolate, finely denticulated, with a few glandular hairs on the nerves beneath; flowers pedicellate, interpetiolar, opposite; calyx gibbous at the base; stamens 11; style villous; ovarium containing above 30 ovula. ♃. S. Native of Brazil.

Marjoram-leaved Cuphea. Pl. 1½ ft.

5 C. salicifòlia (Schlecht. et Cham. in Linnæa. 5. p. 569.) stem suffruticose, erect, glabrous; leaves lanceolate, attenuated at the base, and bluntish at the apex, glabrous; calyx pilose on the inside at the insertion of the stamens; petals 6, unequal; filaments pilose. ♃. S. Native of Mexico, on the banks of rivulets near Masantla. Petals purple.

Willow-leaved Cuphea. Pl. 1 ft.

§ 2. *Longiflòræ* (from *longus*, long, and *flos*, a flower; in reference to the long flowers of the species). *D. C. prod.* 3. *p.* 81. *Stem herbaceous or hardly suffruticose; flowers axillary, disposed in racemose spikes; calyx long, tubular, spurred at the base, not gibbous. Petals small or wanting.*

6 C. Melví'lla (Lindl. bot. reg. t. 852.) stem herbaceous, erect; leaves sessile, lanceolate, attenuated at both ends, scabrous; racemes terminal, simple, many-flowered; petals wanting. ♃. S. Native of Guiana, at Essequibo. Melvílla speciòsa, Anders. journ. sc. ex Lindl. Calyx red at the base, and green at the apex. Pollen green.

Melville's Cuphea. Fl. May. Clt. 1823. Pl. 2 to 3 feet.

7 C. Jorullé'nsis (H. B. et Kunth, nov. gen. amer. 6 p. 208.) stems herbaceous; branches compressed, clothed with clammy pubescence; leaves oblong-lanceolate, acute, on very short petioles, rounded at the base, stiff, scabrous on both surfaces; pedicels 1-3 [illegible]her, alternate, racemose at the tops of the branches; calyx clothed with clammy pubescence, 6-toothed. ♃.? S. Native of Mexico, on Mount Jorullo. Calyx red. Petals wanting. Ovarium 12-14-ovulate. Stamens 11, very unequal, exserted.

Jorullo Cuphea. Pl 1 to 2 feet.

8 C. trìcolor (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 81.) stem herbaceous, erect, pubescent; leaves nearly sessile, oblong, acute; pedicels axillary, disposed in a terminal raceme; calyx puberulous, 6-toothed; petals 6, reflexed. ♃. S. Native of Mexico. Lýthrum álbum, Moc. et Sesse, fl. mex. icon. ined. Pedicels 4-6 lines long, somewhat secund. Calyx red, green at the apex. Petals small, white. Stamens 11, hardly unequal, very little exserted.

Tricolor-flowered Cuphea. Pl. 1 to 2 feet.

9 C. micrope'tala (H. B. et Kunth, l. c. p. 209. t. 551.) stem shrubby, much branched; branches and calyxes rather roughish; leaves oblong-lanceolate, acute at both ends, stiff, scabrous; flowers supra-axillary, secund; ovarium strumose at the apex; petals 6, minute. ♄. S. Native of Mexico. C. strumòsa, Moc. et Sesse, fl. mex. icon. ined. Calyx 12-toothed, scarlet, yellowish at the apex. Petals white. Filaments red. Ovarium 2-celled, many-seeded, with a thick lateral gland at the base.

Small-petalled Cuphea. Fl. July, Aug. Clt. 1824. Shrub 3 to 6 feet.

10 C. verticilla'ta (H. B. et Kunth, l. c. p. 207. t. 552.) stem herbaceous; branches and calyxes hairy; leaves 3 or 4 in a whorl, almost sessile, oblong, acutish, rounded at the base, scabrous from strigæ above, and pilose beneath; flowers extra-axillary, solitary or twin, alternate; petals 5-8, unequal. ♃. S. Native of Peru, in hot places. Calyx 10-16-toothed, coloured, with the limb violaceous. Petals violaceous.

Whorled-leaved Cuphea. Pl. 1 to 2 feet.

11 C. lysimachioìdes (Schlecht. et Cham. in Linnæa. vol. 2. p. 374.) stem simple, straight, rarely a little branched, scabrous like the rest of the plant, and beset with viscid glandular hairs; leaves lanceolate, acuminate, petiolate, verticillate or opposite:

flowers interpetiolar, verticillate, pedicellate; calyx with a short spur at the base; petals 6; stamens 11; style villous; ovarium 3-ovulate. ♃. S. Native of Brazil. Petals rose-coloured.

Lysimachia-like Cuphea. Pl. 1 to 2 feet.

12 C. secundiflòra (Moc. et Sesse, fl. mex. icon. ined.) stem herbaceous, erect, and is, as well as the calyxes, pubescent; leaves on long petioles, ovate, long-acuminated; raceme terminal, subspicate, short; flowers secund; petals 6, rather unequal, spreading. ☉. F. Native of Mexico. Herb with the habit of the first section, but the flowers are referrible to the present. Calyx white. Petals violaceous, 2 upper ones the largest.

Secund-flowered Cuphea. Pl. 1 foot.

13 C. cordifòlia (H. B. et Kunth, l. c. p. 206.) stem herbaceous; branches clothed with clammy pubescence; leaves on short petioles, ovate-oblong, acute, cordate at the base, with revolute margins, stiff, scabrous on both surfaces; peduncles interpetiolar, alternate, somewhat racemose; calyx hispid, clammy; petals unequal. ♃. ? S. Native of New Granada. Calyx 12-toothed. Petals 6, violaceous. Stamens 10-12, exserted, unequal. Ovarium 18-30-ovulate.

Heart-leaved Cuphea. Pl.

14 C. mimuloìdes (Cham. et Schlecht. Linnæa. 5. p. 570.) branches brachiate, and are, as well as the peduncles and calyxes, minutely puberulous; leaves elliptic or lanceolate; pedicels alternate and opposite the leaves, and longer than them; petals 6, minute; stamens 11. ☉. F. Native of Mexico, in humid places near Mesachica. Calyx [illegible]s long.

Mimulus-like Cuphea. Pl. ½ foot.

15 C. cyanæ'a (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 85.) stem herbaceous, erect; branches hispid; leaves opposite, petiolate, ovate-cordate, acuminated, villous on both surfaces; peduncles interpetiolar, alternate, subracemose; calyx rather hispid; petals 2, spatulate, unguiculate. ☉. F. Native of Mexico. Nearly allied to the preceding, but differs in the leaves being all opposite, and standing on petioles, almost an inch long. Calyx red at the base, and yellowish at the apex. Anthers and petals purplish blue. Perhaps the petals are only 2 or probably 6, 3 of which may be deciduous.

Blue-petalled Cuphea. Pl. ½ to 1 foot.

16 C. cocci'nea (D. C. prod. 3. p. 85.) stem shrubby, erect, pubescent at the apex; leaves petiolate, cordate, acute; peduncles many-flowered, disposed in a terminal panicle; petals oblong, acute, reflexed. ♄. S. Native of Mexico, on the mountains of Tuxtla. Lŷthrum cordifòlium, Moc. et Sesse, fl. mex. icon. ined. Calyxes scarlet. Petals and genitals of the same colour.

Scarlet-flowered Cuphea. Shrub 1 to 2 feet.

17 C. Lla'vea (La Llave ex Lexarc. nov. veg. mex. 1. p. 20.) stems numerous, hispid; branches ascending; leaves almost sessile, ovate-lanceolate, strigose; pedicels interfoliaceous, erect; petals 2, obovate, large, the rest abortive; stamens 11. ♃. S. Native of Mexico, on the mountains. Petals pale scarlet. Calyx with a greenish front, and with the back and throat purplish brown. Three of the stamens very long.

La Llave's Cuphea. Pl. 1 to 2 feet.

18 C. linarioìdes (Cham. et Schlecht. Linnæa. 2. p. 367.) stem filiform, erect, always with one side pubescent, intermixed with longer glandiferous hairs; leaves nearly sessile, ovate or ovate-lanceolate, acute, with a few glandular pili on the edges and nerves; flowers interpetiolar, solitary, alternate, pedicellate; calyx furnished with an ascending spur; stamens 11; style glabrous; ovary 3-ovulate. ♄. ? S. Native of Brazil. Petals 6, violaceous.

Linaria-like Cuphea. Pl. 1 foot.

19 C. Bustamo'nta (La Llave ex Lexarc. l. c. p. 21.) stems herbaceous, procumbent; branches ascending: leaves ovate-cordate, on short petioles, acuminated, rather hispid; lateral nerves parallel; flower interfoliaceous, pendulous; outer calycine teeth much elongated; petals 6, upper 2 the largest; stamens 9.—Native of Mexico. There are varieties of this plant with violaceous and rose-coloured petals, marked each with a longitudinal purplish line.

Bustamont Cuphea. Pl. procumbent.

20 C. tuberòsa (Cham. et Schlecht. in Linnæa. 2. p. 372.) root woody, tuberous; stems erect, branched at the apex; branches alternate, rarely opposite; leaves ovate, petiolate, scabrous; flowers pedicellate, interpetiolar, alternate or opposite, forming terminal racemes; calyx with a short spur at the base; petals 6, unequal; stamens 11; style glabrous; ovarium 11-18-ovulate. ♃. S. Native of the southern provinces of Brazil. Flowers purplish. Calyx 5 lines long.

Tuberous-rooted Cuphea. Pl. 1 to 3 feet.

§ 3. *Lythroìdeæ* (from *Lythrum*, and *idea*, like; plants resembling the genus *Lŷthrum* in habit). *D. C. prod.* 3. *p.* 85. *Stems herbaceous. Pedicels interpetiolar, 1-flowered, not spicately racemose. Calyx gibbous at the base, not spurred. Petals rather large, longer than calyx. Stamens* 11-12.

21 C. viscossíssima (Jacq. hort. vind. 2. p. 83. t. 177.) stem herbaceous, erect, branched, clothed with clammy pubescence, hispid; leaves opposite, petiolate, ovate-lanceolate, rather scabrous; flowers pedicellate, solitary, deflexed; calyx 6-toothed, clothed with clammy down; petals 6, unequal. ☉. F. Native of America, from Brazil to Pennsylvania, in humid shady places. Sweet, fl. gard. t. 60. Lŷthrum petiolàtum, Lin. spec. p. 641. L. Cûphea, Lin. fil. suppl. 249. Flowers purple. Ovary 4-6-seeded. Stamens 12. Style pilose.

Very-clammy Cuphea. Fl. July, Aug. Clt. 1776. Pl. 1 foot.

22 C. glutinòsa (Cham. et Schlecht. in Linnæa. 2. p. 369.) plant clammy, pubescent, mixed with longer glanduliferous hairs; stem branched at the apex; leaves lanceolate, acute, on short petioles; flowers interpetiolar, pedicellate; calyx with a short spur; petals shorter than the calyx; stamens 6; style villous; ovarium 4-15-ovulate. ♄. S. Native of Brazil, common. Petals violaceous.

Glutinous Cuphea. Pl. ½ to 1 foot.

23 C. balsamòna (Schlecht. et Cham. in Linnæa. 2. p. 363.) stem erect, hispid from glandular spreading pili; leaves opposite, ovate, attenuated at both ends, petiolate, with cartilaginous finely denticulated margins, scabrous on both surfaces; flowers pedicellate; calyx short, 6-toothed, with a very short acute spur; stamens 11, inclosed; ovarium 5-6-ovulate; style glabrous. ☉. F. Native of Brazil everywhere in humid places, and of Mexico near Jalapa. Balsamòna Pinto, Vand. fl. lus. et bras. spec. p. 30. t. 4. Petals violaceous. Flowers forming leafy racemes at the tops of the stem and branches; racemes shorter than the leaves, 2-4-flowered, rarely reduced to one flower.

Balsam Cuphea. Pl. 1 foot.

24 C. procu'mbens (Cav. icon. 4. p. 55. t. 380.) stem herbaceous, assurgent; branches procumbent, clothed with clammy villi; leaves opposite, on short petioles, ovate-lanceolate, rather hispid; flowers pedicellate, solitary, deflexed; calyx clothed with clammy pili, 6-toothed; petals 6, obovate, 2 of which are larger than the rest; the two longest stamens are woolly beyond the anthers. ☉. F. Native of Mexico. Ker. bot. reg. t. 1981. Petals pale purple. Stamens 11, hairy. Calyx purplish, dilated, and greenish at the apex. Petals rose-coloured.

Procumbent Cuphea. Fl. July, Sept. Clt. 1816. Pl. proc.

25 C. lanceola'ta (Ait. hort. kew. ed. 2. vol. 3. p. 150.)

stem herbaceous, erect, clothed with clammy pubescence; leaves opposite, on short petioles, lanceolate, rather pilose; flowers pedicellate, solitary, deflexed; calyx beset with clammy pili, 6-toothed; petals 6, obovate, two of which are larger than the rest; the two longer stamens woolly beyond the anthers. ⊙. F. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 605. Petals violaceous. Very like *C. procúmbens*, but differs in being erect. Ovarium usually 18-ovulate, ex Kunth.

Lanceolate-leaved Cuphea. Fl. Aug. Sep. Clt. 1796. Pl. 1½ ft.

26 C. ÆQUIPE'TALA (Cav. icon. 4. p. 57. t. 382. f. 2.) stem herbaceous, ascending, branched, hispid from stiff bristles, as well as the calyx; leaves on short petioles, oval-oblong, attenuated at both ends, ciliated; flowers pedicellate, solitary, spreading; petals 6, obovate, nearly equal; filaments of 2 of the stamens bearded, the rest glabrous. ⊙. F. Native of Mexico, between Acapulco and the town of Mexico. Calyx 7-9 lines long. Petals purplish violet. Stamens 11-12.

Equal-petalled Cuphea. Pl. ascending.

27 C. VIRGA'TA (Cav. icon. 4. p. 57. t. 382. f. 1.) stem herbaceous, twiggy, branched, hispid from stiff bristles, as well as the calyxes; leaves almost sessile, ovate-lanceolate, bluntish at the base, hispid; flowers pedicellate, solitary, spreading; petals 6, obovate, nearly equal; many of the filaments are bearded. ⊙. F. Native of New Spain, in shady humid places, near Salvatierra, and of Mexico near Jalapa. C. nitídula, H. B. et Kunth, nov. gen. 6. p. 206. C. adscéndens, Moc. et Sesse, fl. mex. icon. ined. Petals red.

Twiggy Cuphea. Pl. 1 foot.

§ 4. *Melàniæ. Stems herbaceous. Pedicels axillary, very short, 1-flowered. Calyx gibbous at the base, or furnished with a short spur. Petals small. Stamens* 6-9 *or even* 10.

28 C. PARSÓNSIA (R. Br. ex Steud. nom. p. 245.) stem herbaceous, prostrate, branched, rather scabrous; leaves opposite, on short petioles, oval, acute at both ends, glabrous, as well as the calyxes; flowers solitary, almost sessile; petals 6, oblong, nearly equal; stamens 6, 2 of which are a little longer than the rest. ♃. S. Native of Jamaica, St. Domingo, and Porto Rico, in moist rocky places. Parsónsia herbàcea, &c. P. Browne, jam. 199. t. 21. f. 1. Lŷthrum Parsónsia, Lin. spec. 641. Swartz, obs. 193. Melànium scàbrum, Spreng. syst. 2. p. 455. Parsónsia prostràta, Bert. ined. Duvernàya, Desp. in herb. Juss. Flowers pale red.

Parsons's Cuphea. Pl. prostrate or creeping.

29 C. MELA'NIUM (R. Br. et Steud. nom. p. 245.) stems herbaceous, prostrate, pubescent at the apex; leaves opposite, almost sessile, elliptic, acuminated at both ends; flowers almost sessile, solitary, alternate; petals 6, oblong. ♃. S. Native of Jamaica. Melànium, &c. P. Browne, jam. 2, p. 217. Lŷthrum Melànium, Lin. spec. 641. Swartz, obs. p. 103. Melànium alliàceum, Spreng. syst. 2. p. 454. Plant fetid when bruised. Flowers purple. Stamens 8-10, unequal, short. Stigma acute. Ovarium 6-7-ovulate, ex Swartz.

Black Cuphea. Pl. prostrate.

30 C. HI'RTA (D. C. prod. 3. p. 86.) stem herbaceous, erect, branched, hairy; leaves opposite, sessile, lanceolate, scabrous on both surfaces; flowers pedicellate, usually solitary, erect; calyx hairy, striped; petals oblong. ⊙. F. Native of St. Domingo. Lŷthrum Domingénse, Spreng. in herb. Balb. Melànium hírtum, Spreng. syst. 2. p. 454. Stamens 6, ex Spreng. Petals small, purple. Fruit few-seeded.

Hairy Cuphea. Pl. 1 foot.

§ 5. ***Fruticòsæ*** (from ***frutex***, a shrub; the plants contained in this section are shrubby). ***D. C. prod.* 3. *p.* 86. *Stems shrubby. Pedicels alar,* 1-*flowered. Calyx gibbous, or furnished with a short spur at the base. Flowers small.***

* *Stamens* 10.

31 C. SWARTZIA'NA (Spreng. syst. 2. p. 455.) stem shrubby, decumbent, rather scabrous; leaves on short petioles, ovate, cordate, acute, wrinkled, scabrous on both surfaces; racemes secund, leafy; calyx pubescent, 10-toothed; petals 5; stamens 10. ♄. S. Native of St. Domingo, in woods. Lŷthrum cordifòlium, Swartz, fl. ind. occ. 2. p. 866. Petals blood-coloured, nearly equal.

Swartzian Cuphea. Shrub decumbent.

32 C. DECA'NDRA (Ait. hort. kew. 2. edit. vol. 3. p. 151.) stem shrubby, erect, much branched; branches scabrous, compressed at the apex; leaves ovate, acute, ciliated, tapering into the petiole at the base; flowers few, racemose, somewhat secund at the tops of the branches; petals 5-6; stamens 10. ♄. S. Native of Jamaica, on the tops of the mountains among rocks. Lŷthrum ciliàtum, Swartz, fl. ind. occ. 2. p. 868. C. decándra and racemòsa Jamaicénsis, Spreng. syst. 2. p. 455. Flowers purple.

Decandrous Cuphea. Fl. June, Oct. Clt. 1789. Sh. 1 foot.

33 C. RACEMÒSA (Spreng. syst. 2. p. 455.) stems suffruticose, diffuse; leaves ovate, petiolate; racemes terminal; pedicels opposite, long, bracteate; branches and calyxes beset with viscid hairs. ♄. S. Native of South America. Lŷthrum racemòsum, Mutis in Lin. fil. suppl. p. 250. This species is not sufficiently known, but it is nearly related to *C. Swartziàna*.

Racemose-flowered Cuphea. Shrub diffuse.

* * *Stamens* 11.

34 C. SERPYLLIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 201. t. 550. but not of Sims,) stem shrubby, procumbent; branches elongated, clothed with hispid pubescence, viscid; leaves ovate-elliptic, acute, rounded at the base, strigose on both surfaces, and viscid; flowers interpetiolar, alternate; calyx clammy and hispid; petals 6, unequal. ♄. S. Native of Santa Fé de Bogota. Ovarium 7-ovulate. Petals elliptic, purple. Stamens 11, unequal.

Wild-thyme-leaved Cuphea. Shrub procumbent.

35 C. MICROPHY'LLA (H. B. et Kunth, nov. gen. amer. 6. p. 201.) stem shrubby, much branched; branches clammy and hairy; leaves ovate-oblong, acute, rounded at the base, viscid and rather scabrous; flowers interpetiolar, alternate; calyx clammy, hispid; petals 6, rather unequal. ♄. S. Native of Peru, near Ayavaca. Calyx dark purple. Petals violaceous. Filaments 11, villous, purple. Ovarium 9-10-ovulate.

Small-leaved Cuphea. Shrub 3 feet.

36 C. SCA'BRIDA (H.B. et Kunth, l.c. 6. p. 203.) stems shrubby, and are, as well as the branches, bifariously pubescent; leaves oblong, acute at both ends, stiff, rather scabrous from strigæ above, glabrous beneath as well as the calyxes; flowers alternate, interpetiolar; petals 6, rather unequal; stamens 9-11. ♄. S. Native of Mexico, at Salamanca. Petals and stamens purple. Ovary 16-ovulate.

Scabrous Cuphea. Shrub 1 foot.

37 C. ANTISYPHILÍTICA (H. B. et Kunth, l. c. 6. p. 202.) stems shrubby, procumbent, roughish; branches pubescent; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; calyx hispid; petals equal; stamens 11. ♄. S. Native of South America, where it is called *Chiagari*, and where it is used by the inhabitants in the cure of syphilitic complaints. Petals violaceous. Stamens villous. Ovarium 4-ovulate.

Antisyphilitic Cuphea. Shrub proc.

38 C. STRIGULÒSA (H. B. et Kunth, l. c.) stem shrubby;

branches and calyxes clammy and hispid; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; petals 6, nearly equal; stamens 11. ♄. S. Native at the bottom of the Andes near Ibague. Petals violaceous. Filaments villous. Ovarium 7-8-ovulate.

Strigulose Cuphea. Shrub 1 foot.

39 C. DENTICULA'TA (H. B. et Kunth, l. c. p. 198.) stem shrubby; branches clammy, hairy; leaves lanceolate-oblong, acute, cuneated at the base, sharply and ciliately toothletted, glabrous; flowers interpetiolar on the branches, opposite, somewhat racemose; calyxes hispid; petals 6, nearly equal; stamens 11, inclosed. ♄. S. Native of Cumana, in humid places near St. Fernando. Petals spatulate, 2 superior ones violaceous, the rest white. Filaments villous. Ovarium 10-14-ovulate.

Denticulated-leaved Cuphea. Shrub 1 to 3 feet.

40 C. LOXE'NSIS (H. B. et Kunth, l. c. 6. p. 200.) stem shrubby; branches clothed with glandular hairs; leaves oblong, acute, rounded at the base, scabrous above, and pilose on the nerves beneath; flowers interpetiolar, alternate; calyx hispid; petals 6, nearly equal; stamens 11, inclosed. ♄. S. Native of Mexico near Jalapa; and at Loxa in Peru. Petals pale violet. Filaments villous. Ovary 5-6-ovulate.

Loxa Cuphea. Shrub 1 foot.

41 C. HYSSOPIFÒLIA (H. B. et Kunth, l. c. 6. p. 199.) stem shrubby; branches strigose; leaves lanceolate, acutish, obtuse at the base, glabrous above, but beset with strigose pili on the nerve and veins; flowers interpetiolar, alternate; calyx glabrous; petals 6, rather unequal; stamens 11, inclosed. ♄. S. Native of Mexico, near Jalapa. Petal[illegible] violet. Filaments villous. Ovary 5-6-ovulate.

Hyssop-leaved Cuphea. Shrub 6 feet.

42 C. GRA'CILIS (H. B. et Kunth, l. c. 6. p. 199.) stems shrubby, procumbent; branches filiform, elongated, and are, as well as the calyxes, puberulous; leaves lanceolate, acute at both ends, 1-nerved, glabrous; flowers interpetiolar, alternate; petals 6, rather unequal; stamens 11, inclosed. ♄. S. Native on the banks of the Orinoco, near Atures in sandy places. Petals violaceous. Filaments villous. Ovarium 3-4-ovulate.

Slender Cuphea. Shrub procumbent.

43 C. CORDA'TA (Ruiz et Pav. fl. per. prod. p. 119. t 11.) stem suffruticose; leaves cordate, acute; petals 6, the 2 superior ones roundish and large, the 4 lower ones small, oblong; stamens 11. ♄. S. Native of Peru, on hills. Lower leaves coriaceous, upper ones oblong. Branches, peduncles, and calyxes clammy.

Cordate-leaved Cuphea. Shrub 1 foot.

44 C. TRINITA'TIS (D.C. prod. 3. p. 88.) stems suffruticose; leaves ovate, acute at both ends; petals nearly equal, oblong; pedicels axillary, longer than the leaves. ♄. S. Native of the Island of Trinidad. C. serpyllifòlia, Sims, bot. mag. 2580. but not of H. B. et Kunth. Allied to *C. Loxénsis* and *C. gràcilis.* Stamens probably 11.

Trinidad Cuphea. Fl. May. Clt. 1822. Shrub 1 foot.

45 C. MULTIFLÒRA (Lodd. bot. cab. t. 808.) stem suffruticose, branched; leaves oblong, acute at both ends; flowers alternate, interpetiolar; petals 6, nearly equal, oblong-linear. ♄. S. Native of Trinidad. Petals violaceous.

Many-flowered Cuphea. Fl. May, Sept. Clt. 1820. Sh. 1 ft.

46 C. LIGU'STRINA (Schlecht. et Cham. in Linnæa. 2. p. 360.) stem shrubby, procumbent; branches extra-axillary, obsoletely tetragonal, clothed with clammy pubescence, interspersed with long, coloured, glanduliferous hairs, as well as the peduncles and calyxes; leaves oblong-lanceolate, with rather scabrous edges; flowers interpetiolar, pedicellate, spurless; hind tooth of calyx large; style villous; ovary 18-32-ovulate; petals 6, about equal in length; filaments villous; stamens 11, length of calycine teeth. ♄. S. Native of Brazil. Petals violaceous. Calyx 3-4 lines long. Branches extra-axillary.

Privet-like Cuphea. Shrub decumbent 1 foot.

47 C. CALOPHY'LLA (Schlecht. et Cham. in Linnæa. 2. p. 361.) stem shrubby, sparingly branched; branches axillary, when young clothed with short down and longer purplish glanduliferous pili, as well as the branches and calyxes; leaves elliptic, acute at both ends, on short petioles, scabrous; racemes compound; flowers alternate, pedicellate, spurless; teeth of calyx nearly equal; style villous; ovary 5-6-ovulate; filaments villous; petals 6, nearly equal. ♄. S. Native of Brazil, in the province of Rio Janeiro. Petals violaceous, about the length of the calyx.

Beautiful-leaved Cuphea. Shrub 1 foot.

48 C. ERICOÌDES (Schlecht. et Cham. in Linnæa. 2. p. 366.) shrub erect, branched; branches filiform, puberulous; leaves sessile, linear or acerose, 3 in a whorl, and imbricated in 6 rows, scabrous, 3-nerved; flowers crowded at the tops of the branches, pedicellate; calyx with a short spur; style glabrous; ovarium 3-ovulate; stamens 11, inclosed. ♄. S. Native of Brazil. Petals pale purple, nearly equal. Filaments ciliated. Calyx 3 lines long.

Heath-like Cuphea. Shrub 1½ foot.

49 C. THYMOÌDES (Schlecht. et Cham. in Linnæa. 2. p. 368.) smoothish, shrubby; stem filiform, branched, decumbent; branches beset with short hairs on one side; but the stem, leaves, and calyx are furnished with longer glanduliferous hairs; leaves sessile, lanceolate, obtuse, a little ciliated on the margins; flowers interpetiolar, scattered, pedicellate; calyx furnished with a short blunt spur; style glabrous; ovarium 8-ovulate; petals 6, nearly equal; stamens 11, villous. ♄. S. Native of Brazil. Petals purple. Calyx 4 lines long.

Thyme-like Cuphea. Shrub decumbent.

50 C. INGRA'TA (Schlecht. et Cham. in Linnæa. 2. p. 371.) shrubby, much branched; branches pubescent on one side, but every where beset with long stiff glanduliferous hairs; leaves broadly lanceolate, tapering into the short petiole, with reflexed, rather scabrous edges, rather pilose; flowers interpetiolar, alternate, pedicellate; calyx with a short spur; petals one-half shorter than the calyx; style villous; ovarium 10-12-ovulate; stamens 11, villous. ♄. S. Native of Brazil. Petals pale violet. Calyx beset with glandular pili, 4-5 lines long.

Ungrateful Cuphea. Shrub.

*** *Flowers with* 12 *stamens.*

51 C. PARVIFLÒRA (Hook. exot. fl. 151.) stem suffruticose, pubescent; leaves elliptic-lanceolate, tapering into the short petiole at the base, almost quite entire, with somewhat ciliated margins; flowers in terminal racemes; petals 6, oblong, nearly equal; stamens 12. ♄. S. Native about Demerara. Petals rose-coloured. Stamens short, inclosed. Branches clothed with glandular pubescence.

Small-flowered Cuphea. Fl. Oct. Clt. 1824. Shrub ½ ft.

52 C. HIRTE'LLA (H. B. et Kunth, nov. gen. amer. 6. p. 197.) stem shrubby; branches hairy; leaves oblong, acute, cuneated at the base, viscid, hairy; flowers subracemose at the tops of the branches, opposite; calyx clothed with clammy hairs; petals 6, unequal; stamens 12, inclosed. ♄. S. Native of New Granada, near Guadua. Petals white. Ovarium 10-seeded.

Hairy Cuphea. Shrub 1 foot.

53 C. FRUTICÒSA (Spreng. neue entd. 2. p. 156.) stem shrubby, branched, diffuse; branches and calyxes clothed with clammy pili; leaves petiolate, linear-lanceolate, glabrous; flowers in loose racemes; calyx 6-toothed; petals 6; stamens 12. ♄. S. Native of Brazil. Petals violaceous.

Shrubby Cuphea. Shrub 1 foot.

54 C. FLORIBU'NDA (Lehm. sem. hort. hamb. 1831.) shrubby; branches very hispid, elongated; leaves ovate-oblong; peduncles interpetiolar; petals equal; stamens 2, elongated; style very smooth; ovarium many-seeded. ♄. S. Native of Mexico.

Bundle-flowered Cuphea. Shrub 1 to 2 feet.

† *Species not sufficiently known.*

55 C. BRACTEA'TA (Lag. nov. gen. et spec. hort. madr. 1814. p. 16. no. 212.) stem shrubby, beset with retrograde spreading hairs; leaves ovate, acute, somewhat undulated; flowers solitary, interfoliaceous. ♄. S. Native of New Spain. Perhaps the same as Lýthrum Tuxtlénse, Moc. et Sesse, fl. mex. icon. ined.

Bracteate Cuphea. Shrub 1 foot.

56 C. CILIA'TA (Ruiz et Pav. fl. per. prod. p. 119. t. 11.) stem suffruticose; leaves linear, ciliated; petals 6, nearly equal. ♄. S. Native of Peru, on hills. Bánksia ciliàta, Domb. herb. Lýthrum cistifòlium, Lher. in herb. Stem much branched from the base; branches terete, villous at the apex. Leaves oblong, rather scabrous. Pedicels axillary, 1-flowered, length of the calyx. Calyx rather gibbous at the base. Flowers small, purple. Probably referrible to section *Melàniæ*.

Ciliated-leaved Cuphea. Shrub.

57 C. FLA'VA (Spreng. nov. prov. 14.) stem shrubby; leaves cordate-lanceolate, revolute, quite glabrous; flowers terminal, somewhat racemose; calyx striated, 6-toothed. ♄. S. Native of Brazil. Petals yellow.

Yellow-flowered Cuphea. Shrub.

58 C. FRUTICULÒSA (Schrad. ill. pl. bras. in Gœtt. anz. 1821. p. 715.) stem suffruticose, branched; leaves petiolate, elliptic-ovate, acutish, glabrous above, hairy on the margins and the veins beneath; racemes terminal, few-flowered. ♄. S. Native of Brazil. C. fruticòsa, Neuw. reis. bras. no. 31.

Shrubby Cuphea. Shrub.

59 C. CORYMBI'FERA (Neuw. reis. bras. 1821. p. 302.) stems herbaceous, diffuse, clothed with clammy pubescence above; leaves ovate-oblong, on short petioles, roughish; flowers terminal, corymbose. ♃. S. Native of Brazil, along the banks of rivers.

Corymb-bearing Cuphea. Pl. diffuse.

60 C. MEGAPOTA'MICA (Spreng. syst. append. 192.) stem herbaceous, simple, glabrous; leaves opposite, linear-lanceolate; corymbs terminal, few-flowered; calyx glabrous. ♃. S. Native of Brazil, at Rio Grande.

Rio Grande Cuphea. Pl. 1 foot.

61 C. APANXALÒA (Herm. mex. 353. f. 2.). Native of Mexico. Nothing is known of this plant.

Apanxaloa Cuphea. Pl.

Cult. Some of the species of *Cuphea* are very elegant when in flower. They grow well in a mixture of loam, sand, and peat; and cuttings of the perennial-herbaceous, and shrubby kinds root freely in the same kind of earth. The seeds of annual kinds require to be raised on a hot-bed.

IX. ACISANTHE'RA (from *ακις*, *akis*, a point, and *ανθηρα*, *anthera*, an anther; anthers pointed). P. Browne, jam. 217. Juss. gen. 332. D. C. prod. 3. p. 88.

LIN. SYST. *Decándria, Monogýnia.* Calyx ventricose, 5-cleft, the sinuses never drawn out into other segments. Petals 5. Stamens 10; anthers sagittate, variable. Capsule covered and crowned by the calyx, roundish, 2-celled, with 2 placentas, many seeded.—An herb, with opposite leaves. Flowers alternate, axillary, solitary. This genus differs from *Rhéxia* in the quinary parts of the flower, not quaternary, in the cells of the capsule being 2, not 3-4, and in the form of the anthers.

1 A. QUADRA'TA (Juss. in Poir. suppl. 1. p. 111.) ♃. S. Native of Jamaica, in meadows. P. Browne, l. c. t. 22. f. 1. Rhéxia Acisanthèra, Lin. amœn. 5. p. 396. Lun. hort. jam. 1. p. 5. Herb erect, branched at the apex; branches square. Leaves 3-nerved, ovate, crenated.

Square-branched Acisanthera. Fl. July, Sept. Cl. 1801. Pl. 1 to 1½ foot.

Cult. See *Cùphea* for culture and propagation.

X. FATIO'A (this genus is dedicated to Nicolas Fatio de Duillers, a physician of Geneva, who was one of the first who wrote on thermometers, and he was also the first who proposed inarching the branches of fruit trees. Compare Haller. bibl. bot. 2. p. 43.). D. C. prod. 3. p. 88. D. C. coll. mem. 10. t. 2.

LIN. SYST. *Icosándria, Monogýnia.* Calyx bractless at the base, campanulate, 6-cleft; lobes triangular, valvate in æstivation. Petals 6, inserted at the top of the tube of the calyx, and alternating with the calycine lobes. Stamens 24, inserted in the bottom of the calycine tube. Ovary 3-celled. Style filiform, longer than the stamens. Stigma simple. Fruit unknown. Tree or shrub. Branchlets tetragonal, glabrous, rising in fascicles from the nodes of the branches, or in whorls. Leaves opposite, oval, white beneath, quite entire. Peduncles axillary, 3-5-flowered.

1 F. NIPAULE'NSIS (D.C. l. c.) ♄. F. Native of Nipaul. Leaves glabrous and dark green above, but white from short velvety down beneath.

Nipaul Fatioa. Shrub.

Cult. See *Heim*[illegible] culture and propagation, p. 718.

XI. PE'MPHIS (from *πεμφις*, *pemphis*, a blister, which the globular form of the capsule represents). Forst. gen. t. 34. Juss. gen. 331. D. C. prod. 3. p. 89.—Lýthrum species Lin. and Lam.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx turbinate, permanent, 12-furrowed; lobes 12, the 6 inner ones erect, and the 6 outer ones or those produced from the sinuses smaller and spreading. Petals 6, obovate, inserted at the top of the calycine tube, and alternating with the larger or erect lobes of the calyx. Stamens 12, inserted in the middle of the calycine tube, alternately smaller. Ovarium globose. Style short. Stigma capitate. Capsule membranous, 6-valved, 3-celled at the base, circumcised, filling the calyx. Seeds numerous, fixed to the central placenta, which is tridentate.—A canescent shrub. Leaves opposite, quite entire. Pedicels axillary, solitary, bibracteate at the base. Flowers white.

1 P. ACI'DULA (Forst. l. c.) ♄. S. Native of Ceylon, Java, Timor, Madagascar, &c. on the sea shore. Lýthrum Pémphis, Lin. fil. suppl. 249. Lam. ill. 408. f. 2. Melànium fruticòsum, Spreng. syst. 2. p. 455. Mángium porcellánicum, Rumph. amb. 3. p. 84. P. angustifòlia, Roxb. hort. beng. p. 91.

Acidulous Pemphis. Shrub.

Cult. See *Heímia* for culture and propagation, p. 718.

XII. HEI'MIA (in honour of Dr. Heim, a celebrated Berlin physician). Link et Otto, abb. berl. 63. D. C. prod. 3. p. 89. Chrysóliga, Willd. herb.—Nesæ'a spec. Kunth.—Ginòria, Moc. et Sesse, fl. mex. icon. ined. but not of Jacq.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx bibracteolate at the base, campanulate, 12-toothed, the 6 inner teeth largest and erect, and the 6 outer ones, or those produced from the sinuses, small, spreading, and horn-formed. Petals 6, alternating with the erect inner lobes of the calyx. Stamens 12, nearly equal, exserted. Capsule nearly globose, covered by the calyx, 4-celled, rarely only 3-celled from abortion, 4-valved, opening at the cells. Seeds wingless, numerous.—Smooth American shrubs. Peduncles 1-flowered. Flowers yellow.

1 H. SALICIFÒLIA (Link et Otto, l. c. t. 28.) leaves opposite or 3 in a whorl, but the upper ones are usually alternate, on short petioles, lanceolate, acute, tapering at the base; flowers pedicellate; capsule ovoid. ♄. F. Native of Brazil; and Mexico on the declivities of the burning mount Jorullo. Sweet, fl. gard. 281. Nesæ'a salicifòlia, H. B. et Kunth. Ginòria flàva, Moc. et Sesse, fl. mex. icon. ined. Chrysóliga salicifòlia, herb. Willd. Ly'thrum flàvum, Spreng. syst. 2. p. 454. Flowers yellow. Petals roundish-obovate.

Willow-leaved Heimia. Fl. July, Sept. Clt. 1821. Shrub 4 to 6 feet.

2 H. MYRTIFÒLIA (Hort. berol. ex Schlecht. Linnæa. 2. p. 347.) leaves nearly opposite or alternate, lanceolate, acute, smaller than those of *H. salicifòlia*; flowers nearly sessile; capsule globose. ♄. F. Native of Brazil, in the Island of St. Catharine, at the entrance to Rio Janeiro. Ly̆thrum apétalum, Spreng. syst. 2. p. 454. Flowers yellow.

Myrtle-leaved Heimia. Fl. Aug. Sept. Clt. 1826. Shrub 3 to 4 feet.

3 H. LINARIÆFÒLIA (Hort. ex Loud. hort. brit. p. 479.) leaves linear; flowers yellow. ♄. F. Native of South America.

Toad-flax-leaved Heimia. Fl. Aug. Sept. Clt. 1826. Shrub 3 to 4 feet.

4 H. SYPHILI'TICA (D. C. prod. 3. p. 89.) leaves alternate, erect, crowded, linear-lanceolate, attenuated at both ends; petals obovate-oblong. ♄. F. Native of Mexico, at Yechpixtla, where it is called *Hanchinol* by the inhabitants. Ginòria syphilítica, Moc. et Sesse, fl. mex. icon. ined. This plant is said to possess powerful antisyphilitic properties; its expressed juice, taken in doses of 4 ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time.

Syphilitic Heimia. Shrub 4 to 6 feet.

Cult. The species of *Heimia* are very pretty shrubs when in flower; they only require to be sheltered from frost in winter; this may be done by mats, if the plants are planted against a south wall in the open ground; and if in pots they should be placed in the greenhouse. Cuttings of them strike readily either in sand or mould under a hand-glass.

XIII. DIPLUSODON (from διπλοος, *diploos*, double, and *οδους οδοντος*, *odous odontos*, a tooth; a double row of teeth in the calyx). Pohl. pl. bras. 1. p. 82. Friedlándia, Schlecht. et Cham. in Linnæa. 2. p. 348.—Dubæ'a, D. C. diss. ined. 1827. —Nesæ'a species of Kunth.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx bibracteate at the base, hemispherically campanulate (f. 106. *a.*), 12-nerved; limb 12-cleft (f. 106. *b.*), the 6 inner segments largest and erect, and the 6 outer ones, or those from the sinuses, smaller. Petals 6 (f. 106. *e.*), inserted in the calycine tube, and alternating with the erect segments of the calyx. Stamens 12-36, equal, inserted in the lower part of the tube of the calyx, exserted. Capsule globose, covered by the calyx, 2-celled, 2-valved, many seeded. Seeds oval, compressed, girded by an obscure thickish wing.—Shrubs, with quite opposite decussate entire leaves, and racemosely panicled inflorescence.

* *Leaves linear,* 1-*nerved. Outer teeth of calyx erect.*

1 D. HEXA'NDER (D. C. prod. 3. p. 94.) glabrous; branches terete; leaves oblong-linear, with revolute edges, obtuse, on short petioles; flowers on short pedicels; bracteas oblong; stamens 6? ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlándia hexándra, Mart. herb. Habit nearly of *Hypéricum angustifòlium.* Floral branches short, opposite, and slender. Petals reddish-purple. Stamens probably 12.

Hexandrous Diplusodon. Shrub 1 to 2 feet.

2 D. ANGUSTIFÒLIUS (D. C. l. c.) quite glabrous; branches rather tetragonal, slender; leaves linear, with revolute edges, hardly 1-nerved, obtuse, rather coriaceous: pedicels short; bracteas ovate-oblong; stamens? ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlándia angustifòlia, Mart. herb. Habit almost of *Hibbértia angustifòlia.* Stem much branched. Leaves 3-4 lines long, hardly a line broad, greyish as well as the calyxes. Petals and stamens unknown.

Narrow-leaved Diplusodon. Shrub 1 foot.

3 D. CANDÓLLEI (Pohl, herb. ex D. C. l. c.) branches somewhat tetragonal; under sides of leaves as well as the calyxes clothed with adpressed villi; leaves almost sessile, linear, 1-nerved, with revolute margins; flowers on short pedicels; bracteas ovate, acute, longer than the tube of the calyx; stamens 12. ♄. S. Native of Brazil, in the province of Minas Geraes. Habit of a heath. Shrub much branched. Like *D. angustifòlius,* but easily distinguished from that plant by the hairs on the leaves and calyxes. Leaves 3 lines long, but hardly a line broad.

De Candolle's Diplusodon. Shrub 1 foot.

* * *Leaves 3-nerved; lateral nerves marginal, rising from the base. Outer calycine teeth erect.*

4 D. EPILOBIOÌDES (D. C. prod. 3. p. 94.) smoothish; branches nearly terete; when young as well as the leaves, white from fine, short, velvety down; leaves on short petioles, oblong-linear, with somewhat revolute edges, 1-nerved, or the larger ones 3-nerved; pedicels 3-times shorter than the leaves; bracteas linear; stamens 12-15. ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlándia epilobioìdes, Mart. mss. Petals of a rose-purple colour. Habit of *Epilòbium Dodonæ'i.*

Willow-herb-like Diplusodon. Shrub 1 to 2 feet.

5 D. PUNCTA'TUS (Pohl, pl. bras. 1. p. 89. t. 72.) quite glabrous, branches rather tetragonal, slender; leaves sessile, lanceolate, marginate, rather dotted, somewhat coriaceous; bracteas lanceolate, glabrous; stamens 12. ♄. S. Native of Brazil, in the province of Goyaz. Corolla bluish-red. Pairs of leaves remote, 6 lines long and 2 broad. Outer calycine teeth tubercle-formed.

Dotted-leaved Diplusodon. Shrub 1 foot.

6 D. THYMIFÒLIUS (D. C. prod. l. c.) branchlets tetragonal; both surfaces of leaves and calyxes rather downy; leaves almost sessile, oblong, obtuse, 3-nerved, the lateral nerves almost marginal; pedicels shorter than the leaves; bracteas oblong, obtuse, shorter than the calycine tube; stamens 12. ♄. S. Native of Brazil, in the province of Minas Geraes, in the dry fields near Tejuco, at the height of 3000 feet. Friedlándia thymifòlia, Mart. herb. Petals rose-coloured. Leaves 2-3 lines long and 1 line broad.

Thyme-leaved Diplusodon. Shrub 1 foot.

* * * *Leaves feather-nerved, rarely feather-veined.*

7 D. VIRGA'TUS (Pohl, pl. bras. 1. p. 90. t. 73.) glabrous; branches tetragonal; leaves nearly sessile, lanceolate, attenuated at the base; bracteas oblong, glabrous; pedicels short; stamens 18. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Friedlándia albiflòra, Mart. herb. Leaves 8-9 lines long, and 3-4 broad. Flowers white.

Twiggy Diplusodon. Shrub 4 feet.

8 D. MYRSINI'TES (D. C. l. c.) quite glabrous; branches tetragonal; leaves oval or obovate, acute, narrowed at the base, with the lateral veins nearly obsolete; pedicels much shorter than the leaves; bracteas oval-oblong, obtuse; stamens 12. ♄. S. Native of Brazil, in the province of Minas Geraes.

Friedlándia myrsinìtes, Mart. herb. Branches purplish. Leaves thickish. Petals purplish-violet. Style exserted.

Myrtle-like Diplusodon. Shrub 1 to 2 feet.

9 D. VACCINIFÒLIUS (D. C. l. c.) quite glabrous, much branched; branches rather tetragonal; leaves sessile, lower ones cordate, broadly ovate, upper ones oval, all 1-nerved, the lateral veins being hardly discernible; flowers nearly sessile; bracteas oval; stamens 15. ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlándia vaccinifòlia, Mart. herb. Flowers violaceous. Branches, leaves, and calyxes reddish. Leaves 4 lines long, lower ones rather ciliated.

Whortle-berry-leaved Diplusodon. Shrub 1 to 2 feet.

10 D. AMŒ'NUS (D. C. l. c.) glabrous; branches bluntly tetragonal; leaves petiolate, lanceolate, obtuse, with revolute, scabrous margins, with 2 nerves only on each side; flowers pedicellate; bracteas spatulate-lanceolate; lobes of calyx spreading; stamens 12. ♄. S. Native of Brazil, at Chepada and Barbacena. Friedlándia amœ'na, Cham. et Schlecht. in Linnæa. 2. p. 350. Flowers yellow, like those of *Heimia salicifòlia,* disposed in leafy racemes.

. *Pleasing* Diplusodon. Shrub 1 to 2 feet.

11 D. BUXIFÒLIUS (D. C. l. c.) glabrous; branches acutely tetragonal; leaves nearly sessile, ovate, coriaceous, with smooth margins, having 3 nerves on each side; flowers almost sessile; bracteas elliptic-lanceolate, ciliated, shorter than the calyx; stamens 12. ♄. S. Native of Brazil. Friedlándia buxifòlia, Cham. et Schlecht. in Linnæa. 2. p. 351. Inner calycine teeth erect, outer ones reflexed. Petals purplish.

Box-leaved Diplusodon. Shrub 1 to 2 feet.

12 D. PARVIFÒLIUS (D. C. l. c.) branches somewhat tetragonal; leaves and calyxes hairy from stiff, short, crowded down; leaves sessile, subcordate, roundish, coriaceous, with revolute edges, having 3 nerves on each side, which are hairy beneath; flowers almost sessile; bracteas roundish, shorter than the calyx when in flower, deciduous; stamens 12. ♄. S. Native of Brazil, in the province of Bahia, at Sincora. Friedlándia parvifòlia, Mart. herb. Leaves 3-4 lines long and 2 lines broad. Flowers small, red. Outer calycine teeth reflexed.

Small-leaved Diplusodon. Shrub 1 to 2 feet.

13 D. HELIANTHEMIFÒLIUS (D. C. l. c.) branches tetragonal, rather velvety; leaves oval-oblong, attenuated at the base, on short petioles, the margins rather revolute, velvety beneath from short stellate down, having 2 or 3 nerves on each side; flowers almost sessile; bracteas ovate, rather shorter than the calycine tube; calyx glabrous; stamens 12. ♄. S. Native of Brazil, on Serro Frio. Friedlándia helianthemifòlia, Mart. herb. Petals red. Superior leaves 7-8 lines long and 2 lines broad, standing on petioles, a line long.

Sun-rose-leaved Diplusodon. Shrub 1 to 2 feet.

14 D. PEMPHOÌDES (D. C. l. c.) branches tetragonal, puberulous; leaves ovate, sessile, not attenuated at the base, rather scabrous above, but velvety from stellate down beneath, having 2 or 3 nerves on each side; flowers almost sessile; bracteas oval, deciduous; calyx glabrous; stamens 12. ♄. S. Native of Brazil, in mountain fields, at Serro Frio. Outer segments of calyx reflexed. According to Martius this plant is only a variety of the preceding, but differs especially from that species in the leaves being half stem-clasping at the base, not attenuated.

Pemphis-like Diplusodon. Shrub 1 to 2 feet.

15 D. SERPYLLIFÒLIUS (D. C. l. c.) branches tetragonal, hairy; leaves oval-obovate, on short petioles, glabrous above, but villous on the margins and on the veins beneath; flowers almost sessile; bracteas elliptic-obovate, villous beneath on the margins; calyx villous; stamens 12? ♄. S. Native of Brazil, in the province of Minas Geraes. Leaves flat, 4-8 lines long. Calyx very villous at the apex before the flowers expand, not as in *D. microphyllus,* naked. Outer calycine segments short, subulate, and somewhat spatulate. Petals elliptic, narrowed at the base, apparently white.

Wild-thyme-leaved Diplusodon. Shrub 1 to 2 feet.

16 D. MICROPHY'LLUS (Pohl, pl. bras. 1. p. 93. t. 76.) leaves ovate, on short petioles, acutish, ciliated, glabrous above, but pilose on the veins beneath; bracteas oblong, bluntish, having one pilose line on the back as well as being ciliated; stamens 12. ♄. S. Native of the province of Minas Geraes. Branches tetragonal, hairy. Corolla pale yellow.

Small-leaved Diplusodon. Shrub 2 feet.

17 D. HIRTE'LLUS; hairy; branches tetragonal; leaves almost sessile, elliptic-spatulate, glabrous above, and hairy beneath, having 2-3 nerves on each side; bracteas elliptic-spatulate, ciliated, and with a hairy line on the back; calyx pilose; outer segments of calyx reflexed; stamens 12. ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlándia hirtélla, Cham. et Schlecht. in Linnæa. 2. p. 352. Friedlándia villósula, Mart. herb. Flowers violaceous.

Rather-hairy Diplusodon. Shrub 1 to 2 feet.

18 D. HIRSU'TUS (D. C. l. c.) plant canescent from hairs; leaves almost sessile, elliptic, or ovate, obtuse, hairy on both surfaces, rather revolute at the edges, with 4-5 nerves on each side; flowers almost sessile; bracteas elliptic; outer calycine teeth reflexed; stamens 12. ♄. S. Native of Brazil. Friedlándia hirsùta, Cham. et Schlecht. in Linnæa. 2. p. 352. Friedlándia verbenæfòlia, Mart. herb. Petals violaceous. Stamens 12. or perhaps mor[illegible]

Hairy Diplusodon. Shrub 1 to 2 feet.

19 D. LANCEOLA'TUS (Pohl, pl. bras. 1. p. 98. t. 81.) branches nearly terete, the whole plant scabrous from short down; leaves on short petioles, lanceolate, acute, scabrous above and rather pilose, but hairy beneath, having 5 nerves on each side; flowers sessile; bracteas oval, ciliated, pilose; stamens 36. ♄. S. Native of Brazil, in the province of Goyaz. Corolla greyish red.

Lanceolate-leaved Diplusodon. Shrub 2 feet.

20 D. ALUTA'CEUS (Pohl, pl. bras. 1. p. 97. t. 80.) the whole plant clothed with short stiffish down; branches nearly terete; leaves on short petioles, oblong, acute, alutaceously rough above, rather tomentose beneath, with rough ciliated edges, having 6 nerves on each side; bracteas oval tomentose; flowers sessile, outer calycine teeth erect; stamens 24. ♄. S. Native of Brazil, in the province of Goyaz. Leaves nearly 2 inches long and 10-12 lines broad. Corolla greyish red.

Alutaceous Diplusodon. Shrub 2 feet.

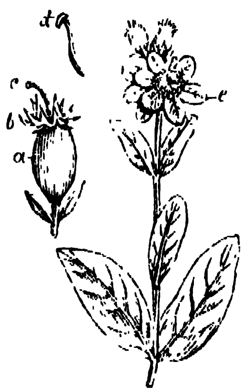
21 D. SCA'BER (Pohl, pl. bras. 1. p. 96. t. 79.) branchlets compressed, rather scabrous; branches and stems terete and glabrous; leaves on short petioles, oblong, acutish at both ends, scabrous from dots above and from hairs beneath, having 5 nerves on each side; flowers sessile; bracteas obovate, narrowed at the base, ciliated; outer calycine segments erect; stamens 24. ♄. S. Native of Brazil, in the province of Goyaz. Leaves an inch long and 5-6 lines broad. Corolla greyish-red, small.

Scabrous Diplusodon. Shrub 1½ foot.

22 D. NI'TIDUS (D. C. prod. 3. p. 94.) plant quite glabrous; branches acutely tetragonal; leaves petiolate, ovate, bluntish, coriaceous, having 5-6 nerves on each side; floral leaves oblong; pedicels 1-flowered, bibracteolate in the middle; bracteas linear; outer teeth of calyx short, reflexed; stamens 12. ♄. S. Native of Brazil, between the provinces of Bahia and Minas Geraes. Friedlándia nítida, Mart. herb. Lower leaves an inch long. Flowers reddish-purple, disposed in leafy racemes.

Shining-leaved Diplusodon. Shrub 1 to 2 feet.

FIG. 106.



23 D. ova'tus (Pohl, pl. bras. 1. p. 95. t. 69.) quite glabrous; branchlets compressed, at length terete; leaves sessile, ovate, acute, glabrous, feather-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer teeth of calyx spreading; stamens 16. ♄. S. Native of Brazil, in the province of Minas Geraes. Leaves broad. Corolla greyish red.

Ovate-leaved Diplusodon. Sh. 1 foot.

24 D. oblóngus (Pohl, pl. bras. 1. p. 95. t. 78.) quite glabrous; branches acutely tetragonal; leaves on short petioles, oblong, quite glabrous, having 4-5 veins on each side, which are reddish beneath; flowers sessile, much shorter than the floral leaves; bracteas oblong, with rather ciliated edges; stamens 12. ♄. S. Native of Brazil, in the province of Goyaz, in dry fields. Corolla greyish red.

Oblong-leaved Diplusodon. Shrub 3 feet.

25 D. ramosi'ssimus (Pohl, pl. bras. 1. p. 94. t. 77.) glabrous, much branched; branches opposite, from compressed to terete; leaves on short petioles, coriaceous, oblong, ciliated, pilose above and glabrous beneath, having 5 veins on each side; rameal and floral leaves smaller, and almost sessile, triple-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer calycine teeth erect; stamens 16. ♄. S. Native of Brazil, in the province of Goyaz, in grassy fields. Corolla greyish red. Leaves more than 2 inches long and 1 broad.

Much-branched Diplusodon. Shrub 3 feet.

26 D. strigòsus (Pohl, pl. bras. 1. p. 88. t. 71.) plant beset with hispid villi; branchlets compressed, at length terete; leaves sessile, ovate, or oblong-elliptic, acutish, rounded at the base, ciliated, strigose, having 7-8 nerves on each side; flowers almost sessile; bracteas roundish-elliptic, pilose; calycine teeth nearly equal; stamens 24-30. ♄. S. Native of Brazil, in the province of Goyaz. Calycine lobes beset with scaly strigæ. Corolla bluish red. Leaves 3 inches long and 2 broad.

Strigose Diplusodon. Shrub 3 feet.

27 D. villòsus (Pohl, pl. bras. 1. p. 91. t. 74.) stem and branches villous; branchlets tetragonal; cauline leaves on short petioles, upper ones oblong-oval, acute, ciliated, villous above and strigose beneath, having 3-4 nerves on each side; flowers almost sessile; bracteas oblong-elliptic, villous, much shorter than the calyx, which is also villous; outer teeth of calyx reflexed; stamens 15-18. ♄. S. Native of Brazil, in the province of Minas Geraes. Corolla bluish red. Leaves 9 lines long and 4 broad. Habit of *D. lythroìdes*.

Villous Diplusodon. Shrub 2 feet.

28 D. lythroi'des (D. C. prod. l. c.) stem and branches terete, beset with short spreading villi; leaves sessile, broadly ovate, acutish, villous, having 4-6 nerves on each side; flowers almost sessile, aggregate in the axils of the leaves; bracteas oval, acutish, shorter than the tube of the calyx, which is villous; outer calycine segments erect; stamens 12, rarely 15. ♄. S. Native of Brazil, in the province of Minas Geraes. Friedlandia lythroìdes, Mart. herb. Leaves vary from opposite to 3 in a whorl. Flowers large, rose-coloured, sometimes verticillate.

Var. β, glabréscens (D. C. l. c.) branches rather hairy; leaves glabrous above, hairy beneath on the nerves and on the calyxes. ♄. S. Petals deep purple.

Lythrum-like Diplusodon. Shrub 2 feet.

29 D. villosi'ssimus (Pohl, pl. bras. 1. p. 94. t. 77.) stem and branches terete and villous; cauline and rameal leaves on short petioles, ovate, acutish, cordate at the base, ciliated, clothed with white villi; bracteas oblong-ovate, tomentose; stamens 18. ♄. S. Native of Brazil, in the province of Minas Geraes. Corolla bluish red.

Very villous Diplusodon. Shrub 1½ foot.

30 D. stachyoìdes (D. C. l. c.) herbaceous? hairy; stem or branches tetragonal; leaves on short petioles, ovate, rather cordate, acute, having 5 nerves on each side; flowers on short pedicels; bracteas rhomboid-ovate, acute, length of calycine tube; outer teeth of calyx erect; stamens 16. ♄. S. Native of Brazil. Friedlándia stachyoìdes, Cham. et Schlecht. in Linnæa. 2. p. 353. Flowers purplish.

Stachys-like Diplusodon. Pl. 1 foot.

31 D. floribu'ndus (Pohl, pl. bras. 1. p. 87. t. 70.) branches terete, rather pilose; leaves sessile, ovate, acute, cordate at the base, pilose, having 4 nerves on each side, rising from the base of the middle nerve; flowers nearly sessile; bracteas ovate, acute, pilose; stamens 24; outer calycine teeth erect. ♄. S. Native of Brazil, in the province of Goyaz. Flowers bluish-red. Leaves an inch long and 6-7 lines broad.

Bundle-flowered Diplusodon. Shrub 1 to 2 feet.

32 D. divarica'tus (Pohl, pl. bras. 1. p. 84. t. 67.) plant smoothish, and rather glaucescent; branches terete; leaves sessile, roundish-ovate, cordate at the base, having 5 nerves on each side; nerves pubescent as well as the branchlets and calyxes; flowers almost sessile; branches roundish, tomentose; outer calycine teeth tubercle-formed; stamens 18. ♄. S. Native of Brazil, in the province of Goyaz, on dry mountains. Corolla purple.

Divaricate Diplusodon. Shrub 1 foot.

33 D. margina'tus (Pohl, pl. bras. 1. p. 83. t. 66.) quite glabrous; leaves sessile, ovate, or roundish-ovate, cordate at the base, glabrous, pruinose, with purplish edges; nerves 5-6 on each side, rising from the lower part of the middle nerve; flowers pedicellate; bracteas ovate; outer calycine teeth short and spreading; stamens 30. ♄. S. Native of Brazil, in the province of Goyaz. Corolla purple. Leaves 2 inches long, and 12-13 lines broad.

Marginate-leaved Diplusodon. Shrub 2 feet.

34 D. imbrica'tus (Pohl, pl. bras. 1. p. 85. t. 68.) glabrous; leaves sessile, ovate, acutish, cordate at the base, glabrous, pruinose, dotted when examined by a lens, imbricated: having 4 nerves on each side, rising from the lower part of the middle nerve; pedicels 1-flowered, shorter than the leaves; bracteas oval-elliptic; teeth of calyx reflexed; stamens 18. ♄. S. Native of Brazil, in the province of Goyaz. Corolla purple. The nerves of the leaves almost agree with those of the following division of the genus.

Imbricate-leaved Diplusodon. Shrub 2 feet.

* * * * *Leaves palmately, many-nerved.*

35 D. glauce'scens (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, hardly apiculated, coriaceous, palmately 7-nerved; pedicels shorter than the leaves; bracteas ovate, shorter than the tube; outer calycine teeth linear; stamens 12. ♄. S. Native of Brazil, on mountains at Serro Frio, Itambe, &c. in the provinces of the mines. Allied to *D. rotundifòlius*, but is easily distinguished by the smaller bracteas. Leaves 10-11 lines long and 8-9 broad.

Glaucescent Diplusodon. Shrub 1 to 2 feet.

36 D. rotundifòlius (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, palmately 7-nerved,

crowded, coriaceous, pruinose; pedicels shorter than the leaves; bracteas broadly ovate, a little longer than the tube of the calyx; outer calycine teeth linear; stamens 12. ♄. S. Native of Brazil, in the province of Minas Geraes. Friclándia rotundifòlia, Mart. mss. Leaves longer than the internodes. Petals apparently white from the dried specimen. Bracteas large.

Round-leaved Diplusodon. Shrub 1 to 2 feet.

37 D. SPECIÒSUS (D. C. l. c.) quite glabrous; branches terete; leaves sessile, roundish-ovate, acute, many-nerved, coriaceous; pedicels 1-flowered, short; bracteas ovate, a little longer than the tube of the calyx; outer calycine teeth reflexed; stamens 24. ♄. S. Native of Brazil. Nesæ'a speciòsa, Kunth, nov. gen. amer. 6. p. 191. in a note. Dubyæ'a melastomoides, D. C. in herb. mus. par. July, 1827.

Shewy Diplusodon. Shrub 1 to 2 feet.

Cult. All the species of *Diplùsodon* are very elegant when in flower, but none of them have yet been introduced to our gardens. However, should they ever be, we would advise their being grown in a mixture of loam, peat, and sand, draining the pots in which they are planted well with sherds; they will be easily propagated by cuttings, like other plants of the same order. Judging from the elevated situations in which they naturally grow in the provinces of the mines in Brazil, we should imagine that many of them will stand in the open air in warm sheltered situations, especially against a south wall, at least they will be sufficiently hardy to stand as greenhouse plants, although we would recommend, on their first introduction, that they be treated as stove plants, until their hardiness be ascertained.

XIV. PHYSOCALY'MNA (from *φυσα*, *physa*, a bladder, and *καλυμμα*, *calymma*, a covering; in reference to the inflated bracteas, which inclose the flower before expansion). Pohl, in flora, 1827. p. 152. with a figure, and pl. bras. 1. p. 99. tt. 92, 93. D. C. prod. 3. p. 89.

LIN. SYST. *Icosándria, Monogýnia.* Calyx bibracteolate at the base, campanulate, inflated, 8-toothed, without any teeth from the sinuses. Petals 8, oval, with undulately crenated margins, inserted in the top of the tube of the calyx. Stamens 24, rising from the base of the calyx beneath the germ. Ovary globose. Style filiform, exserted; stigma capitate. Capsule globose, probably 1-celled.—A tree, with red wood. Leaves oval, quite entire, scabrous, somewhat plicate at the apex, feather-nerved, pilose on the veins beneath. Panicle large, spreading, thyrsoid, with opposite branches. Bracteas glabrous, roundish, mucronate, concave, inclosing the flower-bud before expansion. Calyx purplish. Corolla purplish red.

1 P. FLORIBU'NDA (Pohl, pl. bras. 1. p. 100. tt. 92, 93.). ♄. S. Native of Brazil, in the province of Goyaz. Leaves opposite, decussate, on short petioles. Flower-bud inclosed by 2 inflated bracteas before expansion. The flowers resemble those of a species of *Lagerstrœ'mia.* The wood is rose-coloured, and much esteemed by cabinet makers. It is the celebrated rose-wood of commerce. In Germany this wood is called *Rosenholz.* In the province of Goyaz in Brazil *Cego machado*; in the province of Rio Janeiro *Pao de rosa*; and in England *rose-wood.*

Bundle-flowered Physocalymna or Brazilian Rose-wood. Tree 26 to 30 feet.

Cult. This tree is most splendid when in flower. It has not yet, like the species of the last genus, been introduced to our gardens. The treatment recommended for the species of *Diplùsodon* will answer this tree also.

XV. DE'CADON (from *δεκας*, *dekas*, ten, and *οδους οδοντος*, *odous odontos*, a tooth; in reference to the 10 teeth of the calyx). Gmel. syst. 677. Ell. sketch. 1. p. 513. D. C. prod. 3. p. 90.—Lýthrum species of Lin.—Nesæ'a species of Kunth.

LIN. SYST. *Decándria, Monogýnia.* Calyx hemispherically campanulate, bractless at the base, 10-toothed; inner 5 teeth erect, outer 5 or those from the sinuses spreading and horn-formed. Petals 5, alternating with the inner teeth of the calyx. Stamens 10, 5 of which are very long. Ovarium sessile, almost globose, 3-celled. Capsule covered by the calyx. Seeds minute, wingless.—A downy North American herb. Leaves opposite, or 3 in a whorl. Peduncles 3 or many-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals purple.

1 D. VERTICILLA'TUM (Ell. l. c. with an excellent description). ♃. B. H. Native from Canada to Florida, in swamps. Lýthrum verticillàtum, Lin. spec. 641. Anónymos aquática, Walt. car. 137. Décodon aquáticus, Gmel. syst. 677. Nesæ'a verticillàta, H. B. et Kunth, nov. gen. amer. 6. p. 191. Leaves petiolate, lanceolate. Peduncles many-flowered. Flowers purple, disposed in aggregate, corymbose whorls.

Whorled-flowered Decadon. Fl. July, Sept. Clt. 1757. Pl. 2 to 4 feet.

Cult. See *Lýthrum* for culture and propagation, p. 713. It is a pretty border-plant when in flower.

XVI. NESÆ'A (*Nesæa*, in mythology, a sea-nymph). Comm. in Juss. gen. p. 332. D. C. mem. soc. gen. 3. pt. 2. p. 74. prod. 3. p. 90.—Nesæ'a species of Kunth.—Lýthrum species of Lin.

LIN. SYST. *Octo-Dodecándria, Monogýnia.* Calyx hemispherically-campanu[illegible]ctless at the base, 8-12-lobed: the inner 4 or 6 lobes ere[illegible] and the outer 4-6 or those from the sinuses spreading and horn-formed. Petals 4-6, alternating with the erect lobes. Stamens 8-12, nearly equal. Ovarium sessile, almost globose, 4-celled. Capsule covered by the calyx. Seeds minute, wingless. Herb glabrous. Peduncles 3-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals blue.

1 N. TRIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 191. in a note). ♃. B. S. Native of the Mauritius, in humid grassy places, not of America, as had been formerly supposed. Lýthrum triflòrum, Lin. fil. suppl. p. 249. exclusive of the country. Ly'thrum triántha, Vent. herb. Trótula triánthis, Comm. herb. Willem. herb. maur. 3. with an excellent description. Leaves opposite, oblong-lanceolate, obtuse or acute, on short petioles. Flowers 3, on short pedicels, on the apex of the peduncle. Corolla blue.

Three-flowered Nesæa. Fl. Aug. Clt. 1802. Pl. 2 to 3 ft.

Cult. See *Diplùsodon* for culture and propagation.

XVII. CRE'NEA (meaning not explained by Aublet). Aubl. guian. 1. p. 523. Lam. ill. t. 407. Meyer, prim. esseq. p. 186. D. C. prod. 3. p. 90.

LIN. SYST. *Octándria, Monogýnia.* Calyx urceolate, 4-cleft; lobes broad, triangular, but none are produced at the sinuses. Petals 4, inserted between the lobes of the calyx. Ovarium roundish. Style filiform. Stigma oblong. Capsule 1-5-celled, covered by the calyx, many-seeded. Seeds very minute.—Herbs or subshrubs. Leaves opposite, glabrous. Peduncles axillary, 1 or many-flowered. Flowers white. In the capsules examined by Aublet they were 5-celled, but in those examined by Meyer and De Candolle, only 1-celled at maturity. Perhaps the capsules are 4-8-celled at first, but as they become more mature the dissepiments vanish, and the capsule becomes therefore 1-celled?

1 C. MARI'TIMA (Aubl. guian. l. c. t. 209.) stem nearly herbaceous, nodose; branches tetragonal; angles winged; leaves ovate-oblong; peduncles many-flowered. ♃. B. S. Native of

Cayenne, in saltish water by the sea-side. Pedicels 1-4, disposed in a kind of umbel at the top of the peduncle. Flowers white.

Sea-side Crenea. Pl. 2 to 3 feet.

2 C. RE'PENS (Meyer, l. c.) stem suffruticose, creeping; leaves spatulate; peduncles 1-flowered. ♄. B. S. Native of Guiana, in the island of Arowabisch, in sandy placec inundated by the sea. Flowers white.

Creeping Crenea. Shrub creeping.

Cult. Should either of the species of *Crènea* be ever introduced to the gardens, we would recommend their being grown in sand, kept moist by salted water, or the pots in which they are grown may be placed in pans filled with salted water.

XVIII. LAWSO'NIA (in honour of Isaac Lawson, M.D., author of a Voyage to Carolina, 4to. London. 1709.). Lin. gen. no. 482. Lam. ill. t. 296. f. 1. D. C. prod. 3. p. 90.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-parted, spreading, permanent, having no teeth or lobes produced at the sinuses. Petals 4, alternating with the lobes of the calyx, obovate, unguiculate, spreading. Stamens 8, approximating by pairs, which alternate with the petals. Ovarium sessile. Capsule hardly dehiscent, or a membranous berry, 4-celled, globose. Seeds angular, numerous in the cells.—A smooth shrub. Leaves quite entire. Flowers white, disposed in panicles or corymbs. *Lawsònia acronýchia* of Lin. fil. or more properly *Acronýchia læ'vis* of Forster, is a genus that does not belong to this order. It has been referred to *Aurantiàceæ* by Labillardiere in sert. austr. cal. p. 66.

1 L. A'LBA (Lam. dict. 3. p. 106[illegible]ves opposite, lanceolate, quite entire; flowers in panicles. ♄. S. Native of the East Indies, Levant, and north of Africa, where it is frequently cultivated in gardens. *Cyprus* of the ancients. *Henna* or *Alhenna* of the Arabs. Alcánna, Rumph. amb. 4. t. 17. Mail-Anschi, Rheed. mal. 1. p. 73. t. 40. L. inérmis and L. spinòsa, Lin. spec. 4. p. 498. L. inérmis, Desf. atl. 1. p. 325. Young trees unarmed. Old trees having the branchlets hardened into spines. Flowers white. The powdered leaves, made into a paste, are much used by Egyptian women to dye their nails yellow, which they esteem an ornament. The colour lasts for 3 or 4 weeks before there is occasion to renew it. The plant is supposed to possess vulnerary and astringent properties.

White-flowered Lawsonia. Clt. 1752. Shrub 6 to 10 feet.

† *Species not sufficiently known.*

2 L. FALCA'TA (Lour. coch. 229.) leaves scattered, falcate, rather crenated; flowers corymbose. ♄. G. Native of Cochinchina, among bushes. Flowers white in racemose terminating corymbs. Berry 4-celled, many-seeded, but frequently 2-3 or 1-celled only. Leaves with a strong ungrateful smell.

Falcate-leaved Lawsonia. Shrub 6 feet.

3 L. COCCI'NEA (Smith, in Rees' cycl. 20. no. 3.) branches spinescent; leaves elliptic-obovate, acute; lobes of calyx twice the length of the tube. ♄. S. Native of Banda.

Scarlet Lawsonia. Shrub.

Cult. The species of *Lawsònia* thrive well in a mixture of loam and peat; and cuttings strike root readily in sand, with a hand-glass over them, in heat.

XIX. ABA'TIA (in honour of Pierre Abat, formerly professor of botany at Seville). Ruiz et Pav. syst. fl. per. et chil. 1. p. 136. gen. t. 14. fl. per. et chil. 5. t. 463. D. Don, in edinb. new phil. journ. jan. 1831.

Lin. syst. *Icosándria, Monogýnia.* Calyx with a short, somewhat turbinate tube, having the throat beset with numerous hairs; limb 4-parted; lobes lanceolate. Petals none. Stamens about 20, inserted near the base of the calycine tube; filaments flat, glabrous. Ovary globose, 1-celled, very villous. Style terete. Stigma small, truncate, pruinose. Capsule 1-celled, 2-valved, many-seeded, opening at the apex; valves placentiferous in the middle. Placentas at length free, connate at the base. Seeds small, angular, convex on one side, furnished with a small wing-like crest at the apex.—Shrubs clothed with fascicles of cinereous tomentum. Leaves opposite, petiolate, simple, crenated. Flowers racemose. Pedicels 1-flowered, solitary, or in fascicles, each propped by a bractea. This genus was formerly placed in the order *Bixíneæ* before its relationship was well known.

1 A. RUGÒSA (Ruiz et Pav. l. c.) leaves wrinkled above; anthers oblong. ♄. S. Native of Peru, on cold hills at Rondos, Pillao, and Nanyan. At Pillao it is commonly called *Taucca-taucca.*

Wrinkled-leaved Abatia. Shrub.

2 A. PARVIFLÒRA (Ruiz et Pav. l. c. fl. per. et chil. 5. t. 463.) leaves flat above; anthers roundish. ♄. S. Native of Peru, about Muna, where it is also called *Taucca-taucca.*

Small-leaved Abatia. Shrub.

Cult. See *Lawsònia* for culture and propagation, p. 722.

XX. ANTHERY'LIUM (meaning unknown to us). Rohr, act. soc. hist. nat. hafn. 2. pt. 1. p. 211. D. C. prod. 3. p. 91.

Lin. syst. *Dodecándria, Monogýnia.* Calyx 4-parted, equal; the sinuses not produced into other lobes. Petals 4, alternating with the lobes of the calyx, and hardly longer than them. Stamens 12-16, inserted in the bottom of the calyx. Ovarium sessile, ovate. Style filiform. Capsule many-seeded, ovate, 3-4-sided, 3-4-valved, and when young 3-4-celled; but in the adult state dehiscent, and bearing at the apex a 3-4-angled thick placenta.—A glabrous tree. Leaves opposite or alternate, ovate, quite entire. Spines 2, under each leaf, similar to spiny pulvini. Pedicels axillary, numerous, 1-flowered, crowded in fascicles. This genus is probably more nearly allied to *Legnòtis*, a genus belonging to *Rhizophòreæ.*

1 A. RÒHRII (Vahl. l. c.). ♄. S. Native of the islands of St. Thomas and Porto Rico.

Rohr's Antherylium. Tree.

Cult. See *Lawsònia* for culture and propagation, p. 722.

XXI. DO'DECAS (*δωδεκα, dodeka*, twelve; in reference to the number of stamens). Lin. fil. suppl. p. 36. Ern. Meyer, act. soc. nat. cur. bonn. 12. p. 800. D. C. prod. 3. p. 91.

Lin. syst. *Dodecándria, Monogýnia.* Calyx 4-cleft; tube urceolate; lobes deltoid; the sinuses not produced into other lobes. Petals 4, almost orbicular. Stamens 12; filaments adnate to the tube of the calyx a long way. Anthers oblong, adnate. Style flexuous, obtuse. Capsule globose, half 4-valved, 1-celled. Central placenta stipitate, many-seeded.—A shrub, with tetragonal branches. Leaves opposite, obovate-oblong, quite entire. Pedicels axillary, usually 1-flowered, bibracteolate.

1 D. SURINAME'NSIS (Lin. fil. suppl. p. 245. Ern. Meyer, l. c.). ♄. S. Native of Surinam. Habit of *Lýcium bárbarum.*

Surinam Dodecas. Shrub 6 to 8 feet.

Cult. See *Lawsònia* for culture and propagation, p. 722.

XXII. GINO'RIA (so named by Jacquin in honour of the Marquis Carlo Ginori, who had a botanic garden near Florence, kept up by his son Lorenzo). Jacq. amer. p. 148. t. 91. D.C. prod. 3. p. 91.—Ginòra, Lin. gen. no. 605. Lam. ill. t. 407.—Genòria, Pers. ench. no. 1184.

Lin. syst. *Dodecándria, Monogýnia.* Calyx campanulate, permanent, 6-cleft; lobes lanceolate, acuminated, spreading; the sinuses not produced into other lobes. Petals 6, roundish, on long claws. Stamens 12; anthers reniform. Style subulate.

Capsule roundish, 4-valved, 4-furrowed, 1-celled ? opening from the apex. Seeds small, inserted in a large, roundish placenta. —A shrub. Leaves opposite, lanceolate. Pedicels axillary, 1-flowered. Flowers large, blue.

1 G. AMERICA'NA (Jacq. l. c.). ♄. S. Native of Cuba, on the banks of rivers, where it is called by the inhabitants *Rosa del Rio* or *River-rose*. Flowers nearly an inch in diameter, with a red calyx and blue corolla. Capsule dark red.

American Ginoria. Shrub 3 to 4 feet.

Cult. An elegant plant when in flower. Its culture and propagation is the same as that for *Lawsònia*, p. 722.

XXIII. ADENA'RIA (from αδην, *aden*, a gland; in reference to the petals, calyxes, and ovarium being beset with glandular dots). H. B. et Kunth, nov. gen. amer. 6. p. 185. D. C. prod. 3. p. 91.—Antherýlium species, Spreng. syst. 2. p. 474.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx turbinately campanulate, 4-5-cleft; the sinuses not produced into other lobes. Petals 4-5, unguiculate, inserted between the lobes of the calyx. Stamens 8-10, inserted in the base of the calyx, exserted. Ovarium stipitate, 2-celled. Style inclosed; stigma 2-lobed. Fruit globose, half covered by the calyx, probably indehiscent. Seeds angular, very numerous.—American trees. Leaves opposite, quite entire, beset with glandular dots beneath, as well as on the calyxes, petals, and ovarium. Flowers white, disposed in axillary umbels.

1 A. GRISLEOÌDES (H. B. et Kunth, l. c.) branches nearly terete, finely hairy; leaves oblong, acuminated, membranous, glabrous; umbels on short peduncles. ♄. S. Native of South America, on the banks of the river Magdalena, near Badilla. Antherýlium grisleoìdes, Spreng. l. c. Leaves like those of *Grislea secúnda*. Petals spotted with red or brown glands like the rest.

Grislea-like Adenaria. Tree 20 feet.

2 A. PURPURA'TA (H. B. et Kunth, l. c.) branchlets terete, when young puberulous; leaves oblong, acuminated, purplish, glabrous, but puberulous on the nerves and veins beneath; umbels almost sessile. ♄. S. Native of New Granada, on the banks of Smith's and Quilquasa rivers; and at Guayaquil. Antherýlium purpuràtum, Spreng. l. c.

Purplish-leaved Adenaria. Tree 20 to 30 feet.

3 A. FLORIBU'NDA (H. B. et Kunth, l. c. p. 188. t. 549.) branchlets tetragonal, clothed with canescent pubescence, as well as the under side of the leaves, but the upper surface is quite glabrous; leaves oblong-lanceolate, acuminated; umbels on short peduncles. ♄. S. Native along with the preceding species. Antherýlium floribúndum, Spreng. l. c.

Bundle-flowered Adenaria. Tree 20 feet.

Cult. See *Lawsònia* for culture and propagation, p. 722.

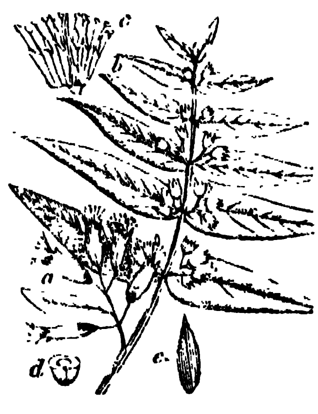
XXIV. GRI'SLEA (in honour of G. Grisley, a Portuguese chemist; author of Viridarium Lusitanicum, Lisbon, 1661, 8vo. republished by Seguier in 1749. It is also in Ray's Sylloge stirpium exterarum). Lœfl. itin. p. 245. Lin. gen. no. 474. H. B. et Kunth, nov. gen. amer. 6. p. 184. D. C. prod. 3. p. 92.—Woodfórdia, Salisb. par. lond. t. 42.

LIN. SYST. *Octo-Dodecándria, Monogýnia.* Calyx coloured, tubular (f. 107. *a.*), 8-12-toothed; the 4 or 6 inner teeth erect; and the 4 or 6 outer ones, or those produced from the sinuses, horn-formed and smaller. Petals 4-6, oblong, unguiculate, inserted in the top of the calycine tube, between the inner teeth of the calyx. Stamens 8-12 (f. 107. *c.*), exserted, inserted in the base of the calyx. Capsule globose, inclosed in the calyx.—Shrubs. Leaves opposite, quite entire, dotted with black glands beneath. Peduncles axillary, many-flowered. Flowers red.

1 G. SECU'NDA (Lœfl. itin. p. 245. H. B. et Kunth, nov. gen. amer. 6. p. 185.) branchlets glabrous; leaves on short petioles, puberulous on both surfaces, but paler beneath; flowers usually with 4 petals and 8 stamens. ♄. S. Native of South America, between Cumana and the Orinoco, and near Caraccas. Perhaps the plant of Lœfling, who says the leaves are glabrous, the calyxes 4-toothed, and the flowers secund, is the same as that of Humboldt, who says that the leaves are puberulous, the flowers axillary, and calyx 8-toothed. Perhaps both plants have 5 petals and 10 stamens in the flowers. Calyx greenish. Petals hardly conspicuous, flesh-coloured. Stamens long, purple.

Secund-flowered Grislea. Clt. 1820. Shrub 4 to 6 feet.

FIG. 107.



2 G. TOMENTÒSA (Roxb. cor. 1. p. 29. t. 31.) branchlets pubescent; leaves sessile, clothed with hoary tomentum beneath, but smoothish above; flowers usually with 6 petals and 12 stamens. ♄. S. Native of the north of Coromandel, on hills (Roxb.), China (Lin.), and the islands of Timor and Java. Ker. bot. reg. 30. Lýthrum fruticòsum, Lin. spec. 641. Woodfórdia floribúnda, Salisb. par. lond. t. 42. Calyx and stamens red. Petals hardly conspicuous. (f. 107.)

Tomentose Grisle[illegible] Fl. May, Ju. Clt. 1804. S[illegible] ft.

3 G. PUNCTA'TA (Hamilt. ex Smith in Rees' cycl. vol. 17. no. 2.) leaves petiolate, lanceolate, smooth; branches and flowers erect; calyx 4 times longer than broad; petals 6; stamens 12. ♄. S. Native of the East Indies. Flowers red. Alabastra turbinate.

Dotted Grislea. Shrub.

Cult. Pretty shrubs and profuse flowerers. Their culture and propagation is the same as that for *Lawsònia*, p. 722.

Tribe II.

LAGERSTRŒMIE'Æ (plants agreeing with *Lagerstrœ'mia* in important characters). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 70. Lobes of calyx exactly valvate in æstivation. Petals numerous, alternating with the calycine lobes, and inserted at the top of the calycine tube between its lobes. Stamens inserted lower down in the calycine tube than the petals, and twice or thrice their number. Seeds expanded into membranous wings. —Trees or shrubs.

XXV. LAGERSTRŒ'MIA (so named by Linnæus from Magnus Lagerstrœm of Gottenburg, who procured many curiosities from China, and gave them to the public). Willd. spec. 2. p. 1178. D.C. prod. 3. p. 93.—Lagerstrœ'mia and Munchaùsia, Lin. gen.

LIN. SYST. *Icosándria, Monogýnia.* Calyx bibracteolate at the base, 6-cleft; lobes distinct, but none produced from the sinuses. Petals 6, unguiculate. Stamens 18-30. Capsule 3-6-valved, girded by the calyx, 3-6-celled.—East Indian trees, and shrubs. Branches tetragonal. Leaves opposite, quite entire. Peduncles axillary, usually constituting panicles or racemes at the tops of the branches. Flowers purple, red or white, showy.

SECT. I. LAGERSTRŒ'MIA (see genus for derivation). Lin. gen. no. 667. Calyx neither furrowed nor plaited. The 6 outer stamens longer and thicker than the rest.

1 L. I'NDICA (Lin. spec. 784.) leaves roundish-ovate, acute, glabrous; panicle many-flowered, terminal; petals curled on

long claws. ♄. S. Native of China, Cochinchina, and Japan, not in India, unless cultivated in gardens. Curt. bot. mag. t. 405.—Rumph. amb. 7. t. 28. Sibi, Kœmpf. amœn. p. 855. Flowers flesh-coloured, large, and handsome. Branchlets acutely tetragonal, nearly 4-winged.

Indian Lagerstrœmia. Fl. Aug. Oct. Clt. 1759. Shrub 6 to 10 feet.

2 L. PARVIFLÒRA (Roxb. cor. 1. p. 47. t. 66.) leaves oblong or oval, obtuse, rather scabrous; peduncles axillary, 3-6-flowered; petals flat, on short claws. ♄. S. Native of the mountains called the Circars, in the East Indies. The peduncles being numerous at the tops of the branches, may be called a panicle. The flowers are small and white. The wood is used for various economical purposes in its native country. Leaves downy beneath.

Small-flowered Lagerstrœmia. Clt. 1818. Sh. 6 to 12 feet.

SECT. II. MUNCHAU'SIA (so named from Baron Gerlach Adolphus de Munchausen). Lin. mant. 153. Juss. gen. 331.—Banàva, Cam. ex Ray, hist. 3. luz. p. 80. Calyx neither furrowed nor plaited. Stamens equal among themselves.

3 L. SPECIÒSA (Pers. ench. 2. p. 72.) leaves oval, glabrous, somewhat attenuated at both ends; panicle terminal; petals flat, orbicular, on long claws. ♄. S. Native of China. Munchaúsia speciòsa, Lin. mant. p. 243. Murr. prod. with a figure. Munch. hausv. 5. p. 356. ex Willd. Lagerst. Munchaúsia, Willd. spec. 2. p. 1179. L. màjor, Retz. Upper leaves alternate. Petals 9 lines long. Flowers very shewy, disposed in terminal racemes.

Shewy Lagerstrœmia. Tree.

4 L. GRANDIFLÒRA (Roxb. hort. beng. p. 38.) leaves ovate, cordate at the base, acuminated at the apex, glabrous on both surfaces; panicles subcorymbose, terminal; petals oval-oblong, on short claws. ♄. S. Native of the East Indies, at Chittagong. Calyx large, cleft into 5 parts beyond the middle. Petals an inch long. Style compressed, thick, exserted. D. C. mem. hist. nat. gen. 3. pt. 2. p. 84.

Great-flowered Lagerstrœmia. Clt. 1818. Shrub.

SECT. III. ADA'MBEA (*Adamba* is the Malabar name of *L. reginæ* and *Katau-adambæ* of *L. hirsùta*). Lam. dict. 1. p. 39. D. C. prod. 3. p. 93. Calyx furrowed and plaited longitudinally. Stamens nearly equal in length.

5 L. REGÌNÆ (Roxb. cor. 1. p. 46. t. 65.) leaves oblong, glabrous; panicle terminal; calyxes tomentose; petals orbicular, undulated, on short claws. ♄. S. Native of the East Indies, in woods on the Circars, and in Java; also of Malabar, in sandy or stony places. Adámbea glàbra, Lam. l. c.—Rheed. mal. 4. tt. 20, 21. Flowers large, nearly 2-3 inches in diameter, of a beautiful rose-colour in the morning, growing deeper through the day, until they become purple in the evening. Angles of branches winged.

Queen's Lagerstrœmia. Clt. 1792. Tree 20 feet.

6 L. HIRSU'TA (Willd. spec. 3. p. 1178.) leaves oblong, pubescent; panicle corymbose, terminal; petals flat, oval. ♄. S. Native of Malabar, on the mountains. Rheed. mal. 4. t. 22. Adámbea hirsùta, Lam. dict. 1. p. 39. Flowers red.

Hairy Lagerstrœmia. Shrub.

7 L. FLORIBU'NDA (Jack, mal. misc. 1. no. 2. p. 38.) leaves nearly opposite, ovate-oblong, glabrous; panicle terminal, much branched, many-flowered, clothed with rusty villi; stamens unequal; calyx turbinate, furrowed. ♄. S. Native of Penang. Flowers smaller and more numerous than those of *L. regìnæ*, but of the same colour. Perhaps belonging to a different section.

Bundle-flowered Lagerstrœmia. Tree 20 feet.

Cult. *Lagerstrœ'mia* is a splendid genus of shrubs. *L. I'ndica* is a hardy stove plant and easily cultivated, and flowers freely. The rest of the species are more tender, and more difficult to preserve through the winter, at which time they require a great heat and but little water, for if they are too freely watered at this season it is a great chance if they survive. In summer they grow freely, at which time they require plenty of room to grow, and to be plentifully supplied with water. Cuttings of them all root readily if planted in sand, with a hand-glass placed over them in heat.

XXVI. LAFOE'NSIA (in honour of the duke of Lafoens, formerly president of the Academy of Sciences of Lisbon). Vand. fl. lus. et bras. (1788) p. 33. t. 2. f. 13. ed. Rœm. p. 112. D. C. prod. 3. p. 93.—Calypléctus, Ruiz et Pav. prod. fl. per. (1794). p. 73.

LIN. SYST. *Icosándria, Monogýnia.* Calyx bibracteolate at the base, campanulate, plicately 10-12-toothed at the apex; teeth as if they were joined together by a peculiar membrane. Petals 10-12. Stamens twice the number of the petals. Ovarium 2-celled. Berry corticate, spherical. Placenta central, globose.—American trees. Leaves opposite, quite entire. Peduncles solitary, 1-flowered. Flowers large, white or pale. The bracteas under the flower caducous.

1 L. SPECIÒSA (D. C. prod. 3. p. 94.) leaves oblong, acuminated; fruit spherical, smooth. ♄. S. Native of New Granada, on the Andes near Almaguer. Calypléctus speciòsus, H. B. et Kunth, nov. gen. amer. 6. p. 183. t. 548. A. and B. Flowers white. Petals oblong, with somewhat lobed and undulated edges.

Shewy Lafoensia. Tree 20 to 30 feet.

2 L. ACUMINA'TA (D. C. l. c.) leaves oblong, bluntly acuminated; fruit spherical, stellately rayed from the middle to the apex. ♄. S. Native of Peru, in warm groves about Pozuzo, where it is called by the inhabitants *Cabeza de Monge.* Calypléctus acuminàtus, Ruiz et Pav. syst. fl. per. p. 129. Racemes large. Fruit sessile, ex Ruiz et Pav.

Acuminated-leaved Lafoensia. Shrub 4 to 6 feet.

3 L. PUNICÆFÒLIA (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 86. t. 1.) leaves oblong, bluntly acuminated, with the middle nerve porose at the apex underneath; fruit ovate, globose, smooth, somewhat apiculated. ♄. S. Native of St. Martha. Calypléctus punicæfòlius, Bert. ined. Lafoénsia Mexicàna, Moc. et Sesse, fl. mex. icon. ined. does not appear to be different.

Pomegranate-leaved Lafoensia. Tree.

4 L. VANDELLIA'NA (D. C. prod. 3. p. 94.) leaves obovate, retuse at the apex, with one gland in the recess, and running down the short petiole at the base, coriaceous, glabrous, shining above; calyx half 10-cleft; fruit ovate-globose, somewhat apiculated. ♄. S. Native of Brazil. Lefoénsia, Vand. fl. lus. et bras. p. 33. t. 3. f. 13. and Rœm. script. p. 112. t. 7. f. 13. Ovary on a short stipe. Style subulate. Petals oblong, serrated, emarginate at the apex, furnished with a nectariferous scale at the base of each.

Vandelli's Lafoensia. Tree.

Cult. See *Lagerstrœ'mia* for culture and propagation.

† *Genera not sufficiently known, and probably not belonging to the present order.*

XXVII. PHYSOPO'DIUM (from *φυσα, physa,* a bladder, and *πους ποδος, pous podos,* a foot; in reference to the tumid pedicels). Desv. in ann. sc. nat. 1826. vol. 9. p. 403.

LIN. SYST. *Decándria, Monogýnia.* Calyx turbinate, 5-toothed, beset with strigose hairs inside. Petals 5, oval-oblong. Stamens 10, twice the length of the petals, alternate ones a little shorter. Anthers oblong, 2-celled. Ovarium oblong. Style capillary, subulate at the apex. Fruit unknown.—Shrub twining. Leaves alternate, quite entire and glabrous, lanceolate. Flowers in spicate panicles, secund, bracteolate; pedicels tumid at the apex. According to Desvaux the present genus is allied to the *Lythràriæ*, but the æstivation of the calyx, the fruit, and seeds is unknown.

1 P. VOLU'BILE (Desv. l. c.) ♄. ◠. S. Native of the Island of Bourbon. Stem terete. Leaves long, lanceolate, stiff, rather mucronate.

Twining Physopodium. Shrub tw.

Cult. See *Lagerstrœmia* for culture and propagation, p. 724.

XXVIII. SYMME'TRIA (from *συμμετρια*, *symmetria*, symmetry; in reference to the proportion of the parts of the flower). Blume, bijdr. p. 1130. D. C. prod. 3. p. 94.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx campanulate, 6-cleft. Petals 6, small, inserted in the calyx. Stamens 12, alternate ones shortest, at length inflexed and marcescent. Ovarium girded by the disk, 4-celled; cells 2-ovulate. Style thick. Stigma obtuse, 4-sided. Drupe baccate, umbonate, covered by the calyx, 1-3-celled; cells containing one nut each; nuts reniform, 1-seeded, covered with fibrous aril. Embryo inverted and curved in the albumen.—A tree, with opposite, obovate, obtuse, obsoletely-denticulated, coriaceous, glabrous leaves, which are full of fine parallel veins. Corymbs axillary, short. Flowers small. The seeds and fruit of this genus disagree entirely with the other genera of this order.

1 S. OBOVA'TA (Blume, l. c.) ♄. S. Native of Java, in mountain woods, where it is called by the inhabitants *Kikukuran.*

Obovate-leaved Symmetria. Tree.

Cult. See *Lagerstrœ'mia* for culture and propagation, p. 724.

ORDER XCVII. TAMARISCI'NEÆ (plants agreeing with *Támarix* in important characters). Desv. diss. inst. gall. lect. 1815. ex ann. sci. nat. (1825) 4. p. 344. Aug. St. Hil. mem. mus. (1816) 2. p. 205. Link, enum. (1821) 1. p. 291.—Tamaríscus, Tourn. inst. 661.—Támarix, Lin. gen. 375. Lam. ill. t. 213. Willd. act. ac. berol. (1812). 13. (ed. 1816) p. 77.

Calyx 4-5-parted, permanent; lobes imbricate in æstivation. Petals inserted into the base of the calyx, marcescent, imbricate in æstivation, equal in number to the lobes of the calyx, and alternating with them. Stamens either equal in number to the petals, or twice that number; filaments either free or monadelphous. Ovarium free, superior, pyramidal, trigonal. Style short; stigmas 3. Capsule trigonal, 3-valved, 1-celled, many-seeded. Placentas 3, either at the base of the cavity, or along the middle of the valves. Seeds erect or ascending, oblong, compressed, comose at the apex, exalbuminous. Embryo with a small straight inferior radicle, and plano-convex oblong cotyledons.—Shrubs, rarely perennial suffruticose herbs, with twiggy branches. Leaves alternate, small, scale-formed, entire, usually glaucous. Flowers in close spikes or racemose spikes; pedicels bracteate. Corollas white or red.

According to De Candolle, this order is allied to *Portulàceæ* from the similitude of the flowers with those of *Telèphium*, but differs in the parietal exalbuminous comose seeds; but according to Auguste St. Hilaire it is more nearly allied to *Lythrarièæ* and *Onagràriæ*, from the former it differs in the æstivation of the petals, as well as in their insertion at the base of the calyx, and in the parietal seeds; from the latter in the free ovarium, and in the imbricate æstivation of the calyx. Dr. Ehrenberg, however, asserts that the order has hypogynous stamens. The same botanist in separating the *Támarix Songàrica* of Willd., and referring it to the vicinity of *Reaumùria*, establishes the affinity of *Tamariscineæ* to the order *Reaumurièæ*.

The bark of all is slightly bitter, and probably tonic. *Támarix Gállica* and *T. Africàna* are remarkable for the quantity of sulphate of soda which their ashes contain. Dr. Ehrenberg found that the manna of Mount Sinai is produced by a variety of *Támarix Gállica*. This substance being analyzed by M. Mitscherlich was found to contain no crystallizable matter, but to consist wholly of pure mucilaginous sugar.

Synopsis of the genera.

1 TA'MARIX. Calyx 4-5-parted. Petals 4-5. Stamens 4-5. Stigmas 3, long, glandular and oblique at the apex. Seed inserted at the base of the valves, or almost in the centre of the capsule; hairs on seeds simple.

2 MYRICA'RIA. Calyx 5-parted. Petals 5. Stamens 10. Stigmas 3 in a head. Seeds parietal in the middle of the valves; hairs on seeds feathery.

3 HOLOLA'CHNA. Calyx 4-5-parted. Petals 4-5. Stamens 8-10. Stigmas 2-4. Seeds parietal in the middle of the valves, their whole surface pilose.

I. TA'MARIX (so called from growing on the banks of the Tamaris, now Tambro, on the borders of the Pyrenees). Desf. ann. sc. nat. 4. p. 348. D. C. prod. 3. p. 95.—Támarix, with 4-5 stamens of other authors.

LIN. SYST. *Tetra-Decándria, Trigýnia.* Calyx 4-5-parted. Petals 4-5. Stamens 4-5, alternating with the petals, almost free. Ovarium tapering to the apex. Stigmas 3, long, divaricate, glandular and oblique at the apex. Seeds erect, inserted nearly at the base of the valves, or almost in the centre of the capsule. Seeds tufted; tuft composed of numerous simple hairs, rising from the apex. Spikes of flowers usually disposed in panicles. Flowers small, red, seldom white.

SECT. I. OLIGADE'NIA (from *ολιγος*, *oligos*, few, and *αδην*, *aden*, a gland; few surrounding the ovarium). Ehrenberg in Schlecht. Linnæa. 2. p. 253. Gland surrounding the germ, 8-toothed. Filaments 4, one between each alternate tooth of the gland.

1 T. TETRA'NDRA (Pall. ind. taur. ex Bieb. fl. taur. 1. p. 247.) glabrous, rather glaucous; leaves lanceolate, stem-clasping, adult ones diaphanous at the apex; racemes of flowers lateral, an inch and a half long; flowers a line long; bracteas longer than the pedicels; ovarium longer than the corolla. ♄. H. Native of the south of Tauria, in valleys about Astracan and Kisliar, ex Bieb.; and probably of the island of Cyprus. T. Gállica, Habl. ined. taur. 6. p. 105. There is a variety having 3-4 valved capsules in the same spike.

Var. β, *octándra* (Pall. nov. act. sc. petr. 10. p. 376.) Stamens 8. Capsules 3-4-valved.

Tetrandrous Tamarisk. Sh. 6 to 8 feet.

2 T. LA'XA (Willd. act. soc. berol. 1812. vol. 13. p. 82. no. 10.) glabrous, rather glaucous; leaves ovate, sessile, acuminated, erect; racemes lateral, about an inch long; flowers remotish, shorter than a line in length; bracteas shorter than the pedicels. ♄. H. Native of Siberia, in the valleys of Astracan and Kisliar, about salt lakes. Capsule reddish yellow, hardly a line in length. Calycine segments orbicularly-ovate, acutish, with membranous edges.

Loose Tamarisk. Shrub 5 to 6 feet.

3 T. ELONGA'TA (Led. fl. ross. alt. ill. t. 254. fl. alt. 1. p. 421.) glabrous, glaucous; flowers crowded, pedicellate, disposed in simple, elongated, lateral racemes; bracteas reflexed, 2 or 3 times longer than the pedicels; calycine segments broad, ovate, acutish, keeled, with membranous margins; petals spreading, exceeding the genitals; styles very short; leaves ovate-lanceolate, acute, when young incurved at the apex; when adult recurved. ♄. H. Native of Siberia, in the desert of Soongaria, in saltish places. Petals reddish.

Elongated Tamarisk. Shrub.

4 T. PARVIFLÒRA (D. C. prod. 3. p. 97.) glabrous, rather glaucous; leaves small, lanceolate, subulate, a little keeled, acute; spikes lateral, crowded, short; bracteas longer than the pedicels; ovarium not exceeding the corolla when in flower. ♄. H. Native country unknown, but cultivated about Constantinople. Spikes or racemes 9-10 lines long. Flowers white, one-half smaller than those of the first species.

Small-flowered Tamarisk. Shrub.

SECT. II. DECADE'NIA (from δεκα, *deca*, ten, and αδην, *aden*, a gland; the gland surrounding the ovarium is 10-toothed). Ehrenberg in Schlecht. Linnæa. 2. p. 253. Gland surrounding the ovarium 10-toothed. Petals 5. Stamens 5, one in each of the alternate teeth of the gland.

5 T. AFRICA'NA (Poir. voy. 2. p. 189. Desf. fl. atl. 1. p. 269.) glabrous, rather glaucous; leaves lanceolate, stem-clasping, imbricate; racemes sessile, scaly, dense, rising from the branches of the same year, usually [illegible] bracteas ovate, chaffy; flowers trigynous; capsule 3-valved. ♄. F. Native in the sand along the Mediterranean sea, in Mauritania; shores of Naples, Egypt; and of the Levant at the torrents about Trapezon. T. Gállica γ, Willd. spec. 1. p. 1498. The bark is browner, and the flowers a little larger than in *T. Gállica*.

African Tamarisk. Shrub 6 to 10 feet.

6 T. TETRA'GYNA (Ehrenberg in Schlecht. Linnæa. 2. p. 258.) like the last; but differs in the bracteas being linear-lanceolate, in the flowers being tetragynous, and in the capsule being 4-valved. ♄. H. Native of the south of Europe. There is a variety of this having the racemes simple at the apex, and proliferous at the base, leafy.

Tetragynous Tamarisk. Shrub 6 to 8 feet.

7 T. GRA'CILIS (Willd. l. c. no. 8.) leaves lanceolate, sessile; racemes short, usually solitary, sessile, rising from the branches of the preceding year; pedicels elongated, about equal in length to the bracteas. ♄. H. Native of Siberia, in salt marshes at the river Irtisch.

Slender Tamarisk. Shrub 4 to 6 feet.

8 T. EFFU'SA (Ehrenberg in Schlecht. Linnæa. 2. p. 258.) leaves lanceolate; racemes loose, elongated, somewhat panicled; pedicels much shorter than the bracteas. ♄. H. Native of the north of Africa.

Effuse-panicled Tamarisk. Shrub.

9 T. ORIENTA'LIS (Forsk. descrip. 206.) glabrous, glaucescent; leaves minute, distant, stem-clasping or sheathing, mucronate; spikes or racemes lateral, slender; capsule 4-valved. ♄. S. Native of Arabia, Persia, and the East Indies. Thùya aphy'lla, Lin. spec. 1422. exclusive of the synonymes. T. articulàta, Vahl. symb. 2. p. 48. t. 32. Flowers minute. Bracteas mucronate. Branches as if they were articulated at the origin of the leaves, with the internodes turbinate. The largest tree of this species appears to be one at Babylon, on the supposed site of the hanging gardens.

Oriental Tamarisk. Tree 10 to 20 feet.

10 T. HÍSPIDA (Willd. l. c. no. 2.) leaves and branches clothed with cinereous hispid pubescence; branches ascending; styles short. ♄. H. Native in the sandy deserts about the Caspian sea. T. pentándra var. Pall. fl. ross. 1. t. 79. B. C. D. T. Gállica β, Willd. spec. T. tomentòsa, Smith in Rees' cycl. 35. no. 2. T. canéscens, Desv. ann. sc. nat. 4. p. 348. Spikes or racemes lateral, somewhat panicled. Leaves lanceolate, subulate, imbricate. Flowers pale red.

Hispid Tamarisk. Shrub 6 to 8 feet.

11 T. CHINE'NSIS (Lour. coch. p. 182.) branches drooping; leaves very minute, imbricate, acute; spikes panicled, slender, and long; petals linear, erect. ♄. G. Native of China, in the province of Canton. According to Loureiro this plant is nearly allied to *T. orientàlis*. T. Gállica var. Ehr. l. c. Flowers red.

China Tamarisk. Tree 12 to 20 feet.

12 T. DIOÍCA (Roth, nov. spec. 185.) glabrous, greenish; leaves scale-formed, acute, stem-clasping at the base; spikes panicled, very slender, elongated; bracteas longer than the flowers; stigmas in the female flowers exserted. ♄. S. Native of the East Indies. Stamens none, or 5 inclosed. A female specimen has only been examined.

Dioecious Tamarisk. Clt. 1823. Shrub 6 feet.

13 T. I'NDICA (Willd. l. c. no. 5.) glabrous, greenish; branches stiffish, twiggy; leaves short, ovate, acute, of an obscure green, with white edges; spikes of flowers elongated, straight, panicled; bracteas shorter than the flowers, subulate, longer than the pedicels; stamens exceeding the corolla. ♄. S. Native of the East Indies. T. epacroìdes, Smith in Rees' cycl. 35. no. 4. T. Gállica var. I'ndica, Ehrenberg, l. c.

Indian Tamarisk. Shrub 6 feet.

14 T. CANARIE'NSIS (Willd. l. c. no. 4. Buch, can.) glabrous, hardly glaucous; branches divaricate; leaves small, stem-clasping, obscure green, margined with white, ending in long cirrhose points, some adpressed, and some spreading; spikes somewhat panicled, very long, slender; stamens length of the corolla. ♄. G. Native of the Grand Canary Island, along the sea side, and at the entrance of the valleys near Las Palmas. In Teneriffe on the east of Santa Cruz, near the sea, where we have seen it growing in great plenty.

Canary Island Tamarisk. Shrub 4 to 6 feet.

15 T. RAMOSI'SSIMA (Led. fl. ross. alt. ill. t. 256. fl. alt. 1. p. 424.) glabrous, glaucous; flowers crowded, disposed in cylindrical racemes, forming a decompound panicle; bracteas exceeding the pedicels; calycine segments ovate-orbicular, acutish; petals erectly connivent; styles much shorter than the ovarium; leaves ovate-lanceolate, acute, stem-clasping, glabrous. ♄. H. Native of Siberia, at Lake Noor-Laisan. Flowers reddish. T. Gállica, Sievers in Pall. nord. beytr. vii.

Much-branched Tamarisk. Shrub 5 to 6 feet.

16 T. GA'LLICA (Lin. spec. 386.) glabrous, glaucous; leaves minute, stem-clasping, adpressed, acute; spikes lateral, somewhat panicled, slender, 5 times longer than broad. ♄. H. Native of France, frequent; and along the Mediterranean. In England, on the coasts of Cornwall, Hampshire, and Sussex. Smith, engl. bot. 1318. Mill. fig. 262. f. 1. Blackw. herb. 331. Tamaríscus Gállicus, All. Tamaríscus pentándrus, Lam. fl. fr. but not of Pall. Flowers flame-coloured or pale-red.

Var. α, *súbtilis* (Ehrenberg in Schlecht. Linnæa. 2. p. 267.) branches subtile, effuse; leaves glabrous, pale green, a little spreading.

Var. β, *Narbonénsis* (Ehrenberg, l. c.) branches stiff, spreading; leaves glabrous, obscure green, densely imbricated, margined with white; spikes of flowers short, rather lateral.

Var. γ, *Nilótica* (Ehrenberg, l. c. p. 269.) branches effuse, rather loose; leaves short, glaucous, spreading; spikes elongated; gland surrounding the ovarium, hypogynous, with 10 equally distant teeth.

Var. δ, *arborea* (Sieb. ex Ehrenberg, l. c.) branches effuse, thickened, stiffish, nearly terete; leaves glabrous, densely adpressed to the stem; teeth of hypogynous gland usually approximate by pairs.

Var. ε, mannífera (Ehrenberg, l. c. p. 270.) branches stiffish; leaves short, glaucous, covered with white powder, spreading; hypogynous gland with teeth at equal distances. The manna of Mount Sinai is the produce of this variety.

a; branches effuse; anthers and gland white. There is another variety of this having the anthers and gland red.

b; branches divaricate; anthers and gland rose-coloured.

Var. ι, heterophýlla (Ehrenberg, l. c. p. 270.) branches very slender; leaves light green, glabrous, short, acute, the upper ones densely imbricated, the middle ones elongated and bluntish, lower rameal ones broad-ovate, flat; spikes much elongated, all very slender.

French Tamarisk. Fl. May, Oct. Britain. Sh. 6 to 12 ft.

17 T. PALLA'SII (Desv. ann. sc. nat. 4. p. 349.) glabrous, hardly glaucous; leaves small, acute, imbricated; spikes panicled, rather thickish; stamens twice the length of the corolla; stigmas very short. ♄. H. Native at Cape Caucasus, and in deserts about the Caspian Sea. T. pentándra, Pall. fl. ross. t. 77. T. Gállica, Bieb. fl. taur. 1. p. 246. T. paniculàta, Steven in litt. A plant gathered by Olivier and Bruguiere between Bagdad and Aleppo is very nearly allied to this species.

Pallas's Tamarisk. Shrub 6 to 12 feet.

18 T. CUPRESSIFÓRMIS (Led. fl. ross. alt. ill. t. 253. fl. alt. 1. p. 423.) glabrous, glaucous; flowers remotish, disposed in lateral simple racemes; bracteas shorter than the pedicels; calycine segments orbicular, with membranous edges; petals spreading; styles much shorter than the ovarium; leaves ovate, stem-clasping, closely imbricated when young. ♄. H. Native of Siberia, in the desert of Soongaria, near salt lakes.

Cypress-formed Tamarisk. Shrub 5 to 8 feet.

19 T. SENEGALE'NSIS (D. C. prod. 3. p. 96.) glabrous, glaucous; leaves lanceolate-subulate, keeled, somewhat stem-clasping, acute, spreading a little; spikes slender, numerous, panicled; stamens hardly longer than the corolla; ovarium acutely trigonal, almost triangular. ♄. S. Native of Senegal, where it flowers in the month of January.

Senegal Tamarisk. Tree.

SECT. III. POLYADE'NIA (from πολυ, *poly*, many, and αδην, *aden*, a gland; in reference to the gland surrounding the ovarium being many toothed). Ehrenberg in Schlecht. Linnæa. 2. p. 271. Gland surrounding the ovarium 20-toothed. Stamens 10, one between each alternate tooth of the gland.

20 T. ERICOÌDES (Rottl. ex Willd. nov. act. nat. scrut. 4. p. 214. t. 4.) leaves oblong, sheathing; spikes terminal; flowers decandrous; bracteas equal in length to the pedicels. ♄. S. Native of the East Indies. Roots creeping deep. T. ericoìdes, Roth, nov. spec. p. 184. and T. mucronàta, Smith in Rees' cycl. do not appear to differ from the present species. Flowers large.

Heath-like Tamarisk. Shrub 4 to 6 feet.

21 T. AMPLEXICAU'LIS (Ehrenberg in Schlecht. Linnæa. 2. p. 275.) stems shrubby; branches divaricate, intricate; young leaves stem-clasping, glaucous, short, acute, older ones half stem-clasping; flowers small, in spikes; capsule 2 lines long. ♄. S. Native of Egypt, in the oases of Jupiter Ammon.

Stem-clasping-leaved Tamarisk. Shrub 4 to 6 feet.

22 T. PYCNOCA'RPA (D. C. prod. 3. p. 97.) leaves stem-clasping, ovate, acute, small, when young adpressed, at length spreading and mucronate; spikes panicled; flowers decandrous; bracteas equal in length to the pedicels; fruit ovate, triquetrous, turgid. ♄. F. Native of the Levant, along the road side between Bagdad and Kermancha.

Slender-fruited Tamarisk. Shrub 2 to 3 feet.

23 T. PASSERINOÌDES (Del. fl. ægypt. p. 58. Desv. in ann. sc. nat. 4. p. 349.) stem erect; branches cinereous, diffuse; leaves half stem-clasping all the summer, short, somewhat triangular, canescent; capsule 3 lines long. ♄. F. Native of Arabia and Egypt, in arid places.

Var. α, divaricàta (Ehrenberg in Schlecht. Linnæa. 2. p. 275.) branchlets divaricate; leaves densely imbricated, obtuse, adpressed; flowers large; capsules about 4 lines long. ♄. F. In the oases of Jupiter Ammon.

Var. β, Hammònis (Ehrenberg, l. c.) branches straight, torose; leaves hoary, densely imbricated, bluntish, adpressed; flowers small; capsule 3 lines long. ♄. F. In the oases of Jupiter Ammon.

Var. γ, macrocárpa (Ehrenberg, l. c.) branches loose, erectish; leaves short, dilated, acuminated, glaucous, rather remote, at length spreading; flowers large; capsule about half an inch long.

Passerina-like Tamarisk. Shrub.

Cult. *Támarix* is a genus of very pretty and delicate shrubs. The hardy species are fit ornaments for decorating shrubberies; they will grow well in any soil or situation, and cuttings planted out in the open ground in autumn or early in spring strike root readily. The stove and greenhouse kinds succeed well in a mixture of loam and peat; and cuttings of them root freely in sand under a hand-glass, those of the former in heat.

II. MYRICA'RIA (*μυρικη*, *myrice*, in Greek, a synonyme of *Tamarix*, deriv[illegible] *μυρω*, *myro*, to run; from growing on the banks of r[illegible] streams). Desv. ann. sc. nat. 4. p. 349. D. C. prod. 3. p. 97. Ehrenberg, in Schlecht, Linnæa. 2. p. 278.—Támarix species of authors.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5 parted. Petals 5. Stamens 10, alternate ones shorter than the rest; filaments monadelphous from the base to about the middle. Stigmas 3, sessile, in a head. Seeds inserted in a line along the middle of the valves, ascending, tufted at one end; hairs of tuft feathery. Flowers in simple, solitary, terminal spikes.

§ 1. *Leaves long, linear, or oblong, sessile, becoming gradually broader towards the base.*

* *Shrubby; fruit pedicellate.*

1 M. GERMA'NICA (Desv. l. c. p. 349.) shrubby; leaves linear-lanceolate, flat; racemes subspicate, elongated, terminal, solitary, but those at the tops of the branchlets are branched; mature flowers distended, ascending; bracteas longer than the pedicels; capsules ascending. ♄. H. Native nearly throughout the whole of Europe, on the banks of rivers; and of Caucasus. Mill. fig. t. 262. f. 2. Támarix Germánica, Lin. spec. p. 386. Schkuhr, handb. t. 35. fl. dan. 434. Blackw. t. 331. Tamaríscus decándrus, Lam. fl. fr. T. decándra, Mœnch. Tamaríscus decándrus, Lob. icon. 2. t. 218. Flowers pink. *Tamarisk*, especially this species, is sometimes used abroad in obstructions of the lower viscera, and especially in diseases of the spleen. By combustion it yields a considerable quantity of fixed salt, which is diuretic and aperient, and approaches to Glauber's salts. The bark of the root is the most efficacious part. A decoction of this is given in doses of 2 or 3 drachms, or even an ounce; of the wood and leaves double that quantity may be taken.

German Myricaria. Fl. June, Sept. Clt. 1582. Sh. 6 to 8 ft.

2 M. DAHU'RICA (D. C. prod. 3. p. 98. Ehrenberg, l. c.) shrubby, glabrous; leaves linear-lanceolate, flat; racemes subspicate, obtuse, lateral, but those on the secondary branches are terminal and simple; bracteas equal in length to the flowers; mature flowers coarctate, ascending. ♄. H. Native of Siberia,

beyond the Baikal, and of Dahuria. Tàmarix Dahùrica, Willd. l. c. no. 16. Flowers pink.

Dahurian Myricaria. Clt. 1818. Shrub 4 to 8 feet.

3 M. squamòsa (Desv. l. c. p. 350.) shrubby; glabrous; leaves oblong, keeled; racemes lateral, short, scaly at the base. ♄. H. Native of Siberia. Flowers pink?

Scaly-racemed Myricaria. Shrub 4 to 6 feet.

* * *Herbaceous; fruit obsoletely pedicellate.*

4 M. herbà'cea (Desv. l. c. p. 350.) glabrous; leaves linear-lanceolate; spikes terminal, simple, solitary; bracteas longer than the flowers; capsules spreading. ♃. F. Native about the Caspian Sea, on the Persian side. Támarix Germánica subherbàcea, Pall. fl. ross. 2. p. 73. t. 80. f. 3. T. Germánica β, Willd. spec. T. herbàcea, Willd. l. c. no. 14. T. Germánica Cáspica, Pers. Flowers red.

Herbaceous Myricaria. Pl. 3 to 4 feet.

§ 2. *Leaves flat, lanceolate-linear, sessile, constricted near the base.*

5 M. longifòlia (D. C. prod. 3. p. 97. Ehrenberg, l. c. p. 279.) leaves spreading; racemes terminal, compound at the base; pedicels elongated, about equal in length to the expanded flower; bracteas with membranous edges; capsules nodding. ♄. H. Native of Siberia, at the Baikal, in saltish places. Támarix Germánica, Pall. fl. ross. 2. p. 73. T. decándra, Pall. l. c. t. 80. f. A. Támarix longifòlia, Willd. l. c. no. 15. M. linearifòlia, Desv. l. c. p. 349. Flowers red.

Var. α, *laxiflòra* (Ehrenberg, in [illegible] Linnæa. 2. p. 279.) flowers distended; capsules drooping [illegible].

Var. β, *coarctàta* (Ehrenberg, l. c.) flowers coarctate; capsules drooping.

Long-leaved Myricaria. Shrub 4 to 6 feet.

Cult. For culture and propagation, see hardy species of *Támarix*, p 727.

III. HOLOLA'CHNA (from ὁλος, *holos*, the whole, and λαχνη, *lachne*, wool; in reference to the whole surface of the seeds being covered with hairs). Ehrenberg, in Schlecht. 2. p. 273. Támarix species of Pall.

Lin. syst. *Monadélphia, Decándria.* Calyx 4-5-parted. Petals 4-5. Stamens 8-10, hypogynous, monadelphous, inserted in the hypogynous gland. Styles short, subulate, 2-4. Capsule 2-4-angled, 2-4-valved, 2-4-celled. Seeds few, large, with the whole surface pilose, attached to the dissepiments in the middle of the valves.—A small shrub, with trigonal, fleshy, obtuse, spreading leaves; spikes lateral; flowers nearly sessile, about equal in length to the bracteas.

1 H. Songa'rica (Ehrenberg, l. c.). ♄. H. Native of Siberia, in the Soongarian desert, in salt places. Támarix Songárica, Pall. act. petr. 10. p. 374. t. 10. f. 4.

Soongarian Hololachna. Shrub 2 to 3 feet.

Cult. See hardy species of *Támarix* for culture and propagation. The plant requires to be refreshed with salted water at the roots now and then.

Order XCVIII. MELASTOMA'CEÆ (plants agreeing with *Melástoma* in important characters). D. Don, in wern. soc. mem. 4. (1823.) p. 281. Schrank et Mart. diss. mss. Ser. diss. mss.—Melástomæ, Juss. gen. p. 328. dict. sc. nat. p. 29. p. 505.

Calyx divided into 4, 5 (f. 808. *b.*), or 6 lobes (f. 109. *b.*), cohering more or less with the angles of the ovarium, but distinct from the surface between the angles, and thus forming a number of cavities, within which the anthers are curved downwards. Petals equal in number to the segments of the calyx (f. 108. *d.* f. 111. *c.* f. 113. *b.*), arising from their base, or from the edge of the disk that lines the calyx, twisted in æstivation (f. 112. *b.*) Stamens usually twice as many (f. 109. *d.* f. 110. *c.*), sometimes equal to them in number; in the former case those which are opposite to the segments of the calyx are alone fertile; filaments curved downwards in æstivation; anthers long (f. 109. *c.* f. 111. *e. f.*), 2-celled, usually bursting by 2 pores at the apex (f. 111. *c.*), which is rostrate, and elongated in various ways (f. 109. *e.*) beyond the insertion of the filaments; sometimes bursting longitudinally (f. 113. *c.*); before flowering contained within the cases between the ovarium and sides of the calyx. Ovarium more or less coherent with the calyx (f. 113. *c. d.*), with several cells, and indefinite ovulas; style 1 (f. 109. *d.* f. 113. *f.*); stigma simple, either capitate or minute; a cup often present upon the apex of the ovarium, surrounding the style. Pericarpium either dry and distinct from the calyx, or succulent and combined with the calyx, with several cells; if dehiscent bursting through the valves, which therefore bear the septa in the middle; placentas attached to a central column. Seeds innumerable, minute, with a brittle testa, and no albumen, usually with appendages of some kind; embryo straight or curved, with equal or unequal cotyledons.—Trees, shrubs, or herbaceous plants. Leaves opposite, undivided, usually entire, without dots, with several ribs. Flowers terminal, usually thyrsoid.—De Candolle's remarks, in his memoir upon *Melastomàceæ*, although composed of exotic plants, and established at a period when but few species were known, is so well characterised, that no one has ever thought of putting any part of it in any other group, or even introducing genera into it that do not rightly belong to it. These distinct characters are the opposite leaves, with several great veins or ribs running from the base to the apex, something as in monocotyledonous plants, and in long beaked anthers, to which, combined, there is nothing to be compared in other families. The greatest affinity is on the one hand with *Lythrarièæ*, on the other to *Myrtàceæ;* from the former it differs in the æstivation of the calyx not being valvate, from the latter in having the petals twisted before expansion, and no dots on the leaves, and from both, and from all others to which they can be compared, in their long anthers bent down parallel to the filaments in the flower, and lying in niches between the calyx and ovarium; with the exception of *Memecýleæ*, in which, however, the union between the calyx and ovarium is complete. The structure of the seeds of *Memecýleæ* is also different.—A slight degree of astringency is the prevailing character of the order, which is, although one of the most extensive known, entirely destitute of any unwholesome species. The succulent fruit of many is eatable, some of which dye the mouth black. "*Blàkea trinérvis* produces a yellow fruit, which is pleasant and eatable, in the woods of Guiana." (Hamilt. prod. p. 42.)

Synopsis of the genera.

Sub-order I. Melastòmea. Anthers opening by 1-2 pores.

Tribe I.

Lavoisie'reæ. *Ovarium free, neither scaly nor bristly at the* *apex. Capsule dry. Seeds ovate or angular, with a lateral linear hilum.*

1 Meria'nia. Calyx campanulate (f. 108. *a.*), 5-6-lobed; lobes subulate at the apex (f. 108. *b.*). Petals 5-6 (f. 108. *d.*). Anthers opening by 2 pores, furnished with a short spur at the base. Capsule 5-6-celled; placentas lunate.

2 Axinæ'a. Calyx cup-shaped, 5-6-toothed. Petals 5-6. Anthers opening by two pores, ending in a simple spur at the base. Capsule 5-6-celled.

3 Chastenæ'a. Calyx campanulate, truncate, entire. Petals 5. Stamens 10. Anthers linear, acute, opening by 1 pore: having the connectives drawn out into an ample roundish appendage at the base. Capsule 5-celled.

4 Lavoisie'ra. Calyx turbinate, 5-10-lobed. Petals 5-10. Stamens 10-20. Anthers opening by 1 pore, furnished with a short, blunt beak; the alternate ones drawn out into a 2-lobed appendage at the base. Capsule 5-10-celled.

5 Da'vya. Calyx campanulate, with the teeth concrete into an entire, membranous limb. Petals 5-6. Anthers beaked, opening by 1 pore: having the connectives drawn out at the base in a simple or bristled spur. Capsule 5-celled.

6 Graffenrie'da. Calyx campanulate, bluntly 5-toothed. Petals 5. Stamens 10. Anthers linear, acute, opening by 1 pore, furnished each with a simple appendage at the base. Capsule 5-valved.

7 Centrònia. Calyx oblong, beset with bristles; with a coarctate, entire limb. Petals 5. Anthers with a long beak, and furnished with a long subulate process at the base. Capsule 5-celled.

8 Trunca'ria. Calyx cylindrical; limb truncate, almost entire. Stamens 10. Anthers elongated, beaked, but without any process at the base, opening by 1 pore.

9 Rhynchanthe'ra. Tube of calyx ovate, globose; lobes 5, linear or setaceous. Petals 5. Stamens 10, 5 of which are sterile. Anthers ending in a long beak, with the connectives long and auricled at the base. Capsule 3, but usually 5-celled.

10 Macai'rea. Tube of calyx ovate; lobes 4. Petals 4. Stamens 8, the 4 longest beset with glandular hairs inside. Anthers linear, opening by 1 pore: in 4 of which the connective is elongated and stipe-formed. Capsule 4-celled.

11 Bucque'tia. Tube of calyx globose; lobes 4, broad. Petals 4. Stamens 8, equal. Anthers opening by 1 pore, without any auricle at the base. Ovary furnished with 4 tubercles at the apex. Capsule 4-celled.

12 Cambessede'sia. Tube of calyx globose; lobes 5, narrow. Petals 5. Stamens 10. Anthers linear, falcate, a little beaked, drawn out at the base into an obtuse, undivided auricle, each of various lengths. Capsule 3-celled.

13 Chætóstoma. Tube of calyx obovate-turbinate, girded by a ring of 4-5 stiff bristles under the lobes, which are 4-5. Petals 4-5. Anthers with short beaks, with the connectives hardly drawn out at the base. Capsule prismatic, 4-5-gonal.

14 Salpi'nga. Calyx oblong-turbinate, 8-10-ribbed, 4-5-toothed. Petals 4-5. Stamens unknown. Capsule trigonal, 3-valved.

15 Bertolònia. Calyx campanulate, 5-lobed; lobes sometimes nearly obsolete. Petals 5. Anthers ovate-obtuse, opening by 1 pore: attenuated at the base, but hardly or not auriculated. Capsule trigonal, 3-valved.

16 Meisne'ria. Calyx globose, 4-lobed. Petals 4. Stamens 8. Anthers ovate, beaked, tubular: in 4 of which the connective is long and auricled at the articulation, in the other 4 it is hardly evident. Capsule 2-celled.

Tribe II.

Rhexie'æ. *Anthers opening by 1 pore at the apex. Ovarium free, neither scaly nor bristly at the apex. Capsule dry. Seeds cochleate, with an orbicular basilar hylum. Species all American, except one.*

17 Appendicula'ria. Tube of calyx somewhat urceolate; limb somewhat campanulate, bluntly 4-toothed. Petals 4. Stamens 8, equal. Connectives drawn out into 2 long bristles at the articulation beneath and above the cells of the anthers. Capsule 3-celled, 3-valved.

18 Comòlia. Tube of calyx campanulately cylindrical; lobes 4-linear. Petals 4. Anthers 8, oblong-linear, falcate; having their connectives short and drawn out into 2 auricles at the articulation. Capsule ovate, 2-celled.

19 Spe'nnera. Calyx globose, with 4-5 short lobes. Petals 4-5. Stamens [illegible]0. Anthers ovate, obtuse, with their connectives long, but not appendiculated. Capsule 2, rarely 3-celled.

20 Microli'cia. Calyx globose, or obovate; lobes 5, subulate. Petals 5. Anthers alternately dissimilar, ovate, short-beaked, with their connectives drawn out into a simple spur at the articulation. Capsule 3-celled, 3-valved.

21 Erne'stia. Calyx globose; lobes 4, narrow. Petals ciliated. Anthers triquetrous, drawn out at the base into 2 long bristles. Capsule 4-celled.

22 Siphanthe'ra. Calyx campanulate, 4-toothed, girded by many bracteas. Petals 4. Stamens 4. Anthers furnished with an obcordate, ascending process at the base, and a tubular beak at the apex. Capsule depressed, 2-celled, obcordate.

23 Rhe'xia. Tube of calyx ventricose (f. 109. *a.*) at the base, but narrowed into a neck at the apex (f. 109. *b.*), limb 4-cleft. Petals 4. Anthers 8 (f. 108. *c.*), with their connectives hardly evident and not auriculated. Capsule at the bottom of the calyx, 4-celled; placentas lunate, pedicellate.

24 Heteronòma. Calyx tubular, 4-toothed. Petals 4. Anthers 8, alternate ones longer; the connectives of the shorter ones drawn out into 2 bristles, of the longer ones into a linear appendage, each of which is bifid at the apex. Capsule 4-celled.

25 Pachylòma. Calyx obconically cylindrical, drawn out beyond the ovarium, hardly 4-toothed. Petals 4. Stamens 8, equal. Anthers linear, elongated: with the connectives long in 4 of them, and drawn out into a simple bristle-like appendage at the base, but in the other 4 drawn out into 2 bristle-like appendages each.

26 Oxy'spora. Calyx oblong, 4-lobed. Petals 4. Stamens 8, equal. Anthers elongated, drawn out into 2 blunt spurs at the base, with their connectives hardly perspicuous. Capsule 4-celled, 4-valved.

27 Trice'ntrum. Calyx ovate; lobes 4, narrow, often with

3 bristles at the apex. Anthers 8, linear: having their connectives furnished with 3 spurs at the base. Capsule 4-celled.

28 Marce'tia. Calyx oblong or cylindrical, 4-lobed. Petals 4. Stamens 8, equal. Anthers oblong, with 2 tubercles at the base. Capsule 4-valved, 4-celled.

29 Tremble'ya. Calyx ovate, constricted at the apex, 5-lobed. Petals 5. Stamens 10, with 5 of the anthers ovate, shortly and bluntly beaked, having their connectives drawn out into an obcordate or spatulate simple ligula: the 5 alternate ones having the ligula almost abortive. Capsule 5-celled.

30 Ade'lobotrys. Calyx somewhat campanulate, bluntly 5-toothed. Petals 5. Stamens 10. Anthers bifurcate at the base. Capsule 5-valved.

Tribe III.

Orbe'ckiæ. *Anthers opening by one pore at the apex. Ovary sometimes free, sometimes adnate to the calyx, crowned by bristles or scales at the apex. Seeds cochleate; with an orbicular, basilar hylum.—Species American, African, Asiatic, and a few Australian.*

31 Lasia'ndra. Calyx ovate; lobes 5, narrow. Petals 5. Stamens 10, pilose. Anthers elongated, with a short beak: having their connectives tumid and biauriculate at the base. Ovarium bristly at the apex, rather [illegible] the calyx. Capsule 5-celled.

32 Chætoga'stra. Calyx turbinate (f. 109. *a.*), pilose or scaly, 5-lobed. Petals 5 (f. 109. *d.*). Filaments 10, glabrous. Anthers oblong: having their connectives drawn out into a simple or bifid spur, and sometimes only into 2 blunt tubercles. Ovarium bristly at the apex. Capsule 5-celled.

33 Arthroste'mma. Calyx turbinate or campanulate, usually beset with bristles or scales on the outside, 4-lobed. Petals 4. Stamens 8, glabrous. Anthers oblong: having their connectives rather long, and bluntly biauriculate at the base. Ovarium bristly at the apex. Capsule 4-celled.

34 Orbe'ckia. Calyx ovate, usually clothed with stellate bristles or down on the outside, 4-5-lobed, furnished with appendages between the lobes on the outside, of various forms and sizes. Petals 4-5. Stamens 8-10, glabrous. Anthers nearly equal, ending in short beaks, but their connectives are furnished with 2 short auricles at the base. Ovarium bristly at the apex. Capsule 4-5-celled.

35 Tibou'china. Calyx turbinate, clothed with imbricate scales on the outside: and girded by a double involucrum at the base, both composed of 2 connate bracteas; lobes 5. Petals 5. Stamens 10, glabrous. Anthers with their connectives bluntly biauriculated at the base. Ovarium free, bristly at the apex.

36 Triste'mma. Calyx tubular, girded by many bracteas at the base, 4-5-cleft, and furnished with bearded appendages near the limb. Petals 4-5. Stamens 8-10. Anthers arched, biauriculate at the base. Ovarium hardly adnate to the calyx at the base, bristly at the apex. Berry 4-5-celled.

37 Sarcopy'ramus. Calyx obversely pyramidal, adnate to the ovarium at the base, with a truncate 4-toothed limb; teeth ciliated. Petals 4. Stamens 8. Anthers simple, straight, naked, opening by 2 pores at the apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved. Seeds triangular.

38 Mela'stoma. Calyx ovate, densely covered with scales or bristles; limb 5, (f. 111. *a.*) rarely 6-cleft, the segments alternating with deciduous appendages. Petals 5-6. Stamens 10-12. Anthers a little arched: the connectives stipe-formed (f. 111. *e.*) in the longer anthers, in the shorter ones biauriculate (f. 111. *f.*) or emarginate. Ovarium bristly at the apex. Capsule baccate, 5-6-celled.

39 Otanthe'ra. Calyx with an ovate tube, half adhering to the ovarium, beset with palmately ciliated scales; limb 5-cleft, deciduous. Petals 5. Stamens 10, equal. Anthers oblong-linear, a little arched, tapering upwards, and opening by a pore, but biauriculate in front at the base. Ovarium bristly at the apex. Berry 5-celled, pulpy.

40 Lachnopòdium. Tube of calyx ovate-oblong; limb 5-cleft; segments subulated. Petals 5. Stamens 10, equal; filaments girded by a ring of hairs at the base; anthers oblong, beaked, naked. Capsule 5-celled; crowned by the segments of the calyx.

41 Pleròma. Calyx ovate, when young often inclosed in 2 bracteas; lobes 5, deciduous. Petals 5. Stamens 10, glabrous. Anthers nearly equal, elongated, arched at the base: having their connectives stipe-formed, and furnished with 2 short auricles at the base. Ovarium adnate to the calyx, bristly at the apex. Capsule baccate, 5-celled.

42 Diploste'gium. Calyx 5-cleft, inclosed in the double, cucullate, hispid calyptra. Petals 5. Anthers nearly equal. biauriculate at the base. Capsule baccate, 5-celled.

43 Aciòtis. Calyx globose, fleshy; limb coarctate, 4-toothed. Petals 4, awned. Stamens 8, furnished with long connectives, and as if it were jointed in the middle. Anthers erect, naked at the base. Capsule baccate, 4-celled.

44 Centrade'nia. Calyx somewhat campanulate, tetragonal; limb 4-toothed. Petals 4. Stamens 8, unequal; the connectives of the larger anthers are drawn out into an elongated cuneate spur, but those of the smaller anthers are gland-formed. Capsule 4-valved, 4-celled.

Tribe IV.

Miconie'æ. ***Anthers opening by 1 or 2 pores at the apex. Ovarium adnate to the calyx. Fruit baccate. Seeds not cochleate. Species for the most part American.***

45 Rousseau'xia. Calyx hemispherical, glabrous, 4-lobed. Petals 4. Stamens 8. Anthers oblong-linear, sometimes all fertile, with their connectives somewhat gibbous at the base: sometimes the alternate ones are sterile, with short connectives, the rest fertile with long connectives, which are furnished with 2 bristles at the base. Ovary furnished with 4 scale-like bristles at the apex.

46 Lea'ndra. Calyx urceolate, drawn out beyond the ovarium; lobes double, 4-6 exterior ones subulate, 6 interior oval. Petals 4-6. Stamens 8-12. Anthers linear, hardly biauriculate at the base. Berry dry? 3-4-celled.

47 Tschu'dya. Calyx globose; lobes 5, bristle-formed. Stamens 10. Anthers oblong, without auricles. Ovary free, bristly at the apex. Capsule globose, 4-5-celled.

48 **CLIDE'MIA.** Calyx ovate, 5-lobed; lobes narrow. Petals 5, rarely 6. Stamens 10. Anthers somewhat constricted at the base, and somewhat biauriculated. Ovarium bristly at the apex. Berry 5-celled.

49 **MYRIA'SPORA.** Calyx ovate-globose, very hispid, irregularly ruptured into 5 lobes. Petals 5? Stamens 10. Anthers thick, bluntish, gibbous at the base. Free part of ovarium bristly. Berry 5-celled.

50 **TOCÒCA.** Calyx oblong, glabrous; with an urceolate, 5-toothed limb. Petals 5. Stamens 10. Anthers equal, with short connectives, or with 2 hardly visible auricles behind. Ovarium crowned by a circle of bristles. Berry 5-celled.

51 **MAIE'TA.** Calyx oblong-ovate, more or less hispid, and often bracteate; lobes 5, subulate. Petals 5. Stamens 10. Anthers equal: having short connectives, which are biauriculate behind. Ovarium glabrous. Berry 5-celled.

52 **CALOPHY'SA.** Calyx oblong, bottle-shaped when in fruit; lobes 4, ciliated. Petals 4. Stamens 8. Anthers oblong, without auricles. Berry 4-celled.

53 **SONERI'LA.** Calyx with an oblong or somewhat trigonal tube, usually muricated, adhering to the ovarium; limb trifid, deciduous. Petals 3. Stamens 3; anthers linear-oblong, emarginate at the base, opening by 2 pores at the apex. Ovarium glabrous at the apex. Capsule turbinate, 3-celled.

54 **MEDINI'LLA.** Calyx with an obovate tube, and a cylindrical, truncate limb. Petals 4. Stamens 8, equal. Anthers elongated, bluntly biauriculate at the base. Berry bottle-formed, 4-celled.

55 **PACHYCE'NTRIA.** Tube of calyx cup-shaped, constricted beneath the middle; limb obsoletely 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong-linear, beaked at the apex, and furnished with a thick, fleshy connective each at the base. Free part of ovarium angular. Berry globose, 4-celled.

56 **POGONANTHE'RA.** Tube of calyx cup-shaped, rather quadrangular, adhering to the ovarium at the base; limb 4-cleft. Petals 4. Stamens 8; anthers oblong, acute, bearded at the base. Ovary hairy at the apex. Berry globose, 4-celled, pulpy.

57 **ALLOMÓRPHIA.** Tube of calyx oblong, adhering to the ovarium at the base; limb 4-toothed. Petals 4. Stamens 8. Anthers linear, acute, emarginate at the base. Fruit dry, ovate-oblong, 4-celled.

58 **HUBE'RIA.** Calyx oblong, constricted at the apex, 4-5-toothed. Petals 4-5. Stamens 8-10. Anthers oblong-linear, drawn out on the back at the base into 2 spur-formed bristles. Free part of ovarium conical. Berry 4-5-celled.

59 **OCTHÓCHARIS.** Tube of calyx obovate, adhering to the ovarium; limb obsoletely 5-toothed, permanent. Petals 5. Stamens 10, equal; anthers oblong, straight, ending each in a bristle at the base. Ovarium truncate and glabrous at the apex. Capsule globose, umbilicate, dry, 3-celled, opening irregularly.

60 **CALYCOGÒNIUM.** Tube of calyx nearly globose, 4-5-sided; limb 4-5-lobed, longer than the tube. Petals 4-5. Stamens 8-10, equal. Anthers oblong, without any auricles at the base. Berry roundish, 4-5-angled, 4-5-celled.

61 **OSSÆ'A.** Tube of calyx ovate, [illegible] 5-nerved, glabrous ovarium; lobes 4, short. Petals 4. Stamens 8. Anthers hardly auricled at the base. Ovarium smoothish at the apex. Berry 4-celled.

62 **SAGRÆ'A.** Calyx not drawn out beyond the ovarium; lobes 4, short. Stamens 8. Anthers hardly auricled at the base. Ovarium smoothish at the apex. Berry 4-celled.

63 **TETRAZY'GIA.** Tube of calyx globose or urceolate; limb drawn out beyond the ovarium, 4-toothed. Petals 4. Stamens 4-8, equal. Anthers linear, obtuse at the base. Ovarium glabrous. Berry 4-celled.

64 **DISSOCHÆ'TA.** Calyx with an oblong, obscurely tetragonal tube, adhering to the ovarium: but with the limb drawn out beyond the ovarium, permanent, and 4-toothed at the apex. Petals 4. Stamens 4, sometimes 8, but the alternate ones are usually sterile. Anthers oblong, linear, furnished on the back near the base with a lamellate, 2-awned, rarely undivided connective each. Berry globose, nearly dry, somewhat 4-celled, indehiscent.

65 **APLE'CTRUM.** Calyx with an ovate, globose tube: having the limb drawn out beyond the ovarium, which is truncate or obsoletely 4-toothed. Petals 4. Stamens 8, alternate ones sterile. Anthers oval, thick, blunt at both ends. Ovarium crowned by 4 cres[illegible] Berry subglobose, 4-celled?

66 **HETERO'TRI**[illegible] Calyx with an ovate-globose tube, and a 5-6-cleft limb. Petals 5-8. Stamens 10-16, equal, glabrous. Anthers oblong, hardly gibbous at the base. Ovary umbilicate at the apex. Berry 5-8-celled.

67 **CONOSTE'GIA.** Limb of calyx conical (f. 111. *a. b.*), calyptriform (f. 111. *a.*), undivided, at length circumcised or irregularly ruptured at the base, and falling off in one piece (f. 111. *a.*). Petals 5-6. Stamens 10-16. Anthers usually biauriculate at the base. Berry 3-8-celled.

68 **DIPLOGE'NEA.** Calyx with a calyptriform, conical, deciduous limb. Petals 4, inserted in the fleshy disk. Stamens 8. Anthers ovate, bicalcarate at the base. Ovarium adhering to the calyx, crowned by the large fleshy disk.

69 **DIPLO'CHITA.** Calyx adhering only at the base to the ovarium, cylindrical, inclosed in 2 bracteas when young: having the throat usually ciliated after flowering; limb 5-6-toothed, drawn out beyond the ovarium. Petals 5-6. Anthers biauriculate at the base. Capsule dry, 5-celled.

70 **PHY'LLOPUS.** Tube of calyx turbinately campanulate; limb 5-toothed; teeth ciliated. Petals 5. Stamens 10, equal. Anthers beaked. Fruit probably baccate, 5-celled.

71 **HENRIE'TTEA.** Calyx campanulate, 5-lobed. Petals 5, velvety. Stamens 10. Anthers thick, bifid at the base, and terminating in a long beak at the apex. Berry juicy, 5-celled.

72 **MARU'MIA.** Tube of calyx adhering to the ovarium at the base, oblong-ovate, bristly; limb quadrifid, drawn out beyond the ovarium, with the segments permanent. Petals 4. Stamens 8; anthers linear, arched, beaked at the apex, and opening by 1 pore, furnished with a fascicle of bristles at the base. Ovarium villous at the apex. Berry ovate, 4-celled.

3 bristles at the [illegible] Tube of calyx globose, adhering to the ovarium; limb short, obsoletely 4-toothed, permanent. Petals 4. Stamens 8, equal. Anthers long, thick, arched, beaked, apiculated at the base by a short connective each. Ovarium glabrous. Berry dry, globose, 4-celled.

74 Phyllaga'this. Tube of calyx oblong, glabrous, adhering to the ovarium at the base; limb 4-cleft, drawn out beyond the ovarium. Petals 4. Stamens 8, equal. Anthers arched, beaked at the apex, but unappendiculate at the base.

75 Lore'ya. Calyx campanulate, truncate at the apex, only adhering to the ovarium at the very base. Petals 5. Stamens 10. Anthers thick, ovate, obtuse, somewhat gibbous at the base. Berry 5-celled.

76 Micònia. Limb of calyx short, 5-toothed. Petals 5. Stamens 10. Anthers oblong-linear, shortly and bluntly auriculated at the base. Berry 5-celled.

77 Oxy'meris. Calyx obovate-turbinate; teeth 5, callous, very short. Petals 5. Stamens 10, equal. Anthers oval-oblong, obtuse, tapering to the base: having their connectives filiform, short, and rather gibbous at the base. Berry 3-5-celled.

78 Crema'nium. Tube of calyx campanulate or obovate; limb 4-5-toothed. Petals 4-5. Stamens 10, equal. Anthers short, rather cuneated at the base, opening by 2 pores at the apex. Berry 3-5-celled.

79 Bla'kea. Calyx campanu[illegible]d at the base by 4-6 broad scales, which are disposed cruciately or in a triple order; limb membranous, 6-lobed, or 6-toothed. Petals 6. Anthers large, twisted into a ring, obtuse at the apex, and opening by 2 pores, and furnished with a short spur-like process at the base. Berry crowned by the calyx, 6-celled.

Sub-order II. Charia'ntheæ. *Anthers 2-celled, bursting longitudinally by 2 chinks* (f. 113. c.). *Fruit fleshy. Seeds cuneated, angular.*

80 Kibe'ssia. Limb of calyx falling off in the form of a calyptra. Petals 4. Stamens 8. Ovarium muricated by branched bristles. Fruit indehiscent, 4-celled.

81 Ewy'ckia. Tube of calyx hemispherical, adhering to the ovarium; limb truncate, obsoletely 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong, obtuse at both ends, furnished each at the base with a short fleshy connective. Berry globose, 4-celled.

82 Charia'nthus. Tube of calyx ovate, rather urceolate; (f. 113. a.) limb 4-lobed. Petals 4. (f. 113. b.) Stamens 8. Ovarium adnate to the calyx (f. 113 c.). Berry globose, umbilicate, 4-celled.

83 Chænopleu'ra. Calyx adnate to the ovarium; limb bluntly 5-toothed. Petals 5. Stamens 10. Anthers bluntly biauriculate at the base. Berry 3-4-celled.

84 Astrònia. Calyx adnate to the ovarium; limb 5-6-toothed. Petals 5-6. Stamens 10-12; filaments compressed. Berry dry, umbilicate, 2-4-celled.

Sub-order I. Melastòmeæ (plants agreeing with *Melástoma*, in the anthers opening by pores at the apex). *Ser. in D. C. prod.* 3. *p.* 100. *Anthers bursting by* 1 *or* 2 *pores at the apex.*

Tribe I.

LAVOISIE'REÆ (plants agreeing with the genus *Lavoisièra* in the characters mentioned below). D. C. prod. 3. p. 100. Anthers bursting by 1 or 2 pores at the apex. Ovarium free from the calyx, neither scaly nor bristly at the apex. Capsule dry. Seeds ovate or angular, never cochleate, with a lateral linear hilum.—American plants.

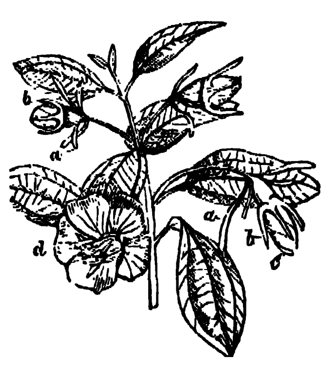
I. MERIA'NIA (in honour of Maria, Sybylla Merian, or Græffin, authoress of De Metamorphosibus Insectorum Surinamensium). Swartz, fl. ind. occ. 2. p. 824. t. 15. D. Don, Wern. mem. soc. 4. p. 322.—Wrìghtia, Sol. mss. but not of Brown.—Rhéxia species, Swartz, prod. Ser. mss.

Lin. syst. *Decándria, Monogýnia.* Calyx with a campanulate tube, and a 5-6-lobed limb (f. 108. *b.*); lobes broad, dilated, and membranous at the base and subulate at the apex. Petals 5-6. (f. 108. *d.*) Stamens 10-12. Anthers obtuse at the apex, and bursting by 2 pores, furnished with 2 short processes at the base. Ovarium globose, rather depressed, glabrous at the apex. Style filiformly-clavate. Capsule free, 5-6-celled; placentas lunate. Seeds small, cuneately angular.—Trees or shrubs, native of Jamaica or South America. Leaves petiolate, denticulated, glabrous, or hardly downy on the nerves. Flowers large, pedicellate, solitary, axillary, white, or purple.

1 M. leuca'ntha (Swartz, fl. ind. occ. p. 826.) branches tetragonally compressed, glabrous; leaves petiolate, ovate-oblong, acuminated, 3-nerved, denticulated, glabrous; peduncles axillary, solitary; bracteas 2, under each flower, ovate-lanceolate, 3-nerved, quite entire; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. ♄. S. Native of the higher mountains of Jamaica. Rhéxia leucántha, Swartz, prod. 61. Rhéxia speciòsa, Bert. in herb. Balb. Petals white, reddish at the base. Anthers large, appendiculated by a short horn.

White-flowered Jamaica Rose. Clt. 1825. Tree 15-30 feet.

FIG. 108.



2 M. ro'sea (Tuss. fl. ant. p. 78. t. 1.) branches terete, glabrous; leaves petiolate, oval, 3-nerved, rather serrulated, glabrous; pedicels axillary, 1-flowered, longer than the petioles; bracteas 2, linear, rather dilated at the apex. ♄. S. Native of Jamaica. Flowers rose-coloured, drying black. This species differs from *M. purpùrea* in there being only 2 bracteas under each flower, not 4; from *M. leucántha* in the colour of the flowers, and from both in the form of the bracteas.

Rose - coloured - flowered Jamaica Rose. Shrub 6 feet.

3 M. purpu'rea (Swartz, fl. ind. occ. p. 826.) branches terete, glabrous; leaves petiolate, ovate-lanceolate, denticulated, glabrous; peduncles axillary, opposite, longer than the petioles; bracteas 4, under each flower, lanceolate, denticulated; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. ♄. S. Native of Jamaica, on the tops of the mountains. Rhéxia purpùrea, Swartz, prod. p. 61. Flowers purple or blood-coloured. Leaves brownish-green.

Purple Jamaica Rose. Clt. 1825. Shrub 6-10 feet.

4 M. obtusifòlia (D. C. prod. 3. p. 101.) quite glabrous; branches nearly terete; leaves on short petioles, elliptic, obtuse, somewhat emarginate, coriaceous, 3-nerved, besides 2 small, marginal nervules, denticulated; pedicels axillary, 1-flowered; bracteas obovate, 3-nerved, denticulated, 4 under each flower. ♄. S. Native of St. Domingo. Melástoma involucràta, Desv. in Lam.

dict. 4. p. 35. but not of D. Don. Petals obovate, yellow, and red. Style exserted. Fruit 5-lobed. Connectives of stamens drawn out into a spur at the base. Anthers bursting by 2 pores at the apex.

Obtuse-leaved Meriania. Shrub 6-10 feet.

5 M. PRUNIFÒLIA (D. Don, in wern. soc. mem. 4. p. 223.) branches terete; petioles, peduncles, and nerves of leaves beneath clothed with flocky, powdery, rufous down; leaves petiolate, ovate, acute, crenulately-serrated, 3-nerved; flowers sessile, solitary in the axils of the upper leaves and at the tops of the branches; calyx 10-striped. ♄. S. Native of Peru. Rhéxia axillàris, Pavon. in herb. Moric. Tube of calyx ovate, nearly 10-ribbed, when young tomentose, but at length glabrous, 5-lobed; lobes dilated at the base. Capsule 5-celled, 5-valved, truncate at the apex. Seeds small, angular. Flowers purple.

Plum-leaved Meriania. Shrub 6 feet.

6 M. PARVIFLÒRA (D. Don, l. c.) leaves elliptic, acute, denticulated; peduncles trifid, 3-flowered. ♄. S. Native of Brazil. Shrub erect, branched. Leaves more than an inch long. Flowers small, rose-coloured.

Small-flowered Meriania. Shrub.

Cult. This is an elegant genus. The species grow best in a mixture of peat and sand, and half-ripened cuttings root freely if planted in the same kind of soil, with a hand-glass over them, in heat.

II. AXINÆ'A (ἀξίνη, *axine*, a hatchet; form of petals). Ruiz et Pav. fl. per. syst. p. 122. D. Don, in wern. mem. soc. 4. p. 320. D. C. prod. 3. p. 101.

LIN. SYST. *Deca-Dodecándria, Monogýnia.* Calyx cup-shaped, naked at the base; limb permanent, 5-6-toothed. Petals 5-6. Stamens 10-12. Anthers obtuse at the apex and opening by 2 pores, and ending in a simple spur at the base. Capsule free, 5-6-celled.—Frondose trees or shrubs, natives of Peru. Leaves ovate-lanceolate, or broadly cordate, coriaceous, dentate, or crenated, 5-nerved, reticulately veined, petiolate, wrinkled or flat above, clothed with short brown tomentum beneath. Flowers terminal, corymbose, or sub-racemose, large, purple, or white.

1 A. PURPU'REA (Ruiz et Pav. syst. 1. p. 122.) leaves cordate, 7-nerved, crenated, reticulately veined, wrinkled above and scabrous, but lacunose and clothed with brown tomentum beneath; peduncles 1-flowered, corymbose. ♄. S. Native of Peru, in groves. Ruiz et Pav. fl. per. 5. t. 510. Flowers purple.

Purple-flowered Axinæa. Shrub 6 to 10 feet.

2 A. MURICA'TA (D. Don, in wern. soc. mem. 4. p. 321.) leaves large, elliptic, crenated, 3-nerved, shortly acuminated, rather cordate at the base, naked above, but granular beneath as well as the branchlets; calyxes muricated. ♄. S. Native of Peru. Leaves a foot long and 5 inches broad. Panicle terminal, many-flowered.

Muricated-calyxed Axinæa. Shrub 5 to 8 feet.

3 A. LANCEOLA'TA (Ruiz et Pav. l. c. p. 122.) leaves elliptic, acuminated, toothed, 5-nerved, flat above, clothed with fuscous tomentum beneath; racemes panicled and terminal. ♄. S. Native of Peru, in woods at Muna and Pinao. Ruiz et Pav. fl. per. 5. t. 509.

Lanceolate-leaved Axinæa. Shrub 6 to 10 feet.

4 A. GLANDULÒSA (Ruiz et Pav. fl. per. 5. t. 512.) leaves ovate, 5-nerved, denticulated, clothed with yellowish tomentum beneath, but flat and glabrous above and biglandular at the base; panicle terminal, many-flowered. ♄. S. Native of Peru. Tree frondose. Flowers white.

Glandular Axinæa. Shrub 6 to 10 feet.

5 A. DEPE'NDENS (Ruiz et Pav. fl. per. 5. t. 511.) leaves lanceolate, acuminated, denticulately serrated, 5-nerved, glabrous above; raceme terminal, panicled, pendulous. ♄. S. Native of Peru.

Hanging-racemed Axinæa. Shrub 6 to 10 feet.

Cult. This genus is composed of elegant flowering shrubs like the last; and its species are cultivated and propagated in the same manner.

III. CHASTENÆ'A (in honour of Victorina de Chastenay, who drew and painted the plants collected by Madame Merian in an elegant style See *Meriània* and *Calêndrier de flore*, &c.). D. C. prod. 3. p. 102.

LIN. SYST. *Decándria, Monogýnia.* Calyx naked at the base, campanulate, truncate, entire. Petals 5, obovate. Stamens 10; filaments flat; anthers linear, acute, bursting by 1 pore, having the connectives dilated into a large, rounded, and perhaps hollow appendage. Style filiform; stigma a pruinose dot. Ovarium free, glabrous. Capsule 5-celled, opening at the apex. Seeds unknown.—A smooth shrub, with the habit of *Meriània.* Leaves petiolate, oval, 3-nerved, entire, coriaceous. Flowers pedicellate, ample, bractless, disposed somewhat in umbels at the tops of the branches and branchlets.

1 C. MERIA'NIÆ (D. C. l. c.). ♄. S. Native of South America, but in what place is unknown. Flowers purple, according to the dried specimen.

Merian's Chastenæa. Shrub 4 to 6 feet.

Cult. See *Meriània* for culture and propagation. An elegant shrub, worthy of cultivation.

IV. LAVOISIERA (this genus is dedicated by De Candolle to the celebrated but unfortunate Lavoisier, whose name deserves this mark of respect). D. C. prod. 3. p. 102.

LIN. SYST. *Deca-Icosándria, Monogýnia.* Tube of calyx turbinately oblong; lobes 5-10. Petals 5-10, oval, or obovate. Stamens 10-20. Anthers ovate, terminating in a short blunt beak at the apex, and bursting by a single pore, dissimilar from the connectives being alternately long and drawn out into a long, somewhat 2-lobed appendage at the articulation, and the others being short and hardly produced. Ovarium not beset with bristles at the apex. Capsule 5-10-celled. Seeds angular.—Brazilian shrubs, nearly all glabrous. Leaves sessile, flat, or keeled, quite entire, or ciliated by a few stiff hairs, 1-nerved or many-nerved at the base: the narrower ones nerveless. Flowers terminal, solitary, sessile. This is a very shewy genus of plants.

§ 1. *Diosmoideæ* (from *Diosma*, an idea, similar; plants with the habit of *Diosma*). *D. C. prod.* 3. *p.* 102. ***Leaves ciliated with stiff bristles.***

1 L. CATAPHRA'CTA (D. C. l. c.) shrubby, dichotomous, or trichotomous; branches somewhat tetragonal, loricated; leaves sessile, half stem-clasping, keeled, having the middle nerve and nerve-formed margins serrated from stiff bristles, the rest quite glabrous and stiff; flowers terminal, sessile, solitary; tube of calyx ovate, shorter than the lobes, which are 6 lanceolate, and ciliately serrated; anthers dissimilar. ♄. S. Native of Brazil, on Serro Frio, in marshes, at the height of 4000 feet. Rhéxia cataphrácta, Schrank, et Mart. mss. Allied to *L. imbricàta*, but the leaves spread more, and the branches are less squarrose; more nearly allied to *L. insígnis*, but the leaves are shorter and more crowded, and the ciliæ of the calyx are not glandular. Perhaps referrible to *Axinæ'a.*

Cuirass Lavoisiera. Shrub 1 to 2 feet.

2 L. IMBRICA'TA (D. C. l. c. p. 103.) shrubby, quite glabrous; branches somewhat tetragonal; leaves imbricated, in 4 rows,

sessile, ovate, 1-nerved, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, bristly, 6-lobed; lobes drawn out into an obovate, scaripus appendage each; anthers dissimilar. ♄. S. Native of Brazil, among rocks. Rhéxia blepharocéntra ciliàta or floribúnda, Mart. herb. Rhéxia imbricàta, Thunb. diss. pl. bras. 1. p. 10. t. 2. f. 2. Bilb. icon. 1817. ex flora, 1821. p. 331. Leaves shining, when dried yellowish. Petals obovate. Stamens 12, shorter than the petals. Anthers ovate-oblong, terminating in a short beak, with the connectives drawn out into a blunt appendage at the base.

Imbricated-leaved Lavoisiera. Shrub 1 to 2 feet.

3 L. CÓMPTA (D. C. l. c.) shrubby, nearly quite glabrous; branches terete; leaves sessile, imbricated in 4 rows, stiff, keeled, acute, hairy, the middle nerve roughish, and the nerve-formed margins serrately ciliated; flowers terminal, solitary, sessile; tube of calyx villous, turbinate, with the lobes ovate-oblong, acute, and entire; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, on the tops of a chain of mountains called Morro de Villa Ricca, and elsewhere. Rhéxia cómpta, Mart. et Schrank, mss. Very like *L. imbricàta.*

Neat Lavoisiera. Shrub 1 to 2 feet.

4 L. INSÍGNIS (D. C. l. c.) shrubby, quite glabrous; branches slender, rather tetragonal; leaves sessile, lanceolate, keeled, usually 1-nerved, imbricated in 4 rows, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, 6-lobed; lobes oblong, acute, ciliately serrated; anthers dissimilar. ♄. S. Native of Brazil. Very like *L. imbricàta*, but differ[illegible]aves being longer, less adpressed, and more acute, in [illegible]ls being ciliated at the apex, and in the different calyx. Stamens as in *L. imbricàta.* Capsule 5-celled, permanent, dehiscing from the base as in *L. mucorifera.* D. C. coll. 1. t. 2.

Shewy Lavoisiera. Shrub 1 to 2 feet.

5 L. VIMINA'LIS (D. C. l. c.) shrubby, glabrous; branches twiggy, tetragonal; leaves sessile, adpressed, lanceolate, many-nerved, striated, ciliated with bristles; floral leaves setose beneath; flowers terminal, few, aggregate, almost sessile; calyx hispid, turbinate, 5-toothed; teeth long, acuminated; anthers dissimilar. ♄. S. Native of Brazil, in alpine fields on Serra de Sincora, at the height of 4500 feet. Rhéxia viminàlis, Mart. et Schrank, mss. Leaves stiff, imbricate. Petals large, purple. Anthers 10, oblong, yellow, beaked, 5 of which are furnished with an obtuse appendage at the base. Allied to *L. imbricàta.*

Twiggy Lavoisiera. Shrub 1 to 2 feet.

§ 2. *Mucoròsæ* (from *mucor*, mouldiness; appearance of bristles). *D. C. prod.* 3. *p.* 103. *Leaves flat, ciliated, with villi or soft hairs.*

6 L. MUCORI'FERA (D. C. l. c.) shrubby; branches tetragonal, puberulous; leaves sessile, lanceolate, ovate at the base, acuminated, quite entire, setosely ciliated, 7-nerved, the middle nerve bristly beneath, the lateral ones hardly perspicuous; flowers terminal, solitary, sessile among the leaves; tube of calyx subglobose, 5-7-lobed; lobes linear, acuminated, ciliated, deciduous; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in alpine fields at 2000 or 3000 feet above the level of the sea. Rhéxia mucorífera, Mart. et Schrank, mss. Setæ for the most part pellucid, and terminated by a globule each, and therefore mucoriferous. Petals obovate-oblong. Anthers 10-14, oval-oblong, terminating in an oblique porose beak, having the connective drawn out in some into a long appendage at the articulation, in others into a short appendage. Capsule 5-7-celled, opening from the base. Seeds angular.

Mucoriferous Lavoisiera. Shrub 1 to 2 feet?

§ 3. *Carinàtæ* (from *carina*, a keel; leaves keeled). *D. C. prod.* 3. *p.* 103. *Leaves glabrous, not ciliated, keeled, not flat.*

7 L. TETRAGO'NA (D. C. l. c.) shrubby, glabrous, usually dichotomously branched; branches terete; leaves sessile, keeled, densely imbricated, in 4 rows, bluntish, destitute of hairs and ciliæ, quite entire, stiff, 1-nerved. ♄. S. Native of Brazil, on the top of Mount Itambe. Rhéxia tetragòna, Mart. et Schrank, mss. Flowers and fruit unknown. Like the rest the flowers are seen to be sessile, terminal, and solitary. In habit it agrees with *L. imbricàta.*

Tetragonal Lavoisiera. Shrub 1 to 2 feet.

§ 4. *Gentianoìdeæ* (*gentiana*, gentian, and *idea*, like; plants resembling the *Gentian* in habit). *D. C. prod.* 3. *p.* 103. *Leaves flat, glabrous.*

8 L. A'LBA (D. C. l. c.) shrubby, quite glabrous; branches and stem tetragonal; leaves sessile, half stem-clasping, broadly ovate, 9-nerved, quite entire; flowers axillary, solitary, on short pedicels, when young involved in 2 bracteas; tube of calyx somewhat cylindrical, longer than the lobes, which are 5-6, oblong, and acute; anthers rather dissimilar. ♄. S. Native of Brazil, on the mountains between Villa Ricca and Tejuco, in stony, exposed places. Rhéxia álba, Mart. et Schrank, mss. Flowers large, white. Petals 5-6, oval-oblong. Anthers 10-12, ovate, terminating in a short and blunt beak, having the connective in 5-6 of them drawn out into a long, somewhat 2-lobed appendage each at the articulation, and in the other 5-6 hardly produced at all.

White-flowered Lavoisiera. Shrub 1 to 2 feet.

9 L. GENTIANOÌDES (D. C. l. c. p. 104.) shrubby; stem and branches tetragonal, glabrous; leaves sessile, half stem-clasping, lanceolate, acuminated, quite entire, many-nerved: the upper and young ones are setose and ciliated; flowers terminal, crowded, on short pedicels; calyx bristly, with the tube cylindrical: and the lobes 5, apiculated by pili, about equal in length to the tube; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in high rocky places. Rhéxia gentianoìdes, Mart. et Schrank, mss. Habit almost of *Gentiàna saponària.* Flowers white. Petals somewhat joined at the base. Anthers 10, ovate, terminating in a short blunt beak, in 5 of them the connective is long and tumid at the articulation, in the other 5 short and hardly auricled.

Gentian-like Lavoisiera. Shrub 1 to 2 feet.

10 L. CRASSIFÒLIA (D. C. prod. 3. p. 104.) shrubby, dichotomously branched, quite glabrous; branches terete; leaves sessile, half stem-clasping, ovate, approximate, stiff, quite entire, 1-nerved; lateral veins obsolete; flowers terminal, solitary, sessile; tube of calyx broad, turbinate, much longer than the lobes, which are broad, mucronate, and very short; anthers dissimilar. ♄. S. Native of Brazil, on Serro Frio. Rhéxia crassifòlia, Mart. et Schrank, mss. Petals 6, obovate, purple, thickish. Anthers terminating in a very short beak, in some the connective is very long and arched, in others short.

Thick-leaved Lavoisiera. Shrub 2 to 4 feet.

11 L. PUNCTA'TA (D. C. l. c.) shrubby, dichotomous, quite glabrous; branches tetragonal; leaves sessile, half-stem-clasping, lanceolate, quite entire, many-nerved, beset with brown dots beneath, 3 of the nerves are much elevated; flowers terminal, solitary, sessile; tube of calyx 16-ribbed, cylindrical, twice the length of the lobes, which are 5, and lanceolate; anthers 10-16, dissimilar. ♄. S. Native of Brazil, in high cold fields. Rhéxia punctàta, Mart. et Schrank, mss. Petals ample, obovate-oblong, purple. Stamens much shorter than the petals, the

alternate ones having longer connectives than the others. Anthers bluntly beaked. Cells of capsule equal in number to the petals.

Dotted-leaved Lavoisiera. Shrub 1 to 2 feet.

12 L. Itamba'na (D. C. l. c.) shrubby, dichotomous, quite glabrous; branches rather angular; leaves sessile, imbricated in 4 rows, ovate, hardly stem-clasping, attenuated at both ends, rather serrated, 1-nerved, lateral veins almost obsolete; flowers terminal, solitary, sessile; calyx dotted with white, having a broad turbinate tube, and 6-7 oval lobes, which are about equal in length to the tube; anthers dissimilar. ♄. S. Native of Brazil, on the high mountains of Itambe and Serro Frio, in the province of Minas Geraes. Rhéxia Itambàna, Mart. et Schrank, mss. Petals obovate-oblong, much longer than either the calyx or stamens. Anthers like those of *L. punctàta.*

Itambe Lavoisiera. Shrub 1 to 2 feet.

13 L. fírmula (D. C. l. c.) shrubby, branched, almost quite glabrous; branches bluntly tetragonal; leaves sessile, half stem-clasping, oval, acutish, quite entire, 1-nerved, lateral veins obsolete; flowers terminal, solitary, sessile; tube of calyx cylindrical, rather ribbed; limb campanulate, 6-cleft; anthers dissimilar. ♄. S. Native of Brazil, on the high mountains of Itambe and Serro Frio. Rhéxia fírmula, Mart. et Schrank, mss. Leaves few, beset with scattered glandular bristles in the disk and on the edges, the rest quite glabrous.

Firm Lavoisiera. Shrub 2 to 4 feet.

14 L. pulche'rrima (D. C. l. c. p. 104.) shrubby, dichotomous, quite glabrous; branches nearly terete, rather glaucous; leaves sessile, half stem-clasping, ovate-lanceolate, acute, quite entire, many veined, with 3 of the veins more elevated than the rest; flowers terminal, solitary; tube of calyx ovate, twice the length of the lobes, which are 6-10 ovate, acute; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in elevated fields. Rhéxia pulchérrima, Mart. et Schrank, mss. Leaves deflexed. Flowers purple. Anthers ovate, with short blunt beaks, the alternate ones with long connectives, which are tumid at the base.

Very-fair Lavoisiera. Shrub 2 to 4 feet.

15 L. linifòlia (D. C. l. c.) shrubby, much branched, glabrous; leaves on short petioles, linear, quite entire, nerveless; flowers solitary, almost sessile, axillary or terminal; tube of calyx turbinate, beset with glandular dots, shorter than the lobes, which are subulate; petals obovate, when young apiculated; anthers dissimilar. ♄. S. Native of Brazil in moist meadows, in the province of Minas Geraes, at Serro Frio. Rhéxia linifòlia, Mart. et Schrank, mss. Anthers 10, oblong, terminated by a blunt beak, in 5 of them the connective is rather long, and hardly tumid at the articulation, in the other 5 it is drawn out into a blunt appendage.

Flax-leaved Lavoisiera. Shrub 1 to 2 feet.

Cult. See *Meriània*, p. 733. for culture and propagation. All the species are delicate elegant plants, well deserving cultivation.

V. DA'VYA (named by De Candolle in honour of the celebrated chemist, Sir Humphry Davy). D. C. prod. 3. p. 105.

Lin. syst. *Deca-Dodecándria, Monogýnia.* Calyx with a campanulate or ovate-oblong tube; teeth 10-12, connected into a membranous entire limb. Petals 5-6. Anthers beaked, opening by one pore, having the connectives drawn out into an elongated simple spur, which is sometimes furnished with 2-3 bristles at the apex. Ovarium free, globose or oblong, depressed and glabrous at the apex. Style filiform. Capsule 5-celled. Seeds unknown.—Shrubs or trees, natives of South America, with the habit of *Banistèria.* Leaves petiolate, oval, 5-nerved, almost glabrous. Flowers corymbose or panicled, yellow. The calyx agrees with *Meriània*, but the habit and colour of the flowers are different.

1 D. panicula'ta (D. C. l. c.) branches terete, tomentose at the apex, as well as the petioles and middle nerve of the leaves, from thick fascicles of pili; leaves petiolate, ovate, acuminated, quite entire, 5-nerved, glabrous, except on the middle nerve; corymbs terminal, trifid at the base; pedicels subumbellate; tube of calyx ribbed, campanulate; anthers 10, 5 of which are furnished with a somewhat spatulate obtuse spur each, and the other 5 with a shorter, somewhat cylindrical spur each. ♄. S. Native of Brazil, in woods near Rio Janeiro. Rhéxia paniculàta, Mart. herb. but not Buch. Petals 5-6, yellow, obovate. Alternate anthers longer, with the appendages copper-coloured.

Panicled-flowered Davya. Shrub 2 to 4 feet.

2 D. gla'bra (D. C. prod. 3. p. 105.) quite glabrous in every part; branches bluntly tetragonal, hardly terete; leaves petiolate, elliptic, attenuated at the base, acuminated at the apex, 3-nerved, quite entire; raceme terminal, somewhat panicled, few-flowered; calyx campanulate, bluntly 5-lobed; anthers with a long copper-coloured spur each. ♄. S. Native of Brazil. Flowers yellow.

Glabrous Davya. Shrub 2 to 3 feet.

3 D. Guiane'nsis (D. C. l. c.) branchlets teretely tetragonal, clothed with deciduous brown bristly down, as well as the petioles, panicles, and leaves when in a young state; leaves petiolate, ovate, acuminated, somewhat crenulated, 5-nerved; nerves beset with rufous bristles, the rest glabrous; panicle terminal, with its branchlets many-flowered and umbelliferous at the apex; tube of calyx oval [illegible] somewhat urceolate; spurs of anthers bearing many bris[illegible] the apex. ♄. S. Native of French Guiana. D. C. coll. 1. t. 3. Topòbea paniculàta, Rich. herb. Flowers pale yellow. Stem 10 inches in diameter, and 20 feet in height.

Guiana Davya. Tree 20 feet.

4 D. Peruvia'na (D. C. prod. 3. p. 105.) branchlets somewhat compressedly terete, hardly terete; petioles, panicles, and young leaves clothed with powdery flocky down; leaves on long petioles, ovate, quite entire, abruptly acuminated, 5-nerved; panicle terminal, having its branches opposite and many-flowered, and its branchlets 3-flowered; calyx bluntly 5-toothed. ♄. S. Native of Peru, near Cochera. Petals yellowish red. Petioles nearly 2 inches long.

Peruvian Davya. Shrub 5 to 6 feet.

Cult. See *Meriània* for culture and propagation, p. 733. Plants worth cultivating for their beauty.

VI. GRAFFENRIE'DA (this name has been given by De Candolle to recall the labours of Fr. L. de Graffenried, editor of J. Bauhin's Historia Plantarum). D. C. prod. 3. p. 105.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx oblong; its limb campanulate and bluntly 5-toothed. Petals 5, obovate. Stamens 10; anthers linear, acute, opening by one pore, furnished with a simple appendage at the base. Style filiform. Ovarium free, not bristly at the apex, but furnished with something like 5 tubercles. Capsule ovate, 5-valved, opening at the apex. Seeds angular, straight.—Shrubs, with the habit almost of *Diplóchita*, but differs in the bracteas being absent, in the fruit dehiscing at the apex, and in the different formed appendages of the anthers.

§ 1. *Anthers furnished with a setaceous appendage each. Teeth of calyx very short and blunt. Fruit not umbilicate at the apex.*

1 G. rotundifòlia (D. C. l. c.) branchlets terete, glabrous; leaves on short petioles, orbicular, somewhat cordate, quite entire, glabrous and shining above, but powdery beneath, 3-nerved, the lateral nerves approximating the margin; thyrse panicled,

terminal; petals 5, obovate. ♄ . S. Native of New Andalusia, near Caripe. Rhéxia rotundifòlia, Bonpl. rhex. t. 25. Flowers rose-coloured.

Round-leaved Graffenrieda. Shrub 3 to 6 feet.

§ 2. *Anthers with an obtuse appendage each. Lobes of calyx triangular. Fruit umbilicate at the apex. Perhaps a proper genus.*

2 G. EXCE'LSA (D. C. l. c.) branchlets tetragonal; peduncles, petioles, and under side of leaves clothed with velvety rufescent down; leaves on long petioles, oval, 7-nerved, crenulated, blistered above, glabrous; thyrse panicled, terminal; bracteas 2 under each flower. ♃ . S. Native of South America, in shady places near Loxa. Rhéxia excélsa, Bonpl. rhex. t. 34. Osbéckia excélsa, Spreng. syst. 2. p. 312. Stems numerous from the same root, herbaceous, 6-10 feet high. The flower-bud or alabastrum almost like that of *Conostègia*, but differs in being cleft longitudinally. Flowers red?

Tall Graffenreida. Pl. 6 to 10 feet.

Cult. See *Meriània* for culture and propagation, p. 733. Elegant plants, which deserve to be cultivated in every collection of stove plants.

VII. CENTRO'NIA (from κεντρον, *kentron*, a spur; anthers furnished with a long spur each). D. Don, wern. mem. soc. 4. p. 314. D. C. prod. 3. p. 106.

LIN. SYST. *Decándria, Monogýnia* Calyx oblong, clothed with retrograde bristles; limb coarctate, entire. Petals 5. Anthers terminating in a long bea[illegible] [illegible]nished with a long subulate acute process at the base. [illegible] of style elongated, tubular, inclosing the ovarium. Stigma blunt. Capsule 5-celled.—A tree, having its branchlets densely clothed with rusty tomentum. Leaves ample, elliptic, acuminated, quite entire, petiolate, coriaceous, feather-nerved and reticulately veined, glabrous and shining above, but when young clothed with brownish deciduous tomentum beneath. Panicle terminal, large, brachiate. Flowers large, purple.

1 C. LAURIFÒLIA (D. Don, in wern. soc. mem. 4. p. 315.) ♄ . S. Native of Peru, in groves. Osbéckia Peruviàna, Ruiz et Pav. in herb. Lamb.

Laurel-leaved Centronia. Tree.

Cult. See *Meriàna*, p. 733. for culture and propagation. An elegant shrub when in flower.

VIII. TRUNCA'RIA (from *trunco*, to lop off; limb of calyx truncate). D. C. prod. 3. p. 106.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx cylindrical, hardly turbinate; limb truncate, nearly entire. Petals 5, ovate. Stamens 10; anthers elongated, beaked, opening by 1 pore, without any auricles. Ovarium altogether free in the bottom of the calyx, 10-sided, and somewhat cup-shaped at the apex. Style filiform. Stigma hemispherical. Fruit unknown.—A climbing Brazilian shrub. It differs from *Medinílla* in the quinary number of its parts, and in the free ovarium; from *Micònia* in the cylindrical calyx; and from *Meriània* in the absence of bracteas to the flowers.

1 T. CARYOPHYLLÆ'A (D. C. l. c.) branchlets bluntly tetragonal; petioles and peduncles nearly glabrous; leaves oval, somewhat cuneated at the base, and mucronately acuminated at the apex, 5-nerved, quite entire, ciliated, rather pilose on both surfaces; thyrse terminal, elongated, having its branchlets 3-flowered, with some bristles under the flowers holding the place of bracteas. ♄ . ◡ . S. Native of Brazil, in the province of Para. Melástoma or Meriània truncàta, Schrank et Mart. mss. Flower-bud or alabastrum almost like that of the clove. Calyx quite glabrous.

Clove-budded Truncaria. Shrub cl.

Cult. For culture and propagation see *Meriània*, p. 733. A plant worthy of cultivation.

IX. RHYNCHANTHE'RA (from ρυγχος, *rhynchos*, a beak, and ανθηρα, *anthera*, an anther; anthers terminated by a long beak each). D. C. prod. 3. p. 106.—Rhéxia species, Bonpl. Schrank et Mart. mss. Ser. mss.—Proboscídia, Rich. herb.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate-globose; lobes 5, linear or setaceous. Petals 5, obovate. Stamens 10, 5 of which bear ovate, long beaked anthers, having their connectives long and auricled at the base; the other 5 are castrated and smaller. Ovarium ovate-globose, glabrous. Capsule 3, but usually 5-celled. Seeds angular or oblong.—Sub-shrubs or herbs, natives of South America. Branches terete or bluntly tetragonal, hairy or pilose. Leaves cordate or oblong, 5-9-nerved. Peduncles axillary, cymose, usually disposed in a terminal thyrse. Flowers purple, not involved by bracteas when young.

* *Leaves cordate.*

1 R. GRANDIFLÒRA (D. C. prod. 3. p. 107.) branches terete, and are, as well as the petioles, clothed with glandulár pili; leaves on long petioles, cordate, somewhat denticulated, hairy, 9-nerved; flowers tern at the tops of the branchlets; tube of calyx subglobose, shorter than the teeth, which are setaceous. ♄ . S. Native of Cayenne, and near the Orinoco, in wet meadows. Melástoma grandiflòra, Aubl. guian. 1. p. 414. t. 160. Rhéxia grandiflòra, Bonpl. rhex. p. 26. t. 11. Osbéckia Aubletiàna, Spreng. syst. 2. p. 311. Tube of calyx purple. Genitals hardly longer than the petals. Five of the stamens are fertile, but the 5 sterile ones reduced to threads. Calyx hispid. Perhaps the plant of Bonpland is the same as that of Aublet.

Great-flowered Rhynchanthera. Shrub 3 to 5 feet.

2 R. NOVEMNE'RVIA (D. C. l. c.) shrub oppositely branched; branches nearly terete, beset with glandular bristles; leaves petiolate, cordate, ovate, somewhat acuminated, crenated, 9-nerved, hardly pilose above, but villous beneath; flowers solitary, in the axils of the bracteas, almost sessile, disposed in something like racemes; tube of calyx hairy, globose, equal in length to the lobes, which are linear-setaceous. ♄ . S. Native of Brazil, in marshes in woods. Flowers purple. The 5 longest anthers have a flat long connective each, and the 5 shortest ones have a terete short connective each. Capsule nearly globose, 3-celled, 3-valved. Seeds ovate, reticulately dotted.

Nine-nerved-leaved Rhynchanthera. Shrub 2 to 4 feet.

3 R. DICHÓTOMA (D. C. l. c.) shrubby; branches somewhat tetragonal; petioles and calyxes rather hispid; leaves petiolate, cordate, ovate, acute, serrated, 7-9-nerved, puberulous on both surfaces; peduncles axillary and terminal, panicled, dichotomous, leafy; tube of calyx ovate; lobes subulate-lanceolate; 5 of the anthers are acuminated by a beak, longer than the connective, which is auricled at the base. ♄ . S. Native of Brazil, in marshes about Rio Janeiro; and of St. Christopher. Melast. dichótoma, Desv. in Lam. Dict. 4, p. 41. Rhéxia Christophoreàna, Schrank et Mart. mss. Petioles 9-10 lines long. The pili on the upper side of the leaves are scattered and largish, under side villous along the nerves and veins. The hairs of the calyx often glandular. Seeds oblong.

Dichotomous Rhynchanthera. Shrub 3 to 5 feet.

4 R. CORDA'TA (D. C. l. c.) suffruticose, simple; stem nearly terete, hispid from long spreading hairs; petioles short, slender, hispid; leaves cordate, ciliately-serrated, acute, 7-nerved, setose on both surfaces; thyrse panicled, elongated, terminal; rachis, calyxes, and peduncles beset with glandular hairs. ♄ . S. Na-

tive of the province of Minas Geraes, in moist meadows. Melastoma cordàtum, Schrank et Mart. mss. Flowers purple. Capsule 3-celled.

Cordate-leaved Rhynchanthera. Shrub 1 to 2 feet.

5 R. Hænkea'na (D. C. l. c.) shrubby; branches terete, hairy, densely clothed with glandular down at the apex; leaves on short petioles, cordate, somewhat peltate, acuminated, serrated, 7-nerved, rather pilose above, and hairy beneath, having the serratures ciliately serrated; flowers cymosely corymbose, terminal; tube of calyx ovate, pilose, shorter than the lobes, which are 5, and setaceous, 5 of the anthers furnished with long beaks. ♄. S. Native of Peru. Melástoma grandiflòra, Schrank, mss. Melástoma Hænkeàna, Mart. mss. Leaves 3 inches long. Petioles 2 lines long. Flowers large, purple, like those of *R. grandiflòra*. Five of the anthers are hardly longer than their elongated beak, but a little longer than their connective, which is tumid at the articulation; the others abortive, and changed into ligulæ. Ovarium free.

Hænke's Rhynchanthera. Shrub 1 to 2 feet.

6 R. Schrankia'na (D. C. l. c.) shrubby; branches terete, hispid from unequal glandular stiff hairs; leaves petiolate, cordate, acuminated, serrated, 5-nerved, hairy on both surfaces; pedicels axillary, 1-flowered; tube of calyx ovate, hairy, shorter than the lobes, which are 5 and linear; anthers 10, 5 of which are short and castrated, the other 5 bearing long beaks. ♄. S. Native of Brazil, in the province of Minas Geraes, in marshes on the mountains. Rhéxia Schrankiàna, Mart. herb. Very like *R. grandiflòra* and *R. Hænkeàna*; from the first it differs in the pentantherous flowers, and from the last in the petioles being twice the length, and from both in the flowers being axillary and solitary.

Schrank's Rhynchanthera. Shrub.

7 R. monody'nama (D. C. l. c.) branches terete, hispid from long spreading bristles, as well as the petioles, peduncles, and calyxes; leaves petiolate, cordate, ovate, acuminated, toothed, pilose on both surfaces, 7-nerved; pedicels axillary, 1-3-flowered; lobes of calyx setaceous, longer than the tube; five of the stamens are antheriferous, one of them twice the size of the others. ♄. S. Native of Brazil, in the province of Para, in woods, and along the river Amazon. Melástoma fothergilloìdes, Schrank et Mart. mss. Capsule 5-celled. A very distinct species. The specific name is derived from μονος, one, and δυναμις, power; in reference to the long stamen.

Monodynamous Rhynchanthera. Shrub.

8 R. pentanthe'ra (D. C. l. c.) shrubby; branches rather tetragonal, beset with glandular pili; leaves petiolate, ovate, acuminated, rather cordate at the base, ciliately serrated, 7-nerved, rather pilose above, but hairy on the nerves beneath; panicle loose, terminal; calyx rather pilose, at length glabrous, with an ovate tube: and 5 subulate lobes, which are broadest at the base, and longer than the tube; the 5 barren stamens filiform, the 5 fertile ones having the anthers bearing long beaks. ♄. S. Native of Brazil, in the province of Minas Geraes, in marshes and woods. Rhéxia pentanthèra, Ser. mss. Flowers purple. Anthers oval, hardly longer than the beaks. Capsule 5-celled. Allied to *Hænkeàna*.

Five-anthered Rhynchanthera. Shrub 1 to 2 feet.

9 R. Mexica'na (D. C. l. c.) shrubby; branches tetragonal, hairy; leaves petiolate, ovate, acuminated, somewhat cordate at the base, ciliately serrated, 7-9-nerved; pedicels axillary, opposite, longer than the petioles, hairy, 1-flowered, each bearing 2 lanceolate-linear leaves; anthers 5, equal. ♄. S. Native of Mexico. Thenárdia ròsea, Moc. et Sesse, fl. mex. icon. ined. Flowers elegant, rose-coloured. Petals mucronate. Capsule 4-valved.

Mexican Rhynchanthera. Shrub 4 to 6 feet.

* * *Leaves shorter than those of the preceding division, not cordate at the base, petiolate or sessile.*

10 R. limòsa (D. C. l. c.) shrubby, erect, branched; branches nearly terete, clothed with glandular hairs; leaves lanceolate, on short petioles, acuminated, bluntly subcordate at the base, serrulated, 5-7-nerved, puberulous on both surfaces, paler beneath; thyrse terminal; calyx puberulous, with a globose tube: and 5 setaceous lobes, which are a little shorter than the tube; anthers 5, with long beaks; capsule 3-celled. ♄. S. Native of Brazil, in the province of Bahia, in muddy places near Caitete. Meriània violàcea, Schrank, mss. Rhéxia limòsa, Mart. herb. Leaves like those of *Cistus Monspeliacus*. Flowers purple, like those of *R. grandiflòra*. Capsule globose. Seeds numerous, angular.

Muddy Rhynchanthera. Shrub.

11 R. rostra'ta (D. C. l. c.) shrubby; branches nearly terete, clothed with glandular bristles; leaves petiolate, oblong, bluntish at the base, acuminated at the apex, ciliately serrulated, 5-nerved, pilose above, and rather hairy on the nerves beneath; cymes axillary and terminal; calyx hairy, with an oblong tube: and 5 setaceous lobes, which are a little shorter than the tube; stamens 10, 5 of which are barren, and 5 bearing long, beaked anthers. ♄. S. Native of Brazil, on the sides of the mountains called Serra St. Antonio. Rhéxia rostràta, Schrank et Mart. mss. Flowers violaceous. Filaments glabrous.

Beaked Rhynchanthera. Shrub 1 to 2 feet.

12 R. Fothero[illegible]æ (D. C. l. c.) shrubby; branches somewhat tetragonal; p[illegible] pedicels densely clothed with bristles; leaves petiolate, oblong, cuneated at the base, acuminated at the apex, 5-nerved, quite entire, beset with adpressed bristles above, but with villi beneath; racemes short, terminal; flowers pedicellate, when young involved in 2 bracteas; calyx strigose, with a campanulate tube, and 5 triangular acute lobes; anthers dissimilar. ♄. S. Native of Brazil, in the provinces of St. Paul and Minas Geraes, in low woods. Rhéxia Fothergíllæ, Schrank et Mart. mss. Allied to *R. grandiflòra*. Petals large, nearly orbicular, purple. Anthers arched, wrinkled transversely, 5 with a drawn out connective, and the other 5 with a short hardly tumid connective each. Filaments rather pilose.

Fothergill's Rhynchanthera. Shrub 1 to 2 feet.

13 R. stachydimórpha (D. C. l. c.) suffruticose; branches tetragonal, rather hairy; leaves on short petioles, ovate-lanceolate, acute, quite entire, 5-nerved, clothed with adpressed pili on both surfaces; peduncles axillary, few-flowered, disposed into an elongated leafy thyrse; flowers decandrous; calyx with an ovate tube, and setaceous ciliated lobes. ♄. S. Native of Brazil, in high grassy fields about Minas Novas. R. stachyoìdes, Schrank et Mart. mss. but not of Humb. et Bonpl. Petals red. The 5 stamens, with the long filaments, bear elongated anthers, which have their connectives not drawn out, but with their beaks dilated at the apex. Seeds irregular, usually oblong-conical, truncate at the base, and reticulated from lacunæ.

Spike-formed Rhynchanthera. Shrub 1 to 2 feet.

14 R. serrula'ta (D. C. l. c) plant herbaceous, erect, clammy; branches bluntly tetragonal, rather hairy; leaves almost sessile, attenuated at both ends, linear-lanceolate, serrulated, 5-nerved; flowers axillary and terminal, solitary, on short pedicels; tube of calyx rather hairy, with rather longer linear lobes; 5 of the stamens sterile; capsule 3-celled. ⊙. H. Native of Guiana, in meadows. Rhéxia serrulàta, Rich. in Bonpl. rhex. t. 28. but not of Nutt. Flowers deep purple.

Serrulated-leaved Rhynchanthera. Pl. ¾ foot.

15 R. salicifòlia (Mart. herb. Schrank, mss. ex D. C. prod. 3. p. 109.) plant herbaceous; stem nearly simple, puberulous,

tetragonal at the apex; leaves on short petioles, serrulated, 3-nerved; middle ones linear; upper ones lanceolate or obovate; flowers axillary, on short pedicels, solitary; tube of calyx ovate, pilose, shorter than the lobes, which are 5, acute and linear. ⊙. S. Native of Brazil, in the province of Bahia in low moist fields. Root fibrous. Leaves sparingly pilose. Anthers linear, falcate, beaked: having their connectives tumid at the articulation, and shortly auricled, not half the length of the anthers; filaments flat.

Willow-leaved Rhynchanthera. Pl. 1 foot.

Cult. The species of *Rhynchanthèra* being natives of marshes and bogs require to be kept moist, especially through the summer; for this purpose the pots in which the species are grown should be kept in pans filled with water; in other respects their culture and propagation is the same as that of *Meriània*, see p. 732.

X. MACAI'REA (dedicated by De Candolle to M. Isr. Macaire, who has written on vegetable chemistry, and who has published in the Memoirs of the Natural History Society of Geneva, some curious remarks upon the influence of narcotic poisons upon living vegetables, &c.) D. C. prod. 3. p. 109.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx ovate; lobes 4, permanent. Petals 4, obovate. Stamens 8, unequal; the 4 longer ones bearing one series of glands on the inner side at the apex; the 4 shorter ones smoothish. Anthers linear, elongated, opening by one pore, in the longer ones the connectives are elongated and stipe-formed, but in all unequally dilated at the base. Ovarium free, ovate, beset [illegible]lar bristles. Style filiform. Capsule 4-celled, clothed by the calyx. Seeds ovate, somewhat truncate at the hylum.—South American shrubs, with terete branches. Petioles and young leaves clothed with rufous villi. Leaves petiolate, ovate, mucronate, coriaceous, quite entire, glabrous above, but rather velvety beneath even in the adult state, at first sight feather-nerved, but there is sometimes a marginal nerve on each side; in this case the leaves are somewhat 3-nerved. Thyrse of flowers panicled and very villous. Flowers white, according to the dried specimens. This genus is analogous to *Lasiándra*, but differs from it in the flowers being octandrous, and in the seeds being ovate.

1 M. thyrsiflòra (D. C. l. c.) branchlets terete, clothed with short adpressed rufous down; leaves petiolate, oval, rosulate, glabrous above, but clothed with short rufous pubescence beneath, 3-nerved; lateral nerves slender, and approximating the margin of the leaf; thyrse panicled; calyx clothed with adpressed short rufous down. ♄. S. Native of Brazil.

Thyrse-flowered Macairea. Shrub 5 to 6 feet.

2 M. rufe'scens (D. C. l. c.) branches bluntly tetragonal; petioles, panicles, calyxes, and young leaves clothed with long rufous villi; leaves petiolate, oval, coriaceous, glabrous above, but clothed with deciduous villi beneath, 3-nerved: lateral nerves slender, and near the margins of the leaf; thyrse panicled; calyx villous, with narrow acute lobes. ♄. S. Native of Brazil, in the province of Rio Negro, on mount Araracoara. Rhéxia anómala, Schrank et Mart. mss.

Rufescent Macairea. Shrub 3 to 6 feet.

3 M. ra'dula (D. C. l. c.) shrubby; branches tetragonal; calyxes and under side of leaves clothed with rusty hairs; leaves elliptic, quite entire, coriaceous, 5-nerved, strigose above; flowers in corymbose fascicles. ♄. S. Native of Brazil. Rhéxia rádula, Bonpl. rhex. p. 107. t. 41. Lobes of calyx linear, acute, longer than the tube. Petals oval, dark purple. Style filiform, curved, hardly thicker at the apex. Calyx clothed with rufous villi, 4-cleft. Filaments clothed with glandular pili.

Rasp-leaved Macairea. Shrub 2 to 4 feet.

4 M. adenoste'mon (D. C. l. c.) shrubby; branches nearly terete; petioles, peduncles, and calyxes clothed with stiff villi; leaves petiolate, obovate, 3-nerved, echinated by strong strigæ above, hairy beneath; panicle terminal; lobes of calyx 5, linear, subulate; filaments bearing stipitate glands. ♄. S. Native of Brazil, in fields near Salgada. D. C. coll. 1. t. 4 Lateral nerves near the edge of the leaf. Leaves obtuse, when young apiculated. Flowers small, purple. Anthers 8, having their connectives short and biauriculate at the base.

Var. β, *ursìna* (Schrank et Mart. herb. ex D. C. l. c.) leaves oblong. ♄. S. Native of the province of Minas Geraes, in calcareous places.

Glandular-stamened Macairea. Shrub 4 to 6 feet.

Cult. For the culture and propagation of the species of this genus see *Meriània*, p. 733.

XI. BUCQUE'TIA (dedicated by De Candolle to M. Bucquet, author of introduction à l'etude des corps naturels tirés du regne vegetal, 2 vol. 8vo. Paris. 1773). D. C. prod. 3. p. 110.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx globose; lobes 4, nearly triangular, hardly acute, permanent. Petals 4, obovate. Stamens 8, equal; filaments glabrous; anthers oblong, opening by one pore at the apex, without auricles at the base; the connectives hardly perspicuous. Style filiform. Ovarium free, somewhat thickened at the tops of the valves, truncate, and furnished with 4 tubercles. Capsule 4-celled. Seeds cuneated, angular.—A shrub, native of New Granada. Branches clammy. Leaves on short petioles, elliptic, 3-nerved, smooth, almost quite entire. Pedicels tern at the tops of the branches. Habit of *Osbéckia* or *Arthrostémma*, but differs in the seeds being angular, not cochleate. Flowers violaceous.

1 B. glutinòsa (D. C. l. c.) ♄. S. Native at the bottom of the Andes about Quindiu. Rhéxia glutinòsa, Bonpl. rhex. t. 17. Osbéckia glutinòsa, Spreng. syst. 2. p. 313.

Clammy Bucquetia. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Meriània*, p. 733.

XII. CAMBESSEDE'SIA (in honour of James Cambessedes, coadjutor of Auguste St. Hilaire, in his Flora Brasiliæ meridionalis, and author of several botanical memoirs. D. C. prod. 3. p. 116.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx globose or obovate, hardly constricted under the limb; lobes 5, narrow, acute, permanent. Petals 5, obovate. Stamens 10; anthers equal in size and shape, linear, falcate, somewhat beaked, gibbously auricled at the base; having the connectives hardly perspicuous, and drawn out into an undivided obtuse auricle at the base, of various lengths. Style filiform. Capsule ovate, globose, 3-celled. Seeds angular or ovate, with the hylum linear.—Brazilian subshrubs, for the most part glabrous. Leaves sessile. Flowers sometimes purple, sometimes copper-coloured, as in *Tropæ'olum.*

1 C. late'-veno'sa (D. C. l. c.) suffruticose; leaves sessile, nearly orbicular, cordate, ciliately fringed, serrated, blistered on the upper surface, reticulated by broad flat veins beneath, clothed with short velvety down on both surfaces; branches of cyme many flowered, opposite, divaricate; flowers decandrous; tube of calyx ovate, coarctate at the apex, longer than the lobes, which are subulate. ♄. S. Native of Brazil, in the province of Minas Geraes, on mountains at the height of 3500 feet. Rhéxia Bucàrdia, Schrank, mss. R. latè-venòsa, Mart. herb. Flowers red, pedicellate. Calyx when young sparingly pilose. Stamens equal among themselves. Anthers falcate, gradually beaked. Seeds oblong, minutely tuberculated; the hylum linear.

Broad-veined-leaved Cambessedesia. Shrub 1 foot.

2 C. purpura'ta (D. C. prod. l. c.) shrubby, quite glabrous; leaves sessile, orbicularly reniform, quite entire, somewhat 5-

nerved, smoothish; cymes terminal, dichotomous; flowers decandrous; tube of calyx ovate, 3 times longer than the lobes, which are lanceolate. ♄. S. Native of Brazil, in the province of Bahia, at the elevation of 5000 feet. Rhéxia purpuràta, Schrank et Mart. mss. Cymes subumbellate, and as if they were involucrated by the 2 upper leaves; the rest of the bracteas small, and lanceolate. Petals scarlet. Anthers bluntly sagittate at the base.

Purplish Cambessedesia. Shrub 1 to 2 feet.

3 C. corymbòsa (D. C. l. c.) shrubby; leaves petiolate, oblong, acute, quite entire, 5-nerved, glabrous above, clothed with velvety tomentum beneath, and dotted from lacunæ; flowers terminal, in cymose corymbs, decandrous; petals acuminated. ♄. S. Native of Brazil, at Itambe, in the province of Minas Geraes, in bogs. Rhéxia corymbòsa, Mart. et Schrank, mss. Branchlets tetragonal. Leaves 10-12 lines long, and 3-4 broad: the lateral nerves hardly distinct. Bracteas glabrous. Calyx glabrous; lobes 5, lanceolate-subulate. Petals red, acute. Anthers yellow, exserted, elongated, with the connectives not drawn out; filaments jointed in the middle.

Corymbose-flowered Cambessedesia. Shrub 1 foot.

4 C. balsamífera (D. C. l. c.) shrubby, quite glabrous; branches dichotomous, terete; leaves oblong, acutish at both ends, dotted, quite entire, 3-nerved; lateral nerves very small; flowers terminal, solitary, decandrous. ♄. S. Native of Brazil, in the province of Bahia, on the tops of mountains, at the elevation of 4000 or 5000 feet. Rhéxia balsamifera, Mart. et Schrank, mss. Leaves almost like those of *Phillyrèa angustifòlia*. Calyx bearing balsam; tube obovate; lobes acute. Petals purple. Anthers yellow, apiculated by a beak: having the connectives short, and drawn out into an obtuse flat auricle each.

Balsam-bearing Cambessedesia. Shrub 1 to 2 feet.

5 C. Sincoré'nsis (D. C. prod. 3. p. 111.) shrubby, much branched, quite glabrous; branches somewhat tetragonal at the apex; leaves on very short petioles, oblong, acutish, quite entire, one-nerved, hardly 3-nerved at the base, beset with minute dots on both surfaces; flowers nearly terminal, axillary, almost sessile; tube of calyx cylindrically obovate, with 5 short teeth. ♄. S. Native of Brazil, on the alps of Serra de Sincora, at the elevation of 4000 feet. Rhéxia resinòsa, Schrank, mss. Rhéxia Sincorénsis, Mart. herb. Leaves 4 lines long, and 1½ broad. Petals purple, obovate, not ciliated. Anthers yellow, apiculated by long beaks, twice the length of the connectives, which are expanded into an obtuse appendage each at the base. Genitals not longer than the petals.

Sincora Cambessedesia. Shrub 1 to 2 feet.

6 C. crenula'ta (D. C. l. c.) shrubby, glabrous, clammy at the tops; branches tetragonally terete; leaves sessile, ovate, hardly 3 veined at the base, flat, length of the internodes, with glandular, hardly crenated, margins; flowers few, at the tops of the branches, disposed in cymose corymbs; calyx with an ovate tube, and 5-6 linear acute lobes. ♄. S. Native of Brazil, in alpine meadows, particularly on Serro Frio. Rhéxia crenulàta, Mart. et Schrank, mss. Flowers purple. Anthers ovate, beaked: with the connectives drawn out at the base into a crenate-spatulate ligula each. Capsule ovate, glabrous. Seeds unknown.

Crenulate-leaved Cambessedesia. Shrub 1 to 2 feet.

7 C. Espòra (D. C. l. c.) plant suffruticose, erect, glabrous, branched from the base; branches somewhat tetragonal; leaves sessile, ovate-cordate, acute, sparingly serrated, 3-nerved; flowers on the short axillary branchlets, solitary, and therefore disposed in a leafy elongated thyrse; calyx turbinate, with 5 acute lobes; petals lanceolate, acute; anthers nearly alike. ♄. S. Native of Brazil, in grassy bogs, in the provinces of St. Paul, and Minas Geraes. Rhéxia Espòra, St. Hil. in Bonpl. rhex. t. 58. Rhéxia chamædrifòlia, Schrank et Mart. herb. Very like *R. adamántium* in habit and colour of flowers, but differs in being glabrous in every part, in the petals being much smaller and of a different form, in the anthers being obtuse, and in their connectives not being drawn out.

Var. β, ilicifòlia (D. C. prod. 3. p. 111.) stem simple, straight, terete, velvety; leaves ovate, in fascicles; thyrse spicate, cylindrical. ♄. S. Native of Brazil, in the province of Minas Geraes. Rhéxia ilicifòlia, Schrank et Mart. mss. Leaves 2 or 3 lines long: those of branches very short and nerveless, in fascicles. Flowers yellow; petals oval-oblong; anthers fuscescent, elongated.

Espora Cambessedesia. Shrub 1 to 2 feet.

8 C. adama'ntium (D. C. l. c.) suffruticose, branched, procumbent, beset with scattered glandular pili; branches tetragonal, pilose, woolly at the knots; leaves on short petioles, ovate-lanceolate, somewhat 3-nerved, rather ciliately serrated, and beset with glandular hairs; thyrse terminal, crowded; calyx turbinate, with very short cordate lobes; petals ovate, acute; anthers nearly similar. ♄. S. Native of Brazil, near Tejuco, in sandy places on the Diamond Mountains. Rhéxia adamántium, St. Hil. in Bonpl. rhex. t. 60. Colour of petals almost like that of a *Tropæ'olum*. Anthers 10, oblong, obtuse, 5 of which are rather gibbous at the base. Capsule ovate-oblong, 3-valved, pilose at the apex. Seeds half ovate.

Adamant Cambessedesia. Shrub procumbent.

9 C. Hilaria'na (D. C. l. c.) suffruticose, glabrous, ascending; branches tetragonal; leaves on short petioles, oblong-linear, bluntish, quite entire, or furnished with 1 or 2 teeth, 3-nerved, bearing s[illegible] in their axils; peduncles 1-3-flowered, axillary, [illegible]nal; calyx bearing glandular hairs, obovate, with 5 broad short mucronate lobes; stamens rather dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in moist sandy places on the tops of the mountains. Rhéxia galioìdes, Schrank et Mart. mss. Rhéxia Hilariàna, Kunth in Bonpl. rhex. t. 56. Rhéxia suberòsa, Spreng. syst. 2. p. 308. Allied to *R. adamántium* in habit and colour of flowers, but differs from that species in the longer and narrower leaves, and in the much more loose panicle.

St. Hilare's Cambessedesia. Shrub 1 to 2 feet.

10 C. bidenta'ta (D. C. l. c.) suffruticose; branches tetragonal, divaricate; leaves lanceolate, in fascicles, glabrous, bidentate; corymbs panicled; pedicels pilose; petals ovate, acuminated; calyx muricated, 10-ribbed; ovarium 3-celled. ♄. S. Native of Brazil, at Barra da Vareda, in open fields. Rhéxia bidentàta, Nees et Mart. nov. act. bonn. 12. p. 53. Said to be allied to *C. Hilariàna*, and probably only a variety of that species according to Kunth.

Bidentate Cambessedesia. Shrub 1 foot.

Cult. See *Meriània* for culture and propagation, p. 733. All the species are small elegant shrubs, deserving cultivation.

XIII. CHÆTO'STOMA

(from χαιτη, *chaite*, a head of hair, and στομα, *stoma*, a mouth; in allusion to the calyx, which is girded by a ring of stiff hairs round the mouth under the lobes on the outside). D. C. prod. 3. p. 112.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx with a somewhat obovate turbinate tube, girded by a ring of stiff bristles on the outside under the lobes; limb 4-5-lobed; lobes erect, pungent. Petals 4-5. Anthers with very short 1-pored beaks: having their connectives not drawn out at the articulation, and hardly gibbous. Capsule prismatic, longish, 4-5-angled. Seeds unknown.—Brazilian heath-like quite glabrous sub-shrubs. Stems slender. Leaves crowded, dry, 1-nerved, acute, quite entire, small. Flowers terminal, solitary. The habit of this genus is very distinct, but its normal characters are not well known.

* *Flowers 5-cleft, decandrous. Capsule prismatic.*

1 C. **PU'NGENS** (D. C. l. c.) shrubby, quite glabrous; leaves sessile, triangular, stiff, pungent, imbricate, quite entire, 3-nerved; lateral nerves hardly perspicuous; flowers terminal, solitary, decandrous; lobes of calyx spinulose. ♄. S. Native of Brazil, in the province of Minas Geraes, on Serro Frio. Rhéxia púngens, Mart. et Schrank, mss. Branches slender, terete. Leaves 2-3 lines long, having the middle nerve thick. Lobes of calyx lanceolate, pungent; spinules rising from the top of the tube. Petals purple. Stamens yellow, 5 shorter than the others; filaments jointed in the middle; connectives not drawn out. Perhaps the same as Rhéxia armàta, Spreng. syst. 2. p. 308.

Pungent-calyxed Chætostoma. Shrub 1 to 2 feet.

* * *Flowers 4-cleft, octandrous. Fruit unknown.*

2 C. **TETRA'STICHUM** (D. C. l. c.) shrubby, glabrous, erect; leaves sessile, triquetrous, stiff, acute, keeled, imbricated in 4 rows; flowers terminal, solitary, octandrous; calyx glabrous, but with a ring of stiff hairs under the teeth. ♄. S. Native of Brazil, on the mountains. Plant 6-8 inches long. Stems terete, slender. Leaves 2 lines long. Calyx campanulate, with an oblong tube, and 4 lanceolate teeth. Anthers with short beaks, dilated at the base.

Var. α, crássipes (D. C. l. c.) caudex or root thick and tuberous, with numerous simple stems rising from it. Rhéxia tetrásticha, Mart. et Schrank, mss.

Var. β, fibrillòsum (D. C. l. c.) [illegible] ; stem branched. Perhaps a proper species. R. scop[illegible] herb.

Four-rowed-leaved Chætostoma. Shrub ½ to 1 foot.

† *A doubtful species.*

3 C. **ERICOÌDES** (D. C. l. c.) shrubby; leaves sessile, opposite, somewhat decurrent, linear, complicated, ciliated; flowers terminal, solitary, octandrous; calyx bearded with bristles at the apex. ♄. S. Native of Brazil. Rhéxia ericoìdes, Spreng. syst. 2. p. 310. Perhaps the same as Rhéxia ericoìdes, Spreng. neue. entd. 1. p. 302. of which the author says that the leaves are almost sessile, in fascicles, quite glabrous; the peduncles corymbose; and the flowers sessile.

Heath-like Chætostoma. Shrub 1 foot.

Cult. This genus is composed of pretty shrubs. For their culture and propagation see *Meriània*, p. 733.

XIV. SALPI'NGA

(from σαλπιγξ, *salpinx*, a tube; in reference to the elongated tube of the calyx). Mart. herb. Schrank, mss. D. C. prod. 3. p. 112.—Aulacídium, Rich. herb.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx turbinately oblong, much elongated, 8-10-ribbed; ribs separated by deep furrows; teeth 4-5, broad, short, permanent. Petals 4-5, lanceolate, acute, connivent. Stamens 8-10. Style short. Stigma orbicular. Capsule cylindrically trigonal, free within the calyx, 3-valved; valves bearing with nerves in the middle, retuse at the apex; central column free. Seeds small, numerous, semi-ovate, disposed in rows along the axis; hylum linear.—Smooth Brazilian subshrubs or herbs. Branches from compressed to terete. Leaves on long petioles, ovate, acuminated, ciliated, rather crenated, 3-5-nerved, membranous, smoothish. Spikes axillary or terminal, disposed in panicles. Flowers sessile along the rachis, all on one side.

* *Calyx 5-toothed, 10-furrowed.*

1 S. **SECU'NDA** (Schrank et Mart. mss. ex D. C. l. c.) stem suffruticose, from compressed to terete, branched, glabrous; leaves ovate, bluntish at the base, acuminated, 5-nerved, ciliately serrated; cymes terminal and axillary, with its branchlets elongated, and bearing a row of secund flowers each; calyx elongated, tube-formed, 10-furrowed. ♄. S. Native of Brazil, in shady humid woods at Porto dos Miranhas. Calyx 6-7 lines long when in fruit.

Secund-flowered Salpinga. Shrub 1 foot.

2 S. **FASCICULA'TA** (Rich. herb. under *Aulacidium*, ex D. C. l. c.) stems herbaceous, branched, somewhat tetragonal, glabrous; leaves oval, attenuated at the base, acutish, ciliately serrated, 3-nerved, membranous, bearing a few scattered bristles on the upper surface, pale beneath and hardly muricated; cymes few-flowered, fascicled; calyx turbinate, 10-furrowed. ⊙. S. Native of French Guiana, in the humid shady woods of Gabriella. Calyx 5 lines long when in fruit. Flowers in fascicles of 4 or 5.

Fascicled-flowered Salpinga. Pl. 1 foot.

* * *Calyx 4-toothed, 8-furrowed.*

3 S. **CRISTA'TA** (Rich. herb. under *Auldcidium*, ex D. C. l. c) stem herbaceous, branched, tetragonal, glabrous; leaves ovate-oblong, coarsely and ciliately toothed, 3-nerved, glabrous on both surfaces; cymes axillary and terminal; flowers numerous, secund along the branches of the cyme; calyx turbinate, attenuated at the base, 8-furrowed. ⊙. S. Native of French Guiana, where it is called *Itoupou.* Calyx 4 lines long.

Crested Salpinga. Pl. 1 foot.

4 S. **PARVIFLÒRA** (D. C. l. c.) stem herbaceous, tetragonal, branched, glabrous; leaves oval-oblong, attenuated at the base, serrulately-subciliated, 3-nerved, membranous, smoothish; cymes terminal, 5-8-flowered; flowers on short pedicels, disposed in secund fascicles; calyx 4-toothed, 8-furrowed, oval, hardly turbinate. ♄. S. Native of French Guiana. Calyx 1-3 lines long. Capsule trigonal: having the valves thickened and somewhat lid-formed at the apex, and bearing a dissepiment in the middle of each; column free.

Small-flowered Salpinga. Shrub 1 to 2 feet.

Cult. The seeds of the annual species of this genus should be sown in pots, filled with a mixture of loam and sand, which should be placed in a hot-bed, and kept rather moist; and when the plants have attained 2 or 3 inches in height, they should be potted off into separate pots, and again placed into the hot-bed, where they may remain until they have ripened their seed, or be removed to the stove when in flower. The shrubby kind thrive well in the same kind of soil, and young cuttings of them root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

XV. BERTOLO'NIA

(in honour of Ant. Bertoloni, an Italian botanist, author of Rariorum Italiæ Plantarum decades, in 3 vols. 8vo. &c.). Raddi, mem. bras. add. (1820.) p. 5. but not of other authors. D. C. prod. 3. p. 113. Triblémma, R. Br. ex Schrank, et Mart. mss.

Lin. syst. *Decándria, Monogýnia.* Calyx with a campanulate tube: and 5 obtuse lobes, which are usually very short and broad, and sometimes concrete into an entire limb. Petals 5, obovate. Stamens rather unequal; anthers ovate-obtuse, opening by 1 pore, attenuated at the base, and hardly or not auriculated. Ovarium not bristly. Capsule trigonal, 3-valved; valves as if they were retusely uncinated at the apex, and cut transversely under the apex, and therefore exhibiting the appearance of a lid. Seeds cuneate, triquetrous, scabrous.—Brazilian, rooting herbs. Leaves stalked, ovate-cordate, 5-11-nerved, crenulated. Cymes corymbose, terminal. Flowers white or purple.

1 B. **NYMPHÆIFÒLIA** (Raddi, l. c.) stem simple, short, creeping, glabrous; leaves petiolate, cordate, rather orbicular, undulately crenulated, 9-11-nerved, smoothish, white beneath;

corymbs pedunculate; limb of calyx hardly erose. ♃. S. Native of the neighbourhood of Rio Janeiro, especially on the mountains called Serra d'Estrella, in humid places, in woods. Rhéxia nymphæifòlia, Kunth, in Bonpl. rhex. t. 58. Flowers white. Leaves 4 inches in diametet.

Water-lily-leaved Bertolonia. Pl. creeping.

2 B. OVA'TA (D. C. prod. 3. p. 113.) stems very short, hairy, simple, creeping; leaves petiolate, cordate, ovate, 5-nerved, somewhat undulately crenated, smoothish; flowers disposed in rather secund spikes; limb of calyx broadly and bluntly 5-lobed. ♃. S. Native of Brazil. Triblémma nymphæifòlium, Mart. herb. This is very distinct from the first species, the leaves being hardly an inch long. Flowers small and purple.

Ovate-leaved Bertolonia. Pl. creeping.

3 B. LEUZEA'NA (D. C. l. c.) stems suffruticose, short, simple, tetragonal, ascending, rather creeping; leaves petiolate, oval-oblong, acute, sharply denticulated, 5-nerved, smoothish; corymbs terminal; limb of 5 obtuse lobes, equal in length to the tube; petals obliquely acuminated. ♃. S. Native about the town of Rio Janeiro. Flowers lilac. Rhéxia Leuzeàna, Bonpl. rhex. p. 144. t. 54. and t. 55.

De Leuze's Bertolonia. Pl. 6 feet.

4 B. MACULA'TA (D. C. l. c.) stem rooting at the base; branches, petioles, peduncles, and calyxes hispid from long bristles; leaves on long petioles, cordate, ovate, quite entire, pilose on both surfaces and on the margins, 5-nerved; peduncles axillary, bearing at the apex a short raceme of 6-7 flowers. ♃. S. Native of Brazil, in the province of Bahia on the mountains, in shady humid places of woods. Triblémma maculàta, Mart. herb. Racemes twisted at the apex. Lobes of calyx 5, ovate, and very blunt. Petals violaceous. Anthers truncate, opening by 1 pore, attenuated at the base but not auricled, 5 of which are smaller than the others. Calyx permanent, at length white from small bristles on the outside at the base. Capsule 3-valved. Seeds small, trigonal, cuneated, scabrous.

Spotted Bertolonia. Pl. creeping.

Cult. *Bertolònia* is a genus of elegant little creeping plants; its species grow best in a mixture of peat and sand. The pots in which they are grown should be kept in pans of water, especially in the summer, when the plants are in full vigour. They are easily increased by dividing the plants, or by seeds.

XVI. MEISNE'RIA (dedicated by De Candolle to C. F. Meisner, author of a monograph on the difficult genus *Polýgonum*, &c). D. C. prod. 3. p. 114.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx globose; lobes 4, lanceolate, acuminated. Anthers 8, ovate, ending in a tubular beak each; 4 of which have a very long connective each, which is auricled at the articulation, in the other 4 the connective is hardly evident. Capsule 2-celled. Seeds small, ovate, triquetrous.—Herbs hardly shrubby, probably annual. Stems erect, terete, rather hairy. Leaves ovate, acute, sessile, 3-nerved, somewhat ciliately serrated. Flowers pedicellate, solitary, alternate in the axils of the branches and of the leaves, and truly cymose at the apex, small, purple. This genus differs from *Spénnera* in the seeds not being cochleate.

1 M. ARENA'RIA (D. C. prod. 3. p. 114.) almost herbaceous; stem and branches almost terete, hispid; leaves hairy. ⊙.? F. Native of Brazil, in the province of Minas Geraes, at Serro Frio in sandy sub-irrigated places. Rhéxia arenària, Schrank et Mart. mss. Hairs on the stems, panicles, and calyxes glandular at the apex, usually pale purple in a young state. Petals apiculated. Capsule subglobose.

Sand Meisneria. Pl. 1 foot.

2 M. PALUDÒSA (D. C. l. c.) almost herbaceous; stem and branches tetragonal, rather pilose; leaves smoothish on both surfaces. ⊙.? S. Native of Brazil, in the province of Minas Geraes, in marshes on the mountains. Rhéxia biloculàris, Schrank et Mart. mss. Very like the preceding species, but the hairs are much fewer, shorter, and never red; the stem is evidently tetragonal, and the hairs are sometimes scattered and sometimes disposed in rows along the branches. Petals purple.

Marsh Meisneria. Pl. ½ to 1 foot.

Cult. See the annual species of *Salpinga*, p. 740. for culture and propagation. The plants should be kept moist by placing the pots in which they are grown in pans filled with water.

Tribe II.

RHEXIE'Æ (plants agreeing with the genus *Rhéxia* in the seeds being cochleate). D. C. prod. 3. p. 114. Anthers opening by 1 pore at the apex. Ovarium free, neither scaly nor bristly at the apex. Capsule dry. Seeds cochleate, with a basilar orbicular hylum.—Species all natives of America, except one.

XVII. APPENDICULA'RIA (from *appendix*, an appendage; appendages to anthers). D. C. prod. 3. p. 114. Rhéxia sect. Appendiculària, Ser. mss.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx ovate and rather urceolate; limb campanulate, broadly and bluntly 4-toothed. Petals 4, obovate. Stamens 8, equal: having the connectives filiform, and drawn out both beneath and above the cells of the anthers into 2 bristles at the articulation. Capsule oblong, 3-celled, 3-valved; central column at length free, and bearing the seeds. Seeds cochleate. An annual, erect, glandular herb, native of Guiana Root fibrous. Leaves petiolate, ovate, 3-5-nerve[illegible]errulated. Cymes terminal, few-flowered. Flowe[illegible], white. This genus comes very near *Salpinga*, but differs in the anthers.

1 A. THYMIFÒLIA (D. C. l. c.). ⊙. S. Native of Cayenne. Rhéxia thymifòlia, Bonpl. rhex. p. 133. t. 50. Nerves of calyx 8, elevated.

Thyme-leaved Appendicularia. Pl. 1 to 1½ foot.

Cult. See annual species of *Salpinga* for culture and propagation, p. 740.

XVIII. COMO'LIA (dedicated to M. Jos. Comoli, author of a Flora of the environs of Come). D. C. prod. 3. p. 114.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx campanulately cylindrical; lobes 4, linear. Petals 4, obovate. Anthers oblong-linear, falcate, opening by 1 pore: having the connectives short and biauriculated at the articulation. Ovarium glabrous. Capsule ovate, 2-celled. Seeds cochleate, compressed, furrowed on the back, and scabrous from tubercles.—A Brazilian shrub, with tetragonal branches. Leaves obovate, somewhat cuneated, ciliately serrated, 3-nerved, beset with adpressed pili. Flowers white, axillary, solitary, nearly sessile.

1 C. BERBERIFÒLIA (D. C. l. c.). ♄. S. Native of Brazil. Rhéxia berberifòlia, H. B. et Bonpl. rhex. p. 110. t. 42. Petals rather acuminated, longer than the genitals. Style filiform. Ovarium glabrous. Glands few along the lobes of the calyx and at their origin. Calyx 8-nerved. Connectives of anthers drawn out at both sides at base.

Barberry-leaved Comolia. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Meriània*, p. 733.

XIX. SPE'NNERA (dedicated by Martius to M. Spenner, author of a Flora of the environs of Friburg). Mart. herb. D. C. prod. 3. p. 115.

LIN. SYST. *Octo-Decándria, Monogýnia.* Tube of calyx globose; lobes 4-5, short. Flower-bud conical. Petals lanceolate, acute. Stamens 8-10; anthers ovate, obtuse, opening by 1 pore: having their connectives long, but not appendiculated. Capsule free, 2, rarely 3-celled. Seeds cochleate, rough.—American erect herbs. Roots fibrous. Leaves petiolate, 5-

nerved, membranous, ciliately serrated. Panicle terminal, loose, with the branches divaricate. Bracteas small, linear, inserted under the branches. Flowers small, white, or rose-coloured.

* *Flowers octandrous. Leaves not cordate at the base.*

1 S. PALUDÒSA (Mart. herb. ex D. C. l. c.) stems rooting at the base, angular, clothed with rufous hairs, the hairs disposed in a bifarious manner; leaves on short petioles, ovate, acute, ciliately serrated, 3-5-nerved, sparingly pilose; cymes somewhat panicled, short. ⊙. S. Native of Brazil, about Rio Janeiro, in humid sandy places. Rhéxia hexándria, Schrank. mss. Calyx 4-cleft. Stamens 8. Fruit small, globose, puberulous.

Marsh Spennera. Pl. ½ to 1 foot.

2 S. A'NNUA (Mart. herb. ex D. C. l. c.) stem tetragonal; angles rather winged; petioles and leaves sparingly pilose; leaves on short petioles, broadly ovate, acute, 5-nerved, ciliately serrated; panicle oblong; fruit glabrous. ⊙. S. Native of Brazil, in the province of Bahia, in watery places. Melástoma ánnua, Schrank. mss. Very like the preceding species, but smaller in every part, and the petioles are shorter. Leaves 15 lines long and 9-10 broad.

Annual Spennera. Pl. ½ to 1 foot.

3 S. BRACHYBÓTRYA (D. C. l. c.) stem creeping at the base, ascending, erect, angular, rather pilose; angles a little winged; leaves on short petioles, oval, acute, 5-nerved, rather pilose, hardly serrulated; panicle short; fruit glabrous. ⊙. S. Native of Brazil, in marshes. Very like *S. ánnua*, but the leaves are on shorter petioles, and the panicle is shorter and more crowded.

Short-bunched Spennera. Pl. ½ [illegible]

4 S. LATIFÒLIA (D. C. l. c.) stem hardly rooting at the base, erect, angular, pilose; petioles pilose, elongated; leaves ovate, bluntish at both ends, 5-nerved, ciliately serrated, rather pilose beneath; panicle corymbose; fruit glabrous. ⊙. S. Native of Brazil, in marshes. Petioles 8 lines long. Leaves 3 inches long and 1½ broad.

Broad-leaved Spennera. Pl. ½ to 1 foot.

5 S. FRA'GILIS (D. C. prod. 3. p. 115.) suffruticose, quite glabrous; stem tetragonal; angles winged; leaves soft, oval-oblong, acuminated, 3-nerved, ciliately serrated; petiole a little winged; thyrse panicled, loose. ♄. S. Native of Guiana, in shady woods, by the sides of ponds and pools of water. Melástoma frágilis, Rchb. herb. Capsule 2-celled. Flowers white. Leaves almost pellucid.

Brittle Spennera. Pl. ½ to 1 foot.

6 S. PELLU'CIDA (D. C. l. c.) suffruticose; stem tetragonal, branched, smoothish; angles winged; leaves petiolate, ovate, acuminated, obtuse at the base, 5-nerved, ciliately serrated, rather scabrous, pellucid, purplish beneath; thyrse panicled, terminal. ♄. S. Native of Guiana, in humid shady parts of woods. Melàstoma pellùcens, Rich. herb. Lower part of stem rather decumbent. Capsules 2-celled, globosely compressed.

Pellucid-leaved Spennera. Pl. ½ to 1 foot.

7 S. LONGIFÒLIA (Mart. herb. ex D. C. l. c.) stems terete; branches, petioles, and nerves of leaves sparingly pilose; leaves on long petioles, oblong, acuminated, 5-nerved, ciliately serrated. ⊙. S. Native of Para, in Brazil. Very like *S. rubicaúlis* and *S. acuminifòlia*.

Long-leaved Spennera. Pl. ½ to 1 foot.

8 S. RUBRICAU'LIS (Mart. herb. ex D. C. l. c.) stems terete, and are as well as the petioles and leaves beset with spreading hairs; leaves petiolate, oval-ovate, long-acuminated, 5-nerved, ciliately serrated; panicle elongated. ⊙. S. Native of Brazil, in the province of Bahia, in woods at the river Hahype. Melástoma rubricaúle, Schrank, mss. Petioles hispid. Stems purplish. Petals white. Anthers red.

Red-stemmed Spennera. Pl. ½ to 1 foot.

9 S. ACUMINIFÒLIA (Mart. herb. ex D. C. l. c.) smoothish; stem terete, and is as well as the leaves sparingly pilose; leaves oval-oblong, acuminated, 5-nerved, ciliately serrated; panicles loose, in the forks of the branches. ⊙. S. Native of Brazil. Very like *S. rubricaúlis* and *S. ánnua*, but differs from both in the smoothness and narrowness of the leaves.

Acuminate-leaved Spennera. Pl. ½ to 1 foot.

10 S. CIRCÆOÌDES (Mart. et Schrank. mss. ex D. C. l. c.) branches quadrangular; hairs scattered, capitulate at the apex; leaves petiolate, ovate, acuminated, ciliately serrulated, 3-nerved, membranous, glabrous on both surfaces, shining above; thyrse oblong, with its branches opposite; tube of calyx rather urceolate, with short, subulate lobes. ♄. ? S. Native of Brazil, about Ega, at the river Amàzon. Flowers small, white. Petals oblong. Four of the anthers are oblong-obovate, and the other 4 shorter, all very blunt: with the connectives hardly drawn out. Leaves like those of *Circæ'a*. Fruit unknown.

Circæa-like Spennera. Sh. ½ to ¾ foot.

11 S. LA'XA (D. C. l. c.) shrubby, weak, hispid in every part from glandular hairs; branches tetragonal; leaves petiolate, ovate, acuminated, obtuse at the base, 5-nerved, ciliated; thyrse panicled, loose, terminal, many-flowered; calyx with an ovate tube, and short acute lobes. ♄. S. Native of French Guiana in shady marshy places of woods. Melástoma láxa, Rich. herb. Capsule 2-celled. Flower-bud acute. Petals apiculated by a short hair each.

Loose Spennera. Pl. ½ to 1 foot.

* * *Flowers octandrous. Leaves cordate at the base.*

12 S. CIRCÆIFÒLIA (D. C. l. c.) stem branched; branches quadrangular, pilose; leaves cordate, ovate-oblong, acuminated, 5-nerved, ciliately serrated, glabrous above and shining, rather pilose beneath; branches of panicle short; capsule 2-celled. ⊙. S. Native of Brazil, in woods. Rhéxia circæifòlia, Humb. et Bonpl. rhex. p. 101. t. 39. Flowers white.

Circæa-leaved Spennera. Pl. 1 foot.

13 S. AQUA'TICA (Mart. herb. ex D. C. l. c.) stem branched; branches quadrangular, pilose; leaves cordate, ovate-oblong, somewhat acuminated, serrated, 5-nerved, glabrous above, but covered with adpressed pili on the nerves beneath; branches of panicle elongated, filiform, loose; capsule 3-celled. ♄. S. Native of Brazil, West Indies, and Guiana, in marshes and bogs. Rhéxia aquática, Swartz, fl. ind. occ. 2. p. 650. Bonpl. rhex. p. 104. t. 40. E. Meyer, in act. bonn. 12. p. 650. Melástoma aquática, Aubl. guian. 1. p. 430. t. 169. Petals oblong, acute, white, shorter than the genitals. Anthers reddish. Capsule nearly globose.

Aquatic Spennera. Shrub ½ to 1 foot.

14 S. POLYSTA'CHYA (D. C. l. c.) stem much branched; branches beset with glandular pili; leaves cordate, ovate, acute, sharply serrated, ciliated, 5-7-nerved, rather pilose; flowers remote along the branches of the panicle; capsule 2-celled. ⊙. S. Native of Brazil, in humid parts of woods. Rhéxia polystàchya, Bonpl. rhex. p. 98. t. 38. Tube of calyx elliptically campanulate. Petals oblong. Capsule spherical, compressed. Flowers white.

Many-spiked Spennera. Pl. 1 foot.

15 S. INDECÒRA (D. C. l. c.) stem branched; branches quadrangular, hairy; leaves cordate, acuminated, serrulated, ciliated, pilose on both surfaces; branches of panicle dichotomous, hairy; flowers pedicellate; calyx clothed with glandular pili, with 4 short teeth. ♃. ? S. Native of Brazil. Rhéxia indecòra, Bonpl. rhex. p. 131. t. 49. Flowers small, white. Leaves like those of *Circæ'a lutetiàna*. Petals ovate, obliquely mucronate. Capsule unknown.

Indecorous Spennera. Pl. 1 to 2 feet.

16 S. SILENIFLÒRA (D. C. l. c.) stem branched; branches quadrangular, glabrous; leaves obsoletely cordate, oblong, acu-

minated, serrulated, ciliated, 5-nerved; flowers sessile, along the branches of the dichotomous panicle; calyx with an inflated, glabrous tube, and 4 hardly manifest lobes. ♃. ? S. Native of Brazil. Rhéxia sileniflòra, Bonpl. rhex. p. 130. t. 48. Flowers small, white. Petals ovate, obliquely mucronate. Capsule unknown. This and the preceding species have been placed in this genus from their habit, the capsules being unknown.

Catchfly-flowered Spennera. Pl. 1 to 2 feet.

* * * *Flowers decandrous.*

17 S. PENDULIFÒLIA (D. C. l. c.) leaves cordate, oval-lanceolate, 5-nerved, denticulated, pendulous, quite glabrous; panicle terminal, much branched; flowers decandrous, minute; capsule 3-celled. ♃. S. Native of Guiana. Rhéxia pendulifòlia, Bonpl. nav. p. 68. t. 26. Calyx with an ovate-roundish tube and 5 linear lobes. Petals oval. Connectives of anthers not auricled. Capsule globose. Habit of *S. aquática*.

Pendulous-leaved Spennera. Pl. ½ to 1 foot.

18 S. GLANDULÒSA (D. C. l. c.) leaves oval, crenulated, quite glabrous on both surfaces, 3-5-nerved: flowers usually solitary, terminal, and axillary, small; capsule 3-celled. ♄. S. Native of Guiana. Rhéxia glandulòsa, Bonpl. nav. p. 70. t. 27. Calyx with a subglobose tube: and linear-oblong lobes, which are much longer than the tube. Petals ovate, white, with 2 spots at the base of each. Filaments red. Connectives of anthers biglandular.

Glandular-stamened Spennera. Shrub ½ to 1 foot.

19 S.? CHÆ'TODON (D. C. l. c.) shrubby; branches terete, smoothish; petioles ciliated with long hairs in front; leaves oblong, acuminated, membranous, somewhat serrulated, glabrous, triple-nerved; panicles axillary, divaricate, capillary; calyx pilose, urceolate, narrowed at the neck: having its lobes setaceous; capsule 3-4-celled. ♄. S. Native of Brazil, in dense woods, in the province of Rio Negro. Melástoma chætodon, Schrank et Mart. mss. Flowers small. Leaves 4-6 inches long.

Hair-toothed-calyxed Spennera. Shrub ½ to 1 foot.

Cult. Pretty little plants, native of marshes and bogs. The species grow best in a mixture of peat and sand, and the pots in which they are grown should be kept in pans of water. The greater part are annuals, and even those called shrubby will not survive more than a season in our stoves; therefore they are all to be increased by seeds. The seeds should be sown in pots filled with the same kind of mould recommended for the plants, placing them in a hot-bed, where they should be kept rather moist; and when the plants are coming into flower they should be removed from the hot-bed to shelves in the stove.

XX. MICROLI'CIA (from μικρος, *micros*, small, and ηλικια, *elikia*, stature; all the plants contained in this genus are humble in stature). D. Don, in wern. soc. mem. 4. p. 301. D. C. prod. 3. p. 117.

LIN. SYST. *Decándria, Monogýnia.* Calyx with a globose or obovate tube, and 5 subulate permanent lobes. Petals 5, obovate. Anthers alternately dissimilar, ovate, ending in short beaks, opening by 1 pore; having their connectives drawn out into a simple blunt spur at the articulation, those in the longer anthers long, and those in the shorter anthers short. Capsule dry, 3-celled, 3-valved, but in a few 2-celled and 2-valved. Seeds cochleate.—Herbs or subshrubs, natives of Brazil and Guiana, in marshes and bogs, and all humid places. Stems branched. Leaves sessile, quite entire, linear or oval, hardly 3-nerved. Flowers purple, terminal or axillary, pedicellate, usually solitary.

* *Annual plants.*

1 M. BREVIFÒLIA (D. C. l. c.) glabrous; stem straight, tetragonal; leaves oblong, quite entire, 3-nerved, lower ones obtuse, upper ones acute; flowers terminal, on short pedicels, solitary; lobes of calyx subulate, longer than the tube; capsule 3-valved. ⊙. B. S. Native of Guiana, in marshes. Melástoma triválvis, Aubl. guian. 1. p. 406. t. 155. f. b. Rhéxia triválvis, Vahl. eclog. 1. p. 38. Rhéxia brevifòlia, Rich. herb. Upper branches rather panicled. Petals ovate, length of the lobes of the calyx, white. Capsule ovate. Seeds cochleate.

Short-leaved Microlicia. Pl. 1 to 2 feet.

2 M. BIVA'LVIS (D. C. l. c.) glabrous; stem straight, tetragonal, hardly branched at the apex; leaves oval, obtuse, 3-nerved, quite entire; flowers terminal, solitary, on short pedicels; lobes of calyx subulate, longer than the tube; capsule 2-valved. ⊙. B. S. Native of Guiana, in marshes. Melástoma biválvis, Aubl. guian. 1. p. 406. t. 155. f. a. Rhéxia biválvis, Vahl. eclog. 1. p. 38. Corolla white.

Two-valved Microlicia. Pl. ½ foot.

3 M. INUNDA'TA (D. C. l. c.) erect; stems tetragonal, glabrous at the base, but beset with glandular hairs above, as well as the pedicels and calyxes; leaves ovate, obtuse, 3-nerved, entire, glabrous, upper ones clothed with glandular down; flowers solitary, pedicellate; tube of calyx ovate, rather shorter than the lobes, which are linear-lanceolate. ⊙. B. S. Native of Brazil, in watery places. Rhéxia inundàta, Schrank et Mart. mss. Capsule 2-valved. Seeds cochleate. Perhaps sufficiently distinct from *M. biválvis*.

Inundated Microlicia. Pl. ½ foot.

* * *Herba[illegible]ous, perennial, or suffruticose plants.*

4 M. LIMNÒBIO[illegible].) herbaceous, rooting at the base, hairy from glandu[illegible]stles; leaves roundish, sessile, rather cordate at the base, quite entire, smoothish; flowers pedicellate; calyx with an obovate tube, and 5 linear lobes; capsule 2 or 3-celled. ♃. B. S. Native of Brazil, in water. Rhéxia limnòbios, Schrank et Mart. mss. Flowers red.

Lake-living Microlicia. Pl. ½ foot.

5 M. ALSINEFÒLIA (D. C. l. c.) herbaceous, ascending, a little branched; stems tetragonal, hispid; leaves on short petioles, rather orbicular, somewhat cordate at the base, acutish at the apex, 5-nerved, almost quite entire, ciliated, rather pilose on both surfaces, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, terminating the branchlets; calyx rather hairy, with an ovate tube, and 5 linear lobes, which are longer than the tube; anthers retuse, dissimilar. ♃. B. S. Native of Brazil, in elevated places in the province of Minas Geraes. Rhéxia alsinefòlia, Mart. et Schrank, mss. Petals obovate, purplish. Anthers 10, the 5 longest having long connectives, and the 5 shortest having short connectives, all 2-lobed at the articulation.

Chickweed-leaved Microlicia. Pl. ½ foot.

6 M. PUNCTATÍSSIMA (D. C. prod. 3. p. 118.) plant somewhat herbaceous, much branched, hispid from glandular pili in every part; branches tetragonal; leaves petiolate, ovate, acute, ciliately subserrated, 3-nerved, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, axillary, and terminal, on short pedicels; calyx with a globose tube, equal in length to the linear lobes; anthers dissimilar. ♃. B. S. Native of Brazil, in moist meadows in the province of Minas Geraes. Rhéxia punctatíssima, Mart. et Schrank, mss. Allied to *M. alsinefòlia*. Capsule ovate, 3-celled, 3-valved. Seeds obovate, truncate at one end.

Var. β, angustifòlia (D. C. l. c.) leaves oblong, almost quite entire.

Much-dotted-leaved Microlicia. Pl. ½ foot.

7 M. RECU'RVA (D. C. l. c.) plant herbaceous, branched, beset with glandular pili in every part; stem and branches tetragonal; leaves petiolate, ovate, somewhat crenated, deflexed, acutish, 3-

nerved; flowers solitary, hardly pedicellate in the axils, and on the tops of the branches. ♃. B. S. Native of Cayenne. Rhéxia recúrva, Rich. act. soc. hist. nat. par. 1792. p. 108. Poir. suppl. 6. p. 6. Rhéxia uniflòra, Vahl. symb. 2. p. 48. but not of Raddi. Melástoma diffùsa, Desr. in Lam. dict. 4. p. 38. Rhéxia uniflòra, recúrva, and diffùsa, Spreng. syst. no. 21. 35. and 84. Stems erect or somewhat decumbent. Calyx globose; lobes 5, subulate. Petals small. Capsule 3-celled, glabrous. Seeds cochleate, muricated.

Recurved Microlicia. Pl. 1 foot.

8 M. VARIA'BILIS (Mart. mss. ex D. C. l. c.) suffruticose, erect; branches tetragonal, beset with glandular pili; leaves almost sessile, broadly ovate, acute, ciliately serrated, pilose on both surfaces, 3-nerved; flowers pedicellate, axillary and terminal, solitary; calyx rather hairy, with a globose tube, and linear subulate lobes, which are about equal in length to the tube; anthers dissimilar. ♄. B. S. Native of Brazil, in alpine meadows in the provinces of St. Paul and Minas Geraes. Anthers as in *M. alsinefòlia.* Flowers rose-coloured.

Var. β, radìcans (Schrank et Mart. mss. ex D. C. l. c.) plant herbaceous, erect, rooting at the base, and less pilose than the species. ♃. B. S. Native of marshes, especially at Serro Frio.

Var. γ, herbàcea (Schrank et Mart. mss. ex D. C. l. c.) plant herbaceous, ascending, rooting at the base, smoothish in every part; flowers axillary, almost sessile. ♃. B. S. Native of the province of St. Paul, in bogs. Rhéxia cordàta, Spreng. neue entd. 1. p. 301. Rhéxia variábilis, Mart. et Schrank, mss. Very like variety β, and truly decap[illegible]ous. Perhaps a proper species. Flowers bluish r[illegible]

Variable Microlicia. Pl. 1 foot.

9 M. LANCEÆFLÒRA (D. C. prod. 3. p. 118.) suffruticose, much branched, erect, hispid from glandular pili in every part; leaves on short petioles, ovate, ciliately serrated, 3-nerved; pedicels axillary, 3-flowered, disposed in an elongated thyrse; tube of calyx cylindrical, a little longer than the lobes, which are 5 and linear; petals oblong; anthers elongated, with their connectives hardly drawn out. ♄. B. S. Native of Brazil, in inundated parts of meadows, particularly in the province of St. Paul. Rhéxia lanceæflòra, Mart. et Schrank, mss. Plant almost like that of *M. variábilis*, but the flowers are much more numerous, and the calyxes tubular; the petals 3 times the length of their breadth. Flower-bud lanceolate. Longer anthers rather unequal among themselves, with their connectives long, but hardly drawn out at the articulation.

Lance-flowered Microlicia. Shrub ½ to 1 foot.

10 M. VIOLA'CEA (D. C. prod. 3. p. 118.) suffruticose, hispid from glandular hairs; leaves sessile, broadly ovate, quite entire, 5-nerved, full of pitted dots on the upper surface when examined by a lens; flowers axillary, solitary, almost sessile; tube of calyx globose, about equal in length to the oblong-linear lobes; petals oblong; anthers elongated, dissimilar. ♄. S. Native of Brazil, on the high mountains in the province of Minas Geraes. Rhéxia violàcea, and perhaps also Rhéxia viscídula, Schrank et Mart. mss. The leaves resemble those of *M. alsinefòlia* and *M. punctatíssima;* anthers and petals those of *M. lanceæflòra.* The five longer anthers have long connectives, which are drawn out into a small blunt 2-lobed appendage each; the five shorter ones have short connectives, which are hardly tumid at the base.

Violaceous-flowered Microlicia. Shrub ½ to 1 foot.

11 M. SERPYLLIFÒLIA (D. Don, in mem. wern. soc. 4. p. 301.) shrubby; leaves elliptic, acute, spreading, downy on both surfaces, as well as the branchlets; flowers solitary, pedicellate; calyxes pubescent. ♄. S. Native of Brazil. Stem erect, much branched. Branches tetragonal. Leaves obsoletely 3-nerved, about the size of those of wild-thyme. Flowers purple.

Wild-thyme-leaved Microlicia. Sh. ½ foot.

12 M. GRAVE'OLENS (D. C. prod. 3. p. 119.) suffruticose, diffusely branched; branches somewhat tetragonal, beset with glandular hairs; leaves sessile, ovate, acute, 3-nerved, obsoletely serrated, full of setose dots on both surfaces; flowers axillary, sessile, solitary, crowded at the tops of the branches; tube of calyx 10-furrowed, beset with glandular bristles, longer than the lobes, which are 5, lanceolate and acute; anthers dissimilar. ♄. B. S. Native of Brazil, in the province of Minas Geraes, on the mountains and in irrigated parts of meadows. Rhéxia gravèolens, Mart. et Schrank, mss. Leaves 2 lines long. Petals violaceous. Anthers 10, ovate, with short blunt beaks: having the connectives of 5 drawn out into a dilated somewhat 2-lobed appendage each, those of the other 5 short. Capsule ovate-conical, 3-celled, 3-valved. Seeds somewhat cochleate. Plant with a heavy scent.

Strong-scented Microlicia. Sh. ½ to 1 foot.

13 M. MARIFÒLIA (D. Don, mem. wern. soc. 4. p. 301.) shrubby; leaves decussate, ovate, bluntish, 3-nerved, on short petioles, downy on both surfaces, as well as the branches; flowers axillary, solitary, pedicellate. ♄. S. Native of Brazil: An erect, much branched, leafy shrub, with tetragonal branches and obsoletely crenulated leaves. Calyx downy.

Cat-thyme-leaved Microlicia. Sh. ½ foot.

14 M. JUNGERMANNIOÌDES (D. C. l. c.) shrubby; branches hispid; leaves sessile, ovate, ciliately serrated, 5-nerved, smoothish above, but bristly beneath; flowers usually solitary, axillary, and terminal; calyx setigerous, with the tube globose, and the lobes linear-subulate, about equal in length to the tube; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, on the Diamond Mountains. Rhéxia jungermannioìdes, Mart. et Schrank, mss. The bristles on the upper part of the plant are glandular. Leaves like those of *Bétula nàna.* Petals violaceous. Anthers 10, ovate-oblong, ending each in a short cucullate beak: 5 of which have their connectives longer than the anthers; those of the other 5 short. Capsule ovate-globose, 3-valved.

Jungermannia-like Microlicia. Sh. ½ to 1 foot.

15 M. SUBSETÒSA (D. C. l. c.) stem shrubby; branches terete, bristly; leaves sessile, oblong-ovate, acutish, quite entire, finely 3-nerved, full of glandular dots on both surfaces, and with a few bristles on the margins and nerves; flowers terminal, solitary, sessile, decandrous; calyx full of glandular dots, having 5 oblong rather bristly lobes. ♄. S. Native of Brazil, on the mountains. Rhéxia setòsa, Schrank et Mart. mss. but not of Spreng. Leaves 2-3 lines long. Petals purple. Anthers yellow, beaked: having their connectives drawn out at the articulation into a blunt appendage each, 3-times the length of the anthers. From habit this species is allied to *M. variolòsa.*

Subsetose Microlicia. Sh. ½ to 1 foot.

16 M. SERINGEA'NA (D. C. l. c.) shrubby, hispid from yellowish hairs; branches tetragonal; leaves sessile, ovate, serrated, approximate, somewhat 3-nerved, full of glandular and pellucid dots, hairy; flowers solitary, sessile, terminal; calyx hairy, with a turbinate 10-ribbed tube, and 5 triangular lobes; anthers dissimilar. ♄. S. Native of Brazil. Rhéxia Seringeàna, Mart. herb. Petals purple, ciliated when young. Anthers 10, oval, bluntly beaked, 5 with long connectives, which are appendiculated at the base. Capsule 3-celled, permanent. Allied to *M. variolòsa*, but distinct.

Seringe's Microlicia. Sh. ½ to 1 foot.

17 M. VESTÌTA (D. C. l. c.) shrubby, branched; branchlets filiform, rather hairy from small pili; leaves sessile, somewhat imbricated in four rows, ovate, acute, quite entire, somewhat 3-nerved, smoothish above, beset with long adpressed bristles or

villi beneath, and on the margins; flowers solitary, on short pedicels in the axils of the upper leaves; calyx bristly, with an urceolate tube and a 5-toothed limb; anthers dissimilar. ♄. S. Native of Brazil, in the province of Bahia, on the mountains. Rhéxia vestìta, Schrank et Mart. mss. Petals purplish. Leaves 2 lines long. Anthers ovate, terminating in short beaks; with the connectives appendiculate, the appendages in 4 filiform, and in the other 4 they are dilated and blunt.

Clothed Microlicia. Sh. ½ to 1 foot.

18 M. VARIOLÒSA (D. C. prod. 3. p. 119.) shrubby, branched, erect; branches tetragonal; leaves sessile, ovate, oval or oblong, quite entire, somewhat 3-nerved, full of glandular dots on both surfaces; flowers solitary, axillary or subterminal, on short pedicels; calyx turbinate, with 5 triangularly oblong lobes, which are hardly shorter than the tube; anthers dissimilar. ♄. S. Native of Brazil and Peru. Leaves 2-4 lines long, and 1½ to 3 broad. Capsule ovate, 3-celled, 3-valved. Seeds oblong, kidney-shaped, dotted when examined with a lens.

Var. α, hirsùta (D. C. l. c.) branches and leaves villous on both surfaces, or velvety. The Rhéxia fasciculàta, virgulàta, thymifòlia, baccharoìdes, euphorbioìdes, aviculàris, hirsùta, venaista, and enérvia of Schrank and Mart. mss. are probably only variations of the same.

Var. β, glàbra (D. C. l. c.) branches rather hispid; leaves glabrous. The Rhéxia elachistophýlla, Cochobámbæ, altérnans, and variolòsa of Schrank et Mart. mss. are probably variations of this plant.

Variolose Microlicia. Sh. ½ to 1 foot.

19 M. GLA'BRA (D. C. prod. 2. p. 120.) shrubby, much branched, glabrous on both surfaces; branches fastigiate, tetragonal; leaves sessile, oval-oblong, acute, quite entire, hardly 3-nerved at the base, full of depressed dots on both surfaces; flowers on short pedicels, axillary and terminal, solitary; calyx with an obovate tube: and 5 lobes, which are triangular at the base, and subulate at the apex, hardly shorter than the tube; anthers dissimilar. ♄. S. Native of Brazil. This is an intermediate species between *M. variolòsa* and *M. scopària*. Perhaps the same as *M. linophýlla*.

Glabrous Microlicia. Sh. ½ to 1 foot.

20 M. LINOPHY'LLA (D. Don, l. c.) shrubby, much branched, glabrous; leaves lanceolate, awned, flat, quite entire, 3-nerved, glabrous; flowers solitary, nearly sessile, terminal or axillary. ♄. S. Native of Brazil. Shrub erect, twiggy, with tetragonal branches. Leaves spreading. Calyx glabrous.

Flax-leaved Microlicia. Sh. ½ to 1 foot.

21 M. SCOPA'RIA (D. C. l. c.) suffruticose, much branched, quite glabrous; branches fastigiate, tetragonal, erect; leaves sessile, linear-subulate, quite entire, rather fleshy, nerveless, channelled above; flowers solitary, terminal, on short pedicels; calyx with a cylindrically turbinate tube: and 5 linear-subulate lobes, which are about equal in length to the tube; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes in sandy fields on the tops of the highest mountains. Rhéxia scopària, Aug. St. Hil. in Bonpl. rhex. p. 152. t. 59. Leaves 2-3 lines long. Petals purple. Anthers 10, oblong, the 5 smaller ones ending in a short cylindrical appendage each, and having their connectives drawn out into an arched thread. Ovarium 3-celled, many-seeded.

Broom Microlicia. Sh. 1 to 2 feet.

22 M. ISOPHY'LLA (D. C. l. c.) fruticulose, much branched, glabrous; branches fastigiate, filiform, tetragonal; leaves sessile, oblong-subulate, quite entire, 1-nerved, full of pitted dots; flowers solitary, terminal; tube of calyx turbinate; lobes subulate, longer than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, in the high sandy pastures on the mountains. Rhéxia isophýlla, and R. uncàta, Schrank and Mart. mss. Very like *M. scopària*. Capsule 3-4-celled. Anthers dissimilar, ovate, beaked: in the longer ones the connective is drawn out into a long, cuneiform, rather emarginate appendage, but in the others it is short and blunt at the articulation.

Equal-leaved Microlicia. Sh. 1 foot.

23 M. ARISTA'TA (D. C. prod. 3. addend. p. 484.) fruticulose, much branched, glabrous; branches tetragonal; leaves linear, quite entire, slightly 3-nerved, full of dots on both surfaces, ending in an awn, like the calycine lobes; flowers axillary, solitary, and terminal tern, almost sessile; calyx oblong, 10-ribbed. ♄. S. Native of Brazil, in the province of Minas Geraes on the mountains, particularly on Serro Frio. The habit of the plant is almost that of *Lythrum* or *Saturéja*. Anthers ovate-oblong, terminated by a tubular beak each; the connectives of the 5 longer ones long, and calcarate at the base. Capsule 3-celled. Seeds cochleate, permanent around the axis.

Arned-calyxed Microlicia. Pl. ½ to 1 foot.

24 M. ERICOÌDES (D. Don, l. c. p. 302.) shrubby; leaves linear, mucronate, flat, loose; flowers twin; calyx glabrous. ♄. S. Native of Brazil. Stems numerous, ascending, tetragonal, almost simple, tufted, rising from a thick root. Rhéxia ericoìdes, Spreng. is distinct from this plant, and is probably referrible to the genus *Chætóstoma*.

Heath-like Microlicia. Sh. ½ to 1 foot.

25 M. CUPRE'SSINA (D. Don. l. c.) shrubby; leaves lanceolate, pungent, numerous, imbricate, marginate; flowers solitary; calyx hispid. ♄. S. Native of Brazil. Stem erect, much branched; branches terete, slender, proliferous, full of leaves at the apex, but naked below.

Cypress-like Microlicia. Sh. ½ 1 to foot.

26 M. TRICHOC[illegible]. C. l. c.) shrubby, much branched, smoothish; branches tetragonal; leaves sessile, oblong-linear, acute, almost quite entire, usually 3-nerved, glabrous, full of glandular dots beneath; floral and calyx leaves bearing long distant stiff hairs; calyx subglobose, with 5 subulate lobes; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, on Mount Grao-mayor, at the height of 4000 feet. Rhéxia trichocalycìna, Mart. et Schrank, mss. Leaves longer and more spreading than those of *M. scopària*, to which the present plant is nearly allied. Petals purple. Anthers 10, ovate, with short beaks: 5 of which have their connectives appendiculate. Capsule 3-celled. Seeds oblong, rather incurved, dotted when examined by a lens.

Hairy-calyxed Microlicia. Sh. 1 foot.

27 M. ARENARIÆFÒLIA (D. C. l. c.) suffruticose, much branched, quite glabrous; branches slender, terete; leaves sessile, linear, acuminated, quite entire, almost veinless; flowers on short pedicels, axillary, solitary; lobes of calyx 5, linear-subulate, longer than the tube; capsule 3-valved. ♄. S. Native of Peru, at Cochobambo. Rhéxia arenariæfòlia, Mart. et Schrank, mss. Flower-bud oblong, acute. Stamens unknown. Flowers unknown.

Sand-wort-leaved Microlicia. Sh. ¼ to ½ foot.

28 M. SETÒSA (D. C. l. c.) fruticulose; branches glabrous, fuscous, knotted; leaves almost sessile, full of dots, quite glabrous, linear-oblong, obsoletely 3-nerved, bristly; peduncles very short, axillary, and terminal; calyx campanulate, with 5 linear spreading teeth, each terminating in a bristle. ♄. S. Native of Brazil. Rhéxia setòsa, Spreng. neue. entd. 1. p. 304.

Bristly Microlicia. Sh. ½ to 1 foot.

Cult. All the species are dwarf plants, growing in inundated places of meadows. Some of them, therefore, require to be grown as subaquatic plants, that is, in pans filled with a mixture of peat and sand in the bottom, and filled up with water, but the water should not rise higher than an inch or an inch and a half above the soil; others require to be grown in pots, placed in pans of water. The species are increased by seeds or dividing.

XXI. ERNE'STIA (in honour of Ernest Meyer, author of primitiæ Floræ Essequeboensis Gottingen. 4to. 1818.) D. C. prod. 3. p. 121.

Lin. syst. *Octándria, Monogýnia.* Calyx with a globose tube, and 4 narrow acuminated lobes. Petals 4, obovate, ciliated. Anthers triquetrous, drawn out at the base into 2 long bristles each. Capsule 4-celled. Seeds unknown.—Herb, with the habit of *Spennèra*, but differs in the form of the anthers, which are anomalous in this genus, and in the capsule being 4-celled.

1 E. TENE'LLA (D. C. l. c.) ⊙. S. Native of New Granada, on Mount Quindiu in shady places. Leaves cordate, oval, acuminated, setosely denticulated, 5-nerved. Flowers panicled, octandrous. Calyx clothed with glandular pili; tube ovate; lobes ovate, ending in long points. Petals obovate, white. Genitals longer than the corolla. Style subclavate.

Slender Ernestia. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Spénnera*, p. 743.

XXII. SIPHANTHE'RA (from σιφων, *siphon*, a tube, and ανϑηρα, *antheia*, an anther; in reference to the anthers, which terminate in a long tubular beak). Pohl. pl. bras. 1. p. 102. D. C. prod. 3. p. 121.

Lin. syst. *Tetrándria, Monogýnia.* Calyx campanulate, 4-toothed, girded by many bracteas; bracteas permanent. Petals 4, orbicular. Stamens 4, exserted; anthers oblong, furnished with an obcordate ascending process at the base, and a tubular beak at the apex. Ovarium adnate to the calyx at the base. Style filiform. Capsule depressed, 2-celled, 2-valved, obcordate at the apex. Seeds numerou[illegible] ate or ovate, rather convex on one side, reticulated.—Small elegant annual herbs, clothed with glandular hairs. Leaves opposite, sessile, toothed, feather-nerved. Flowers crowded into axillary and terminal heads; with rose coloured or white petals, and blue anthers.

1 S. CORDA'TA (Pohl. pl. bras. 1. p. 183. t. 84.) leaves broad, cordate, upper ones narrower, serrated, villous; fascicles many-flowered, on short peduncles; bracteas ovate, toothed, inner ones narrow; beak of anthers long and attenuated. ⊙. S. Native of Brazil, in the province of Goyaz, in boggy meadows on the tops of the mountains. Rhéxia veronicæfòlia, Mart. herb. Stem reddish. Branches somewhat tetragonal. Petals rose-coloured.

Cordate-leaved Siphanthera. Pl. ½ to 1 foot.

2 S. TE'NERA (Pohl. pl. bras. 1. p. 104. t. 85. a.) leaves roundish-ovate, unequally toothed; fascicles of flowers on long peduncles; bracteas ovate, acute, terminated by a long hair each; beaks of anthers very short. ⊙. S. Native of Brazil, on the tops of mountains in the province of Goyaz. Branches tetragonal. Petals white, spotted with red at the base.

Tender Siphanthera. Pl. ½ foot.

3 S. SU'BTILIS (Pohl. l. c. p. 105. t. 85. f. b.) leaves oblong-ovate, acutish, unequally denticulated; fascicles of flowers on long peduncles; bracteas oblong, denticulated, terminated by a long hair each; beaks of anthers rather elongated. ⊙. S. Native of Brazil, in the province of Goyaz, on sandy parts of mountains, particularly between Corimba and Rio St. Marcos. Branches tetragonal. Corolla white.

Subtile Siphanthera. Pl. ½ foot.

Cult. All the species are elegant little annual plants. Their culture and propagation are the same as that for *Spénnera*, p. 743.

XXIII. RHE'XIA (from ῥηξις, *rhexis*, a rupture; supposed to cure by its astringent qualities). R. Br. ex D. Don, mem. soc. wern. 4. p. 297. Nutt. gen. amer. 1. p. 244.—Rhéxia species, Lin. Bonpl. and Seringe.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx ovate and ventricose at the base (f. 109. *a.*), but constricted at the neck at the apex (f. 109. *b.*); limb 4-cleft (f. 109. *b.*), permanent. Petals 4, obovate. Stamens 8 (f. 109. *c.*). Anthers not drawn out at the base. Capsule free in the bottom of the calyx, 4-celled, with lunate pedicellate placentas. Seeds cochleate.—Smooth North American herbs. Stems erect, quadrangular. Leaves sessile, quite entire, linear-lanceolate, or ovate, 3-nerved. Flowers by threes, disposed in cymose corymbs, purple or yellow.

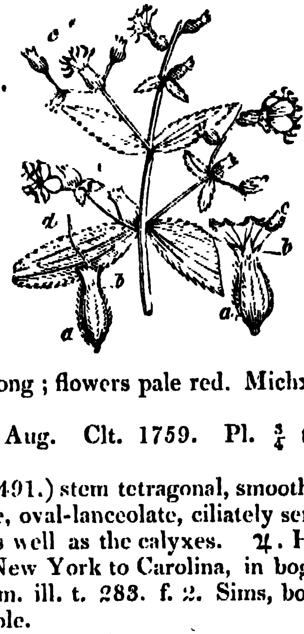


FIG. 109.

1 R. MARIA'NA (Lin. spec. 491.) stem terete, hairy; leaves on short petioles, lanceolate, acute at both ends 3-nerved; calyx smoothish. ♃. H. Native of North America, in sandy woods from New Jersey to Carolina; also in Maryland, and probably in Louisiana, if R. Ludoviciàna, Rafin. fl. lud. p. 92. be the same. Lodd. bot. cab. t. 366.—Pluk. alm. t. 428. f. 1. Lam. ill. t. 283. f. 1.

Var. α, purpùrea; leaves narrow-lanceolate or oblong; flowers deep purple. Michx. fl. bor. amer. 1. p. 221.

Var. β, rubélla; leaves oval-oblong; flowers pale red. Michx. l. c. Sweet, fl. gard. t. 41.

Maryland Rhexia. Fl. June, Aug. Clt. 1759. Pl. ¾ to 1 foot.

2 R. VIRGI'NICA (Lin. spec. p. 491.) stem tetragonal, smoothish; angles winged; leaves sessile, oval-lanceolate, ciliately serrated, 3-nerved, rather hispid, as well as the calyxes. ♃. H. Native of North America, from New York to Carolina, in bogs and woods in humid places. Lam. ill. t. 283. f. 2. Sims, bot. mag. t. 968. Flowers small, purple.

Var. β, septemnérvia (Walt. fl. car. p. 130.) leaves 5-7-nerved. ♃. H. R. Virgínica gigántea, Poir. dict. 6. p. 1.

Virginian Rhexia. Fl. June, Aug. Clt. 1759. Pl. ¾ foot.

3 R. CILIÒSA (Michx. fl. bor. amer. 1. p. 221.) stem somewhat quadrangular, smooth; leaves on short petioles, oval, glabrous beneath, but with a few hairs above and ciliated on the margins; flowers growing by threes, sessile, involucrated. ♃. H. Native of Lower Carolina, in marshes. Pursh, fl. amer. sept. 1. t. 10. Sweet, fl. gard. 298.—Pluk. amalth. t. 425. f. 4. ex Nutt. gen. amer. 1. p. 243. R. petiolàta, Walt. car. 130.? Leaves small. Flowers large, reddish purple. Anthers short. Calyx when in fruit rather globose at the base.

Ciliated Rhexia. Fl. June, Aug. Clt. 1812. Pl. ½ to 1½ foot.

4 R. SERRULA'TA (Nutt. gen. amer. 1. p. 243.) stem quadrangular, smooth; leaves on short petioles, roundish-ovate, smooth on both surfaces, rather ciliated at the base, and with the margins serrated; flowers pedunculate, ciliated; calyx beset with glandular hairs; the lobes acute. ♃. H. Native of Georgia and Florida, in open marshes. Very like *R. ciliòsa.* Flowers purple, subcorymbose.

Serrulated-leaved Rhexia. Pl. ¾ foot.

5 R. GLABE'LLA (Michx. fl. bor. amer. 1. p. 222.) stems terete, smooth; leaves sessile, erect, lanceolate, smooth, finely denticulated or entire (ex Nutt.); flowers subcorymbose; calyx beset with glandular hairs. ♃. H. Native of Carolina and Georgia, in sandy humid woods. Bonpl. rhex. t. 44. Flowers large, pale purple. Root tuberous.

Var. β; leaves obovate. R. Alifànus, Walt. car. p. 131. ex Pursh, fl. bor. amer. 1. p. 258.

Smooth Rhexia. Pl. 4 feet.

6 R. STRI'CTA (Pursh, fl. amer. sept. 1. p. 258.) stem straight, tetragonal, glabrous, but bearded at the joints; angles winged;

leaves sessile, erect, narrow-lanceolate, tapering into an acumen at the apex, 3-nerved, glabrous on both surfaces; corymbs dichotomous; calyxes smoothish. ♃. H. Native of Georgia and Lower Carolina, in humid places. Flowers purple. Very like the variety of *R. glabélla* according to Nutt. gen. amer.

Straight Rhexia. Pl. ¾ to 1 foot.

7 R. lu'tea (Michx. fl. bor. amer. 1. p. 222.) stem quadrangular, hispid; leaves furnished with a few long hairs, lower ones cuneate-oblong, obtuse; upper ones lanceolate; calyx marginated, with the lobes acute; anthers short. ♃. F. Native of Georgia and Florida. Flowers yellow. Petals oval, obtuse.

Yellow-flowered Rhexia. Pl. ½ to ¾ foot.

8 R. angustifòlia (Nutt. gen. amer. 1. p. 244.) stem nearly terete, hairy; leaves linear-lanceolate, sometimes oblong, hairy, bearing smaller leaves in the axils; flowers cymose; cymes bifid; calyx cylindrical, short, smooth; stamens declinate. ♃. H. Native of Georgia and Carolina. R. lanceolàta, Walt. fl. car. 129. Poir. dict. ency. 6. p. 2. R. Mariàna γ exálbida, Lam. ill. t. 288. f. 3. Michx. fl. bor. amer. 1. p. 221. Flowers middle-sized, white.

Narrow-leaved Rhexia. Fl. June, Aug. Clt. 1812. Pl. ½ ft.

N. B. Rhéxia linearifòlia of Poir is *Isnárdia alternifòlia*.

Cult. All the species of this genus are very elegant when in flower, and if planted in a bed of peat soil (which is the only soil in which they grow) they will thrive and increase abundantly; and if grown in pots, which is sometimes the case, they must be planted in peat soil. They are all increased by dividing at the root.

XXIV. HETERONO'MA (from *ἑτερος*, *heteros*, and *νωμα*, *ατος*, *noma*, *atos*; original form; inequality of leaves). D.C. prod. 3. p. 122.

Lin. syst. *Octándria, Monogýnia.* Calyx tubular, with 4 triangular, acute, permanent teeth. Petals 4, oval, somewhat mucronate. Stamens 8. Anthers alternately longer; in the longer anthers the connective is drawn out into a linear appendage, which is bifid at the apex; in the smaller or shorter ones it is drawn out into 2 bristles. Capsule 4-celled, equal in length to the calyx. Seeds cochleate, compressed, wrinkled transversely, scabrous, the stripes on the back parallel.—A glabrous herb. Branches tetragonal. Leaves petiolate, ovate, acute, 5-nerved, ciliately serrated, opposite, very unequal in size, the one large and the other small. Cymes corymbose, few-flowered, loose, terminal. Flowers elegant, rose-coloured.

1 H. diversifòlium (D. C. prod. 3. p. 122.) ♃. S. Native of Peru ex herb., Dombey, and of Mexico. Rhéxia diversifòlia, Bonpl. rhex. t. 45. Rhéxia inæqualifòlia, Moc. et Sesse, fl. mex. ined. t. 334.

Diverse-leaved Heteronoma. Pl. 2 feet.

Cult. Peat is the best soil for this plant; and cuttings will root in the same kind of earth under a hand-glass, in heat.

XXV. PACHYLO'MA (from *παχυς*, *pachys*, and *λωμα*, *loma*, a fringe; in reference to the thick marginal nerve of the leaf). D. C. prod. 3. p. 122.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx obconically cylindrical, drawn out beyond the ovarium; limb somewhat truncate, hardly 4-toothed. Petals 4, oval. Stamens 8, equal. Anthers linear, elongated, acuminated, opening by one pore; having the connectives in 4 of them long and drawn out into a simple bristle-like appendage; in the other 4 it is drawn out into 2 bristle-like appendages. Ovarium free, 4-ribbed, glabrous. Style filiform, exserted. Stigma dot-formed. Fruit unknown.—Smooth Brazilian shrubs. Branches terete, nodose at the insertion of the leaves. Leaves on short petioles, oval, 5-nerved, besides being margined by a thick nerve, coriaceous, quite entire. Thyrse panicled, loose, terminal, bractless. Flowers purple. The character of this genus is very doubtful, from the fruit being unknown, but the habit is very singular.

1 P. coria'ceum (D. C. l. c.) ♄. S. Native of Brazil, in the province of Rio Negro, and at the river Amazon. Rhéxia pachylòma, Mart. herb.

Var. a, glabérrima (D. C. l. c.) calyxes glabrous; leaves oblong. Rhéxia bicúspis, Schrank, mss.

Var. β, subsetòsa (D. C. l. c.) calyx covered with glandular bristles; leaves ovate. Rhéxia Amazònium, Schrank, mss.

In both varieties the leaves vary in the same specimen, and are cleft in a singular manner at the apex, the points cross over each other in the manner of the bill of a cross-beak, Lóxia of Lin.

Coriaceous-leaved Pachyloma. Tree 30 to 40 feet.

Cult. See *Meriània*, p. 733. for culture and propagation.

XXVI. OXY'SPORA (from *οξυς*, *oxys*, sharp, and *σπορα*, *spora*, a seed; in allusion to the seeds being awned at both ends). D. C. prod. 3. p. 123.—Arthrostémma species, D. Don, in wern. soc. mem. l. c.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx oblong; lobes 4, ovate, mucronulate. Petals 4, lanceolate, obliquely acute. Stamens 8, equal; filaments flattish. Anthers elongated, drawn out at the base into 2 blunt spurs, having their connectives hardly evident. Capsule 4-celled, 4-valved. Seeds small, hardly curved, awned at both ends: with the hylum concave and terminal.—Shrubs, native of Nipaul. Leaves petiolate, elliptic, oblong, acuminated, denticulated, 5-7-nerved, glabrous on the upper surface. Thyrse panicled, terminal. Flowers red, droop[illegible]

1 O. va'gans (Wall. pl. rar. asiat. 1. p. 78.) rather climbing; branches nodding; leaves somewhat cordate-ovate, acuminated, crenulated, ciliated, clothed with tomentose villi on the under surface, as well as on the branchlets and petioles; panicle elongated, nodding; connectives of anthers all spurred upwards; calyx ribbed. ♄. G. Native of Chittagong. Melástoma vàgans, Roxb. mss. Flowers red.

Var. β, cérnua (Wall. l. c.) leaves ovate-lanceolate, 5-nerved, glabrous; panicle terminal, slender, elongated, nodding; peduncles 4-winged. ♄. S. Native of Chittagong. Melástoma cérnua, Roxb. mss.

Common Oxyspora. Shrub 2 to 4 feet.

2 O. panicula'ta (D. C. prod. 3. p. 123. Wall. pl. rar. asiat. 1. p. 78. t. 88.) leaves somewhat cordate-ovate, acuminated, crenulated, clothed with villous tomentum beneath as well as on the petioles and peduncles; panicle ovate, erect; connectives of the longer anthers obsoletely spurred; capsule nerveless. ♄. G. Native of Nipaul. Flowers red. D. C. coll. p. 33. t. 4. Arthrostémma paniculàta, D. Don, prod. fl. nep. p. 222.

Panicled-flowered Oxyspora. Shrub 2 to 4 feet.

Cult. For culture and propagation see *Lasiándra*, p. 752. Both are very elegant shrubs when in blossom.

XXVII. TRICE'NTRUM (from *τρεις*, *treis*, three, and *κεντρον*, *kentron*, a spur; in reference to the connectives of the anthers being furnished with three spurs at the base). D. C. prod. 3. p. 123.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx ovate; lobes 4, narrow, acute, usually ending in three bristles each at the apex. Petals 4, oblong or oval. Stamens 8; filaments glabrous; anthers similar, linear, opening by one pore, beaked: having their connectives furnished with 3 spurs each, 2 of the spurs are above and 1 behind. Ovarium free, not bristly at the apex. Style filiform. Capsule ovate, 4-celled. Seeds cochleate.—Small South American shrubs. Flowers rose-coloured, solitary, nearly like those of *Rhéxia*.

1 T. ovalifòlium (D. C. l. c.) beset with glandular pili in

every part; branches somewhat tetragonal; leaves ovate, mucronate, villous, 5-nerved; flowers bibracteolate, on short pedicels in the axils of the upper leaves. ♄. S. Native of Brazil. Calyx cylindrical, villous; lobes 4, linear. Petals oblong. Stamens exactly as in the following species.

Oval-leaved Tricentrum. Sh. 1 foot.

2 T.? leptophy'llum (D. C. prod. 3. p. 123.) glabrous; stems procumbent, tetragonal; leaves linear, 1-nerved, serrulated at the apex; flowers terminal, solitary. ♄. S. Native on the banks of the Orinoco, near Maypures. Rhéxia leptophýlla, Bonpl. rhex. t. 24. Habit very different from the first species, but the flowers and fruit, as far as known, are similar. Seeds unknown. Ovarium free. Style filiform.

Slender-leaved Tricentrum. Sh. procumbent.

Cult. For culture and propagation see *Lasiándra*, p. 752.

XXVIII. MARCETIA (dedicated by De Candolle to his friend Fr. Marcet, who has advanced vegetable physiology by a singular memoire on the effects of poison on living vegetables). D. C. prod. 3. p. 124.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx oblong or cylindrical; lobes 4, lanceolate. Petals 4, oval, acute. Stamens 8, equal; anthers oblong, furnished with 2 tubercles at the base, opening by one pore. Ovarium free, glabrous. Style filiform. Stigma dot-formed. Capsule 4-valved, 4-celled, about equal in length to the tube of the calyx. Seeds cochleate.—Brazilian shrubs. Branches terete. Leaves rather fleshy, oblong, usually with revolute edges, cordate at the base, on very short petioles or almost sessile, quite entire, usually nerveless. Flowers axillary, solitary, almost sessile, bibra[illegible]e or reddish.

1 M. decussa'ta (D. C. l. c.) suffruticose, branched; leaves sessile, ovate, rather cordate, bluntish, quite entire, 3-nerved at the base, downy, as well as the branchlets and calyxes; flowers axillary, pedicellate: lobes of calyx lanceolate-subulate, hardly shorter than the tube; petals oval, acute. ♄. S. Native of Brazil, in the province of Bahia, on woody mountains, at the height of 2000 feet. Rhéxia decussàta, Mart. et Schrank, mss. Leaves hardly 2-3 lines long. Genitals exserted. Stamens alternately unequal, but similar to the rest. Anthers furnished with 2 tubercles at the base. Seeds wrinkled, truncate at the base.

Decussate-leaved Marcetia. Sh. 1 foot.

2 M. cordígera (D. C. l. c.) shrubby, much branched; branches hispid from bristles; leaves sessile, cordate, when young revolute at the margins, but at length becoming flat, and truly heart-shaped, rather scabrous from minute glandular down; flowers axillary, pedicellate, solitary, disposed in a leafy raceme; petals obliquely mucronate. ♄. S. Native of Brazil, in the province of Rio Janeiro, on the Alps. Rhéxia cordígera, Mart. et Schrank, mss. Flowers white. Allied to *M. taxifòlia.*

Heart-bearing Marcetia. Sh. 1 foot.

3 M. excoria'ta (D. C. l. c.) suffruticose, much branched; leaves almost sessile, oblong, rather cordate at the base, obtuse at the apex and mucronulate, densely clothed with down, somewhat 3-nerved; flowers axillary, pedicellate, disposed in short leafy racemes; anthers furnished with 2 tubercles at the base. ♄. S. Native of Brazil, on the mountains between Villa Ricca and Tejuco. Rhéxia excoriàta, Mart. et Schrank, mss. Bark at length separating from the stem. Leaves with a bluntish mucrone, covered with resiniferous down. Teeth of calyx linear. Petals oblong-obovate, rose-coloured. Genitals exserted. Seeds hardly wrinkled, truncate at the base.

Excoriated Marcetia. Sh. 2 to 3 feet.

4 M. taxifòlia (D. C. l. c.) shrubby, much branched, clothed with glandular down in every part; leaves nearly sessile, oval-oblong, nearly linear, cordate at the base, with the margins revolute; flowers axillary, solitary; calyx covered with glandular hairs, with 4 oblong-linear lobes; petals obliquely mucronate. ♄. S. Native of Brazil, in the province of Minas Geraes, in sandy places. Rhéxia taxifòlia, St. Hil. in Bonpl. rhex. t. 57. Flowers white, on pedicels, which are furnished with one bractea each?

Var. β, *cinèrea* (D. C. l. c.) the whole plant almost white from short cinereous down. ♄. S. Native of Brazil, in the province of Minas Geraes, at the height of 4000 feet, in fields. Rhéxia cinèrea, Mart. herb. Flowers purplish.

Yew-leaved Marcetia. Sh. 1 to 2 feet.

5 M. glandulòsa (D. C. l. c.) shrubby, much branched; branches thickly beset with glandular hairs; leaves sessile, oval-oblong, but nearly lanceolate from the margins being revolute; cordate at the base, nerveless, crowded, ornamented with glandular hairs; flowers axillary; pedicels short, bibracteolate in the middle; lobes of calyx subulate. ♄. S. Native of Brazil, in the province of Minas Geraes. Rhéxia quadrivàlvis, Mart. herb. Flowers purplish, a little larger than those of *M. taxifòlia.*

Glandular Marcetia. Sh. 1 to 2 feet.

6 M. pube'scens (D. C. l. c.) shrubby, branched; branches clothed with glandular down; leaves sessile, oval-oblong from the revolution of the margins, oblong, cordate at the base, downy, not glandular, nerveless; flowers axillary, almost sessile; bracteoles small, setaceous; lobes of calyx short. ♄. S. Native of Brazil. Rhéxia Langsdorfiàna, Kunth ex Mart. Flowers purplish.

Pubescent Marcetia. Sh. 1 to 2 feet.

7 M. tenuifòlia (D. C. l. c.) shrubby, much branched; branches rather tetragonal, clothed with short hispid down; leaves sessile, linear, nerveless, clothed with short velvety down, revolute at the margins; pedicels axillary, short, 1-flowered, furnished with 2 bracteas each. ♄. S. Native of Brazil. Rhéxia tenuifòlia, Mart. herb. Allied to *M. taxifòlia,* from the white flowers, but differs from it in the down not being glandular, and in the leaves being narrower and more spreading.

Fine-leaved Marcetia. Sh. 1 to 2 feet.

8 M. Junipe'rina (D. C. l. c.) suffruticose; branches slender, downy; leaves lanceolate, but linear from the revolution of the edges, acute, nerveless, clothed with rough pubescence; flowers axillary, solitary, sessile, bibracteate; lobes of calyx linear-subulate; petals oval-oblong, awnedly mucronate. ♄. S. Native of Brazil. Rhéxia junipérina, Spreng. syst. 2. p. 310.

Juniper-like Marcetia. Sh. 1 foot.

9 M. tamaríscina (D. C. l. c) shrubby; leaves sessile, rather fleshy, oblong, cordate, with revolute margins, and hence as if they were sagittately cordate; flowers axillary, almost sessile; petals lanceolate. ♄. S. Native of Brazil, in the province of Minas Geraes. Rhéxia tamaríscina, Schrank et Mart. mss. Leaves, branches, and calyxes rather downy; lobes of calyx narrow, acute, acerose. Petals white. Stamens similar. Anthers rather tumid at the base. Seeds truncate at the base. Leaves almost like those of *Empètrum.* Very near *M. taxifòlia.*

Tamarisk-like Marcetia. Sh. 1 to 2 feet.

10 M. aceròsa (D. C. l. c.) suffruticose, very humble; leaves clothed with velvety down, oblong-linear, with revolute edges; flowers solitary, terminal, erect, sessile; genitals shorter than the petals, which are orbicular, and hardly apiculated. ♄. S. Native of Brazil, in the province of Minas Geraes, in the Certao or desert, in stony sandy fields. Rhéxia aceròsa, Schrank et Mart. mss. A small heath-like shrub. Leaves 1-2 lines long. Branches filiform. Anthers ovate, hardly auricled at the base. Petals purple. Allied to *M. taxifòlia* from the leaves, but differs in the flowers being 4-petalled and octandrous. Habit of *Tetrathèca.*

Needle-leaved Marcetia. Sh. 1 foot.

11 M. serpula'ria (D. C. l. c.) shrubby, branched; branchlets and leaves rough from thick glandular down; leaves sessile,

oval, with revolute margins, nerveless, small, crowded, coriaceous; flowers solitary at the tops of the branches; calyx oblong, beset with short, glandular hairs. ♄. S. Native of Brazil, in the province of Minas Geraes, at the height of 5000 feet. D.C. coll. mem. 1. t. 5. Rhéxia sertulària, Schrank et Mart. mss. Stamens exserted. Petals oval, white in a dried state. Very elegant and very distinct from the other species.

Sertularia-like Marcetia. Shrub 1 foot.

Cult. The species of *Marcètia* are elegant little shrubs, but probably of difficult cultivation. Should any of them be ever introduced to the gardens, we would recommend their being grown in a mixture of loam, peat, and sand, draining the pots well with sherds, and placing them on the shelves in a stove. Young cuttings will perhaps root in sand under a bell-glass, in heat.

XXIX. TREMBLE'YA (dedicated to Abraham Trembley, who by his observations on fresh water polypes, has contributed to determine the limits of the vegetable kingdom). D. C. prod. 3. p. 125.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate, constricted at the apex; lobes 5, rather dilated from the base, awned, or oblong. Petals 5, oval. Stamens 10, 5 of which bear ovate-oblong anthers, with short blunt beaks; having their connectives drawn out into an obcordate or spatulate simple ligula each; the 5 alternate ones having the ligula hardly evident. Stigma dot-formed. Capsule ovate, 5-celled, glabrous. Seeds cochleate?—Shrubs, native of Brazil. Leaves sessile or petiolate, oblong or linear, quite entire, 1-3-nerved. Pedicels axillary or terminal, 1-3-flowered.—This genus agrees with *Rhéxia* in the urceolate calyx, but differs in the corolla being pentapetalous. The habits of the species are heterogeneous, but the characters are not so. The genus is therefore divided into 3 sections.

SECT. I. JACÒBIA (dedicated to James Andr. Trembley, who wrote a thesis on vegetation, which has been falsely attributed to Calandrini, a Swiss botanist). D. C. prod. 3. p. 125. Calyx turbinate, hardly constricted at the apex; lobes subulate. Petals oval, mucronate. Connectives of anthers drawn out into a short appendage each. Flower solitary, yellow. This section almost agrees with the genus *Marcètia*, but differs in the petals being yellow. Perhaps a proper genus. Seeds unknown.

1 T. ROSMARINOÌDES (D. C. prod. 3. p. 125.) shrubby, much branched, glabrous; branches tetragonal; leaves on short petioles, linear, quite entire, 1-nerved, besides 2 marginal veins, which are joined with the reticulating veins, clothed with yellowish down beneath; flowers axillary, solitary, pedicellate, and at the tops of the branches; tube of calyx ovate, somewhat costate, equal in length to the lobes, which are subulate, and 5-6 in number; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, on the tops of mountains, at the elevation of 5000 feet. Rhéxia rosmarinoìdes, Schrank et Mart. mss. Petals obovate, yellow. Anthers ovate, with short blunt beaks; the alternate ones furnished with a longer auricled connective each.

Rosemary-like Trembleya. Shrub 1 foot.

SECT. II. ABRAHA'MIA (in honour of Abraham Trembley, see genus). D. C. prod. 3. p. 126. Calyx urceolate; lobes subulate or linear. Petals not gradually mucronated but apiculated. Connectives of anthers drawn out into a broad appendage each. Flowers purplish, pedicellate.

2 T. PHLOGIFÓRMIS (D. C. l. c.) plant suffruticose, oppositely branched; branches somewhat tetragonal, beset with glandular hairs; leaves sessile, elliptic-oblong, attenuated at both ends, ciliately serrated, 3-nerved, hispid on both surfaces; pedicels 1-flowered, axillary, and at the tops of the branches; calyx rather hispid, with an urceolate tube, and a limb which is campanulate at the base and 5-lobed at the apex, the lobes ending in setaceous points, hardly shorter than the tube; anthers dissimilar. ♄. S. Native of Brazil, in the province of St. Paul, in fields. Rhéxia phlogifórmis, Mart. et Schrank, mss. Petals oval-oblong, purple. Anthers 10, ovate, with short blunt beaks; the 5 longer ones having their connectives drawn out into a broad obcordate appendage each, and those of the 5 shorter ones drawn out into a small narrow appendage each. Capsule ovate, 5?-celled.

Phlox-leaved Trembleya. Shrub 1 to 2 feet.

3 T. AGRE'STIS (D. C. l. c.) shrubby; branches bluntly tetragonal; leaves elliptic-oblong, cuneated at the base, rather acutish, quite entire, 3-nerved, pruinose on both surfaces as well as the branchlets; upper ones pilose as well as the calyxes; flowers solitary, terminal; lobes of calyx 5, oblong, a little longer than the tube; petals obovate, cuneated. ♄. S. Native of Brazil, in the province of Minas Geraes, in elevated stony fields. Rhéxia agréstis, Mart. and Schrank, mss. Leaves 7-9 lines long and 3 lines broad. Flowers small. Anthers oval-oblong, ending in very short beaks, but having their connectives drawn out into a long, club-shaped process each at the articulation; inner anthers furnished with shorter connectives. The rest unknown.

Field Trembleya. Shrub 1 to 2 feet.

4 T. HETEROSTE'MON (D. C. l. c.) shrubby; branches bluntly tetragonal, when young clothed with velvety villi; leaves petiolate, lanceolate, cuneated at the base, obtuse at the apex, quite entire, 3-nerved [illegible] clothed with velvety tomentum beneath, smoothish above [illegible]mes 5-7-flowered, axillary, 3-times shorter than the leaves; [illegible]mately globose, with 5 short teeth; anthers 10, dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, near subalpine fountains. Rhéxia heterostèmon, Mart. et Schrank, mss. Leaves 2 inches long, and 5 lines broad. Petals oblong, white. Anthers ovate, short, ending in short beaks, 5 of which are spurless, and the other 5 having their connectives drawn out at the base into an obcordate appendage each, which is about equal in length to the anther.

Variable-stamened Trembleya. Shrub.

5 T. TRIFLÒRA (D. C. l. c.) shrubby; branches tetragonal, glabrous; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, glabrous above, but white beneath from very minute down; peduncles axillary, 3-flowered, angular; calyx turbinate, glabrous, with 5 triangular short lobes; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in woods near Villa Ricca. Rhéxia triflòra, Mart. et Schrank, mss. Petals obovate, oblong, 3-4 lines long, not ciliated. Anthers 10, ovate, ending in short beaks, 5 of which have their connectives drawn out into a yellow retuse appendage each.

Three-flowered Trembleya. Shrub 2 feet.

SECT. III. ERIOLEU'CA (from *εριον*, *erion*, wool, and *λευκος*, *leucos*, white; plant clothed with white tomentum in every part). D. C. prod. 3. p. 126. Calyx hardly constricted at the apex, woolly on the outside; lobes oblong. Petals obtuse. Connectives of the longer anthers drawn out each into a broad appendage. Flowers axillary, sessile. Seeds unknown. Perhaps a proper genus.

6 T. LYCHNÌTIS (D. C. l. c.) shrubby, clothed in every part with white woolly tomentum, except the petals, genitals, and the upper surface of the adult leaves; branches terete; leaves almost sessile, ovate, or somewhat oblong, 3-nerved, quite entire; flowers axillary, sessile, somewhat verticillate; tube of calyx turbinate, equal in length to the lobes, which are 5, oblong, and glabrous inside; anthers dissimilar. ♄. S. Native of Brazil, in the province of Minas Geraes, in exposed stony places on the sides of mountains. Rhéxia lychnitis, Schrank et Mart. mss. Me-

lástoma laniflòrum, D. Don, in mem. wern. soc. 4. p. 292. Flowers about 3 together in each axil, yellow? Petals obovate-oblong. Stamens 10, one-half shorter than the petals. Anthers ovate, obtuse, ending in short beaks. The specific name is derived from λυχνις, a lamp; in reference to the cottony appearance of the wool on the plant resembling wicks.

Lamp Trembleya. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Marcètia*, p. 749.

XXX. ADE'LOBOTRYS (from αδηλος, *adelos*, obscure, and βοτρυς, *botrys*, a raceme; in reference to the flowers not being sufficiently known). D. C. prod. 3. p. 127.

Lin. syst. *Decándria, Monogýnia.* Calyx free, somewhat campanulate, with 5 short blunt teeth. Petals 5, oval. Stamens 10. Anthers bifurcate at the base, and 2-valved? at the apex. Ovarium and style unknown. Capsule bursting by 5 parts, with the central column at length free from the valves.—Seeds unknown.—A climbing shrub with terete branches. Leaves clothed with rufous villi on both surfaces when young, but in the adult state glabrous, except the nerves, petiolate, ovate-cordate, acuminated, ciliately serrated, 5-nerved. Flowers white, crowded in cymose heads at the tops of the branches.

1 A. sca'ndens (D. C. l. c.). ♄ . ◡. S. Native of French Guiana, on the banks of the river Sinemari. Melástoma scándens, Aubl. guian. 1. p. 435. t. 172. Rhéxia scándens, Rich. herb. Ser. mss.

Climbing Adelobotrys. Shrub cl.

Cult. For culture and propagation see *Lasiándra*, p. 752. Being a climbing shrub it is fit for covering [illegible] in stoves.

Tribe III.

OSBE'CKIA (plants agreeing with *Osbéckia* in important characters). D. C. prod. 3. p. 127. Anthers opening by 1 pore at the apex. Ovarium sometimes free, and sometimes adnate to the calyx, crowned by scales or bristles at the apex. Seeds cochleate, with a basilar orbicular hylum. The species are natives of America, Africa, Asia, and a few of Australia.

XXXI. LASIA'NDRA (from λασιος, *lasios*, hairy, and ανηρ ανδρος, *aner andros*, a male; in reference to the hairy stamens). D. C. prod. 3. p. 127. Rhéxia species, Schrank and Mart. mss. —Pleròma species, D. Don, l. c.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx ovate; lobes 5, narrow, acuminated. Petals 5, obovate. Stamens 10; filaments pilose; anthers elongated, terminating in short beaks, having their connectives tumid and biauriculate at the base. Ovarium setose at the apex, probably somewhat adnate to the calyx in the young state. Style usually pilose. Capsule dry, 5-celled. Seeds few, cochleate, rather angular, with a somewhat orbicular, basilar hylum.—Shrubs, natives of South America. Branches clothed with adpressed bristles. Leaves on short petioles or sessile, 3-5-nerved, quite entire, ciliated, bristly on the upper surface; the bristles adpressed, and usually regularly directed from the middle to the nerves; villous or setose on the nerves beneath, and velvety or villous between the nerves. Flowers large, purple, disposed in terminal racemes or panicles; before expansion hidden by 2 bracteas each, which fall off as the flower expands. The species have the habit of *Pleròma*, but differ in the genitals being hispid, and in the capsule being dry and free, not baccate and adnate to the calyx.

* *Calyx rough from stiffish bristles.*

1 L. frigi'dula (D.C. prod. 3. p. 127.) branches somewhat compressed, smoothish; leaves sessile, somewhat cordate at the base, oval-oblong, acute, quite entire, 3-nerved, glabrous; peduncles axillary, trichotomously cymose, disposed in a panicled thyrse; bracteas involving the flower-bud when young; calyx bristly, with 5 ciliated lobes; petals ciliated; filaments rather pilose. ♄ . S. Native of Brazil, in the alpine fields of Serro Frio. Rhéxia frigídula, Schrank et Mart. mss. Style much elongated.

Frigid Lasiandra. Shrub 2 to 3 feet.

2 L. trifòlia (D. C. l. c.) branches trigonal, roughish; leaves 3 in a whorl, almost sessile, oblong, quite entire, acute, 3-nerved, glabrous in the disk above, but beset with adpressed bristles beneath and on the margins; panicle terminal; calyx bristly, with 5 ciliated deciduous lobes; petals ciliated; filaments hispid; style glabrous. ♄ . S. Native of Brazil, in the province of St. Paul, in fields and on the edges of woods. Leaves 3 inches long, but hardly an inch broad. Pedicels and calyxes bristly. Rhéxia trifòlia, Schrank et Mart. mss.

Three-leaved Lasiandra. Shrub 2 to 3 feet.

3 L. Martiusia'na (D. C. l. c.) shrubby; branches nearly terete, beset with adpressed bristles; leaves sessile, ovate, 3-nerved, quite entire, glabrous above, dotted beneath but hardly bristly; thyrse terminal; bracteas 2, oval, half involving the flower-bud; calyx bristly, with an obovate tube: and 5 oval-oblong ciliated lobes, which are longer than the tube; filaments hispid; anthers rather dissimilar. ♄ . S. Native of Brazil, in the province of Minas Geraes in fields, at the elevation of 2000 feet. Rhéxia Lasiándra, Schrank et Mart. mss.

Martius's Lasiandra. Shrub 2 to 3 feet.

4 L. Moricandia'na (D. C. prod. 3. p. 128.) shrubby; branches nearly terete, clothed with short adpressed villi; leaves petiolate, oblong, acute, 3-5-nerved, clothed with adpressed bristles above and pale villi beneath; flowers in threes, terminal; bracteas ovate, clothed with adpressed villi, large; tube of calyx campanulate, bristly, longer than the lobes; filaments beset with glandular pili. ♄ . S. Native of Brazil. Rhéxia Moricandiàna, Ser. mss. Anthers long, having their connectives furnished with 2 tubercles at the base. Lobes of calyx at length deciduous. The outer nerves of the leaves almost marginal.

Moricand's Lasiandra. Shrub 2 to 3 feet.

5 L. Maximilia'na (D. C. l. c.) branches tetragonal, and are as well as the petioles and peduncles scabrous from bristles; leaves petiolate, ovate, obtuse at the base, acute at the apex, 5-nerved, bristly above, nerveless beneath, but with the nervules beset with silky bristles; thyrse panicled, corymbose, terminal; bracteas, and outside of calyx scabrous from adpressed bristles; style glabrous; filaments rather pilose at the base. ♄ . S. Native of Brazil, where it was collected by Prince Maximilian de Neuweid. Very like *L. Gaudichaudiàna*, but differs in the bristles being more stiff and harsh.

Maximilian's Lasiandra. Shrub 4 to 6 feet.

6 L. Gaudichaudia'na (D. C. l. c.) branches tetragonal, rough from small adpressed bristles; leaves petiolate, ovate, acuminated, 5-nerved, beset with small, softish bristles on both surfaces; panicle terminal; bracteas acuminated, shorter than the tube of the calyx; calycine tube ovate, clothed with adpressed bristles, twice the length of the lobes, which are acuminated; filaments rather pilose; style glabrous. ♄ . S. Native of Brazil. Lateral nerves of leaves forming a margin. Anthers long, falcate, having their connectives hardly drawn out into a thick appendage at the base.

Gaudichaud's Lasiandra. Shrub 2 to 3 feet.

7 L. ochype'tala (D. C. l. c.) branches tetragonal, and are as well as the petioles, peduncles, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acuminated, 5-nerved, quite entire, clothed with adpressed villi beneath; racemes terminal, short; pedicels opposite, 1-3-flowered; calyx bristly, with an ovate-globose tube and lanceolate lobes; filaments and style hispid at the base. ♄ . S. Native of Peru, on the mountains. Rhéxia ochypétala, Ruiz et Pav. fl. per. 3. p. 86. t. 321. f. a. Rhéxia oxypétala, Spreng. syst. 2. p. 306.

Pleròma ochypétala, D. Don, l. c. Bracteas ovate, deciduous, bristly. Petals large, obovate, retuse, nearly obcordate, with a mucrone in the recess. Ovarium free.

Sharp-petalled Lasiandra. Shrub 10-12 feet.

8 L. Kunthia'na (D. C. l. c.) branches tetragonal, and are as well as the petioles clothed with adpressed villi; leaves petiolate, oblong, acute, 5-nerved, quite entire, scabrous above from little bristles, but white from adpressed silky villi beneath; pedicels hispid, axillary, 1-flowered, and terminal; tube of calyx campanulate, beset with stiff bristles, but with the lobes deciduous; filaments and style hispid. ♄. S. Native of Brazil. Petals very blunt. Ovarium bristly at the apex, rather longer than the tube of the calyx. Bracteas large, deciduous.

Kunth's Lasiandra. Shrub 4 to 8 feet.

9 L. æ'mula (D. C. l. c.) shrubby; branches, petioles, and peduncles clothed with hairy tomentum; leaves petiolate, ovate, mucronately acute, 5-nerved, quite entire, scabrous from bristles above, but densely clothed with adpressed villi beneath; pedicels rising from the upper axils of the leaves, and solitary at the tops of the branches, disposed in something like racemes; calyx bristly, with a globose tube; and 5 lanceolate deciduous lobes, which are glabrous inside. ♄. S. Native of Brazil, in the province of Minas Geraes. Meriània æ'mula, Schrank and Mart. mss. Ovarium bristly at the apex. Filaments and style hairy. Very like *L. hygróphila.*

Emulous Lasiandra. Shrub 4 to 6 feet.

10 L. hygróphila (D. C. l. c.) shrubby; branches terete, hispid from bristles; leaves sessile, ovate, acute, 5-7-nerved, ciliately serrated, rough from stiff bristles above, but hairy beneath; pedicels axillary, 1-flowered, disposed in racemose cymes; calyx bristly: with 5 subulate lobes, which are a little longer than the tube. ♄. S. Native of Brazil, in the province of St. Paul, in bogs in woods. Rhéxia hygróphila, Mart. mss. Leaves hardly an inch long and 8-9 lines broad. Like *L. Tonnèsii*, but differs in the anthers being shorter, and in the filaments bearing a few subglandular hairs.

Water-loving Lasiandra. Shrub 4 to 6 feet.

11 L. Tibouchinoìdes (D. C. l. c.) shrubby; branches bluntly tetragonal, beset with bristly pili; leaves petiolate, elliptic-oblong, mucronate, quite entire, 3-nerved, bearing a few scattered bristles above, but clothed with villous tomentum beneath; flowers terminal, bracteate, usually twin; calyx bristly, with 5, ovate, acute, ciliated lobes. ♄. S. Native of Brazil, in the province of St. Paul, in marshes. Rhéxia tibouchinoìdes, Schrank and Mart. mss. Leaves an inch long and 5-6 lines broad. Calyx ovate, red; lobes 5. Petals large. Anthers linear, falcate, acuminated by the beaks, a little longer than the connectives, which are tumid at the base. Stamens exserted, rather unequal, glabrous, and bearing a few glands at the very base. Habit of *Tibouchina* of Aublet or *Chætogástra lepidòta.*

Tibouchina-like Lasiandra. Shrub 6 to 8 feet.

12 L. hóspita (D. C. prod. 3. p. 129.) shrubby, much branched, scabrous in every part from adpressed bristles; branchlets somewhat tetragonal; leaves on short petioles, elliptic, 3-nerved, quite entire, acute; pedicels axillary, 1-flowered; calyx globose, scarcely 5-toothed; capsule 5-celled. ♄. S. Native of Brazil, in the province of Minas Geraes, on the mountains, in cold places. Rhéxia hóspita, Schrank and Mart. mss. Leaves an inch long. The bristles on the leaves regularly disposed between the veins. Bracteas deciduous. Stamens unknown. The branches becoming tumid from a species of cynips.

Stranger Lasiandra. Shrub 2 to 3 feet.

13 L. macrochi'ton (D. C. l. c.) shrubby; branches tetragonal, beset with adpressed little bristles; leaves petiolate, oval, 3-nerved, beset with adpressed bristles above, but with dot-like setæ beneath; thyrse terminal; bracteas 2, rather villous, involving the flower in its young state; calyx bristly, with an ovate tube, and 5 ovate, ciliated, longer lobes; filaments hispid; anthers long, nearly similar. ♄. S. Native of Brazil. Rhéxia macrochìton, Mart. mss. Petals ciliated when young. Anthers falcate, beaked.

Long-coated Lasiandra. Shrub 2 to 3 feet.

* * *Calyx clothed with adpressed, rather silky villi.*

14 L. Thereminia'na (D. C. l. c.) shrubby; branches terete, clothed with adpressed short villi; leaves petiolate, ovate, acute, quite entire, 7-nerved, clothed with canescent villi beneath, villous above; flowers solitary, terminal; bracteas 2, ovate; villi on calyx silky and adpressed; calycine lobes longer than the tube, which is very villous; filaments villous; appendages of the connectives of the anthers bearing scattered glands. ♄. S. Native of Brazil. Very like *Chætogástra muricàta*, but differs in the longer petiolate 7-nerved leaves; the flowers are also larger, and bibracteate and the anthers shorter.

Theremian Lasiandra. Shrub 8 to 10 feet.

15 L. semideca'ndra (Schrank et Mart. mss. ex D. C. l. c.) shrubby; branches tetragonal, villous; leaves petiolate, ovate, acute, quite entire, 5-nerved, rough from stiff bristles above, but villous beneath; flowers solitary, terminal, and axillary, pedicellate; bracteas bristly, deciduous, involving the flower-bud before they fall off; calyx clothed with silky villi: with 5 acuminated lobes, which are glabrous inside and longer than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, on the [illegible] Rhéxia semidecándra, Schrank et Mart. mss. Bra[illegible]y. The rest as in *L. hygróphila.* Flowers as in *L. Fontenesiàna.* The 5 alternate stamens larger; anthers falcate: having their connectives knotted at the base, and twice the length of the anthers. Style pilose.

Semidecandrous Lasiandra. Shrub 4 to 6 feet.

16 L. Candollea'na (D. C. l. c.) shrubby; branches nearly terete, rough from small adpressed bristles; leaves petiolate, oval-oblong, attenuated at both ends, triple-nerved, membranous, quite entire, clothed with adpressed bristles on both surfaces; pedicels axillary, solitary, tern; bracteas oval, oblong, acute, deciduous; calyx white from adpressed villi, having its lobes longer than its tube, which is ovate; style and filaments hispid. ♄. S. Native of Brazil, at Rio Grande de Belmonte. D. C. Coll. 1. f. 6. Rhéxia Candolleàna, Mart. herb. Allied to *L. Fontanesiàna*, but differs in the lateral nerves of the leaves being simple, not bifid. Petals violaceous, ciliated when young. Stamens 10, alternate ones rather the smallest.

De Candolle's Lasiandra. Shrub 2 to 3 feet.

17 L. Raddia'na (D. C. l. c.) shrubby; branches somewhat tetragonal, furnished with a few adpressed bristles; leaves petiolate, oblong, acuminated at both ends, quite entire, smoothish, but bearing a few adpressed bristles, 3-nerved; flowers terminal, usually solitary; calyx densely clothed with adpressed silky villi. ♄. S. Native of Brazil. Rhéxia uniflòra, Raddi. mem. l. c. p. 9. but not of Vahl. Rhéxia Raddiàna, Moricand. herb. Ser. mss. Flowers large. Style and filaments hispid. Lobes of calyx deciduous.

Raddi's Lasiandra. Shrub 4 to 6 feet.

18 L. Fontanesia'na (D. C. prod. 3. p. 130.) branches tetragonal; angles winged; petioles, peduncles, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved, beset with adpressed bristles beneath on the nerves and on the margins, the rest clothed with white stellate velvety down; racemes terminal; pedicels opposite, 1-3-flowered; calyx very villous, white; filaments very hairy. ♄. S. Native of Brazil, about Rio Janeiro and St. Paul. Rhéxia Fontanèsii, Bonpl. rhex. t. 36. Rhéxia alàta, Raddi. mem. p. 8. Melástoma granulòsa, Desr. in Lam. dict. 4. p.

44. Sims, bot. mag. t. 214. Pleròma granulòsum, D. Don, wern. soc. mem. 4. p. 293. Melástoma Fontanesiànum, Spreng. syst. Rhéxia dasystamínea, Schrank, mss. Flowers large, of a rose-purple colour.

Var. β, angústior (D. C. l. c.) leaves not half the breadth; flowers smaller.

Desfontain's Lasiandra. Shrub 5 to 8 feet.

19 L. FISSINE'RVIA (D. C. l. c.) branches tetragonal, not winged; petioles, peduncles, and leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved or only 3-nerved, with the 2 lateral ones bifid, beset with adpressed bristles on the margins and on the nerves on the under surface, the rest velvety from dense stellate down; flowers racemose; peduncles opposite, 1-3-flowered; calyx clothed with adpressed white pubescence; filaments hairy; style glabrous. ♄. S. Native of Brazil, in the province of Minas Geraes. Rhéxia fissinérvia, Schrank et Mart. mss. Like *L. Fontanesiàna*, but differs in the stem being tetragonal, not winged, in the calyx being less villous, and in the flowers being smaller.

Cleft-nerved Lasiandra. Shrub 5 to 10 feet.

20 L. STENOCA'RPA (D. C. l. c.) branches tetragonal, having the angles rather winged, and are as well as the petioles and peduncles clothed with adpressed stiff villi; leaves on short petioles, oblong, acute, mucronate, 5-nerved, quite entire, beset with adpressed bristles above, and silky villi beneath; flowers panicled; branches of panicle tetragonal, opposite, 3-flowered; calyx clothed with adpressed villi; filaments hairy; style rather pilose. ♄. S. Native of Brazil, in rocky places near Maraca, in the province of Bahia. Rhé[illegible] Estre[illegible]is, Raddi, mem. p. 9.? Rhéxia stenocárpa, Schra[illegible]. mss. Allied to *L. Fontanesiàna*, but differs in the flowers being smaller, and especially in the down, which is very distinct.

Narrow-fruited Lasiandra. Shrub 5 to 8 feet.

21 L. LANGSDORFIA'NA (D. C. l. c.) branches tetragonal, having the angles winged, beset with bristles as well as the peduncles; petioles short, villous; leaves oval, acute from a mucrone, 5-nerved, clothed with adpressed bristles above, and with adpressed villi on the nerves beneath, and soft stellate tomentum between the nerves; panicle thyrsoid, terminal, many-flowered; calyx clothed with adpressed white villi, with an ovate tube, and lanceolate, deciduous lobes; filaments and style beset with bristles. ♄. S. Native of Brazil, in exposed fields in the provinces of Rio Janeiro and St. Paul. Rhéxia Langsdorfiàna, Bonpl. rhex. t. 51. Osbéckia Langsdorfiàna, Spreng. syst. 2. p. 312. Allied to *L. Fontanesiàna*, but differs in the leaves being ovate at the base, and rather rufescent beneath. Thyrse panicle-formed. Stamens beset with glandular pili.

Langsdorf's Lasiandra. Shrub 5 to 6 feet.

22 L. PROTEÆFÓRMIS (D. C. l. c.) branchlets acutely tetragonal, and are as well as the peduncles beset with bristles; petioles hardly any, villous; leaves ovate, mucronate, 5-nerved, densely clothed with adpressed silky villi on both surfaces, the down on the under surface stellate; thyrse panicled, terminal, many-flowered; bracteas and calyxes very villous; lobes of calyx lanceolate, acute; petals a little ciliated, twice the length of the calycine lobes; style and filaments beset with a few hairs. ♄. S. Native of Brazil, in woods, and in bushy exposed places in the province of Minas Geraes. Rhéxia proteæfórmis, Schrank et Mart. mss. Allied to *L. Langsdorfiàna*, but differs in the flowers not being above half the size, and in the nerves of the leaves being clothed with yellowish villi.

Protea-formed Lasiandra. Shrub 5 to 6 feet.

23 L. URVILLEA'NA (D. C. l. c.) branches tetragonal, clothed with soft villi; leaves on short petioles, oval-oblong, mucronate, 5-nerved, quite entire, clothed with adpressed silky villi on both surfaces; thyrse panicled, crowded, terminal; bracteas and calyxes very villous; lobes lanceolate, acute; filaments and style beset with glandular pili, from the base to the middle. ♄. S. Native of the island of St. Catharine, in the entrance to the Rio Janeiro, where it was collected by Captain d'Urville. Petals purple, ciliated, almost bearded at the apex. Knots of branches thickly beset with spreading bristles.

D'Urville's Lasiandra. Shrub 5 to 6 feet.

24 L. ADENOSTE'MON (D. C. l. c.) branches tetragonally winged, and are as well as the peduncles clothed with adpressed bristles; petioles hardly any; leaves ovate, quite entire, mucronate, 5-nerved, villous above and on the nerves beneath, but clothed with stellate tomentum between the nerves on the under surface; thyrse panicled, terminal; calyx and bracteas clothed with adpressed villi; lobes of calyx lanceolate; filaments and style pubescent and beset with glandular pili at the base; the 5 alternate filaments bearing a few thick pedicellate glands. ♄. S. Native of Brazil, about Rio Janeiro in exposed fields. Meriània adenostèmon, Schrank et Mart. mss. Habit of *L. proteæfórmis*, but the stamens are almost that of *Macairea*.

Gland-stamened Lasiandra. Shrub 5 to 6 feet.

25 L. ARGE'NTEA (D. C. prod. 3. p. 131.) branches tetragonal, clothed with adpressed bristles; leaves sessile, ovate, 5-7-nerved, quite entire, densely clothed with silky villi on both surfaces; thyrse panicled, terminal, with the rachis very villous and compressed; calyx tubular; filaments and style bearing a few pili. ♄. S. Native of Brazil, about Rio Janeiro. Melástoma argéntea, Desv. in Lam. dict. 4. p. 45. Rhéxia holoserícea, Bonpl. rhex. t. 12. Ker. bot. reg. t. 323. Lodd. bot. cab. t. 236. Delaun. herb. amat. t. 321. Spreng. syst. 2. p. 307. exclusive of the synonyme. Pleròma holoseríceum, D. Don, mem. soc. wern. 4. p. 293. Melástoma clavàta, Pers. ench. 1. p. 476. Flowers purple. A very beautiful species, and very distinct from the *Melástoma holosericea* of Lin. and Swartz.

Silvery Lasiandra. Fl. July. Clt. 1816. Sh. 6 to 10 feet.

Cult. All the species are elegant shrubs, bearing thyrsoid panicles of large purple flowers. They grow best in a mixture of loam, peat, and sand; and young cuttings root readily if planted in the same kind of soil, placed in heat, under a hand-glass.

XXXII. CHÆTOGA'STRA (from χαιτη, *chaite*, a bristle, and γαστηρ, *gaster*, a belly; in allusion to the tube of the calyx being beset with bristles or scales). D. C. prod. 3. p. 131.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx túrbinate, pilose, or scaly; lobes 5, permanent. Petals 5, obovate. Stamens 10, with glabrous filaments and oblong anthers; anthers opening by 1 pore at the apex; having their connectives drawn out, sometimes into a simple or bifid spur, and sometimes into 2 small, obtuse tubercles. Ovarium free, bristly at the apex, and often denticulated. Capsule 5-celled. Seeds cochleate.—Shrubs, rarely herbs, natives of South America, for the most part clothed with strigose pili. Leaves 3-5-nerved, quite entire, or hardly serrulated. Flowers terminal, purple, or white. This genus differs from *Lasiándra* in the stamens being glabrous, and in the inflorescence; from *Arthrostémma* in the quinary number of the parts of the flower, not quaternary; from *Osbéckia* in there being no appendages between the calycine lobes.

SECT. I. MONOCE'NTRA (from μονος, *monos*, one, and κεντρον, *kentron*, a spur; in reference to the anthers having their connectives drawn out into a simple spur at the base). D. C. prod. 3. p. 131. Tube of calyx obovate or turbinate; lobes 5, lanceolate, rather dilated at the base. Anthers having their connectives drawn out into a simple spur at the base. Ovarium toothed at the apex.—Showy Peruvian shrubs, with the habit of *Lasiándra*. Branches terete. Flowers large, purple. Perhaps a proper genus.

1 C. SPECIÒSA (D. C. l. c.) branches clothed with short, simple

down; leaves on short petioles, oblong, 3-nerved, quite entire, ciliated, glabrous on both surfaces, except the nerves, which are downy; flowers terminal, solitary; calyx turbinate, pubescent; connectives of anthers drawn out in a simple, thick, conical spur each. ♄. S. Native of Peru, on Mount Quindiu and near Popayan, where it is called *Flor de Mayo.* Rhéxia speciòsa, Bonpl. rhex. t. 4. Habit of *Cistus ladaniferus.* Flowers large, of a rose-purplish colour.

Showy Chætogastra. Shrub 3 to 6 feet.

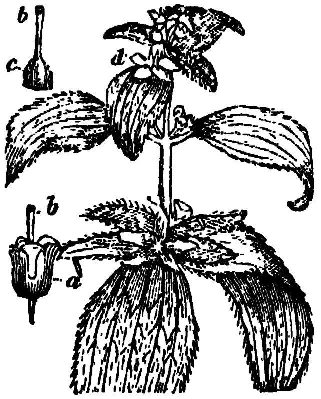
2 C. RETICULA'TA (D. C. l. c.) branches clothed with rufous villi; leaves petiolate, ovate-lanceolate, obtuse at the base, acuminated at the apex, denticulated, 5-nerved, beset with bristles on the upper surface, which are bullate at the base, reticulated beneath, and hairy on the nerves; flowers few, terminal; calyx villous; connectives of anthers drawn out into a simple, slender spur each; ovarium toothed at the apex. ♄. S. Native of Peru, on Mount Saragura, in cold places near Loxa. Rhéxia reticulàta, Bonpl. rhex. t. 9. Flowers large, violaceous. Style very long.

Reticulated-leaved Chætogastra. Tree 10 to 20 feet.

SECT. II. DIOTANTHE'RA (from δις, *dis*, two, *ους ωτος*, *ous otos*, an ear, and *ανθηρα*, *anthera*, an anther; in reference to the connectives of the anthers being drawn out into a bifid spur or 2 auricles). D. C. prod. 3. p. 131. Tube of calyx obovate, bractless; lobes 5. Connectives of anthers drawn out into a bifid spur or two auricles at the base. Flowers white or rose-coloured.

3 C. LANCEOLA'TA (D. C. l. c.) stem herbaceous, rather tetragonal, clothed with adpressed villi; leaves petiolate, broad-lanceolate, acuminated, serrulately ciliated, 5-nerved, villous on both surfaces; peduncles trichotomous, axillary, and terminal; tube of calyx ovate, rather longer than the subulate lobes, which are reflexed and ciliated; connectives of anthers drawn out into a didymous spur at the base. ⊙. S. Native of Peru and Trinidad. Hook. bot. mag. 2836. Rhéxia flexuòsa, Ruiz et Pav. fl. per. 3. p. 85. t. 320. f. 6. Rhéxia lanceolàta, Bonpl. rhex. t. 21. but not of Walt. or Poir. Osbéckia lanceolàta, Spreng. syst. 2. p. 312. Lateral nerves of leaves rather concrete at the base on both sides. Flowers white.

FIG. 110.



Lanceolate-leaved Chætogastra. Pl. 1 to 2 feet.

4 C. LONGIFÒLIA (D. C. prod. 3. p. 132.) stem herbaceous, angular, beset with adpressed pili; leaves petiolate, lanceolate, elongated, acuminate, pilose, 5-nerved; lateral nerves concrete at the base; panicle axillary, dichotomous, shorter than the leaves; tube of calyx ovate, longer than the lobes, which are subulate. ♃.? S. Native of South America. Rhéxia longifòlia, Vahl. eclog. 1. p. 39. icon. amer. t. 15.

Long-leaved Chætogastra. Pl. 1 to 2 feet?

5 C. HAVANE'NSIS (D. C. prod. 3. p. 132.) stem almost herbaceous; branches tetragonal, hairy; leaves petiolate, oval, acuminated, almost quite entire, 5-7-nerved, beset with scattered villi on both surfaces; panicles axillary, cymose, shorter than the leaves, alternate ones disposed in a panicled thyrse; tube of calyx ovate, villous, rather longer than the lobes, which are subulate; anthers furnished with 2 tubercles at the base. ♄. S. Native about the Havannah, in Cuba, where we have seen it growing in plenty, at very little distance from the town. D. C. coll. 1. t. 7. It is very nearly allied to the preceding species, but differs in the leaves being broader, cymes shorter, and in the connectives of the anthers being hardly evident.

Havanna Chætogastra. Shrub 1 to 2 feet.

6 C. SCHIEDEA'NA (Schlecht. et Cham. in Linnæa. 5. p. 566.) suffruticose; branches terete, beset with adpressed hairs; leaves on short petioles, ovate-lanceolate, acuminated, 3-nerved, obsoletely serrulated, strigose on both surfaces and ciliated on the margins; cymes terminal and axillary, 3-5-flowered; flowers on short pedicels; calyx strigose, campanulate, with linear-spatulate segments, which are about equal in length to the petals, which are obovate; connectives of anthers biauriculate at the base. ♄. S. Native of Mexico, near Misantla. Flowers rose-coloured.

Var. β, *macrántha* (Schlecht. et Cham. in Linnæa. 5. p. 566.) flowers purple, double the size of those of the species; petals twice the length of the calycine lobes; seeds small, white, cochleate.

Schiede's Chætogastra. Shrub 1 to 2 feet.

7 C. HI'SPIDA (D. C. l. c.) stem herbaceous, tetragonal, hispid; leaves petiolate, oval, attenuated at the base, and acuminated at the apex, 5-nerved, hardly serrulated, (lateral nerves confluent at the base,) villous above, hispid on the nerves beneath, but pubescent between the nerves; panicles lateral and terminal, disposed in a thyrse; calyx ovate, villous, with subulate lobes; connectives of anthers very short, furnished with 2 very short tubercles at the base of each. ♃. S. Native of Brazil. Like *C. lanceol*[illegible]*nénsis* and probably all three constitute but one species. Flowers white.

Hispid Chætogastra. Pl. 1 to 2 feet.

8 C. HYPERICOÌDES (D. C. l. c.) plant erect, simple, densely clothed with canescent villi; leaves oval, on short petioles, acute, 7-nerved; panicles axillary and terminal, leafy, loose; tube of calyx ovate, longer than the lobes; petals obovate, hardly exceeding the calycine lobes. ⊙. S. Native of Guiana, in marshes. Melástoma villòsa, Aubl. guian. 1. p. 168. Rhéxia villosíssima, Rich. in Bonpl. rhex. t. 31. Flowers small, white. Connectives of anthers drawn out into 2 elongated auricles. Ovarium bristly at the apex.

St. John's-wort-like Chætogastra. Pl. 1 to 2 feet.

9 C. LYCHNITOÌDES (D. C. l. c.) plant herbaceous, erect; stem almost simple, densely beset with spreading hairs; leaves sessile, oval, acute, clothed with adpressed silky villi, 7-nerved, quite entire; thyrse elongated; flowers bracteate, crowded on the peduncles; calyx villous, with an ovate tube, nearly twice the length of the lobes, which are lanceolate and acuminated. ♃.? S. Native of Brazil, in the province of Minas Geraes, on sandstone rocks. Rhéxia lychnitoìdes, Schrank et Mart. mss. Very like *C. hypericoìdes*, but differs in the calyxes being twice the size, and in the flowers being more crowded. Stamens unknown. Capsule 5-celled. Seeds small, cochleate, smooth.

Lychnitis-like Chætogastra. Pl. 1 to 3 feet.

10 C. STACHYOÌDES (D. C. l. c.) plant herbaceous, erect; branches tetragonal, hairy; leaves on short petioles, oblong, obtuse at the base, acute at the apex, quite entire, 5-nerved, clothed with adpressed villi; flowers crowded into verticillate heads in the axils of the leaves; calyx 4-5-cleft: appendages hair-formed, hardly distinct. ⊙. S. Native of Brazil. Rhéxia stachyoìdes, Bonpl. rhex. t. 43. Flowers rose-coloured. Five of the stamens are almost without auricles at the base, and the other 5 are furnished with a long connective each which ends in 2 bristles. There is a variety of this species, according to Bonpland, with 4-5-cleft octandrous or decandrous flowers.

Stachys-like Chætogastra. Pl. 2 feet.

11 C. ciliàris (D. C. l. c.) stem herbaceous, tetragonal, and is as well as the petioles and peduncles hispid; leaves on short petioles, oblong, acuminated, serrulated, 5-nerved, beset with stiff villi above and densely clothed with pale soft villi beneath; cymes terminal, subcorymbose; calyx very villous, with short, lanceolate lobes; connectives of anthers bluntly biauriculated at the base. ♃. S. Native of Santa Fe de Bogota. ex herb. Humb. Meriània ciliàris, Vent. choix. t. 34. Osbéckia ciliàris, Ser. mss. Flowers purple. Petals obovate, ciliated. Stamens glabrous.

Ciliated-petalled Chætogastra. Pl. 1 foot.

12 C. tortuòsa (D. C. l. c.) branches loose, terete, rather hairy; leaves petiolate, lanceolate, 3-nerved, quite entire, rather villous; flowers nearly terminal, 1-3-together; tube of calyx ovate, villous, almost equal in length to the lobes which are nearly subulate; connectives of anthers simple, but bifid at the apex. ♄. S. Native of Mexico, in arid places, near Tasco. Rhéxia tortuòsa, Bonpl. rhex. t. 7. Osbéckia tortuòsa, Spreng. syst. 2. p. 312. Flowers small, white.

Twisted Chætogastra. Shrub 1 foot.

13 C. divaricàta (D. C. l. c.) plant herbaceous, rather sarmentose; stem acutely tetragonal, divaricately branched at the apex, and scabrous along the angles; leaves on short petioles, lanceolate, acute, 3-nerved, ciliated, scabrous at the angles beneath; flowers disposed in a loose dichotomous panicle; calyx pentagonal, scabrous on the angles; petals ovate, awned, ciliated. ♃.? S. Native on the banks of the Orinoco, in shady places. Rhéxia divaricàta, Bonpl. rhex. t. 22. Osbéckia divaricàta, Spreng. syst. 2. p. 312. Flowers [illegible]

Divaricate Chætogastra. Pl. sarmentose.

14 C. gràcilis (D. C. prod. 2. p. 133.) herbaceous, erect, nearly simple, naked at the apex; stem tetragonally terete, villous; leaves almost sessile, lanceolate-linear, acute, quite entire, 3-5-nerved, villous; pedicels axillary, 1-flowered: and terminal, in threes; tube of calyx ovate, about equal in length to the lobes, which are lanceolate and acuminated. ♃. S. Native of Brazil, in elevated grassy fields about Rio Janeiro. Rhèxia grácilis, Kunth, in Bonpl. rhex. t. 52. Rhéxia agrostémma, Mart. et Schrank. mss. Root creeping. Petals violaceous. Anthers elongated, acutish, opening by 1 pore. Capsule 5-celled. Seeds cochleate.

Slender Chætogastra. Pl. 2 to 3 feet.

15 C. fratèrna (D. C. l. c.) herbaceous, erect; stem from compressed to terete, scabrous from adpressed short bristles; leaves hardly petiolate, oblong-linear, acute, 5-nerved, nearly entire, beset with adpressed bristles; racemes panicled, terminal, elongated; tube of calyx ovate, beset with adpressed bristles: with the lobes lanceolate, acute, coloured and glabrous on the inside. ♃. S. Native of South America. Very like *C. grácilis.*

Brotherly Chætogastra. Pl. 1 to 2 feet.

16 C. hirsùta (D. C. l. c.) plant herbaceous, erect, almost simple; stem terete, densely clothed with spreading hairs; leaves sessile, lanceolate, 5-nerved; cymes axillary, pedunculate and terminal, almost disposed in a panicle; petals ciliated at the apex; calyx bristly, with an ovate tube and 5 lanceolate acuminated lobes. ♃. S. Native of Brazil. Very like *C. grácilis*, but differs in the stem being hairy, not beset with adpressed bristles.

Hairy Chætogastra. Pl. 1 to 2 feet.

17 C. hieracioìdes (D. C. l. c.) almost herbaceous; stems simple, and are as well as the leaves and calyxes very hairy; leaves sessile, ovate, acute, 5-nerved, very few at the base of the stem; cymes racemosely panicled, contracted; flowers with 18 stamens; calyx very villous, with lanceolate, pectinately ciliated lobes; petals obovate; anthers elongated, acute. ♃. S. Native of Brazil, in the province of Minas Geraes, on the more elevated mountains, in fields. Rhéxia hieracioìdes, Mart. et Schrank, mss. Very like *Rhéxia piloselloìdes* of Bonpl. but the leaves are much broader, and 5-nerved, not 7-nerved, and all parts of the plant are much more hairy, the flowers more numerous, and on shorter pedicels, and according to Schrank the petals are obovate, of pale lilac colour, not yellow, nor terminated by a hair, and in the anthers being twice the length.

Hawkweed-like Chætogastra. Pl. 1 foot.

18 C. strigillòsa (D. C. l. c.) almost herbaceous, erect, densely clothed with adpressed stiff pili; leaves on short petioles, oval, acute, 5-nerved; peduncles longer than the leaves, bearing sessile flowers in the axils of the bracteas; flowers decandrous. ♃. S. Native of Brazil, in the province of Minas Geraes, on the sides of mountains. Rhéxia strigillòsa, Schrank et Mart. mss. Stem a foot high, hardly branched. Leaves nearly 3 inches long. Flowers purple, 9-10 lines in diameter; lobes of calyx lanceolate-linear. Petals obovate, ciliated. Anthers having their connectives hardly produced under the cells, tumid, straightish, and acuminated at the base. Allied to *C. hieracioìdes.*

Strigillose Chætogastra. Pl. 1 foot.

19 C. sherardioìdes (D. C. l. c.) plant erect, herbaceous, branched, rough from strigose adpressed short pili; leaves on very short petioles, narrow-lanceolate, quite entire, 3-nerved; flowers terminal, 3-together, or axillary and solitary, decandrous. ♃. S. Native of Peru, ex Hænke, or of Brazil, in the province of Minas Geraes, ex Mart. Rhéxia sherardioìdes, Schrank, mss. Leaves 6-7 lines long and 2-3 broad. Flowers middle-sized. Tube of calyx ovate; lobes 5, linear-subulate, elongated. Anthers linear, acuminated, drawn out at the base into a long pedicel each, which ends in 2 bristles. Style long, and is as well as the filaments glabrous.

Sherardia-like Chætogastra. Pl. ½ foot.

20 C. clinopodifòlia (D. C. l. c.) plant herbaceous, of many stems, beset with long villi in every part; leaves petiolate, ovate, serrulated, 3-nerved; flowers axillary, on short pedicels, solitary: or terminal, in threes; calyx hispid, campanulate, 5-toothed; anthers equal. ♃. S. Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in shady woods. Melástoma rèpens, Schrank et Mart. mss. but the fruit is capsular, not baccate. Herb humble. Root fibrous. Flowers small. Anthers ovate, opening by 1 pore, having short hardly auricled connectives. Capsule globose, 5-celled, free, dehiscent. Seeds cochleate. Bristles on the ovarium few. Appendages hardly any, bristly, and rather palmate at the base.

Clinopodium-leaved Chætogastra. Pl. ½ foot.

21 C. móllis (D. C. prod. 3. p. 134.) shrubby; branches terete, clothed with soft adpressed villi; leaves petiolate, ovate, acuminated, 7-nerved, beset with soft villi; thyrse panicled, terminal, crowded, hairy; tube of calyx ovate, velvety, about equal in length to the lobes, which are linear; petals oval, acuminately mucronate; anthers almost without auricles at the base. ♄. S. Native of Peru, in groves about Loxa. Rhéxia móllis, Bonpl. rhex. t. 19. Flowers of a violaceous blue colour. Ovarium hairy.

Soft Chætogastra. Shrub 6 feet.

22 C. canéscens (D. C. l. c.) shrubby; branches terete, and are as well as the leaves densely clothed with short hairs; leaves petiolate, ovate-lanceolate, 3-nerved, quite entire; flowers subterminal, usually 3 together, drooping, on short pedicels; calyx rather hairy, with an ovate tube, which is about the length of the lobes; connectives of anthers hardly evident; anthers bluntly bifurcate at the base. ♄. S. Native of cold places, on Mount Purase at Popayan, where it is called *Sarzileja.*

Rhéxia canéscens, Bonpl. rhex. t. 6. Flowers dark purple or violaceous. Calyx red.

Canescent Chætogastra. Shrub 3 feet.

23 C. sarmentòsa (D. C. l. c.) shrubby; branches climbing almost terete, villous; leaves on short petioles, oval, somewhat cordate, serrulated, 7-nerved, villous; flowers terminal, approximating by threes, on very short pedicels; calyx villous, with the tube about equal in length to the lobes; connectives of anthers long, furnished with 2 tubercles each at the base. ♄. ◡ S. Native of Peru, in hot places near Cuenca and St. Felipe. Rhéxia sarmentòsa, Bonpl. rhex. t. 10. Flowers large, of a reddish violaceous colour.

Sarmentose Chætogastra. Shrub cl.

24 C. murica'ta (D. C. l. c.) shrubby; branches, peduncles, and calyxes pilose; leaves petiolate, broadly ovate, somewhat cordate, hardly acute, 5-nerved, beset with bristles above, which are blistered at the base, but clothed with silky tomentum beneath; flowers terminal, solitary; anthers each furnished with a slender appendage, which is bidentate at the base. ♄. S. Native of cold places on Mount Purase, near Popayan. Rhéxia muricàta, Bonpl. rhex. t. 1. Habit almost of *Cistus salvifòlius.* Flowers large, purple, or violaceous.

Muricated Chætogastra. Shrub 4 to 5 feet.

25 C. strigòsa (D. C. l. c.) suffruticose; branches tetragonal, beset with adpressed bristles; leaves on short petioles, ovate, acute, hardly 3-nerved, quite entire, with a few thick, scattered, adpressed bristles on the upper surface, and scabrous on the nerves beneath; cymes terminal, pedunculate, few-flowered; tube of calyx hispid, with 5 short, acute, lobes. ♄. S. Native of Guadaloupe, on the top of the Sulphur Mountain, among sphagnum; and on the mountains of Montserrat and Martinique. Melástoma strigòsa, Lin. fil. suppl. p. 236. Mel. ciliàta, Desr. in Lam. dict. 4. p. 49. Osbéckia ornàta, Swartz, fl. ind. occ. p. 647. Rhéxia incónstans, Vahl, elc. 1. p. 37. Rhéxia strigòsa, Rich. act. soc. hist. nat. par. 1791. p. 108. Rhéxia ornàta, Rich. in Bonpl. rhex. t. 26. R. chamæcístus, Sieb. pl. exsic. mart. no. 297. Flowers pale purple, bractless. Anthers yellow, obtuse, almost without auricles at the base. Capsule ovate, 5-celled, bristly at the apex. There are varieties of this plant having flowers either with 4 or 5 petals, smaller, and larger.

Strigose Chætogastra. Sh. 6 to 8 feet.

26 C. lepidòta (D. C. l. c.) shrubby; branchlets bluntly tetragonal, and are, as well as the petioles, leaves, peduncles, and calyxes scabrous from imbricated scaly bristles; leaves petiolate, oblong-lanceolate, 5-nerved, hardly serrulated; cymes pedunculate, terminal; flowers few, almost sessile, crowded; calyx with an obovate tube, and obtuse lobes; connectives of anthers hardly evident, and almost without any auricles at the base. ♄. S. Native of Peru, in cold places near Jaen de Bracamoros. Rhéxia lepidòta, Bonpl. rhex. t. 15. Flowers purple or violaceous. Capsule globose, bristly, and denticulated at the apex.

Lepidoted Chætogastra. Sh. 6 feet.

27 C. cardina'lis (D. C. l. c.) branchlets somewhat tetragonal, very hairy, and very leafy; leaves almost sessile, orbicularly reniform, quite entire, 5-7-nerved, strigose above, but clothed with silky hairs beneath; flowers terminal, crowded, almost sessile; calyx hispid, with a campanulate tube, rather longer than the lobes, which are bluntish; connectives of anthers hardly produced, emarginate. ♄. S. Native of Brazil, in hot places near Gran-Para. Rhéxia cardinàlis, Bonpl. rhex. t. 37. Melástoma cardinàlis, Spreng. syst. 2. p. 298. Calyx coloured inside. Flowers of a rose purple-colour.

Cardinal Chætogastra. Sh. 2 to 4 feet.

28 C. stricta (D. C. l. c.) branches terete, velvety from short down; leaves on short petioles, oval-lanceolate, 3-nerved, quite entire, rather hairy; flowers nodding, bibracteate; calyx campanulate, rather villous; connectives of anthers drawn out into 2 bristles, which are capitate at the apex. ♄. S. Native of Peru, in cold places on Mount Purase, and near Loxa. Rhéxia stricta, Bonpl. rhex. t. 8. but not of Pursh. Shrub much branched, straight. Flowers purple or violaceous. Calyxes and bracteas purplish. Petals ciliated. Ovarium bristly. There is a variety of this species having 4-petalled flowers.

Straight Chætogastra. Sh. 4 to 5 feet.

29 C. echina'ta (D. C. prod. 3. p. 135.) branches terete, and are, as well as the peduncles, petioles, and calyxes beset with thick adpressed stiff pili; leaves ovate, 5-nerved, woolly beneath, echinated above, quite entire; flowers inclinate; tube of calyx ovate, about equal in length to the lobes, which are lanceolate; connectives of anthers thick at the base. ♄. S. Native of Peru, on the tops of hills. Rhéxia echinàta, Ruiz et Pav. fl. per. 3. p. 85. t. 319. f. 6. Flowers large, spreading, of a violaceous purple-colour. Capsule 5-celled, bristly at the apex. Seeds cochleate.

Echinated Chætogastra. Sh. 2 to 3 feet.

30 C. cernua (D. C. l. c.) branches tetragonal, rough at the angles; leaves on short petioles, oval, rather crenulated, 5-nerved, often hispid along the nerves; flowers pedicellate, usually 3 together, terminal, drooping; tube of calyx campanulate, one-half shorter than the lobes, which are linear-lanceolate. ♄. S. Native of Peru, on the Andes, on Mount Purase near Popayan. Rhéxia cérnua, Bonpl. rhex. t. 13. Osbéckia cérnua, Spreng. syst. 2. p. 312. Petals oval, violaceous. [illegible] violaceous. Capsule 5-celled.

Drooping-[illegible]

Sect. III. Bractea'ria (from *bractea*, a bractea or prop; in reference to the flowers, which are furnished with 6 bracteas each at the base). D. C. prod. 3. p. 135. Calyx with an obovate pilose tube, girded at the base by 6 free bracteas, which are arranged in 3 series; lobes 5, obtuse. Anthers hardly biauriculate at the base.

31 C. confe'rta (D. C. l. c.) suffruticose, much branched; branchlets hairy; leaves on short petioles, crowded, small, oval, obtuse, 3-nerved, beset with adpressed bristles; flowers terminal, solitary, drooping; bracteas 6, involving the flower; calyx pilose, with 5 bluntish teeth. ♄. S. Native of Peru, in cold places near Loxa. Rhéxia confèrta, Bonpl. rhex. t. 20. Petals roundish, violaceous, almost conniving into a tube. Capsule globose, denticulated from 5 bristle-like teeth.

Crowded Chætogastra. Sh. 3 feet.

Cult. For culture and propagation see *Lasiándra*, p. 752.

XXXIII. ARTHROSTE'MMA (from αρϑρον, *arthron*, a joint, and στεμμα, for στημον, *stemon*, a stamen; in reference to their stamens or connectives being jointed). Pav. ex D. Don, mem. soc. wern. 4. p. 298. D. C. prod. 3. p. 135.—Melànium, Rich. herb.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx turbinate or campanulate, usually clothed with bristles, pili, or scales; lobes 4, lanceolate, permanent, without any appendages between them. Petals 4. Stamens 8; filaments quite glabrous. Anthers oblong, opening by one pore at the apex, furnished with longish connectives, which are biauriculated at the base. Ovarium bristly at the apex. Capsule 4-celled. Seeds cochleate.—Herbs or subshrubs, very variable in habit, all natives of South America. The genus is composed, as it now stands, of a heterogeneous mass of species, which may hereafter be divided into many genera, instead of sections.

Sect. I. Chætope'talum (from χαιτη, *chaite*, a bristle, and πεταλον, *petalon*, a petal; in reference to the petals, which are terminated by a bristle each). D. C. prod. 3. p. 135. Petals 4, oval, each terminated by a bristle. Anthers 8, equal, having their connectives not appendiculated. Ovarium 4-toothed at the apex. Capsule 4-celled. Seeds reniform, not truly cochleate.—Herbs, suffruticose at the base. Flowers white or yellow. Perhaps this section is sufficient to form a proper genus.

1 A. Angusture'nse (D. C. l. c.) herbaceous; leaves lanceolate, 3-nerved, quite entire, pilose on both surfaces; flowers terminal, almost solitary; calyx clothed with stellate down. ♃. S. Native on the banks of the Orinoco, near Angustura. Rhéxia Angusturénsis, Bonpl. rhex. p. 77. t. 29. Flowers white. Genitals hardly longer than the petals. Anthers linear, falcate.

Angustura Arthrostemma. Pl. 2 to 3 feet.

2 A. piloselloìdes (D. C. prod. 3. p. 136.) suffruticose at the base; leaves crowded at the roots, lanceolate, quite entire, 7-nerved, pilose; stem almost a scape, loosely panicled, few-flowered; calyx pilose. ♄. S. Native of New Grenada, in cold places at the elevation of 3900 feet. Rhéxia piloselloìdes, Bonpl. rhex. p. 12. t. 5. Flowers yellow, spreading. Style short, rather clavate.

Mouse-ear-like Arthrostemma. Pl. ½ to ¾ foot.

Sect. II. Brachyòtum (from βραχυς, brachys, short, and ους ωτος, *ous otos*, an ear; auricles of the connectives of the anthers short). D. C. prod. 3. p. 136. Calyx 4-cleft, without any appendages. Petals 4, subaristate, usually convolute. Connectives of anthers furnished with 2 short auricles each. Ovarium bearing bristles at the apex, not 4-toothed. Capsule 4-celled.—Suf[illegible] Flowe[illegible]

3 A. rosmarinifòlium (D. C. l. c.) shrubby; branches terete, echinated; leaves nearly sessile, oblong-linear, 3-nerved, with revolute quite entire edges; peduncles 1-5-flowered, pendulous; calyx hispid; petals convolute. ♄. S. Native of Peru, on arid hills. Rhéxia rosmarinifòlia, Ruiz et Pav. fl. per. 3. p. 84. t. 318. f. a. Leaves small, numerous. Flowers violaceous, spreading in the night and morning. Style exserted, rather clavate.

Rosemary-leaved Arthrostemma. Shrub 1 to 2 feet.

4 A. lute'scens (D. C. l. c.) shrubby; branches rugged, pilose; hairs thick, stiff, short; leaves ovate, 3-nerved, curled a little, white beneath; peduncles 3-flowered; calyx pilose; petals convolute. ♄. S. Native of Peru, on the mountains. Rhéxia lutéscens, Ruiz et Pav. fl. per. 3. p. 84. t. 319. f. a. Leaves small, firm; when in a dry state they are olive-coloured above, and yellowish beneath. Calyx purplish, with lanceolate teeth. Petals yellowish.

Yellowish Arthrostemma. Sh. 2 feet.

5 A. quinquene'rve (D. C. l. c.) shrubby, much branched; branches tetragonal, beset with adpressed bristles; leaves petiolate, ovate, acute, quite entire, 5-nerved, bristly above, but villously tomentose beneath; peduncles axillary and terminal, many-flowered, inflexed at the apex; flowers drooping; calyx bristly, with an ovate tube, shorter than the lobes, which are setaceous. ♄. S. Native of Peru, on mountains and hills. Rhéxia quinquenérvis, Ruiz et Pav. fl. per. 3. p. 83. t. 321. f. 3. Petals almost conniving into a tube, ciliated. Connectives of anthers furnished each with 2 very short auricles. Capsule 4-valved, bristly at the apex. Style exserted.

Five-nerved-leaved Arthrostemma. Sh. 6 feet.

6 A. campanula're (D. C. l. c.) shrubby; branches clothed with rufous down; leaves ovate, 5-nerved, quite entire, very hispid above, but tomentose beneath; flowers drooping, campanulate; calyx pilose. ♄. S. Native of Peru, in cold places near Loxa, at the elevation of 8000 feet. Rhéxia campanulàris, Bonpl. rhex. p. 35. t. 14. Petals deep purple or violaceous, awned. Style thickened at the apex. Capsule globose. This plant appears to be intermediate between the first and the present section.

Campanulate-flowered Arthrostemma. Sh. 4 feet.

Sect. III. Ladanópsis (from λαδανον, *ladanon*, the ladanum bush, and οψις, *opsis*, resemblance; plants with the habit of *Cistus ladanifera* or ladanum-tree). D. C. prod. 3. p. 136. Calyx 4-cleft. Petals 4, obovate, expanded. Connectives of anthers rather long, furnished with two short auricles at the base of each. Capsule 4-celled, bristly at the apex. Seeds cochleate.—Herbs or subshrubs.

7 A. ladanoìdes (D. C. l. c.) plant hèrbaceous, erect; hairs or strigæ on the stems and leaves adpressed, but those on the calyx are spreading, and in fascicles; stem tetragonal; leaves on short petioles, lanceolate, acuminated, ovate at the base, 3-nerved, serrulated; pedicels elongated, loose, axillary, 1-flowered, and terminal 3-flowered; tube of calyx ovate, longer than the lobes, which are oblong and ciliated. ☉. S. Native of Brazil and Guiana, in marshes. Rhéxia híspida, Rich. in act. soc. hist. nat. par. 1791. p. 108. Rhéxia ladanoìdes, Rich. in Bonpl. rhex. t. 27. Rhéxia ùda, Mart. herb. Melástoma trichótomum, Willd. ined. ex herb. mus. par. Anthers oval, truncate, short, rather dissimilar, especially 4, having short connectives, and 4 with longer ones. Ovarium bristly, 4-celled. Seed cochleate. Flowers purplish.

Ladanum-like Arthrostemma. Pl. 1 to 1½ foot.

8 A. herba'ceum (D. C. prod. 3. p. 137.) herbaceous; stem tetragonal, covered with minute hairs; leaves on short petioles, ovate-lanceolate, acuminated, crenulately serrated, villous above, but clothed with hairy tomentum beneath; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ovate ciliated lobes; anthers rather dissimilar. ☉. ? S. Native of Brazil, in woods, in the province of Rio Janeiro and Minas Geraes, but rare. Rhéxia herbàcea, Schrank et Mart. mss. Petioles hairy. Petals obovate-oblong, when young ciliated at the apex. Anthers 8 oblong, with smooth beaks, the 4 longest having straight connectives, and the 4 shortest arched ones.

Herbaceous Arthrostemma. Pl. 1 foot.

9 A. hirsuti'ssimum (D. C. l. c.) herbaceous, erect; stem tetragonal, very hairy from long, rather bristly, spreading, somewhat retrograde hairs; leaves on short petioles, lanceolate, acuminated, crenulately serrated, densely clothed with adpressed villi; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ciliated lobes; anthers dissimilar. ☉. S. Native of Brazil. Very like *A. herbàceum*, but differs in the hairiness. Ovarium bristly at the apex. Seeds cochleate.

Very-hairy Arthrostemma. Pl. 1 foot.

10 A. Martiusia'num (D. C. l. c.) stem erect, hairy, almost herbaceous, oppositely and paniculately branched; branches quadrangular; leaves on short petioles, ovate-lanceolate, acute, serrulated, 5-nerved, beset with adpressed strigæ above, but with soft villi beneath; peduncles dichotomous, 3-7-flowered. ♃. ? S. Native of Para, in Brazil. Rhéxia paniculàta, Mart. herb. and Schrank, mss. but not Hamilt. Rhéxia Martiusiàna, Ser. mss. Rhéxia cerastiifòlia, Schrank, et Mart. mss. Tube of calyx ovate, rather pilose; lobes 4, acute. Petals ovate, purple, pilose on the back. Anthers articulated at the base; the articulation distant from the cells, and tumid on one side. Ovarium bristly at the apex.

Martius's Arthrostemma. Pl. 1 to 2 feet.

11 A. polygonoìdes (D. C. l. c.) suffruticose? branches loose, tetragonal, beset with a few slender adpressed bristles; leaves on short petioles, oblong, quite entire, 3-nerved, beset with adpressed bristles on both surfaces; flowers axillary, solitary, almost sessile; lobes of calyx 4, rarely 5, longer than the

tube, ovate-lanceolate, each terminating in a hair. ♃. ? S. Native of Brazil, in marshy fields in the province of Minas Geraes. Rhéxia polygonoìdes, Mart. herb. Very like *A. pùmilum*. Leaves terminating in a long hair. Hairs on the calyx simple, and adpressed. Petals small, white. Ovarium bristly at the apex.—Bonpl. rhex. t. 35. f. 4.

Polygonum-like Arthrostèmma. Pl. 1 to 2 feet.

12 A. villòsum (D. C. l. c.) suffruticose, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, oval, denticulated, 3-nerved; flowers few, almost sessile at the tops of the branches; calyx with an ovate tube, and 4 lobes, which are subulate at the apex; connectives of anthers furnished with 2 horns each. ♄. S. Native of Cayenne, at Aroura in sandy meadows. Rhéxia villòsa, Aubl. guian. 1. p. 334. t. 129. f. 1. Petals concave, violaceous. Capsule 4-celled.

Villous Arthrostemma. Pl. decumbent.

13 A. Auble'tii (D. C. l. c.) suffruticose, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, roundish, acutish, serrulated, 5-nerved; flowers solitary, terminal; tube of calyx globose; lobes subulate at the apex; connectives of anthers furnished with 2 horns at the base. ♄. S. Native of Guiana, in sandy meadows at Aroura. Rhéxia latifòlia, Aubl. guian. t. 129. f. 2. Very like the preceding species, but differs in every part, being twice the size.

Aublet's Arthrostemma. Shrub decumbent.

14 A. versi'color (D. C. l. c.) suffruticose, pilose; leaves petiolate, ovate, serrulated, 5-nerved, discoloured beneath; flowers terminal, solitary; lobes of calyx 4, serrated at the apex. ♄. S. Native of Brazil, on the sea shore. Rhéxia versícolor, Lindl. bot. reg. t. 1066. Petals obovate, ciliated, at first white, but at length becoming reddish. Ovarium bristly at the apex. Anthers hardly biauriculate at the base. Habit of *Chætogástra clinipodifòlia*.

Party-coloured-flowered Arthrostemma. Fl. Sept. Clt. 1825. Shrub 1 foot.

15 A. nummularioìdes (D. C. l. c.) shrubby, much branched, clothed with minute down; leaves petiolate, nearly orbicular, cordate, crenated, 5-nerved, rather tomentose beneath; flowers solitary, on the tops of the axillary branchlets; connectives of anthers drawn out each into 2 blunt appendages, or one bifid one. ♄. S. Native near Esmaraldas, on the Orinoco. Rhéxia nummularioìdes, Bonpl. rhex. 2. p. 23. Flowers rose-coloured. Perhaps this species belongs to a different section.

Money-wort-like Arthrostemma. Shrub decumbent.

Sect. IV. Trifurca'ria (from *tres*, three, and *furca*, a fork; in reference to the connectives of the anthers being drawn out each into a 3-toothed appendage, or into 3 bristles at the base). D. C. prod. 3. p. 138. Calyx 4-cleft. Petals 4. Connectives of anthers drawn out each into a tridentate appendage, or into 3 bristles at the base.

16 A. cilia'tum (Pav. ex D. Don, mem. soc. wern. 4. p. 299.) stem herbaceous, quadrangular; leaves cordate, smooth on both surfaces, serrulated and ciliated on the margins; appendages of anthers tridentate at the base. ♃. S. Native of Peru.

Ciliated-leaved Arthrostemma. Pl. 2 to 3 feet.

17 A. latifòlium (D. Don, l. c.) stem shrubby; leaves broad, ovate, acuminated, serrulated and ciliated; panicle large; appendages of anthers of 3 bristles. ♄. S. Native of French Guiana.

Broad-leaved Arthrostemma. Shrub.

Sect. V. Monochæ'tum (from μονος, *monos*, one, and χαιτη, *chaite*, a bristle; in reference to the appendages of anthers being drawn out into one single or emarginate spur at the base). D. C. prod. 3. p. 138. Calyx 4-cleft. Petals 4. Connectives of anthers drawn out each into one simple or emarginate ascending spur, or in a bristle at the same base. Perhaps this section is sufficient to constitute a distinct genus.

18 A. calcara'tum (D. C. l. c.) shrubby; branchlets somewhat tetragonal, smoothish, bearing wherles of bristles at the knots; leaves petiolate, oblong, acuminated, 3-nerved, ciliately serrated, beset with a few bristles beneath; flowers pedicellate, solitary, or by threes at the tops of the branchlets; calyx beset with adpressed bristles: with 4 lanceolate, somewhat coloured, ciliated lobes; anthers with long beaks, ending in a long slender spur at the base. ♄. S. Native of Mexico. Flowers purple, like those of a species of *Lasiándra*, but differs in the petals being 4, and in the stamens being glabrous. Ovarium densely beset with bristles.

Spurred-anthered Arthrostemma. Sh. 1 to 2 feet.

19 A. Deppea'na (Schlecht. et Cham. in Linnæa. 5. p. 566.) suffruticose, much branched; branches terete, beset with adpressed hairs; leaves narrow-lanceolate, bluntish, triple-nerved, quite entire, strigose on the nerves on the under surface, and between the nerves on the upper surface, and on the margins; flowers terminal, solitary; tube of calyx turbinate, strigose; calycine segments lanceolate, acute; petals roundish, obovate; connectives of anthers drawn out into a simple ascending spur. ♄. S. Native of Mexico, at San Andres and on Serro Colorado. Flowers purple.

Deppe's Arthrostemma. Fl. Aug. Sh. 1 to 2 feet.

20 A. myrtoideum (D. C. l. c.) suffruticose; branches clothed with powdery down; leaves oblong, quite entire, glabrous, triple-nerved, [illegible] beneath, perhaps from down; flowers axillary and s[illegible]r terminal and tern; tube of calyx turbinate, glabrous, [illegible]ete. ♄. S. Native of Mexico, near Quaretaro; and near Santa Fe de Bogota. Rhéxia myrtoidea, Bonpl. rhex. t. 3. Petals violaceous, oval-lanceolate. Adult branches glabrous, with separable bark. Ovarium downy at the apex from minute stellate down.

Myrtle-like Arthrostemma. Sh. 2 feet.

21 A. Bonpla'ndii (D. C. l. c.) suffruticose; branches densely clothed with short down; leaves on short petioles, ovate, 5-nerved, quite entire, villous on both surfaces from soft down, canescent beneath; flowers pedicellate, 1-3-together, axillary, and terminal; tube of calyx ovate, longer than the lobes. ♄. S. Native of South America, on the banks of the river Amazon. Rhéxia canéscens, Bonpl. rhex. p. 14. t. 18. Rhéxia Bonplándii, Kunth, ined. Rhéxia incàna, Spreng. syst. 2. p. 309. Flowers violaceous.

Bonpland's Arthrostemma. Sh. 3 feet.

22 A. dicrananthe'rum (D. C. l. c.) suffruticose, much branched; branches tetragonal, and are, as well as the peduncles, calyxes, and leaves, beset with long spreading hairs; leaves almost sessile, ovate, acute, 5-nerved, entire; flowers subcorymbose; calyx with an ovate-globose tube, and 4 oval acute lobes. ♄. S. Native of Peru, in woods. Rhéxia dicrananthèra, Ruiz et Pav. fl. per. 3. p. 84. t. 320. f. a. Arthr. multiflòrum, D. Don, in mem. wern. soc. 4. p. 299. Ovarium pilose at the apex. Seeds cochleate.

Two-headed-anthered Arthrostemma. Sh. 1 to 2 feet.

23 A. linea'tum (D. Don, l. c.) stem shrubby, pilose; leaves lanceolate, quite entire, with hairy lines on both surfaces. ♄. S. Native of Peru. The rest unknown.

Lined-leaved Arthrostemma. Shrub.

24 A. multiflòrum (D. C. l. c.) suffruticose, branched at the base; leaves on short petioles, lanceolate, 5-7-nerved, quite entire, villous; thyrse panicled, terminal, many-flowered; appendages of anthers bristle-formed, rising from the base. ♄. S. Native on the banks of the Orinoco, in humid shady places. Rhéxia multiflòra, Bonpl. rhex. t. 16. Osbéckia Bonplandiàna, Spreng. syst. 2. p. 313. Flowers rose-coloured.

Many-flowered Arthrostemma. Sh. 3 feet.

Cult. The shrubby species of this genus should be cultivated and propagated in the manner of the species of *Melástoma*, p. 764. The annual species in the manner of those of *Centradènia*, p. 766.

XXXIV. OSBE'CKIA (in honour of Peter Osbeck, a Swedish clergyman and naturalist, author of Dagbock Oefer en Ostendyck resa, 1 vol. 8vo. Stockholm, 1757). Lin. gen. no. 467. D. Don, in mem. soc. wern. 4. p. 292. D. C. prod. 3. p. 138.

Lin. syst. *Octo-Decándria, Monogýnia.* Tube of calyx ovate, usually clothed with stellate bristles or down; lobes 4-5, permanent or deciduous: bearing appendages between the lobes on the outside of various sizes and forms. Petals 4-5. Stamens 8-10; filaments glabrous; anthers nearly equal, terminating in short beaks, and having their connectives furnished with 2 short auricles at the base. Ovarium bristly at the apex. Capsule 4-5-celled. Seeds cochleate.—Herbs, but usually sub-shrubs, natives of America, Africa, and Asia. Leaves quite entire, 3-5-nerved. Flowers terminal. This genus is perhaps divisible in several genera instead of sections.

Sect. I. Micro'lepis (from *μικρος*, *mikros*, small, and *λεπις*, *lepis*, a scale; so named on account of the small scale-like appendages between the lobes of the calyx). D. C. prod. 3. p. 139. Tube of calyx ovate-oblong, urceolate, and constricted at the apex; limb 5-cleft: teeth deciduous. Stamens [illegible] Appendages between the lobes of the calyx small and [illegible] Species all South Amer[illegible] Flow[illegible]

1 O. urceola'ris (D. C. prod. 3. p. 139.) plant almost herbaceous; stems tetragonal; leaves petiolate, oval, quite entire, 5-nerved, clothed with villous tomentum on both surfaces; panicles terminal and axillary; calyx 5-toothed, with an ovate tube, which is constricted under the teeth; appendages between the teeth of the calyx short and lacerately ciliated; petals ciliated. ♃. ? S. Native of Brazil, near Rio Janeiro. Rhéxia urceolàris, Schrank et Mart. mss. Petioles 6 lines long. Leaves 4 inches long. Petals purple. Anthers linear-falcate, beaked, length of filaments: having their connectives short, and tumid at the articulation. Seeds cochleate, truncate at the base, striated longitudinally.

Urceolate-calyxed Osbeckia. Pl. 1 foot.

2 O. jucu'nda (D. C. l. c.) shrubby, glabrous; branches terete; leaves petiolate, ovate-lanceolate, acuminated, quite entire, 3-nerved, or somewhat 5-nerved; panicle terminal; peduncles and calyxes clothed with furfuraceous down; tube of calyx urceolate; petals oblong. ♄. S. Native of Brazil, in shady woods near Almada, in the province of Bahia. Rhéxia jucúnda, Schrank et Mart. mss. Leaves 6-7 inches long, and 2 broad. Petals white, 3 or 4 times longer than the calycine teeth. Stamens 10; filaments bluish. Anthers yellow, elongated, with short beaks: 5 of which have their connectives drawn out into a little lateral sack, and those of the other 5 are not drawn out.

Pleasant Osbeckia. Shrub 1 to 2 feet.

3 O. pityrophy'lla (D. C. l. c.) shrubby; leaves on very short petioles, oblong-ovate, acuminated, 3-nerved, glabrous above and shining, with impressed veins, clothed with white tomentum beneath, as well as on the calyxes; cymes few-flowered, terminal; lobes of calyx acute, 3 times shorter than the ovate tube; petals acuminated. ♄. S. Native of Brazil, on high dry mountains, in the province of Minas Geraes. Rhéxia pityrophýlla, Mart. herb. Rhéxia acuminàta, Schrank, mss. Shrub branched; branches tetragonal, with separable bark. Leaves 10 lines long. Anthers falcate, without any beak. Style very long. Ovarium beset with small bristles at the apex. Appendages of calyx small. Tomentum velvety. Fruit and seeds unknown.

Scurfy-leaved Osbeckia. Sh. 1 to 2 feet.

4 O. oleæfòlia (D. C. l. c.) suffruticose; branches hardly tetragonal, clothed with powdery tomentum; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, clothed with white velvety tomentum beneath, glabrous above; thyrse terminal; bracteas hiding the calyx when young; calyx velvety from small stellate down: lobes or teeth 5 or 6, short, oblong; anthers rather dissimilar. ♄. S. Native of Brazil, in the province of St. Paul, in elevated dry fields. Rhéxia oleæfòlia, Schrank et Mart, mss. Petals purple, minutely ciliated. Anthers linear, falcate, long, beaked: having their connectives drawn out into a ligula each, which are sometimes bifurcate, and sometimes somewhat 2-lobed. Leaves 15-20 lines long, and 6-7 broad.

Var. β, quaternifòlia (D. C. l. c.) young branches tetragonal, furfuraceous, and bearing glandular pili; leaves on short petioles, 3 or 4 in a whorl, oblong, blunt at the base, and acute at the apex, 5-nerved, minutely dotted above, but clothed with white furfuraceous velvety down beneath. ♄. S. Native of Brazil, in the province of Minas Geràes, at the sides of woods. Rhéxia quaternifòlia, Schrank et Mart. mss. Petals purple, obovate-oblong. Anthers long, linear, falcate, beaked: 5 of which have forked connectives. Ovarium bristly at the apex. Down on calyx stellate.

Olive-leaved Osbeckia. Sh. 1 to 2 feet.

Sect. II. Chæto'lepis (from *χαιτη*, *chaite*, a bristle, and *λεπις*, *lepis*, a scale; there are stiff bristles between the lobes of the calyx, which hold the place of the appendages). D. C. prod. 3. p. 140. Lobes of calyx 4, with as many stiff simple bristles between the lobes on the outside, holding the place of appendages.—American plants.

5 O. microphy'lla (D. C. l. c.) shrubby, much branched; branches terete, scabrous from strigæ; leaves on short petioles, ovate, quite entire, 5-nerved, scabrous on both surfaces from adpressed strigæ, pale beneath; flowers solitary, subcorymbose, pedicellate; tube of calyx ovate, bristly at the apex; ovarium furnished with 8 bristles at the apex. ♄. S. Native of Guadaloupe, on the mountains; and near Santa Fe de Bogota. Rhéxia microphýlla, Bonpl. rhex. t. 2. Flowers yellow. Anthers obtuse. Petals obovate. Lobes of calyx, as well as the appendages, permanent.

Small-leaved Osbeckia. Sh. 1 foot.

Sect. III. Ptero'lepis (from *πτερον*, *pteron*, a wing, and *λεπις*, *lepis*, a scale; in reference to the appendages between the lobes of the calyx being pectinated). D. C. prod. 3. p. 140. Stamens 8-10. Calyx 4-5-cleft; lobes permanent, with the appendages between the lobes elongated and pectinated.—American plants.

* *Flowers 5-cleft, decandrous.*

6 O. parnassifòlia (D. C. prod. 3. p. 140.) shrubby, clothed in every part with silky villi; branches terete; leaves sessile, orbicular, rather cordate at the base, quite entire, 5-nerved; flowers almost sessile, axillary, usually solitary, but sometimes terminal and aggregate; calyx very hairy, with villous bristle-formed appendages between the lobes, and 5 ciliated coloured lobes. ♄. S. Native of Brazil, in stony grassy places, in the province of Bahia. Rhéxia parnassifòlia, Mart. et Schrank, mss. Lobes of calyx purplish, linear-oblong. Petals purple, obovate-cuneated. Style a little longer than the calyx. Stamens unknown. Young leaves mucronate. Capsule 1-5-celled. Seeds cochleate.

Parnassia-leaved Osbeckia. Shrub.

7 O. striphnocalyx (D. C. l. c.) shrubby; branches nearly terete, and are, as well as the peduncles and under side of the

leaves, scabrous from adpressed bristles; leaves petiolate, elliptic-oblong, acuminated, quite entire, 3-nerved, glabrous above, and with oblique stripes between the nerves; panicles terminal; calyx very hairy; bristles palmately stellate; anthers 5. ♄. S. Native of Brazil, in the province of Rio Negro. Rhéxia striphnocalyx, Mart. herb. Anthers linear, beaked, 3 times the length of the connectives, which are drawn out into one or two small lobules at the base. Calyx clothed with long white hairs. Stripes between the nerves of the leaves very evident. Flowers purple.

Hairy-calyxed Osbeckia. Shrub.

8 O. Si'msii (D. C. l. c.) branches tetragonal, hispid; leaves on short petioles, oblong-elliptic, 3-nerved, ciliated on the nerves and margins; flowers terminal, aggregate; appendages of calyx bristle-formed. ♄. S. Native of the Mauritius, but probably cultivated there. Melástoma Osbeckioìdes, Sims, bot. mag. 2235. Flowers large, purple. Perhaps the same as Osbéckia Chinénsis, Lin.

Sims's Osbeckia. Fl. July. Clt. 1818. Sh. 2 feet.

9 O. Pri'nceps (D. C. l. c.) branches angular, and are, as well as the leaves, clothed with fuscescent tomentum beneath; leaves petiolate, oblong, rather cordate at the base, sharply serrulated, 7-nerved, unequal, strigose on the upper surface; corymbs terminal; hairs on calyx glandular; appendages of calyx ending in a stellate tuft of hairs. ♄. S. Native of Brazil. Rhéxia Prínceps, Bonpl. rhex. t. 48. Flowers large, purple, composed of 5 petals according to the description, but only of 4 according to the figure.

Princeps's Osbeckia. Sh. 3 to 4 feet.

** *Flowers 4-cleft, octandrous.*

10 O. alpe'stris (D. C. l. c.) shrubby, beset in every part with somewhat adpressed strigose pili; leaves on short petioles, ovate, acute, quite entire, nerveless; flowers almost sessile, disposed in a terminal head; calyx very villous. ♄. S. Native of Brazil, on the alps of Serro Frio and Itambe. Rhéxia semiadnàta, Schrank, mss. Rhéxia alpéstris, Mart. herb. Leaves 6 lines long and 4 broad; petioles thick, semiadnate. Lobes of calyx lanceolate, glabrous inside. Petals violaceous, minutely ciliated. Anthers falcate, wrinkled transversely, with short beaks; having their connectives not drawn out beyond the articulation.

Alp Osbeckia. Sh. 1 to 2 feet.

11 O. repa'nda (D. C. prod. 3. p. 141.) herbaceous; stem nearly terete, and is, as well as the peduncles and leaves, villous from adpressed strigæ; leaves petiolate, lanceolate, 3-5-nerved, quite entire, acute; peduncles elongated, dichotomous; calyx very strigose, with the lobes acuminated and ciliated at the base, and having the scales or appendages between the lobes pectinated; petals somewhat repandly truncate at the apex. ♃. S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Rhéxia repánda, Mart. et Schrank, mss. Petals purple. Anthers linear-falcate, acuminated by the beaks, twice the length of their connectives, which are hardly tumid at the base. Habit of *Arthrostémma grácilis.*

Repand-leaved Osbeckia. Pl. 1 to 2 feet.

12 O. glomera'ta (D. C. prod. 3. p. 141.) herbaceous; branches nearly tetragonal, scabrous from adpressed bristles; leaves on short petioles, ovate-lanceolate, acuminated, 3-nerved, clothed with adpressed stiff hairs; flowers axillary, usually solitary, but capitate at the tops of the branches; tube of calyx beset with branched stellate pili, ovate: with its scales ciliately pectinated, elongated and distant, and with its lobes ciliated, stiff, and lanceolate. ⊙. S. Native of Martinique, Trinidad, Surinam, and Brazil. Hook. bot. mag. 2838. Rhéxia glomeràta, Rottb. sur. 8. t. 46. Rhéxia capitàta, Rich. in Bonpl. melas. 2. t. 32. Petals rose-coloured, obovate, hardly longer than the lobes of the calyx, minutely ciliated. Connectives furnished with 2 tubercles at the base of each.

Var. β, *albiflòra* (D. C. l. c.) flowers white, fewer and larger. Rhéxia glomeràta, Lodd. bot. cab. t. 334. Native of Brazil. Perhaps a proper species.

Glomerate-flowered Osbeckia. Fl. July, Aug. Clt. 1818. Pl. 1 to 2 feet.

13 O. sipaneoìdes (D. C. l. c.) shrubby, very hairy all over; leaves sessile, oval-oblong, acute, 3-nerved, terminated by a bristle; flowers sessile in the axils of the upper leaves, and somewhat aggregate at the tops of the branches; calyx hispid from palmate bristles, having its lobes terminating in a hair, and the appendages long, and ending in a palmate tuft of bristles at the apex. ♄. S. Native of Brazil. Rhéxia sipaneoìdes, Mart. herb. Habit almost of *Chætogástra lychnitoìdes*, but the characters are very different.

Sipanea-like Osbeckia. Sh. 1 to 2 feet.

14 O. bracteola'ris (D. C. l. c.) shrubby; leaves on short petioles, oblong, 5-nerved, quite entire, villously pubescent above, but clothed with velvety tomentum beneath, reticulated; peduncles axillary, dichotomous, bracteolate; flowers octandrous; calyx, branches, and peduncles densely clothed with glandular hairs; lobes of calyx linear, about equal in length to the tube, which is ovate. ♄. S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Rhéxia bracteolàris, Schrank et Mart. mss. Calyx nearly as in *Osbéckia Chinénsis*, [illegible]ntly 8-[illegible] from the intervening scales. Anthers elongated, falcate, [illegible]less. Seeds cochleate, hairy, truncate at the base. Ovarium [illegible]

Bracteolate Osbeckia. Sh. 2 to 3 feet.

15 O. pu'mila (D. C. l. c.) herbaceous, rather pilose; leaves oblong-lanceolate, entire, 3-nerved; flowers axillary and terminal, solitary, almost sessile; calyx clothed with stellate hairs, with the lobes acute, and shorter than the tube, and having the appendages ending in a stellate tuft of hairs at the apex.—Native country unknown. Rhéxia pùmila, Bonpl. rhex. t. 35. without a description. Flowers according to the figure small, and pale purple. Connectives of anthers bluntly biauriculated at the base. Ovarium bristly at the apex. Calyx beset with scattered pili, which are stellate at the apex.

Dwarf Osbeckia. Pl. ½ foot.

Sect. IV. Osbeckia'ria (an alteration from the generic name). D. C. prod. 3. p. 141. Calyx 4-5-cleft, ornamented with bristles on the tube, which are palmate from the base: with the appendages between the lobes plumose, but usually pectinated; the lobes fall off along with the appendages, leaving the mouth of the calyx truncate, or as if it was cut round.—All natives of Asia.

16 O. Chine'nsis (Lin. spec. p. 490.) nearly herbaceous; stems 4-winged; leaves almost sessile, lanceolate-oblong, 3-nerved, rather hispid, a little crenulated; flowers cymose, terminal, few; calyx hemispherical, with 4-5 acute, linear acute, bristly, deciduous lobes. ♄. G. Native of China. Ker. bot. mag. t. 542. Petals obovate, acuminated, purple, longer than the stamens. Anthers rather falcate. Style filiform, incurved at the apex. Capsule roundish, white, 5-celled. Perhaps *O. Símsii*, no. 8. is the same.

China Osbeckia. Fl. July. Clt. 1818. Sh. 1 to 2 ft.

17 O. Zeyla'nica (Lin. fil. suppl. p. 215.) suffruticose; branches tetragonal, beset with adpressed bristles; leaves ovate-lanceolate, rather reflexed, 3-nerved, nearly sessile, strigose; flowers nearly sessile, usually 3-together; calyx tubular, with 4 ovate-oblong lobes; ovarium crowned by 16-20 bristles. ♄. S. Native of Ceylon, Amboyna, and Manilla, Lam. ill. t. 283. f. a. 1. Ker. bot. reg. t. 565. O. Chinénsis, Gærtn. fruct. 2. p. 202.—Pluk. alm. t. 173. f. 4. Calycine scales radiating into ciliæ,

nearly the length of the tube. Petals 4, obovate, somewhat truncately acuminated, rose-coloured, largish. Stamens 8. Style a little curved. Capsule elliptic, 4-5-celled.

Ceylon Osbeckia. Fl. July, Aug. Clt. 1799. Sh. 1 to 2 ft.

18 O. angustifòlia (D. Don, prod. fl. nep. p. 221.) stem herbaceous, straight, tetragonal, beset with adpressed strigæ; leaves ovate-lanceolate, tapering to the apex, 3-nerved, beset with adpressed bristles; flowers bracteate, aggregate into terminal few-flowered heads; calyx tubular, glabrous, with 4 oval-oblong lobes, having the appendages between the lobes ending in a palmated tuft of bristles; ovarium crowned by 8 bristles. ♃. S. Native of Nipaul. Wall. pl. asiat. rar. 3. p. 33. t. 251. O. ciliàris and O. tènuis Hamilt. herb. Flowers purple. Anthers 8, furnished with a long slender beak each. Very nearly allied to *O. Nipaulénsis*.

Narrow-leaved Osbeckia. Pl. 2 to 3 feet.

19 O. lineàris (Blum. in bot. zeit. 1831. no. 27. p. 473.) plant herbaceous, beset with short strigose bristles; branches tetragonal; leaves sessile, linear-lanceolate, 3-nerved; heads terminal, few-flowered, bracteate; calyx furnished with 5 appendages at the throat, terminating in palmate bristles; calycine segments ovate-oblong, acute, ciliated; ovarium crowned by numerous bristles. ♃. S. Native of Java, near Batavia, in humid places; also of the Moluccas. Tristemma angustifòlia, Blum. bijdr. p. 1079.

Linear-leaved Osbeckia. Pl. 1 to 2 feet.

20 O. Nipaulénsis (Hook, exot. fl. t. [illegible]) suffruticose; branches somewhat tetragonal, rough from short adpressed bristles; leaves sessile, oblong-lanceolate, b[illegible] with [illegible]pressed hairs, 5-nerved; flowers bracteate [illegible]; scales of calyx b[illegible] the lobes deciduous, length of the tube, which is obovate. ♄. G. Native of Nipaul. O. speciòsa, D. Don, prod. fl. nep. p. 222. Petals 5, obovate, violaceous. Anthers 10, somewhat falcate, undulated. Fruit 5-celled, truncate, naked from the scales being deciduous.

Var. β, *albiflòra* (Lindl. bot. reg. 1475.) flowers white. ♄. S. Native of Nipaul.

Nipaul Osbeckia. Fl. June. Clt. 1821. Sh. 2 to 3 feet.

21 O. stellàta (D. Don, in bot. reg. t. 674. and prod. fl. nep. p. 221.) suffruticose; branches rough from adpressed hairs; leaves petiolate, ovate-lanceolate, acuminated, 5-nerved, beset with stiff hairs on both surfaces; flowers corymbose; tube of calyx elongated, urceolate, covered with stellate plumose scales. ♄. S. Native of Nipaul. Petals 4, obovate, violaceous. Anthers 8, yellow, falcate, long. Style deflexed. Capsule 4-celled, inclosed in the truncate, elongated calyx. Seeds scabrous. Hook, exot. fl. t. 37. Melástoma stellàta, Hamilt. mss.

Var. β; scales of calyx palmately ciliated, and more distant.

Stellate-calyxed Osbeckia. Fl. Ju. Aug. Clt. 1820. Sh. 2 ft.

22 O. ternifòlia (D. Don, in prod. fl. nep. 221.) shrubby; branches trigonal, furnished with rough bristles; leaves opposite, but usually 3 in a whorl, and sometimes even 4, almost sessile, lanceolate, acuminated, 5-nerved, beset with minute bristles along the margins and the nerves; racemes disposed in a terminal panicle; bracteas cordate; calyx urceolate, beset with ciliately pectinated scales, which at length fall off, and the calyx becomes in consequence naked; lobes of calyx lanceolate-linear, acute, hispid, deciduous. ♄. S. Native of Nipaul. Wall. pl. asiat. rar. t. 3. p. 21. t. 240. Calyx almost like that of *O. stellàta*. Flowers large, purple. Anthers 8, yellow.

Tern-leaved Osbeckia. Shrub 2 to 4 feet.

23 O. Leschenaultiàna (D. C. prod. 3. p. 142.) shrubby; branches tetragonal, beset with stiff pili; leaves sessile, ovate, acutish, approximate, 5-nerved, villous on both surfaces; flowers sessile, bracteate, in heads, usually of threes; tube of calyx globose, with the scales palmately ciliated, and the lobes 4 and lanceolate. ♄. S. Native of the East Indies, on the Nelligherry mountains, where it is called *Taberi-Guida*. Leaves hardly an inch long. Stamens 8.

Leschenault's Osbeckia. Shrub 3 to 4 feet.

24 O. Manilliàna (D. C. l. c.) suffruticose; branches tetragonal, and are as well as the petioles hispid; leaves petiolate, ovate, acuminated, 5-nerved, somewhat ciliately serrated, and with a few scattered hairs on both surfaces, pale beneath; flowers terminal, and in the forks of the branches, 3-5 in a fascicle; tube of calyx beset with long stellate hairs: having the lobes and appendages deciduous. ♄. S. Native of Manilla, one of the Philippine Islands. Flowers large, purple, almost like those of a species *Lasiándra*.

Manilla Osbeckia. Shrub 6 to 8 feet.

25 O. áspera (Blum. in bot. zeit. 1831. no. 27. p. 474.) shrubby, rough from short strigose bristles; branches obscurely tetragonal; leaves on short petioles, oblong-ovate, or oblong-lanceolate, acute, obtuse at the base, 3-nerved; flowers decandrous, on short pedicels, terminal, subracemose; calyx clothed with adpressed down, furnished with subulate, minute appendages at the throat; calycine segments ovate-oblong, obtuse; ovarium rather downy. ♄. S. Native of Ceylon. Melástoma áspera, Lin. spec. p. 560. Rheed. mal. 4. p. 91. t. 43. Rumph. amb. 4. p. 135. t. 71. Flowers red or purple.

Rough Osbeckia. Shrub 3 to 4 feet.

26 O. rèpens (D. C. prod. 3. p. 142.) stem suffruticose, branched, creeping at the base, tetragonal at the apex, glabrous; leaves petiolate, roundish-obovate, somewhat cuneated at the base, 3-5-nerved, glabrous, almost quite entire; flowers terminal, solitary, on short pedicels; tube of calyx beset with chaffy bristles; lobes 4-7, lanceolate: with the appendages between the lobes spiny-ciliated. ♄. S. Native of China. Melástoma rèpens, Desrous. in Lam. dict. 4. p. 54. Rhéxia heteranthèra, Bonpl. rhex. t. 23. Flowers rose-coloured. Capsule 5-celled. Habit of *Córnus Canadénsis*.

Creeping Osbeckia. Shrub creeping.

27 O. octándra (D. C. prod. 3. p. 142.) stems suffruticose, glabrous, but beset with adpressed bristles at the tops, creeping at the base; leaves petiolate, ovate, 3-nerved besides the 2 marginal nervules, glabrous, except the margins and the nerves on the under surface, which are beset with adpressed bristles; flowers solitary, terminal, on short pedicels; tube of calyx ovate, scabrous from bristles. ♄. S. Native of Ceylon. Melástoma octándra. Lin. spec. 560. Willd. spec. 2. p. 595. Very like *O. rèpens*, but differs in the leaves being not cuneated at the base.

Octandrous Osbeckia. Shrub 1 foot.

28 O. Chulèsis (D. Don, prod. fl. nep. p. 221.) shrubby; branches lepidotted; leaves oval-oblong, mucronulate, 5-nerved, cordate at the base, pilose and rough on both surfaces, canescent beneath; flowers corymbose; scales on calyx membranous, ciliated with bristles, scattered: segments ovate-oblong and ciliated. ♄. G. Native of Nipaul, at Narainhetty. Melástoma Chulèsis, Hamilt. mss. Leaves 3 inches long and an inch or an inch and a half broad. Flowers large, pale purple, 5-cleft, at first bracteated by broad membranous scales.

Chulesis Osbeckia. Fl. June. Shrub 2 to 3 feet.

29 O. rostràta (D. Don, prod. fl. nep. p. 221.) leaves lanceolate, acute, somewhat 5-nerved, rounded at the base, nakedish on both surfaces, green; flowers corymbose; bracteas cordate; calyx oblong, furnished with numerous scattered bristly scales; the lobes oblong-lanceolate and ciliated. ♄. G. Native of Nipaul, at Narainhetty. Melástoma? rostràta, Hamilt. mss. Flowers purple, 4-cleft.

Beaked Osbeckia. Shrub 2 to 3 feet.

Cult. All the species of *Osbéckia* are worth cultivating for the beauty of their flowers. Their culture and propagation is the same as that for the species of *Melástoma*, p. 764.

XXXV. TIBOUCHI'NA (meaning not explained by Aublet). Aubl. guian. 1. p. 445. D. C. prod. 3. p. 143.—Savastènia, Neck. elem. no. 795.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx turbinate, clothed with imbricate scales; girded at the base by a double involucrum, both formed of 2 connate bracteas; lobes 5, lanceolate, without any appendages between the lobes, as in *Osbéckia.* Petals 5, oval. Stamens 10; filaments glabrous; connectives of anthers bluntly biauriculate at the base. Ovarium free, bristly at the apex. Capsule dehiscent. Seeds cochleate. —A shrub, native of Guiana. Branches slightly tetragonal, and are as well as the petioles scabrous from scales. Leaves on short petioles, ovate, blunt at the base and acute at the apex, quite entire, 5-nerved, clothed with stiffish hairs beneath, and adpressed villi above, which is confluent between the nerves. Flowers few, nearly terminal, girded by a double involucrum.

1 T. a'spera (Aubl. guian. 1. p. 177.). ♄. S. Native of French Guiana. Rhéxia áspera, Willd. spec. 2. p. 304. Melástoma Tibouchìna, Desr. in Lam. dict. 4. p. 49. D. Don, mem. soc. wern. 4. p. 288. Melástoma aromática, Vahl. ecl. 1. p. 41. Flowers purple.

Rough Tibouchina. Shrub 2 to 3 feet.

Cult. For culture and propagation, see *Melástoma*, p. 764.

XXXVI. TRISTE'MMA (from τρεις, *treis*, three, and στεμμα, *stemma*, a crown; in reference to the calyx being girded by 3 circles of bristles). Juss. gen. p. 329. D. C. prod. 3. p. 144.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx tubular, 4-5-cleft, furnished with margins or bearded appendages near the limb, and surrounded by many bracteas at the base. Petals 4-5, unguiculate. Stamens 8-10; anthers a little arched, somewhat auriculated at the base. Ovarium hardly adnate to the calyx at the base, and crowned by stiff hairs at the apex. Berry variously depressed, 4-5-celled, clothed by the calyx. Seeds unknown. Subshrubs or herbs, with tetragonal stems. Leaves 3-5-nerved. Flowers capitate. This genus appears to be intermediate between *Osbéckia* and *Melástoma*.

1 T. virusa'num (Comm. mss. ex Juss. l. c.) stem suffruticose; leaves oval, acuminated, 5-nerved, pilose on both surfaces as well as the branches; heads of flowers terminal, almost sessile, usually composed of 5-8 flowers. ♄. S. Native of the Mauritius. Vent. choix. t. 35. Tristémma Mauritiànum, Pers. ench. 1. p. 476. Melástoma virusàna, D. Don, in wern. soc. mem. 4. p. 396. Calyx girded by 3 rings of bristles. Flowers purple.

Poisonous Tristemma. Shrub 1 foot.

2 T. hi'rtum (Vent. choix. p. 35. in a note) stem herbaceous, tetragonal; branches and petioles beset with spreading stiff hairs; leaves ovate, 5-nerved, acuminated; flowers capitate, terminal, sessile, bracteate. ♃. S. Native of Guinea, in the kingdom of Waree. Beav. fl. d'ow. vol. 1. p. 93. t. 57, with a figure. Very like *T. virusànum,* but differs in the stems being herbaceous, and in the hairs being longer and more patent. Calyx having only 2 circles of bristles. Flowers red.

Hairy Tristemma. Pl. 1 foot.

Cult. For culture and propagation, see *Melástoma*, p. 764.

XXXVII. SARCOPY'RAMUS (σαρξ σαρκος, *sarx sarcos*, flesh, and πυραμις, *pyramis*, a pyramid; in allusion to the herb, which is fleshy and pyramidal in its growth). Wall. tent. fl. nep. 1. p. 32. t. 23. D. C. prod. 3. p. 485.

Lin. syst. *Octándria, Monogýnia.* Calyx adhering to the ovarium at the base, permanent, obversely pyramidal, with a truncate 4-toothed border; teeth compressed, ciliated, having the interstices naked. Petals oval, acute. Stamens 8. Anthers simple, straight, naked, opening by 2 pores at the apex. Ovarium semi-adnate to the calyx, with a funnel-shaped, 4-lobed apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved; valves dilated and foliaceous. Seeds cuneated and triangular. —A fleshy erect herb. Leaves petiolate, oval, acute, 3-nerved, with entire margins, those opposite each other unequal in size. Flowers rose-coloured, in cymes. This genus differs from others in a remarkable degree, in the fruit being capsular, and in the ovarium being semi-adnate at the same time.

1 S. Nipaule'nsis (Wall. l. c. t. 23.). ⊙. S. Native of Nipaul, in moist stony valleys, among the mountains.

Nipaul Sarcopyramus. Pl. 1 foot.

Cult. For culture and propagation, see *Centradenia*, p. 760.

XXX[illegible]I. MELA'STOMA (from μελας, *melas*, black, and στομα, *sto*[illegible], the mouth; the berries of some of the species are black: the[illegible] are commonly eaten by children, whose mouths they stain [illegible]ck). Burm. fl. ind. D. C. prod. 3. p. 144.—Melástoma [illegible]cies of Lin. gen. 544. D. Don, in wern. soc. mem. 4. p. 2[illegible].

Lin. syst. [illegible]eca-Dodecándria, *Monogýnia.* Tube of calyx ovate, half adh[illegible]ng to the ovarium, densely covered with scales [illegible] bristles; li[illegible]5 (f. 111. *a.*), rarely 6-cleft; the segments al[illegible] [illegible] appendages, both deciduous. Petals 5 (f. 111. *c.*)-6. Stam[illegible] the [illegible] of the petals. Anthers oblong-linear, a little a[illegible] opening by a pore at the apex, each furnished with a stipe-formed connective, which is in some species elongated, and in others short, but always biauriculate or emarginate in front. Free part of ovarium conical and bristly. Style filiform, somewhat thickened at the apex. Stigma a pruinose dot. Capsule baccate, 5-6-celled opening irregularly. Seeds cochleate. —Shrubs, usually covered with strigæ. Leaves petiolate, quite entire, or serrulated, nerved. Peduncles terminal, disposed in fascicles or panicled-corymbs, sometimes solitary; pedicels bibracteate. Flowers large, white, rose-coloured, or purple. The genus differs from *Osbéckia* in the fruit being hardly dry, not opening regularly at the cells, but fleshy at the base and opening in an irregular transverse manner.

* *Fruit baccate.*

1 M. denticula'tum (Labill. caled. 1. p. 65. t. 64.) shrubby; branches a little compressed, and are as well as the petioles scabrous from adpressed bristles; leaves petiolate, oval-oblong, acuminated, 5-nerved, scabrous from small bristles above, pale beneath, and beset with adpressed strigæ along the nerves; flowers few, in a kind of cyme; calyx urceolate, clothed with adpressed strigæ, with the lobes lanceolate and deciduous. ♄. G. Native of New Caledonia. Ovarium bristly at the apex. Seeds cochleate. Flowers white?

Denticulated-leaved Melastoma. Shrub 3 to 4 feet.

2 M. Taite'nse (D. C. prod. 3. p. 144.) shrubby; branches tetragonal, and are as well as the petioles rough from strigæ; leaves petiolate, oval-oblong, acuminated, rather denticulated, 3-nerved, besides the 2 marginal nervules, scabrous from bristles on the upper surface, but strigose on the nerves beneath; corymbs few-flowered; calyx scabrous from thick bristles; lobes 5, oblong, deciduous. ♄. G. Native of the Island of Tait, in the South Sea. Allied to *M. denticulàtum*, but differs in the corolla being of 5, not of 6 petals, and in the leaves being 3-nerved, not 5-nerved. Flowers white. Berry 5-celled. Seeds cochleate.

Tait Melastoma. Shrub 3 to 6 feet.

3 M. affìne (D. Don, in mem. wern. soc. 4. p. 288.) shrubby; branches scaly; leaves lanceolate, acute, 3-nerved, pilose on both surfaces; flowers usually 3 together; calyx densely clothed with scales. ♄. S. Native of the East Indies and the Straits of Sunda. Very like the preceding and following species, and probably only a variety of one or the other; from the following it differs in the leaves being longer and narrower, 3-nerved, and more rough.

Allied Melastoma. Shrub 4 to 6 feet.

4 M. Malaba'thricum (Lin. spec. p. 559.) shrubby; branches tetragonal, rough from strigæ; leaves elliptic-oblong, obtuse at the base, acute at the apex, quite entire, green on both surfaces, and scabrous from strigæ; corymbs 1-5-flowered; calyx clothed with adpressed strigose scales: with ovate, acute lobes; alternate stamens barren, according to Blume; connectives of the anthers short or very long. ♄. S. Native of the East Indies; frequent in the Indian Archipelago.—Rheed. mal. 4. t. 42.—Rumph. amb. 4. t. 72. Flowers large, purple.

Malabar Melastoma. Fl. Ju. Aug. Clt. 1793. Sh. 6 to 8 ft.

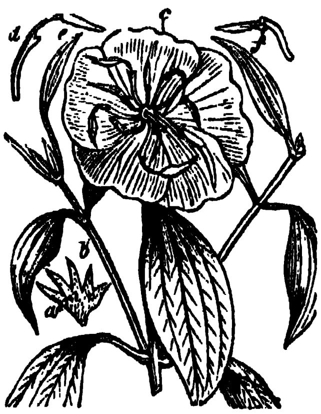
5 M. ere'ctum (Jack, in Lin. soc. trans. 14. p. [illegible]) shrubby; branches terete, or obscurely tetragonal; leaves ovate, 5-nerved, acute at both ends, villous; flowers corymbose, terminal, few; bracteas small; calyx scabrous from long, erect [illegible], with linear deciduous segments; fruit 5-celled. ♄. S. Native of Sumatra and Java. Petals large, purple. Probably distinct from *M. Malabáthricum*, according to Blume, bijdr. p. [illegible]16.

Erect Melastoma. Shrub 6 to 8 feet.

6 M. ca'ndidum (D. Don, in mem. soc. [illegible] p. 228.) shrubby; br[illegible]ved, densely clothed with silky white down on both surfaces; calyxes covered with soft, white, linear-elongated, adpressed scales. ♄. S. Native of China and the Straits of Sunda. Flowers purple.

White Melastoma. Fl. May, Ju. Clt. 1822. Sh. 4 to 6 ft.

FIG. 111.



7 M. macroca'rpum (D. Don, in mem. soc. wern. 4. p. 289.) shrubby; branches nearly terete, clothed with adpressed stiff hairs, as well as the petioles; leaves oval-oblong, acuminated, 5-nerved, quite entire, green on both surfaces, scabrous from scattered bristles above, as well as on the nerves beneath, and between them puberulous; flowers terminal, usually solitary; calyx roundish, densely clothed with long stiff hairs; stamens alternately dissimilar. ♄. G. Native of China. Melástoma Malabáthricum, Sims, bot. mag. t. 529. D. Don, in bot. reg. t. 672. Flowers large, reddish purple.

Large-fruited Melastoma. Fl. June, Aug. Clt. 1793. Sh. 4 to 6 feet.

8 M. sangui'neum (D. Don, l. c.) shrubby; branches terete, very rough from red bristles; leaves on short petioles, ovate-lanceolate, acuminated, 5-nerved, green above and shining, but red at the nerves beneath and on the petioles; flowers few, terminal; calyx covered with very long incurved bristles; petals 6, large. ♄. S. Native of the Straits of Sunda. Sims, bot. mag. 2241. Flowers large, purple. Very like *M. macrocárpum*.

Bloody-veined Melastoma. Fl. Sept. Oct. Clt. 1818. Sh. 4 to 6 feet.

9 M. polya'nthemum (Blume, in bot. zeit. 1813. no. 28.) branches, petioles, and under side of leaves rough on the nerves, from little scales; leaves elliptic or ovate-oblong, acute at both ends or obtuse at the base, quite entire, 3-nerved, besides 2 little marginal nervules, scabrous from strigæ above, but clothed with silky pubescence beneath; flowers 7-11 or more, disposed in a corymbose panicle; calyx covered with adpressed, scale-like strigæ: having short, triangular, ovate, acute segments; each of the alternate stamens has its connective elongated. ♄. S. Native of Java and Sumatra in bushy places. M. Malabáthricum, Jack, in Lin. trans. 14. p. 4. Blum. bijdr. p. 1070.—Rumph. amb. 4. t. 72. Flowers purple.

Var. β; scales of the calyx spreading.

Var. γ; leaves on short petioles; flowers smaller, white; segments of the calyx bluntish.

Many-flowered Melastoma. Shrub 4 to 6 feet.

10 M. Tidore'nse (Blum. l. c. p. 482.) branches, petioles, and nerves on the under surface of the leaves rough from scaly strigæ; leaves ovate-oblong, acuminated, rounded at the base or obtuse, denticulated, rough from strigæ above, but very hairy beneath, 5-nerved; flowers subcorymbose, terminal; calyx beset with adpressed bristles: with broad, subulate segments; each alternate stamen has its connective elongated. ♄. S. Native of the Moluccas, on the top of Mount Tidor. M. Malabáthricum, Reinwd. ined. Flowers purple.

Tidor Melastoma. Shrub 4 to 6 feet.

11 M. Roye'nii (Blum. l. c. p. 483.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves lanceolate or ovate-lanceolate, acuminated at both ends or bluntish at the base, slightly denticulated, 3-nerved, as well as having 2 marginal, hardly distinct nervules, rough from strigæ; flowers 5-7, disposed in a terminal kind of corymb; calyx beset with scale-like adpressed strigæ: having short, broad-subulate segments; each alternate stamen has its connective elongated. ♄. S. Native of Ceylon.—Burm. thes. 2. p. 154. t. 72. Flowers purple.

Royen's Melastoma. Shrub 4 to 6 feet.

12 M. a'sperum (Blume, bijdr. p. 1076. but not of Lin.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves ovate-oblong, acuminated, obtuse at the base, quite entire, sub-5-nerved, rough from strigæ; flowers 3-7, in a terminal fascicle; calyx beset with adpressed, scale-like strigæ, with linear elongated segments; stamens equal, each with an elongated connective. ♄. S. Native of Java, in woods on the higher mountains. M. Malabáthricum, flore albo, Reinwd. ined. Flowers white. Stamens all equal and fertile.

Rough Melastoma. Shrub 4 to 6 feet.

13 M. sylva'ticum (Blum. bijdr. p. 1077.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves elliptic-oblong, acuminated, acute at the base, quite entire, 5-nerved, scabrous; flowers 3-5, in terminal fascicles; calyx beset with scale-like strigæ: with linear-elongated segments; stamens equal, each having a short connective. ♄. S. Native of Java, where it is called *Harendong-Gunung*. Flowers whitish. Stamens 10, yellowish.

Var. β, *uniflòrum* (Blum. l. c. in bot. zeit. 428.) stems decumbent, rooting; leaves smaller; flowers terminal, solitary. ♄. S. Native of Java, in the province of Bantam.

Wood Melastoma. Shrub 4 to 6 feet.

14 M. seti'gerum (Blum. bijdr. p. 1077.) branches, petioles, and nerves on the under surface of the leaves, thickly beset with chaffy bristles; leaves ovate-oblong, acuminated, rounded at the base, 5-nerved, bristly above, roughish and hairy beneath. ♄. S. Native of Java, on Mount Salak.

Var. β, *angústo-bracteàtum* (Blum. in bot. zeit. 1831. no. 28.) leaves ovate-oblong, rounded at the base, nearly 5-nerved; flowers in terminal corymbs; bracteas linear, acuminated; calyx beset with adpressed scale-like strigæ, with the segments broad-subulate. ♄. S. Native of Java, on the mountains called Megamendung in woods.

Var. γ, lato-bracteàtum (Blum. l. c.) leaves oblong-lanceolate, obtuse at the base, 3-nerved; flowers in terminal bundles; bracteas oval, acuminated, fringed. ♄. S. Native along with the preceding var. at Laga.

Bristle-bearing Melastoma. Shrub 4 to 6 feet.

15 M. lanuginòsum (Blum. bijdr. p. 1077.) branches, petioles, and nerves of leaves on the under surface clothed with chaffy bristles; leaves ovate, or oblong-ovate, acute, rather cordate at the base or roundish, quite entire, 5-nerved, clothed with yellowish villi on both surfaces, but when in a young state woolly; flowers few, in terminal fascicles; calyx beset with adpressed scale-like bristles, with the segments broad-subulate; each alternate stamen has its connective elongated. ♄. S. Native of Java, in the province of Tjanjor, near Tjibidoy. Flowers purple?

Woolly Melastoma. Shrub 4 to 6 feet.

16 M. Cele'bicum (Blum. in bot. zeit. 1831. no. 28.) branches, petioles, and nerves of the leaves on the under surface covered with adpressed scales; leaves ovate-oblong, acuminated, rounded at the base, or obtuse, finely denticulated, 3-nerved, as well as with 2 lateral nervules, bristly above and villous beneath; flowers in terminal corymbs; calyx beset with adpressed scale-like strigæ, with the segments subulate. ♄. S. Native of Celebes, on Mount Sempa.

Celebes Melastoma. Shrub 3 to 6 feet.

17 M. porphy'reum (Zipp. ex Blum. l. c.) branches, petioles, and nerves of leaves on the under surface, rough from scales; leaves oblong-lanceolate, acuminated, obtuse at the base, finely denticulated, 3-nerved, as well as having 2 lateral nervules, rather scabrous; flowers terminal, usually solitary, on short peduncles; calyx covered with long, incurved, spreading bristles. ♄. S. Native of the Moluccas. Flowers purple?

Porphyry Melastoma. Shrub 4 to 6 feet.

18 M. Walli'chii (D. C. prod. 3. p. 146.) branches terete, strigose; leaves elliptic-oblong, narrowed at the base, acuminated at the apex, 5-nerved, villous on both surfaces; flowers 3 together at the tops of the branches; calycine tube subglobose, covered with scale-like ciliated strigæ, with 6 deciduous segments. ♄. G. Native of Nipaul. Appendages between the lobes of the calyx small. Flowers purple. Each alternate stamen has its connective elongated.

Wallich's Melastoma. Shrub 4 to 6 feet.

19 M. norma'le (D. Don, prod. fl. nep. 220.) branches thickly covered with bristly hairs; leaves elliptic, acute, rounded at the base, 5-nerved, beset with bristly hairs above and with tomentum beneath; flowers 3 together at the tops of the branches; calyx globose, covered with narrow, hoary, ciliated adpressed scales, the lobes deciduous. ♄. G. Native of Nipaul. Appendages between the lobes of the calyx small. Flowers pale red. Each alternate stamen has its connective elongated. Habit of *M. Malabàthricum.*

Normal Melastoma. Shrub 3 to 6 feet.

20 M. decemfidum (Roxb. hort. beng. p. 90. ex Jack. in Lin. trans. 114. p. 6.) shrubby, decandrous; branches terete, beset with scattered, scale-like strigæ; leaves ovate-lanceolate, attenuated, 5-nerved, hardly spinulose on the margins; flowers terminal, usually solitary, on short pedicels; calyx 5-cleft, echinated, from soft stretched bristles; anthers of the longer stamens apiculated at the base. ♄. S. Native of Pulo-Penang. Flowers purple. Allied to *M. Malabàthricum,* but the flowers are larger and more beautiful. The appendages between the lobes of the calyx large.

Ten-cleft-calyxed Melastoma. Shrub 3 to 4 feet.

21 M. cyanoìdes (Smith, in Rees. cycl. vol. 23.) leaves ovate, acute, entire, 5-nerved, beset with yellowish bristles; racemes terminal, forked; calyx densely clothed with bristles; bracteas oval, fringed. ♄. S. Native of Amboyna. Rumph. amb. 4. t. 71.—Rheed. mal. 4. t. 43. ex Smith.

Cyanus-like Melastoma. Shrub 3 to 6 feet.

22 M. dodeca'ndrum (Lour. coch. p. 274.) shrubby; leaves ovate, quite entire, glabrous, 5-nerved; peduncles few-flowered, terminal; flowers dodecandrous, rose-coloured; larger stamens have their connectives elongated, in the smaller ones the connectives are hardly evident, all fertile; berry roundish, 5-celled. ♄. G. Native of Cochin-china and China, about Canton. M. ròsea, Poir. dict. suppl. 3. p. 644. Flowers red.

Dodecandrous Melastoma. Shrub 1 foot.

23 M. obvolu'tum (Jack. in Lin. trans. 14. p. 3.) shrubby; branches tetragonal, scaly; leaves ovate, 5-nerved, clothed with adpressed pili; flowers few, in terminal panicles; bracteas ovate, involving the calyx; calyx covered with stellate pili; anthers of longer stamens furnished with 2 appendages at the base; ovarium 5-celled. ♄. S. Native of Sumatra. Limb of calyx crowned by long scales on the outside. Flowers purple.

Obvolute-calyxed Melastoma. Shrub 2 feet.

24 M. septemne'rvium (Lour. p. 273.) shrubby; branches terete; leaves oval-lanceolate, quite entire, 7-nerved, pilose on both surfaces, glabrous, petiolate; flowers few, terminal, large, purple, decandrous; calyx 5-cleft; petals roundish; stamens [illegible] refract, furnished with a long tail each; berry ovate, hispid, [illegible]-celled. ♄. G. Native of Cochin-china, every where on the [illegible] fields. Flowers purple.

Seven-nerved-[illegible] Melastoma. Shrub [illegible] feet.

25 M. Madagascarie'nsis (D. Don, mem. wern. soc. 4. p. 290.) leaves elliptic, 3-nerved, mucronate, acute at the base, beset with stiff hairs beneath as well as the branches; flowers panicled; calyx hispid; anthers furnished with long connectives, each ending in 2 bristles. ♄. S. Native of Madagascar.

Madagascar Melastoma. Shrub.

* * *Species natives of Sierra Leone, with dry capsules.*

26 M. cymòsum (D. C. prod. 3. p. 147.) stem branched, bluntly tetragonal, warted, pubescent; leaves cordate, acuminated, petiolate, serrulated, 7-nerved; flowers cymose; calyx campanulate: with its teeth triangular, and one-half shorter than the tube; petals obovate, somewhat laterally acuminated, purple or red; genitals deflexed; larger stamens falcate, purple, each furnished with a prominent connective, which is broadish at the base and somewhat truncately emarginate at the apex; style filiform; capsule 5-celled, 5-valved. ♄. S. Native of Sierra Leone. Vent. hort. malm. t. 14. Lois. herb. amat. t. 135. ex Balb. Sims, bot. mag. 984. Flowers purple.

Cymose-flowered Melastoma. Shrub 2 feet.

27 M. plumòsum (D. Don, l. c.) herbaceous, erect; stem branched; branches quadrangular; leaves roundish-ovate, entire, acute, 3-nerved, pilose on both surfaces as well as the branches; flowers scattered, solitary, on the tops of the branches and branchlets; calyx beset with scales, which are stellately plumose at the apex. ⊙. S. Native of Sierra Leone, on the mountains, particularly in the coffee plantations near the Governor's house. Osbéckia rotundifòlia, Smith, in Rees' cycl. vol. 25.

Plumose-scaled Melastoma. Pl. ½ foot.

28 M. involucra'tum (D. Don, l. c. but not of Desr. nor Schrank, nor Mart.) the whole plant beset with stiff pili; stems and branches red; branches diffuse; leaves elliptic, or ovate-lanceolate, acute, obsoletely 5-nerved, quite entire; flowers few

together, sessile, terminal, glomerated, involucrated by lanceolate bracteas; calyx pilose, with the segments lanceolate and acuminated. ♄. S. Native of Sierra Leone, on the banks of rivulets, in shady places. Petals red. Anthers yellow. Flowers 3-5 in each cluster.

Involucrated-flowered Melastoma. Shrub 1 to 2 feet.

29 M. AFZELIA'NUM (D. Don, l. c.) the whole plant beset with short stiff hairs; branches erect and furrowed; leaves ovate, acuminated, 5-nerved as well as with 2 marginal nervules; flowers secund, terminal, racemose or panicled; calyx covered with bristles, which are usually disposed in stellate fascicles, with the segments linear and plumose at the apex. ♄. S. Native of Sierra Leone, by the sides of rivulets, in shady places. Osbéckia Afzeliàna, Smith, in Rees' cycl. vol. 25.

Afzelius's Melastoma. Shrub 1 to 2 feet.

30 M. ALBIFLÒRUM; shrubby, branched; rather pilose; stems and branches quadrangular; leaves elliptic, acute, 5-nerved, beset with short pili on both surfaces, purplish beneath; flowers in terminal, crowded heads; calyx glabrous. ♄. S. Native of Sierra Leone. Petals white; anthers yellow. The calyx very smooth, that is, without any bristles or scales; it is therefore doubtful whether it is a true species of *Melástoma*.

White-flowered Melastoma. Shrub 2 to 3 feet.

31 M. CAPITA'TUM; shrubby, branched; branches quadrangular, pilose; leaves ovate, acute, quite entire, 5-nerved, pilose, yellowish beneath; calyx glabrous, nerved; flowers sessile, disposed in crowded heads. ♄. S. Native of Sierra Leone. Petals red. Anthers yellow. Calyx smooth [illegible] last species.

Capitate-flowered Melastoma. Shrub 1 to [illegible]

32 M. THEÆFÒLIUM; [illegible] branches quadrangular; leaves small, oval-lanceolate, [illegible] quite entire, sessile, 3-nerved; flowers terminal, disposed in crowded heads. ♄. S. Native of Sierra Leone, in the low lands, common. Calyx smooth, like the 2 last species.

Tea-leaved Melastoma. Shrub 5 to 10 feet.

33 M. ELONGA'TUM (D. Don, l. c.) the whole plant beset with stiff hairs; root black, tuberous; tubers numerous from the same neck, fusiform; stems herbaceous, quadrangular, erect, simple, several from the same root; leaves small, elliptic, acute, entire, 3-nerved, as well as with 2 lateral nervules; flowers panicled; peduncles axillary and terminal, few-flowered; calyx oblong, clothed with scales on the outside, which are terminated by a tuft of hair at the apex: having the segments oblong and membranous, bristly at the apex. ♃. S. Native of Sierra Leone, plentiful in the low lands about Freetown, among grass, flowering in great abundance in March and April. Nothing can exceed the beauty of this plant when in flower, in its native place of growth; the flowers are large and vary from blue to purple and white. Osbéckia grandiflòra, Afz. mss. Smith, in Rees' cycl. vol. 25.

Elongated-peduncled Melastoma. Fl. March, April. Clt. 1822. Pl. 1 to 1½ foot.

34 M. DECU'MBENS (Beauv. fl. d'ow. 1. p. 69. t. 61.) stem decumbent at the base, tetragonal; leaves ovate-lanceolate, 3-nerved, besides the lateral nervules, petiolate serrated; flowers solitary, terminal. ♄. S. Native of the western coast of Africa, on the banks of the river Formosa, in humid parts of woods. Flowers large, rose-coloured. Anthers 10, bisetose under the anthers. Capsule 5-celled.

Decumbent Melastoma. Shrub dec.

Cult. All the species of *Melástoma* are very showy when in flower. A mixture of loam, peat, and sand suits them best; and young cuttings root readily, if planted in pots filled with peat, and placed in heat, with a hand-glass over them.

XXXIX. OTANTHE'RA (from ους ωτος, *ous otos*, an ear, and ανθηρα, *anthera*, an anther; in reference to the anthers being furnished with 2 auricles at the base of each). Blume, in bot. zeit. 1831. no. 28. p. 488. Melástoma species, Blum. bijdr. 1078.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate, half adhering to the ovarium, beset with palmately ciliated scales; limb 5-cleft, deciduous. Petals 5, obovate. Stamens 10, equal. Anthers oblong-linear, a little arched, attenuated upwards and opening by 1 pore, but biauriculate in front at the base; their connectives indistinct. Free part of ovarium conical and bristly. Style filiform. Stigma a pruinose dot. Berry pulpy, 5-celled. Seeds cochleate.—A shrub with terete, glabrous branches, outer branches rather tetragonal; petioles and nerves of leaves on the under surface beset with scattered, adpressed bristles. Leaves elliptic-lanceolate, acuminated, almost quite entire, 5-nerved, membranous, roughish, pale green, but with the nerves blush on the under surface. Panicle terminal, trifid, or trichotomous; branches usually 3-flowered. Flowers small, white, lateral ones bibracteate, middle one on a short pedicel, bractless.

1 O. MOLUCCA'NA (Blum. l. c. p. 489.). ♄. S. Native of Amboyna. Melástoma Moluccàna, Blum. bijdr. p. 1078.—Rumph. amb. 4. t. 71. middle figure.

Molucca Otanthera. Shrub 1 to 2 feet.

Cult. See *Melástoma* for culture and propagation, p. 764.

XL. LACHNOPO'DIUM (from λαχνη, *lachne*, down, and πους ποδος, *pous podos*, a foot; in reference to the filaments or stalks of the anthers being girded by a crown of hairs at the base). Blum. in bot. zeit. 1831. no. 27. p. 477. in a note.—Melástoma species, Link. et Otto.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate-oblong, adhering to the ovarium; limb 5-cleft, with the segments linear-subulate. Petals 5, ovate-oblong, obtuse. Stamens 10, equal; filaments girded by a crown of hairs at the base. Anthers oblong, beaked. Style filiform; stigma small, obtuse. Capsule 5-celled, crowned by the calycine segments. Seeds cochleate? This genus comes very near *Pleròma* and *Lasiándra*.

1 L. RU'BRO-LIMBA'TUM (Blum. l. c.) branches terete, clothed with rufescent stiff hairs; leaves opposite, petiolate, cordate-oblong, acuminated, denticulately crenated, 5-nerved, wrinkled, beset with rufous pili; flowers cymose, axillary, contracted; bracteas obsolete; calyx margined with red in the adult state. ♄. S. Native of the East Indies. Melástoma rùbro-limbàtum, Link. et Otto, abb. t. 41. Flowers white.

Red-limbed-calyxed Lachnopodium. Shrub 4 to 6 feet.

Cult. For culture and propagation, see *Melástoma*, p. 764.

XLI. PLERO'MA (from πληρωμα, *pleroma*, fulness; cells of capsule). D. Don, wern. soc. 4. p. 293. exclusive of Lasiándra of D. C. prod. 3. p. 151.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate, when young often involved in 2 deciduous bracteas; lobes 5, deciduous. Petals 5, obovate. Stamens with glabrous filaments; anthers nearly equal, elongated, arched at the base, each furnished with a stipe-formed connective, which is biauriculate at the base. Ovarium adnate to the calyx, bristly at the apex; stigma a pruinose dot. Capsule baccate, 5-celled, Seeds cochleate.—American shrubs, with the habit of *Lasiándra*, but differs in the filaments being glabrous, not villous, and in the ovarium being adnate to the calyx, not free. Capsule baccate, not dry.

1 P. LEDIFÒLIUM (D.C. prod. 3. p. 151.) branches nearly terete, villous from stiffish somewhat adpressed hairs beneath; leaves ovate-oblong, obtuse at the base, acutish at the apex, scabrous from scattered bristles above, 3-nerved, with revolute edges; pedicels axillary, 1-flowered, length of petioles; brac-

teas 2 under each flower, ovate, villous on the outside and brown inside. ♄. S. Native of Peru. Melástoma ledifòlia, Desr. in Lam. dict. 4. p. 48. Tube of calyx beset with adpressed bristles; lobes 5, obtuse. Petals purple, ciliated. Stamens with smooth filaments. Free part of ovarium conical, rather bristly.

Ledum-leaved Pleroma. Shrub.

2 P. la'xum (D. C. l. c.) branches nearly terete, and are as well as the petioles beset with spreading bristles; leaves ovate, rather cordate, ending in a short acumen, ciliately serrated, beset with scattered nearly adpressed bristles on the upper surface, but villously tomentose beneath; peduncles nearly opposite, axillary, long, bifid at the apex: branches 3-flowered; calyx very villous. ♄. S. Native of Peru. Melástoma láxa, Desr. in Lam. dict. 4. p. 41. Tube of calyx ovate; lobes 5, lanceolate-linear, about equal in length to the tube. Petals purple, ciliated. Filaments glabrous. Anthers long, rather falcate, beaked, each furnished with a long connective. Fruit baccate.

Loose Pleroma. Shrub 3 to 6 feet.

3 P. tricho'podum (D. C. l. c.) branches from compressed to tetragonal, rather hispid; petioles hispid from villi; leaves oval-oblong, acuminated at both ends, 3-nerved, somewhat denticulated, hardly pubescent above, pale beneath, and clothed with adpressed bristles, especially on the nerves; flowers solitary in the axils of the upper leaves, and on the tops of the branches, pedicellate; bracteas 2, oval, involving the calyx, which is bristly. ♄. S. Native of Brazil. Habit of *Lasiándra*, but differs from that genus, in the stamens being glabrous [illegible] ovarium being adnate to the calyx.

Hairy-petioled Pleroma. Sh. 4 to 6 feet.

4 P. vimi'neum (D. Don, in mem. soc. wern. 4. p. 293.) leaves ovate-lanceolate, acute, petiolate, and are as well as the branches scabrous, but canescent beneath; calyx covered with glandular hairs: having the segments lanceolate and mucronate. ♄. S. Native of Brazil. Rhéxia vimínea, D. Don, in bot. reg. t. 664. Spreng. syst. 2. p. 302. Flowers purple. Filaments smooth.

Twiggy Pleroma. Fl. Ju. Aug. Clt. 1821. Sh. 6 feet.

5 P. heteroma'lla (D. Don, l. c.) leaves oval, cordate, petiolate, beset with flocky wool beneath; calycine segments oblong, obtuse; petals obcordate. ♄. S. Native of Brazil. Melástoma heteromálla, D. Don, in bot. reg. t. 644. Sims, bot. mag. 2337. Filaments short, glabrous, conniving. Anthers arched at the base. Petals 5-6, purplish violet. Calyx pubescent; teeth deciduous.

Heteromallous Pleroma. Fl. July, Sept. Clt. 1819. Sh. 4 to 6 feet.

6 P. villòsum (D. C. prod. 3. p. 152.) branches terete, and are, as well as the leaves, villous beneath; leaves ovate, acute, quite entire, villous, 5-nerved; flowers terminal, few, pedunculate; petals obovate, retuse, mucronate; stamens 5 fertile and 5 sterile. ♄. S. Native of South America. Melástoma villòsum, Sims, bot. mag. t. 2630. Lodd. bot. cab. t. 853. but not of Aubl. Filaments glabrous.

Villous Pleroma. Fl. May, Ju. Clt. 1820. Sh. 3 to 4 ft.

7 R.? diffu'sum (D. C. prod. 3. p. 152.) stems tetragonal, decumbent, much branched, pilose: leaves ovate, acute, 3-nerved, serrated, pilose beneath; flowers axillary, solitary, pedicellate; calyx globose, nearly naked: having lanceolate, mucronate segments. ♄. S. Native of Porto Rico. Melástoma diffùsa, Pav. ex D. Don, mem. wern. soc. 4. p. 291. Flowers purple.

Diffuse Pleroma. Sh. decumbent.

8 P.? Mexica'num (D. C. prod. 3. p. 152.) stem erect, branched, pilose; leaves lanceolate, acuminated, 3-nerved, pilose on both surfaces; flowers 1-2, axillary or terminal; calyx pilose, with linear acute segments. ♄. S. Native of Mexico. Melástoma áspera, Pav. in herb. Lamb. Melástoma Mexicàna, D. Don, in mem. wern. soc. 4. p. 290.

Mexican Pleroma. Sh. 2 to 3 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

XLII. DIPLOSTE'GIUM (from διπλοος, *diploos*, double, and στεγος, *stegos*, a covering; in reference to the calyx, which is inclosed in a double calyptra or covering). D. Don, in mem. wern. soc. 4. p. 296. D. C. prod. 3. p. 152.

Lin. syst. *Decándria, Monogýnia.* Limb of calyx 5-cleft, permanent, inclosed in a double cucullate hispid calyptra. Petals 5. Stamens 10; anthers nearly equal, biauriculate at the base. Ovarium? Stigma a pruinose dot. Capsule baccate, 5-celled. Seeds unknown.—A Brazilian shrub. Stem terete, densely beset with white pili. Leaves ovate, acute, quite entire, petiolate, 5-nerved, clothed with silky pili beneath, but scabrous above. Peduncles terminal, trichotomous, 3-flowered. Flowers large, red.

1 D. cane'scens (D. Don, l. c.) ♄. S. Native of Brazil.

Canescent Diplostegium. Sh.

Cult. For culture and propagation see *Melástoma*, p. 764.

XLIII. ACIO'TIS (from ακις, *akis*, a point, and ους ωτος, *ous otos*, an ear; in reference to the petals, which are obliquely awned). D. Don, in mem. wern. soc. 4. p. 296. D. C. prod. 3. p. 152.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx globose, fleshy; limb coarctate, permanent, 4-lobed; petals 4, obliquely awned at the apex. Stamens 8, with long connectives, and as if [illegible] were joi[illegible] in the middle. Anthers erect, naked at the base. [illegible] Capsule baccate, 4-celled. Seeds cochleate. —A West [illegible] fruticose plant, with numerous, erect, tetragonal, branched stems. Leaves petiolate, elliptic-oblong, acuminated, 3-nerved, purple beneath, and of a deep shining green above. Flowers small, red, disposed in spicate racemes. Berry globose, purple, edible, with a grateful acid taste.

1 A. díscolor (D. Don, l. c. p. 301.) ♄. S. Native of the Island of St. Vincent. Rhéxia bícolor, Anders. in herb. Lamb.

Two-coloured-leaved Aciotis. Fl. July, Sept. Clt. 1816. Sh. 1 foot.

Cult. For culture and propagation see *Melástoma*, p. 764.

XLIV. CENTRADE'NIA (from κεντρον, *kentron*, a spur, and αδην, *aden*, a gland; in reference to the gland-formed spur of the smaller stamens). Rhéxia, nov. gen. Cham. et Schlecht. in Linnæa. 5. p. 567.

Lin. syst. *Octándria, Monogýnia.* Calyx rather tetragonal, campanulate, membranous, 8-nerved, rather pilose; limb 4-toothed; teeth broad, triangular, acute. Petals obovate. Stamens 8, alternately smaller; filaments glabrous; anthers opening by 1 pore, elliptic, those of the longer stamens drawn out each into an emarginate cuneated copper-coloured spur or connective, but the spurs of the smaller stamens are gland-formed. Style short, smooth, crowned by a subcapitate stigma. Ovarium free, crowned by one series of short bristles at the base of the style. Capsule within the calyx 4-valved, 4-celled, at length separating from the axis along with the dissepiments. Seeds numerous, minute, clavately elliptic, echinated, brown: with a terminal dot-formed hardly coloured hylum.—An annual, branched herb, with tetragonal pilose branches. Leaves opposite each other, unequal in size, one of which being almost abortive. Large leaves, oblong-lanceolate, acute, on short petioles, unequal-sided, quite entire, ciliated, triple-nerved, pale beneath, 2 inches long, and 5 lines broad. Racemes few-flowered, axillary. Flowers on longish pedicels, small, white.

1 C. inæquælatera'lis. ⊙. S. Native of Mexico, in Cuesta Grande de Chiconquiaco. Rhéxia inæquælateràlis, Cham. et Schlecht. l. c.

Unequal-sided-leaved Centradenia. Pl. 1 to 1½ foot.

Cult. The seeds of this plant require to be sown in a hot-bed; and when the plant have attained the height of 2 or 3 inches, they may be potted off into separate pots, and again returned to the hot-bed; and when they begin to come into flower, they may be removed to the stove.

Tribe IV.

MICONIEÆ (this tribe contains plants agreeing with *Micònia* in important characters). D. C. prod. 3. p. 152. Anthers opening by 1 or 2 pores at the apex. Ovarium adnate to the calyx. Fruit baccate. Seeds not cochleate.

XLV. ROUSSEAU'XIA (dedicated by De Candolle to — Desrousseaux, coadjutor with Lamarck in his Dictionnaire de Botanique.) D. C. prod. 3. p. 152.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx hemispherical, smooth; lobes 4, broad. Petals 4, obovate. Stamens 8; anthers oblong-linear, opening by 1 pore? sometimes all fertile, with their connectives rather gibbous at the base; sometimes the alternate ones are sterile, having their connectives short: and the others fertile, with long connectives, which are furnished with 2 bristles at the base. Ovarium adnate to the calyx, bearing 4 bristle-like scales at the base around the origin of the style. Style filiform. Capsule baccate, opening at the apex. Seeds angular, shining.—Shrubs, natives of Madagascar. Leaves petiolate, 3-nerved, quite entire, oval-oblong. Cymes trichotomous, terminal.

§ 1. *Stamens equal, all fertile, each furnished with [illegible] connective.*

1 R. CHRY[illegible]g branches bluntly tetragonal, at length glabrous, rather bristly at the apex; leaves petiolate, oval-oblong, acute, 3-nerved, glabrous on both surfaces, beset with adpressed setæ on the nerves beneath, and on the margins, which are entire; cymes terminal, twice trifid; tube of calyx campanulate, quite smooth: with 4 broad-lanceolate lobes, which are ciliated with bristles. ♄. S. Native of Madagascar. Melástoma chrysophýlla, Desr. in Lam. dict. 4. p. 50. but not of Rich. Leaves yellowish when dried. Petals 5, obovate. Flower-bud conical, acute. Stamens 8, equal; filaments glabrous. Anthers oblong-linear, bluntish. Ovarium crowned by 4 spiny-ciliated scales. Style filiform, rising between the scales. Fruit unknown.

Golden-leaved Rousseauxia. Shrub.

§ 2. *Stamens alternately unequal; fertile ones furnished each with a long connective, which ends in 2 bristles.*

2 R. ARTICULA'TA (D. C. l. c.) branches bluntly tetragonal, at length terete, knotted at the insertion of the leaves, roughish from rather adpressed scattered bristles; leaves petiolate, oval-oblong, acuminated, quite entire, 3-nerved, glabrous above, bristly beneath, but especially on the nerves; cymes trichotomous; tube of calyx hemispherical, glabrous, with 4 broad obtuse lobes; ovarium bristly at the apex. ♄. S. Native of Madagascar, ex herb. Juss. not of Cayenne, as mentioned by Desrousseaux. Melástoma articulàta, Desr. in Lam. dict. 4. p. 56. Capsule adnate to the calyx, opening at the apex. Seeds angular, shining. Style filiform. Filaments glabrous, filiform. Anthers linear, opening by one pore, rather shorter than their connectives.

Articulated-stamened Rousseauxia. Shrub.

Cult. See *Melástoma* for culture and propagation, p. 764.

XLVI. LEA'NDRA (in honour of — Leandro do Sacramento, director of the botanic garden at Rio Janeiro, author of Nova Plantarum Geneva, inserted in Act. Acad. Monach. vol. 7. Raddi in mem. soc. ital. 1820. p. 6. D. C. prod. 3. p. 153.)

LIN. SYST. *Octo-Decándria, Monogýnia.* Tube of calyx ovate, urceolate, almost bottle-shaped, drawn out beyond the ovarium; lobes disposed in two rows, with 4-6 outer subulate ones, and 6 inner oval membranous ones, in front of the outer ones. Petals 4-6, linear-lanceolate. Stamens 8-12. Anthers linear, hardly auricled at the base. Style filiform, exserted, hairy at the base. Stigma dot-formed. Berry dry, 3-4-celled. Seeds angular, somewhat ovate and shining, with a linear hylum.—Brazilian shrubs, more or less rough from villi or setæ. Leaves triple-nerved, ciliately-serrated. Flowers capitate, usually bracteate.

SECT. I. LEANDRA'RIA (an alteration from the generic name). D. C. prod. 3. p. 153. Calyx 5-6-cleft; lobes disposed in two series. Hairs of the calyx and bracteas bristly.

1 L. AMPLEXICAU'LIS (D. C. l. c.) branches tetragonal, rough from bristles, as well as both surfaces of the leaves and margins; leaves oval-oblong, acuminated, triple-nerved, quite entire, sessile, cordate and stem-clasping at the base; heads of flowers bracteate; bracteas obtuse or emarginate. ♄. S. Native of Brazil, at the river Xipote. L. híspida, Schrank et Mart. mss. Calyx almost bottle-shaped, rough from short bristles; lobes double, 6 outer ones subulate and thick, and the 6 inner ones oval and rather membranous. Seeds angular, shining, with a linear hylum. Stamens not seen.

Stem-clasping-leaved Leandra. Sh. 2 to 3 feet.

2 L. PAULI'NA (D. C. l. c.) branches terete, thickly beset [illegible] villi; leaves on very short petioles, broadly ovate, bluntly cordate at the base, acute at the apex, somewhat denticulately serrated, quintuple-nerved, very villous on both surfaces; heads of flowers dense, hairy, almost sessile along the short rachis; calyx very villous; inner lobes of calyx linear and glabrous, outer ones lanceolate and villous on the outside. ♄. S. Native of Brazil, in woods on the mountains between Rio Janeiro and St. Paul. Melástoma Paulìnum, Schrank et Mart. mss. Upper leaves hispid from hairs, which are somewhat bulbous at the base, but clothed with villous tomentum beneath. Bracteas very villous on the outside, and smooth inside.

St. Paul Leandra. Sh. 2 to 3 feet.

3 L. UMBELLA'TA (D. C. l. c.) branches terete, and are, as well as the petioles, densely clothed with velvety down; leaves petiolate, ovate, acuminated, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense umbellate heads; bracteas oblong; calyx beset with glandular hairs, 6-lobed, bearing 6 appendages on the outside similar to the lobes. ♄. S. Native of Brazil, in woods, in the low lands in the province of Minas Geraes. Melástoma umbellàtum, Schrank et Mart. mss. Petioles 14 lines long. Leaves 2-3 inches long. Peduncles and calyx thickly beset with capitate hairs. Lobes of calyx length of the tube. Petals linear, acute. Anthers linear, falcate. Connectives short. Genitals exserted.

Umbellate-flowered Leandra. Sh. 2 to 3 feet.

4 L. INVOLUCRA'TA (D. C. prod. 3. p. 154.) branches terete, and are, as well as the petioles, densely clothed with short velvety down; leaves petiolate, ovate, acuminated, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense heads; bracteas ovate; heads disposed in a terminal panicle, like those of the preceding species; calyx covered with glandular hairs, appendiculated with 5 lobes on the outside of the inner ones. ♄. S. Native of Brazil, in woods. Melástoma involucràtum, Schrank et Mart. mss. Perhaps the same as *L. umbellàta*, but the bracteas are broader at the apex; tube of calyx a little longer, lobes shorter, petals narrower, and the style is hairy at the base.

Involucrated Leandra. Sh. 2 to 3 feet.

5 L. SERI'CEA (D. C. l. c.) branches terete, and are, as well as

the peduncles and petioles, densely clothed with rusty villi; leaves oval-lanceolate, acuminated, ciliately serrated, quintuple nerved, scabrous from bristles above, but clothed with silky soft villi beneath; lateral nerves distant from the margin of the leaf; racemes terminal, very villous; heads on short peduncles; bracteas concave, ovate. ♄. S. Native of Brazil, in the province of Rio Janeiro. Osbéckia Brasíla, Schrank, herb. Leándra Ráddii? Mart. herb. Petals lanceolate. Tube of calyx very villous; lobes double, outer ones tooth-formed, inner ones ovate.

Silky Leandra. Shrub 3 to 6 feet.

6 L. villòsa (D. C. l. c.) branches terete, and are, as well as the petioles and peduncles, densely clothed with short hairs; leaves petiolate, elliptic-oblong, acuminated, attenuated at the base, quintuple-nerved; (lateral nerves approximating the margins,) denticulated, scabrous above from short scattered bristles, which are bulbous at the base, villous beneath, and rather foveolate; flowers in dense heads; the heads disposed in a thyrse; bracteas glabrous on the outside; inner lobes of calyx membranous, exceeding the outer ones. ♄. S. Native of Brazil, at Rio Janeiro. Intermediate between *L. sericea* and *L. scàbra*.

Villous Leandra. Shrub 3 to 6 feet.

7 L. sca'bra (D. C. l. c.) branches terete, and are, as well as the peduncles and petioles, beset with longish retrograde stiff hairs; flowers in dense heads; bracteas glabrous inside; heads disposed in a crowded thyrse; inner lobes of calyx membranous, shorter than the outer ones. ♄. S. Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in woods on [illegible] mountains. Melástoma acutiflòrum, Schrank et Mart. herb. L. melastomoìdes, Raddi, l. c. p. 7. t. 8. Tube of calyx oblong, campanulate, hairy. Petals very acute. Style filiform, exserted.

Scabrous Leandra. Shrub 3 to 6 feet.

8 L. angustifòlia (D. C. l. c.) branches terete, and are, as well as the petioles, clothed with short rufous down; leaves oblong-linear, 3-nerved, acuminated, ciliately serrated, scabrous from bristles above, villous beneath; heads axillary, sessile, few-flowered; bracteas linear; outer lobes of calyx subulate, villous: inner ones very short or hardly any. ♄. S. Native of Brazil. Flower-bud conical. Petals acuminated. Style exserted. Perhaps a species of *Clidèmia*, belonging to section *Axillària*.

Narrow-leaved Leandra. Shrub 2 to 3 feet.

9 L. du'bia (D. C. l. c.) branches rather tetragonal, and are, as well as the panicles, petioles, and leaves, rather hispid from scattered bristles; leaves petiolate, oblong, acuminated both at the base and the apex, ciliated, and triple-nerved; nerves arising from about the sixth part of the length of the leaves; panicle short, terminal; flowers crowded on the tops of the branches. ♄. S. Native of Brazil, in woods between Rio Janeiro and Lorena. Melástoma dùbium, Schrank et Mart. mss. Lobes of calyx double, very short, hardly distinguishable.

Doubtful Leandra. Shrub 3 to 6 feet.

10 L. sylve'stris (D. C. l. c.) branches terete, and are, as well as the panicles, petioles, and leaves, hispid; leaves petiolate, oval-oblong, acuminated at both ends, ciliated, entire, quintuple-nerved; panicle terminal, trifid at the base, divaricate; flowers bractless, approximating by threes; calyx ovate, hispid. ♄. S. Native of Brazil, in the province of Minas Geraes, in woods. Melástoma silvéstre, Schrank et Mart. mss. Seeds small, angular, attenuated, shining. Lobes of calyx so short as hardly to be distinguishable.

Wild Leandra. Shrub 3 to 6 feet.

11 L. hi'rta (Raddi, l. c. p. 8.) leaves oblong-lanceolate, acuminated, crenulated, 3-nerved, pilose beneath; flowers in terminal bractless racemes. ♄. S. Native of Brazil, on Mount Mandiocca near Rio Janeiro. Perhaps distinct from *L. sylvéstre*.

Hairy Leandra. Shrub 2 to 3 feet.

Sect. II. Leandroi'des (so named from the plant being like *Leándra* in habit, but whether it is a true species of the genus is doubtful). D. C. prod. 3. p. 155. Calyx 4-cleft; lobes double. Bracteas and calyxes clothed with stellate tomentum. Petals and genitals unknown.

12 L.? racemi'fera (D. C. prod. 3. p. 155.) branches terete, and are, as well as the petioles, densely clothed with branched tomentum; leaves on short petioles, oblong, acuminated, repandly subserrated, 5-nerved, or almost quintuple-nerved, glabrous above in the adult state, but scabrous from stellate down beneath; panicle terminal, elongated, racemose, oppositely branched; flowers crowded on the branchlets; calyxes very hairy, 4-cleft. ♄. S. Native of Brazil. Melástoma racemífera, Schrank et Mart. mss. Anthers 8, oblong, obtuse.

Raceme-bearing Leandra. Sh. 4 to 6 feet.

Cult. See *Melástoma* for culture and propagation, p. 764.

XLVII. TSCHU'DYA

(dedicated to M. le Baron de Tschudy, author of Traite des Arbres coniferes et resineux). D. C. prod. 3. p. 155.

Lin. syst. *Decándria, Monogýnia*. Tube of calyx globose; lobes 5, bristle-formed, small, permanent. Petals 5. Stamens [illegible]ttish; anthers oblong, without auricles, opening by one [illegible] the apex. Ovarium free, bristly at the apex. Style filifo[illegible] [illegible]pule globose, membran[illegible], perhaps indehiscent, 4-5-celled. Seeds numerous, small, [illegible]unately incurved, crowned by a cellular acute curved appendage.—Shrubs, with the habit of *Clidèmia*, clothed with rufous hairs in every part. Branches terete. Leaves on short petioles, 5-nerved, oval, acuminated, toothed, having the nerves hairy on both surfaces. Thyrse panicled, terminal. Flowers small, very hispid, sometimes 4-cleft and octandrous.

1 T. verticilla'ta (D. C. l. c.) branches of panicle unequal, 6 in a whorl. ♄. S. Native of French Guiana, in woods at Yueri. Melástoma verticillàta, Rich. herb. Panicle loose, beset with dark purple pili. Young fruit whitish. Flowers small, white.

Whorled Tschudya. Shrub 1 to 2 feet.

2 T. rufe'scens (D. C. l. c.) branches of panicle opposite, rarely furnished with a small short branchlet; leaves serrulated. ♄. S. Native of Brazil and Guiana. Melástoma heterocárpum, Schrank et Mart. herb. Melast. rufídula, Rich. herb. Fruit whitish, smaller than a grain of pepper.

Rufescent Tschudya. Sh. 1 to 2 feet.

3 T. asperiu'scula (D. C. l. c.) branches of panicle opposite, short; leaves nearly quite entire. ♄. S. Native of Cayenne, in woods. Melástoma asperiúscula, Rich. herb. Flowers white. Thyrse narrower than in *T. ruféscens*. Down short, rufous. Seeds not seen. Ovarium and base of style hairy.

Roughish Tschudya. Sh. 3 to 6 feet.

4 T. pulverule'nta (D. C. l. c.) branches of panicle opposite, 3-5-flowered; leaves quite entire, and rather ciliated; down on the branches of the panicle and on the leaves stellate. ♄. S. Native of Guiana, at Yuera, in woods. Melástoma pulverulénta, Rich. herb. Flowers small, 4-cleft, and sometimes the lower ones are 3-cleft. Seeds like those of the rest of the genus, but the habit of the plant is by no means similar. Ovarium hardly villous at the apex. Stamens not seen. Leaves membranous. Flowers white.

Powdery Tschudya. Shrub 3 to 6 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

XLVIII. CLIDE'MIA (in honour of Clidemi, an ancient Greek botanist). D. Don, in mem. soc. wern. 4. p. 306. D. C. prod. 3. p. 155.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx ovate, naked, rarely bracteate at the base; lobes 5, permanent, narrow, acute. Petals 5, rarely 6. Stamens 10; anthers constricted at the base, and rather biauriculate, opening by one pore at the apex. Ovarium adnate to the calyx, usually crowned by a circle of bristles at the apex. Style filiform; stigma a pruinose dot. Capsule baccate, 5-celled. Seeds ovate or rather angular, not cochleate, nor appéndiculated.—Hispid or hairy shrubs, native of South America. Leaves usually crenated, 3-7-nerved. Flowers axillary and terminal. This genus is easily distinguished from the rest of the genera of the present order by the habit, but the species are difficult to define. Perhaps the species with obtuse petals are separable from those with acute petals.

§ 1. *Axillàres. Flowers in axillary panicles or spikes.*

* *Flowers crowded, almost sessile.*

1 C. AGGREGA'TA (D. Don, in mem. soc. wern. 4. p. 309.) leaves elliptic, quite entire, acute at both ends, and are, as well as the branches, pilose; flowers axillary, verticillate, almost sessile. ♄. S. Native of Peru.

Aggregate-flowered Clidemia. Sh. 1 to 2 feet.

2 C. SERI'CEA (D. Don, l. c.) leaves oval, acute, crenated, 5-nerved, clothed with silky villi on both surfaces; flowers solitary, axillary, verticillate, scaly at the base. ♄. S. Native of Peru. The rest unknown.

Silky Clidemia. Sh. 2 to 3 feet.

3 C. CONF[illegible] branches terete, densely clothed with retrograde villi; leaves on [illegible] petioles, oval, acute, nearly entire, villous beneath, and beset with short bristles above, 7-nerved; nerves crowded above the base of the leaves; panicles axillary, crowded, very short; tube of calyx very hairy. ♄. S. Native of Brazil, near Rio Janeiro, in woods. Melástoma aggregàtum, Schrank et Mart. mss. Petioles an inch long, covered with spreading down. Setæ long, yellow. Lobes of calyx 5, hardly distinct. Petals oval-lanceolate, flesh-coloured, but red in the middle. Anthers oval, furnished with filiform connectives. Style filiform.

Crowded-flowered Clidemia. Sh. 3 to 4 feet.

4 C. RETROPI'LA (D. C. l. c.) branches hairy, beset with rufous retrograde pili; petioles very hairy; leaves oval, acuminated, serrulated, quintuple-nerved, hairy or downy on both surfaces; nerves rather distant from the base; flowers in almost sessile clusters in the axils of the leaves; calyx hispid, 5-cleft. ♄. S. Native of Brazil. Petioles 5 lines long, rufous from spreading down. Lobes of calyx 5, setaceous.

Bent-haired Clidemia. Sh. 2 to 3 feet.

5 C. MARGINA'TA (D. C. l. c.) branches nearly terete, and are, as well as the petioles, clothed with small short powdery velvety down; leaves petiolate, elliptic, acuminated, ciliated, triple-nerved, besides the marginal nervules, downy beneath, but beset with scattered bristles above; racemes few-flowered, axillary, 3 times shorter than the petiole; calyx very hispid, 5-cleft. ♄. S. Native of Brazil, near Rio Janeiro, on the mountains in woods. Melástoma marginàta, Desr. in Lam. dict. 4. p. 32. Melast. Januarénsis, Schrank et Mart. mss. Flowers and fruit not sufficiently examined.

Margined-leaved Clidemia. Sh. 3 to 4 feet.

6 C. AMYGDALOI'DES (D. C. l. c.) branches tetragonal, and are, as well as the petioles and panicles, clothed with stiff bristles; leaves petiolate, oblong, acuminated, 3-5-nerved, somewhat crenulated, villous on both surfaces; panicles axillary, short, few-flowered; calyx very hispid, 5-lobed; lobes bearing small stellate down on the inside. ♄. S. Native of Brasil, in woods on mount Cercòvado, near Rio Janeiro. Melástoma amygdaloìdes, Schrank et Mart. mss. Leaves almost triple-nerved, 3 inches long, and 8-9 lines broad. Petals white, oblongly triangular, acute.

Almond-like Clidemia. Sh. 4 to 6 feet.

7 C.? BRACHYSTA'CHYA (D. C. l. c.) branches terete, and are, as well as the petioles, densely hispid; leaves petiolate, elongately linear, acuminated, 3-nerved, ciliately serrated, bristly on the middle nerve above, the rest glabrous, but covered with long bristles beneath; spikes hispid, axillary, shorter than the petioles. ♄. S. Native of Brazil, in the province of Rio Janeiro, in woods. Rhéxia spicàta, Schrank et Mart. mss. Very near *C. amygdaloides.* Fruit globose, hairy, crowned by the 5 short acute lobes of the calyx. Flowers not seen.

Short-spiked Clidemia. Sh. 1 to 2 feet.

8 C. CONGLOMERA'TA (D. C. l. c.) branches terete, hispid from thick branched hairs; petioles clothed with the same kind of hairs; leaves ovate, attenuated at the base, acuminated at the apex, irregularly crenated and ciliated, 5-nerved, glabrous except on the nerves, membranous; flowers in terminal and axillary, almost sessile clusters; calyx beset with violaceous hairs, with 5 lobes, each ending in a plumose bunch of bristles. ♄. S. Native of Cayenne, in woods. A very beautiful species, allied to *C. purpùrea.* Melástoma conglomeràta, Rich. herb.

Conglomerate-flowered Clidemia. Sh. 1 to 2 feet.

9 C. ERYTHROPÒGON (D. C. prod. 3. p. 157.) branches terete, and are, as well as the petioles, hairy; leaves petiolate, oval-acu[illegible]ticulated, 5-nerved, beset with scattered stiff hairs on both surfaces; racemes axillary, almost sessile, 3-flowered; calyx very hispid from red bristles, with 6 setaceous lobes. ♄. S. Native of Jamaica. Melástoma sessilifòlium, Spreng. syst. 2. p. 295.? Petals and stamens not seen.

Red-bearded Clidemia. Sh. 3 to 4 ft.

* * *Peduncles axillary,* 1-*flowered.*

10 C. CILIA'TA (D. Don, mem. soc. wern. 4. p. 309.) leaves cordate, acute, crenated, almost sessile, pilose above, densely clothed with stellate tomentum beneath; calyx tomentose. ♄. S. Native of Peru. Melástoma ciliàta, Pav. in herb. Lamb. but not of Desr. nor Rich. Perhaps belonging to a different section.

Ciliated-leaved Clidemia. Sh. 2 to 3 feet.

11 C. CAPILLA'RIS (D. Don, l. c. p. 308.) leaves elliptic, crenulated, 3-nerved, acuminated, clothed with silky villi on both surfaces, and on the branchlets; pedicels capillary, axillary, twin, 1-flowered. ♄. S. Native of Peru. Melast. capillàris, Pav. in herb. Lamb. but not of Swartz.

Capillary-pedicelled Clidemia. Sh. 2 to 3 feet.

* * * *Peduncles axillary, bearing cymes or panicles of flowers.*

12 C. EPIBATE'RIUM (D. C. prod. 3. p. 157.) stem climbing, branched, terete, rooting, clothed with rufous hairs above, as well as the petioles; leaves petiolate, ovate, acuminated, obtuse at the base, 5-7-nerved, denticulated, rather pilose; flowers few, in axillary racemose cymes; calyx hispid. ♄. S. Native of Brazil, in the province of Rio Negro. Melástoma Epibatèrium, Mart. herb. Melast. volùbile, Schrank, mss. A very distinct species. Lobes of calyx bristly at the apex. Anthers bluntly auriculated at the base, opening by one pore at the apex. The name is derived from επι, upon, and βαινω, to walk, in allusion to the plant climbing upon others.

Climbing Clidemia. Sh. climbing.

13 C. PETIOLA'TA (D. C. l. c.) branches terete, and are, as well as the petioles, covered with rufous spreading hairs; leaves on long petioles, cordate-ovate, acuminated, 7-nerved, ciliated, with a few bristles above, but smoothish

flowers aggregate, almost sessile, few, hispid. ♄. S. Native of Guiana. Melástoma petiolàta, Rich. herb. Easily distinguished from the other species in the leaves being cordate, and in the petioles being 1-2 inches long.

Petiolate Clidemia. Sh. 1 to 2 feet.

14 C. HI'RTA (D. Don, in mem. wern. soc. 4. p. 309.) branches terete; petioles and panicles clothed with rufous villi; leaves ovate-lanceolate, somewhat attenuated at the base, and acuminated at the apex, denticulated, 5-nerved, densely pilose on the nerves, but sparingly so on the rest of the leaf; panicles axillary, trichotomous, few-flowered, hardly the length of the petioles; calyx hispid, with an ovate tube and setaceous-lobes; petals obovate. ♄. S. Native of Jamaica. Melástoma hírta, Lin. spec. p. 559. Swartz, obs. p. 175. Sims, bot. mag. t. 1971. but not Desr. Melast. rústica, Forst. mss. There is a variety of this plant with 6-petalled dodecandrous flowers.

Hairy Clidemia. Sh. 1 to 2 feet.

15 C. PETIOLA'RE (Cham. et Schlecht. in Linnæa. 5. p. 562.) branches terete, silky at the apex; leaves ovate, acuminated, acute or obtuse at the base, 5-nerved, crenulately denticulated; cymes axillary, nearly sessile, trichotomous, beset with spreading hairs, shorter than the petioles; tube of calyx hispid, hemispherical, longer than the lobes, which are setaceous; petals elliptic. ♄. S. Native of Mexico, among bushes near Hacienda de La Laguna, &c. Leaves 4 inches long, and 2 broad. Like *C. hirta.*

Petiolar Clidemia. Sh. 1 to 2 feet.

16 C. PAUCIFLÒRA (D. C. l. c.) branches terete, [illegible] well as the panicles, petioles, and leaves, beset with long spreading stiff hairs; leaves on short petioles, ovate, acutish, rather cordate at the base, 5-nerved, ciliated, hardly crenulated; panicles terminal, few-flowered, oppositely branched; lobes of calyx 5, setaceous, shorter than the tube; calyx interspersed with bristles and short starry down. ♄. S. Native of Brazil, in the province of Bahia. Melástoma pauciflòra, Desr. in Lam. dict. 4. p. 49. Melast. crýptodon, Schrank et Mart. Allied to *C. élegans*, but certainly distinct.

Few-flowered Clidemia. Sh. 1 to 2 feet.

17 C. CRENA'TA (D. C. l. c.) branches from compressed to terete, and are, as well as the panicles, petioles, and both sides of the leaves, hairy from long spreading pili; leaves petiolate, rather cordate at the base, broadly ovate, acuminated, crenated, ciliated, 5-nerved; panicle axillary, trichotomous, few-flowered, wideish, a little longer than the petiole: tube of calyx ovate, with subulate lobes; petals oblong. ♄. S. Native of Porto Rico, Brazil, Cuba, Trinidad, &c. Melástoma crenàta, Vahl. ecl. amer. 3. p. 41. icon. pl. amer. 2. t. 22. Melast. aristàtum, Mart. mss. Clid. hírta, D. Don, l. c. ? There is no down between the hairs on the plant. Petals crenated, ex Rich. Perhaps not distinct from Clid. crenàta, D. Don.

Crenate-petalled Clidemia. Sh. 2 to 3 feet.

18 C. E'LEGANS (D. Don, l. c. p. 309.) branches from compressed to terete, and are, as well as the petioles, panicles, and both sides of the leaves, beset with long scattered stiff bristles; leaves cordate, acuminated, 5-nerved, ciliated, broadly crenated, crenæ rounded and crenulated; panicles axillary, trichotomous, few-flowered, longer than the petioles; calyx hispid, with an ovate tube, and setaceous lobes; petals obovate. ♄. S. Native of Cayenne, on walls; and in Brazil. Melástoma élegans, Aubl. guian. 1. p. 425. t. 167. Flowers small, white.

Elegant Clidemia. Fl. July, Aug. Clt. 1822. Shrub 1 to 2 feet.

19 C. TILIÆFÒLIA (D. C. prod. 3. p. 158.) branches from compressed to terete, rather hispid, but at length glabrous; petioles clothed with brown hairs; leaves ovate, cordate at the base, acuminated at the apex, doubly crenated, ciliated, rather pilose on both surfaces, 7-nerved; panicles axillary, trichotomous, few-flowered, longer than the petioles, loose, and are, as well as the calyxes, smoothish. ♄. S. Native of Brazil, at Para, in woods. Melástoma tiliæfòlium, Schrank et Mart. mss. Leaves crenated, as in *C. élegans.*

Lime-tree-leaved Clidemia. Sh. 2 to 3 feet.

20 C. BLEPHARÒDES (D. C. l. c.) shrubby; branchlets terete, and are, as well as the petioles, hispid; leaves petiolate, ovate, acuminated, quite entire, 3-nerved, ciliated, rather bristly; racemes somewhat capitate, lateral, pedunculate, hispid; bracteas ciliated; lobes of calyx setaceous, longer than the tube, which is campanulate and hispid; anthers oblong-linear. ♄. S. Native of Brazil, near Bananal and elsewhere. Melástoma blepharòdes, Mart. herb. Melast. Bananàle, Schrank, mss. Style long, filiform, not dilated at the apex. Petals of a rose purple-colour. Fruit unknown. Perhaps a proper genus.

Eye-lash-bractead Clidemia. Sh. 1 to 2 feet.

21 C. URCEOLA'TA (D. C. l. c.) branches terete, and are, as well as the panicles, covered with glandular bristles and branched down; leaves petiolate, cordate, acuminated, serrately ciliated, 5-nerved, setose above, but clothed with stellate tomentum beneath; panicles terminal, oppositely branched; calyx hairy, urceolate, 5-cleft. ♄. S. Native on dry mountains about Rio Janeiro. Melástoma urceolàtum, Schrank et Mart. mss. Petals obovate, rose-coloured. Allied to *C. umbonàta.*

Urceolate-calyxed Clidemia. Sh. 1 to 2 feet.

22 C. BULLÒSA (D. C. l. c.) shrubby; branches terete, and [illegible] well as the petioles, calyxes, and peduncles, clothed with [illegible] down; leaves petiolate, ovate, acuminated, somewhat cordat[illegible] ciliately serrated, covered with bulla[illegible] the upper surface, and tomentum beneath; [illegible]nicles axillary, terminal, loose-flowered; bracteas bristle-formed under the flower. ♄. S. Native of Brazil, at Para, in hedges. Melástoma bullòsum, Schrank et Mart. mss. and perhaps the same as Melast. bullòsum of Spreng. neue. entd. 2. p. 172. Calyx campanulate, short, with 5 short bristly teeth. Anthers oval, obtuse, opening by 1 pore. Flowers small, purple. Fruit unknown.

Blistered-bristled Clidemia. Sh. 2 to 3 feet.

23 C. BISERRA'TA (D. C. l. c.) branches terete, and are, as well as the panicles and petioles, clothed with branched stellate down, mixed with stiff glandular bristles; leaves petiolate, ovate, somewhat cordate at the base, acuminated at the apex, 5-nerved, doubly and unequally serrate-ciliated, beset with bristles on the upper surface, which are tumid at the base, but covered with branched down beneath, intermixed with foveolate bristles; panicles axillary, and nearly terminal, with opposite divaricate branches; calyx ovate, acutely 5-lobed. ♄. S. Native of Brazil, in woods about Rio Janeiro. Melástoma biserràtum, Schrank et Mart. mss. Very like *C. urceolàta* and *C. umbonàta.* Petals ovate, purple.

Biserrate-leaved Clidemia. Sh. 2 to 3 feet.

24 C. UMBONA'TA (D. C. l. c.) branches terete, and are, as well as the panicles, petioles, and under side of the leaves, clothed with stellate branched soft down; leaves petiolate, ovate, somewhat cordate, acuminated, ciliately serrated, covered with hairs on the upper surface, which are tumid at the base; panicle terminal, oppositely branched; calyx urceolate. ♄. S. Native of Brazil, in hedges at Nogueira. Melástoma umbonàtum, Schrank et Mart. mss. Petals ovate, purple.

Umbonate-fruited Clidemia. Sh. 2 to 3 feet.

25 C. PURPU'REA (D. Don, mem. soc. wern. 4. p. 308.) branches terete, hispid from spreading bristles, as well as the petioles; leaves broadly elliptic, acuminated, crenulated, 5-nerved, villous on both surfaces, but especially beneath, and when young they are purple, as well as the calyxes; peduncles axillary,

trichotomous, 3-flowered. ♄. S. Native of Peru. Melástoma purpùrea, Pav. in herb. Lamb. M. purpuráscens, Domb.

Purple-leaved Clidemia. Sh. 2 to 3 feet.

26 C. denta'ta (D. Don, l. c.) leaves oval, crenated, acuminated, 5-nerved, covered with rough hairs on both surfaces, as well as the stem; peduncles short, axillary, trichotomous, many flowered. ♄. S. Native of Peru. Melástoma dentàta, Pav. in herb. Lamb.

Toothed-leaved Clidemia. Sh. 2 feet.

27 C. Japure'nsis (D. C. prod. 3. p. 159.) branches nearly terete, and are, as well as the petioles and panicles, hispid; leaves elliptic-oblong, acuminated, quite entire, membranous, rather pilose on both surfaces, and on the margins, 7-nerved; lateral nerves somewhat feathered from the middle to the base; panicles axillary, loose, shorter than the leaves; teeth of calyx setaceous, very short. ♄. S. Native of Brazil, in the woods of Japura. Melastoma Japurénse, Schrank et Mart. mss. Flowers small. Fruit globose, crowned by the teeth of the calyx. Seeds small, angular. Anthers nearly terete, obtuse, hardly tumid at the base.

Japura Clidemia. Sh. 2 feet.

28 C. plumòsa (D. C. prod. 3. p. 159.) branches, petioles, peduncles, and calyxes woolly from rufous pili; leaves oval, rather cordate at the base, acuminated, crenulated, 5-7-nerved, pilose beneath, but especially on the nerves; panicles axillary, trichotomous; bracteas and calycine lobes plumose from purple bristles. ♄. S. Native of St. Domingo. Melástoma plumòsa, Desr. in Lam. dict. 4. p. 32. Leaves 6-7-inches long, [illegible] 3 broad, standing on petioles one inch long.

Plumose-calyxed Clidemia. Sh. 2 to 3 feet.

29 C. latifo'lia (D. C. l. c.) bran[illegible]s hispid; leaves petiolate, broad-ovate, acuminated, denticulated, ciliated, 7-nerved, pilose on both surfaces, but especially on the nerves; panicles axillary, usually twin, trichotomous; bracteas setaceous; fruit spherical. ♄. S. Native of the West Indies. Melástoma latifòlia, Desr. in Lam. dict. 4. p. 31.

Broad-leaved Clidemia. Sh. 4 to 6 feet.

30 C. diversifòlia (D. C. l. c.) branches terete, and are, as well as the petioles, panicles, and under surface of the leaves, clothed with flocky powdery down; the leaves opposite each other are different in form, the one is large and broadly ovate, 7-nerved, and tapering abruptly into the petiole, the other is smaller and truly ovate, and almost sessile; panicles axillary, trichotomous, length of the smaller leaves; calyx with a globose tube, which is urceolate at the apex, and 5 subulate lobes. ♄. S. Native on the banks of the river Magdalena, near St. Bartholomew. Melástoma diversifòlia, Bonpl. mel. t. 59. Fruit blue, 5-celled. Seeds cuneated. Petals small, white.

Diverse-leaved Clidemia. Sh. 4 to 6 feet.

* * * * *Peduncles axillary, spike-formed.*

31 C. spica'ta (D. C. l. c.) branches terete, and are, as well as the petioles and panicles, hispid from elongated bristles, intermixed with stellate down; leaves petiolate, ovate, acuminated, serrated, obtuse at the base, 5-nerved, beset with stiff hairs on both surfaces; peduncles axillary, spicately racemose; pedicels opposite, short, 1-3-flowered; calyx hispid, with an ovate-globose tube, and setaceously acuminated lobes. ♄. S. Native of French Guiana, Brazil, Trinidad, &c. Melástoma spicàta, Aubl. guian. 1. p. 423. t. 165. Vahl. ecl. 3. p. 20. Meyer in act. bonn. 13. p. 792. Flowers white. Berry red.

Spicate-racemed Clidemia. Sh. 1 to 2 feet.

32 C. pustula'ta (D. C. l. c.) branches terete, and are, as well as the petioles, hairy from short glandular down; leaves ovate, acuminated, obtuse at the base, and nearly cordate, ciliately subserrated, 7-nerved, scabrous from bristles above, and rather pustulate at the base of the bristles, but beset with foveolate fascicles of hairs beneath; panicles elongated, axillary, with their branches twice trifid or 3-flowered; calyx hispid, with lanceolate lobes, which are shorter than the tube. ♄. S. Native of Brazil, in the provinces of Rio Negro and Para, in woods. Melástoma pustulàtum, Schrank et Mart. Habit almost of *C. spicàta*, but the thyrse is more loose, the lobes of the calyx are broader, and the hairs are different. Perhaps the same as *C. strigulòsa?*

Pustulate-leaved Clidemia. Sh. 2 to 3 feet.

33 C. strigillòsa (D. C. l. c.) branches rather tetragonal, and are, as well as the petioles, pilose; leaves oblong, rather cordate at the base, acuminated, 5-nerved, 3 times longer than the petioles, rather denticulated, hispid above, and clothed with canescent tomentum beneath; racemes axillary, with short opposite 3-4-flowered branchlets; calyx hairy, with filiform teeth; petals oblong. ♄. S. Native of Jamaica. Melástoma strigillòsa, Swartz, fl. ind. occ. p. 793. Berry roundish, hairy, 5-celled. Like *C. spicàta*, but differs in the leaves being cordate at the base, and in the racemes being compound.

Strigulose Clidemia. Sh. 2 to 3 feet.

34 C. capitella'ta (D. Don, in mem. wern. soc. 4. p. 310.) branches terete, and are, as well as the petioles, densely clothed with branched down intermixed with a few bristles; leaves petiolate, ovate, acuminated, 5-7-nerved, serrulated, very hairy above, and woolly beneath; peduncles axillary, bearing heads of flowers; lower heads of flowers opposite; flowers very hairy and [illegible]. ♄. S. Native of New Granada, in shady woods. Melástoma capitellàtum, Bonpl. melast. p. 5. t. 3. Lobes of calyx 5, obtuse, very hispid on the outside, but glabrous inside. Style filiform. Berry blue, rather globose. Flowers white.

Headed-flowered Clidemia. Sh. 6 to 12 feet.

35 C. negle'cta (D. Don, l. c. p. 307.) leaves ample, cordate, acuminated, crenated, 7-nerved, very hairy on both surfaces, as well as the stems; spikes elongated, axillary, drooping, simple or compound; calyx girded by 5 scales at the base. ♄. S. Native of Peru.

Neglected Clidemia. Sh. 3 to 4 feet.

§ 2. *Terminales* (from *terminus*, the end; in reference to the spikes or panicles of flowers being terminal). D. C. prod. 3. p. 160. *Spikes or panicles of flowers terminal. Flowers 5-petalled, decandrous.*

* *Thyrse spike-formed, terminal.*

36 C. spicæfórmis (D. C. prod. 3. p. 160.) branches clothed with silky villi; leaves broadly elliptic, crenulated, triple-nerved, acute at both ends, clothed with silky villi beneath; racemes terminal, spike-formed; pedicels 3-flowered. ♄. S. Native of Peru. Melástoma spicàta, Pav. in herb. Lamb. but not of Aubl. Clid. spicàta, D. Don, l. c. p. 308. Evidently distinct from the species of the same name from Guiana.

Spike-formed Clidemia. Sh. 2 to 3 feet.

37 C. depe'ndens (D. Don, in mem. wern. soc. 4. p. 307.) leaves elliptic, acuminated, crenated, 3-nerved, very hairy on both surfaces, as well as the stem; spikes terminal, drooping; calyxes sessile, each girded by 5 bracteas at the base. ♄. S. Native of Peru. Melástoma depéndens, Pav. in herb. Lamb.

Dependent-spiked Clidemia. Sh. 2 to 3 feet.

38 C. eróstra'ta (D. C. prod. 3. p. 160.) shrub densely clothed in every part with stiff ferruginous hairs; leaves petiolate, broadly ovate, obtuse, crenated, 5-7-nerved; spikes terminating the branchlets; flowers sessile along the branchlets, in crowded whorles. ♄. S. Native of Brazil, at Coari. Melástoma eróstràtum, Mart. et Schrank, mss. Allied to *C. spicàta*, but differs in the leaves being obtuse, in the hairs being rufes-

cent, in the lobes of the calyx being small and oblong. Anthers oblong, falcate, each with a long connective. Style filiform.

Beakless-anthered Clidemia. Sh. 4 to 6 feet.

39 C. ceramica'rpa (D. C. l. c.) branches, petioles, and nerves of leaves on the under surface, clothed with adpressed silky villi; leaves ovate-oblong, acute, crenated, villous on both surfaces, 7-nerved; nerves rather feathered at the base; thyrse subspicate, terminal, shorter than the leaves, and rather hispid from villi; branches 3-flowered; tube of calyx bluntly 8-ribbed, with a quite entire limb; petals 5, linear. ♄. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Melástoma ceramicárpum, Schrank et Mart. mss. Anthers elongated. Seeds small, angular. Fruit globose, a little ribbed, hardly the size of a coriander.

Ribbed-fruited Clidemia. Shrub 2 to 3 feet.

40 C.? verticilla'ta (D. C. l. c.) branches tetragonal, densely clothed with villi; leaves petiolate, ovate-oblong, attenuated, denticulated, villous, scabrous above; racemes axillary, whorled along the rachis; calyx villous, with lanceolate-linear, short, reflexed lobes. ♄. S. Native of South America. Melástoma verticillàta, Vahl. eclog. 1. p. 14. Berry globose, small. Petals lanceolate. Perhaps belonging to a separate section.

Whorled-flowered Clidemia. Sh. 2 to 3 feet.

** *Thyrse panicled, terminal.*

41 C. astrótricha (D. C. l. c.) branches from tetragonal to terete, and are, as well as the petioles, panicles, and leaves, hispid; hairs nearly all bristle-formed and stellately branched at the apex, with a very few simple ones on the calyxes and teeth of the leaves; leaves ovate, acuminated, obtuse at the base, dentately serrated, 5-nerved; panicle terminal, having its branches opposite and elongated; teeth of calyx setaceous, not half so long as the tube. ♄. S. Native of Brazil, in Para. Melástoma agréste, Schrank et Mart. mss. but not of Aubl. Petals oval, obtuse. Anthers linear.

Starry-haired Clidemia. Sh. 3 to 4 feet.

42 C. Berbicea'na (D. C. l. c.) branchlets tetragonal, and are, as well as the petioles and peduncles, clothed with soft woolly deciduous irregularly branched down; leaves on short petioles, oval, obtuse at the base, and ending in a short abrupt acumen at the apex, 5-nerved, bristly on both surfaces, but with soft velvety down on the nerves beneath; the margins irregularly and almost doubly crenated; panicle terminal, oppositely branched; calyx and bracteas smoothish. ♄. S. Native of Berbice. Leaves crenated, nearly as in *C. élegans*. Flowers small. Limb of calyx bluntly 5-toothed. Petals oval. Fruit unknown.

Berbice Clidemia. Sh. 2 to 3 feet.

43 C. dichótoma (D. Don, mem. wern. soc. 4. p. 307.) leaves large, ovate, acuminated, serrated, 7-nerved, very villous on the under surface, as well as on the stems; panicle terminal, racemose. ♄. S. Native of Peru. Melástoma dichótoma, Pav. in herb. Lamb. but not of Desr.

Dichotomous Clidemia. Sh. 2 to 3 feet.

44 C. pilòsa (D. Don, l. c. p. 308.) leaves cordate, acuminated, crenulated, 7-nerved, very pilose on both surfaces, as well as on the stems; panicle small, terminal; peduncles usually 3-flowered. ♄. S. Native of Peru. Melástoma pilòsa, Pav. in herb. Lamb. but not of Swartz.

Pilose Clidemia. Sh. 2 to 3 ft.

45 C. trístis (D. Don, l. c. p. 307.) leaves cordate-oblong, crenulated, acuminated, 5-nerved, rough from pili above, but clothed with fuscous wool beneath; panicle terminal, woolly. ♄. S. Native of Peru. Melástoma trístis, Pav. in herb. Lamb.

Sad Clidemia. Sh. 4 to 6 ft.

46 C. agre'stis (D. Don, l. c. p. 309.) stems and branches terete, and are, as well as the petioles, panicles, and leaves, villous; leaves on short petioles, ovate-oblong, acuminated, somewhat serrated, 5-nerved: panicle terminal, oppositely branched; bracteas none or very small; calyx with a globose tube, and 5 short acute lobes. ♄. S. Native of Cayenne, on the banks of rivulets, and in hedges. Melástoma agréstis, Aubl. guian. 1. p. 425. t. 166. Petals oval, white. Berry blue, villous.

Field Clidemia. Fl. Ju. Aug. Clt. 1822. Sh. 1 foot.

47 C. reve'rsa (D. C. l. c.) branches, petioles, and peduncles densely clothed with reflexed stiff hairs; leaves petiolate, lanceolate-oblong, acuminated, crenulately serrated, hispid, 5-nerved; panicle terminal; tube of calyx subglobose, with lanceolate, acuminated lobes, which are about the length of the tube. ♄. S. Native of Brazil. Melástoma revérsum, Ser. mss. Allied to C. *agréstis*.

Reverse-haired Clidemia. Sh. 1 foot.

48 C. anisophy'lla (D. C. l. c.) branches terete, and are, as well as the petioles, peduncles, and calyxes hispid from long spreading distant hairs; the leaves that are opposite each other are very unequal in size; they are petiolate, oval-oblong, acuminated, ciliated, toothed, triple-nerved, besides the marginal nervules, beset with a few scattered pili above, hairy beneath, especially on the nerves; thyrse panicled, terminal, bractless, [illegible] than the leaves; lobes of calyx plumose from bristles. ♄. S. [illegible] of Guiana, where it is called *Tarimoutou*. Melástoma str[illegible] 5-nerved, acutely [illegible] the genitals, have been see[illegible]

Unequal-leaved Clidemia. Sh. 1 to 2 feet.

49 C. trichòdes (D. C. l. c.) branches terete, and are, as well as the petioles, panicles, and leaves densely clothed with long crowded bristles; leaves petiolate, oval-oblong, 5-nerved, ending each in a long taper-point, quite entire, ciliated, with a few scattered bristles above; panicle terminal, oppositely branched, furnished with ovate bracteas at the origin of the branches and flowers, which are pilose on the outside. ♄. S. Native of Cayenne. Leaves 6-7 inches long and 2 broad. Lobes of calyx 5, short, very pilose. Berry blue, pilose at the apex. Seeds ovate. Petals not seen.

Hairy Clidemia. Sh. 2 to 3 feet.

50 C. depaupera'ta (D. C. l. c.) branches terete, and are, as well as the peduncles and petioles, hispid from long spreading scattered rufous bristles; leaves on long petioles, oval, acuminated, 5-nerved, crenated, pilose on both surfaces; the crenæ blunt and crenulated, ciliated; panicle terminal, loose, very hispid, few-flowered; fruit hispid. ♄. S. Native of Guiana, in woods. Melástoma depauperàta, Rich. herb. Leaves soft, spreading.

Depauperated Clidemia. Sh. 2 to 3 feet.

51 C. lìma (D. C. l. c.) branchlets terete, and are, as well as the peduncles, petioles, and calyxes, hispid from short thick adpressed scale-like strigæ; leaves petiolate, oval, acutish, 3-5-nerved, toothed, beset with bristles above, which are bullate at the base, and reticulately foveolate beneath; the nerves rough from bristles; thyrse terminal, short; branches 3-flowered; calyx 5-toothed; petals lanceolate, short, acute. ♄. S. Native of the West Indies. Melástoma Lima, Desr. in Lam. dict. 4. p. 47. Style filiform, acutish. Ovarium bristly. Seeds unknown.

Wrasp Clidemia. Sh. 3 to 4 ft.

52 C. a'ptera (D. C. l. c.) branches bluntly tetragonal, and are, as well as the panicles, petioles, and under side of leaves, hairy from short, bristly, crowded, rufous down; leaves petiolate,

ovate or oblong, acuminated, obtuse at the base, and a little ciliated; nerves 5-7, somewhat feathered; panicle terminal, with opposite divaricate branches; calyx globose, very hairy, with 5 acute lobes, but the points being deciduous they at length become obtuse. ♄. S. Native of Brazil, in woods, in the province of St. Paul. Melástoma ápterum, Schrank et Mart. mss. The whole plant is brown when dried.

Wingless Clidemia. Shrub 2 to 3 ft.

53 C. PURPURA'SCENS (D. C. l. c.) branchlets terete, and are as well as the panicles and petioles clothed with reflexed villi; leaves petiolate, oblong-lanceolate, acuminated, ciliated, hardly quite entire, 5-nerved; panicle terminal, rather loose, oppositely branched; calyx urceolate, hispid, 5-cleft, with the lobes glabrous on the inside. ♄. S. Native of Brazil, near Oeiras, in the province of Bahia. Melástoma purpuráscens, Schrank et Mart. mss. But is different from *Melástoma purpuráscens* of Aubl. in the flowers being nearly twice the size. Branches and calyxes brownish purple on the outside. Bracteas linear. Petals and genitals unknown.

Purplish Clidemia. Shrub 3 to 4 feet.

54 C. CARASSA'NA (D. C. prod. 3. p. 162.) branches nearly terete, rather compressed, and are as well as the petioles, panicles, and under surface of leaves densely clothed with velvety stellate down; leaves on long petioles, oval, acuminated, scabrous on the upper surface from short, simple bristles, quintuple-nerved; panicle terminal; style much exserted, acute. ♄. S. Native of Brazil, on the high mountain called Carassa, in the province of Minas Geraes. Melástoma Caras[illegible] Schrank et Mart. mss. Petioles 12-15 lines [illegible] Ovarium bristly at the ap[illegible]

Carassa Clidemia. Shrub 1 to 2 ft.

55 C. BRACTEA'TA (D. C. prod. 3. p. 162.) branches terete, and are as well as the panicles and petioles hairy from crowded, long, rufous bristles; leaves oval, rather cuneated at the base, acuminated at the apex, 5-nerved, almost quite entire, ciliated, beset with stiff hairs beneath; thyrse panicled, terminal, with opposite branches, bearing dense heads of flowers at the apex, intermixed with ovate acute bracteas. ♄. S. Native of Guiana, between Conana and Yueri. Melástoma trístis, Rich. herb. Flowers white.

Bracteate-flowered Clidemia. Shrub 1 to 2 feet.

56 C. MUTA'BILIS (D. C. l. c.) branchlets terete, and are as well as the petioles and peduncles very villous from rufous, adpressed, strigose hairs; leaves oval, cuneated at the base, acuminated at the apex, quite entire, 5-nerved, clothed with adpressed hairs on both surfaces; thyrse panicled, terminal, with opposite branches bearing heads of sessile bracteate flowers at the apex; calyx densely clothed with silky villi. ♄. S. Native of Guiana, in shady woods. Melástoma mutábilis, Rich. herb. Very nearly allied to *C. bracteàtum*, but differs in the calyxes being silky, not hairy, and in changing to a greenish-glaucous colour on drying.

Changeable-coloured Clidemia. Shrub 1 to 2 feet.

57 C. LAPPA'CEA (D. C. l. c.) branches terete, and are as well as the petioles covered with somewhat adpressed, thick, strigose hairs; leaves oval, somewhat acuminated, 5-nerved, crenated, ciliated, beset with scattered bristles on both surfaces, but hairy on the nerves beneath; thyrse panicled, terminal, short, with opposite branches, bearing heads of sessile bracteate flowers at the apex; fruit very hispid. ♄. S. Native of Guiana, in woods. Melástoma lappàcea, Rich. herb. This species is nearly allied to the two preceding, but differs in the leaves being broadly crenated or somewhat bicrenate, and purple beneath.

Burdock Clidemia. Shrub 1 to 2 feet.

58 C. VIOLA'CEA (D. C. l. c.) branches terete, and are as well as the petioles, nerves of leaves, and calyxes, clothed with adpressed silky villi; leaves on short petioles, ovate, acuminated, obtuse at the base, crenated, somewhat ciliated, quintuple-nerved, beset with scattered hairs between the nerves; thyrse racemose, terminal, much shorter than the leaves, with crowded, 3-flowered branchlets: calyx densely clothed with hairs; petals oblong, obtuse. ♄. S. Native of Cayenne, in shady woods. Melástoma violàcea, Rich. herb. Fruit globose, ribless, pilose, crowned by the limb of the calyx, which is very short and somewhat 5-toothed. Ovarium pilose at the apex. Leaves purplish.

Violaceous-leaved Clidemia. Shrub 1 to 3 feet.

59 C. COCCI'NEA (D. C. l. c.) branches terete, and are as well as the petioles clothed with adpressed bristles; leaves ovate-oblong, acuminated, toothed, triple-nerved, besides the 2 marginal nervules, beset with scattered bristles, but with silky villi on the nerves; thyrse terminal, panicled, beset with short hairs, with its branchlets opposite, and bearing 3 flowers each at the apex; calyx covered with short adpressed villi. ♄. S. Native of Guiana, in shady woods. Melástoma coccínea, Rich. herb. but not of Rich. in act. soc. hist. nat. par. Very like *C. violàcea*, but the leaves are only purple beneath.

Scarlet Clidemia. Sh. 1 to 2 feet.

60 C. LANA'TA (D. C. l. c.) branches, petioles, both surfaces of leaves as well as the branches and calyxes densely clothed with woolly down; hairs some of them sessile and stellate, others bristle-like and stellate at the apex; leaves petiolate, ovate, terminating in short taper points, 3-nerved, besides the [illegible] nervules, denticulated; panicle terminal, crowded with flowers, having its branches opposite; teeth of calyx 5, obtuse. ♄. S. Native of Guiana, Cuba, about the Havannah, and the Island of Trinidad. Melástoma lanàtum, Lamb. herb. Flowers white, very fragrant. Petals obovate. Anthers linear, opening by 1 pore, bluntly biauriculated at the base. Ovarium girded by a ring of bristles at the apex. Stigma somewhat capitate. A very distinct species.

Woolly Clidemia. Shrub 1 to 2 feet.

61 C. OBSCU'RA (D. C. l. c.) branchlets as well as the petioles, panicles, and under side of leaves densely clothed with rusty woolly down and small hairs; leaves petiolate, broadly ovate, acute, 5-7-nerved, quite entire, beset with pili above, which are bullate at the base; panicle terminal, with its branches opposite and crowded with flowers at the apex. ♄. S. Native of Peru, in frigid places. Melástoma obscùra, Bonpl. mel. t. 52. Limb of calyx campanulate, bluntly 5-toothed. Petals obovate-roundish. Ovarium half free from the calyx, furnished with 10 bristles at the apex. Stigma peltate. Berry 3-4-celled. Flowers white.

Obscure Clidemia. Shrub 2 to 3 feet.

62 C. INVOLUCRA'TA (D. C. prod. 3. p. 163.) branches terete, and are as well as the petioles hairy; leaves petiolate, oval, attenuated at the base, acuminated at the apex, toothed, ciliated, triple-nerved, besides the marginal nervules, pilose on both surfaces; thyrse sessile, capitate, terminating the branchlets, bracteated or involucrated by 2 leaves, hairy, very short. ♄. S. Native of Guiana, in woods. Melástoma involucràtum, Rich. herb. Leaves thin, soft. Branches spreading. Heads of flowers a violaceous purple colour.

Involucrated Clidemia. Shrub 2 feet.

* * * *Panicles terminal, very hispid from purplish hairs.*

63 C. RHODO'POGON (D. C. prod. 3. p. 163.) branchlets terete, and are as well as the petioles and nerves of leaves densely clothed with bristles; leaves beset with scattered bristles on both surfaces, petiolate, oblong, acuminated, serrated, ciliated, 3-nerved besides the marginal nervules; panicle terminal, much branched, divaricate, and are as well as the calyxes very hispid

from long purplish bristles. ♄. S. Native of Brazil, in the province of Para, in woods. Melástoma rhodópogon, Schrank et Mart. mss. This is a very showy species. Petals purplish or white. Stamens not seen. Style filiform. Lobes of calyx 5, narrow, acute, confused with the bristles.

Red-bearded Clidemia. Shrub 2 to 3 feet.

* * * * *Panicles terminal. Petals lanceolate. Bristles on the stems spreading, and very stiff.*

64 C. XANTHOLA'SIA (D. C. l. c.) branches terete, and are as well as the panicles and petioles hispid from long, spreading, stiff bristles; leaves petiolate, oblong, acute at the base, long-acuminated at the apex, 5-nerved, somewhat serrately ciliated, glabrous, except some bristles on the nerves beneath; panicle terminal; calyx urceolate, very hispid, bearing a few stellate soft hairs among the bristles. ♄. S. Native of Brazil, in the province of Rio Janeiro, on the mountains in shady places of woods. Melástoma xantholàsia, Schrank et Mart. mss. Hairs on the panicles and calyx yellow.

Yellow-haired Clidemia. Shrub 2 to 3 feet.

65 C. LONGIBA'RBIS (D. C. l. c.) branches nearly terete, and are as well as the panicles, petioles, and leaves, hispid from scattered, stiff, long bristles, intermixed with rufous down on the panicle; leaves oblong, petiolate, serrately ciliated, acuminated, obtuse at the base, 5-nerved; panicle terminal; bracteas linear, each ending in a bristle. ♄. S. Native of Brazil, in woods. Melástoma longibárbe, Schrank et Mart. mss Petals lanceolate, acuminated. Anthers oblong-linear

Long-bearded Clidemia. Shrub 2 to 3 feet.

66 C. STENOPE'TALA (D. C. l. c.) shrubby; branches somewhat tetragonal, densely clothed with retrograde bristles; leaves petiolate, ovate, acuminated, serrated, 5-nerved, villous on both surfaces as well as on the margins; panicle terminal; calyx clothed with spreading stiff hairs or bristles; petals 5, linear-lanceolate, very acute. ♄. S. Native of the interior of Brazil. Melástoma stenopétalum, Mart. et Schrank, mss. Lobes of calyx 5, narrow, acute. Flower-bud conical. Style filiform, not dilated at the apex, longer than the stamens. Anthers oblong, somewhat tuberculate at the base, obtuse at the apex, either opening by 1 or 2 pores. Fruit unknown.

Narrow-petalled Clidemia. Shrub 2 to 3 feet.

67 C. GLOMERA'TA (D. C. l. c.) branches, panicles, petioles, and under surface of leaves hispid from long stiff bristles, intermixed with small, stellate down; leaves petiolate, ovate, short-acuminated, obtuse at the base, 5-nerved, ciliated, somewhat crenulated, bristly above; panicle terminal, capitate, few-flowered. ♄. S. Native of Brazil, in woods. Melástoma conglomeràtum, Schrank et Mart. mss. Calyx and peduncles beset with black bristles; upper surface of leaves with yellowish ones, and the branches with retrograde ones.

Glomerate-flowered Clidemia. Shrub 1 to 2 feet.

68 C.? NIA'NGA (D. C. l. c.) suffruticose; branches tetragonal, and are as well as the petioles, peduncles, and calyxes hispid from deflexed spreading bristles; leaves on long petioles, ovate, hardly cordate at the base, long-acuminated, denticulated, 5-nerved; thyrse panicled, terminal; flowers decandrous; lobes of calyx linear, ciliated with bristles, a little shorter than the tube; anthers beakless. ♄. S. Native of Brazil, in woods on Mount Cercovado near Rio Janeiro. Rhéxia Niánga, Mart. et Schrank, mss. Bristles stiff, purplish, intermixed with down. Petals an inch long. Leaves 4 inches long. Branches of thyrse spreading or deflexed. Petals, according to the msst, white or very pale red. Fruit unknown. Perhaps a species of *Melástoma*. *Nianga* is the native name of the plant.

Nianga Clidemia. Shrub 1 to 3 feet.

69 C. FOVEOLA'TA (D. C. l. c.) branches nearly terete, and are as well as the panicles, petioles, and leaves hispid from thick, spreading, stiff bristles; leaves petiolate, oval-oblong, blunt at the base, and somewhat cordate, acuminated at the apex, serrulated, ciliated, rather blistered above, 5-nerved, but bristly and foveolate beneath; panicle oblong, terminal; calyxes bearing stellate down among the bristles. ♄. S. Native of Brazil, in the province of Minas Geraes, in irrigated places of woods. Melástoma foveolàtum, Schrank et Mart. mss. Hairs on the lower surface of the leaves diverging, disposed in 2 rows at the sides of the nerves. Petals lanceolate, acute.

Foveolate-leaved Clidemia. Shrub 2 to 3 feet.

70 C. BISE'PTENA (D. C. prod. 3. p. 164.) branches from tetragonal to terete, and are as well as the panicles and petioles clothed with crowded, spreading, somewhat deflexed bristles; leaves on long petioles, ovate, blunt at the base, acute at the apex, toothed, ciliated, clothed with stiff villi on both surfaces, 7-nerved; panicles axillary and terminal, with opposite spreading branches; petals 7, linear-lanceolate, acute. ♄. S. Native of Brazil. Melástoma biseptenàtum, Schrank et Mart. mss. Bristles long, rufous. Calyx hispid, 5-cleft. Style filiform. Anthers oblong, obtuse, said to be allied to *M. agréstis*.

Bisceptenate-flowered Clidemia. Shrub 1 to 2 feet.

* * * * * *Panicles terminal, with the branches spreading, and bearing the flowers on one side only.*

71 C. HETEROBA'SIS (D. C. l. c.) branchlets somewhat tetragonal, and are as well as the panicles, petioles, and leaves, especially on the under surface, clothed with soft hairs or down; leaves on long petioles, ovate, unequally cordate at the base, acuminated [illegible] 7-nerved, acutely and unequally toothed, [illegible]ated; panicle terminal; calyx rather glandular, hispid, with 5 short, acuminated lobes. ♄. S. Native of Brazil, in the province of Para. Melástoma heterobàsis, Mart. herb. Melast. soleníferum, Schrank, descr. Petioles 12-15 lines long. Flowers small. Anthers violaceous, obtuse. Allied to *C. secúnda*, but truly distinct from it in the leaves being somewhat cordate at the base, in being toothed, not serrated, and in the hairs being soft, not bristly, &c.

Unequal-based-leaved Clidemia. Shrub.

72 C. INTERME'DIA (D. C. l. c.) branches terete, and are as well as the panicles, calyxes, petioles, and leaves clothed with adpressed bristles; leaves on long petioles, ovate, acuminated, obtuse at the base and somewhat cordate, ciliately serrated, 5-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund. ♄. S. Native of Brazil, in woods at Rio Negro. Melástoma hispidum, Mart. herb. Very like *C. secúnda*, but differs in the leaves being of the form of those of *C. heterobàsis*.

Intermediate Clidemia. Shrub.

73 C. SECUNDIFLÒRA (D. C. l. c.) branchlets terete, and are as well as the calyxes, panicles, petioles, and leaves clothed with adpressed stiff villi; leaves petiolate, oval, acuminated, ciliately serrated, 5-nerved, or almost quintuple-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund. ♄. S. Native of Brazil, in woods, at Para, and Rio Negro. Melástoma secúndum, Mart. et Schrank, mss. The habit of the plant and the inflorescence agrees with *C. làcerum*, but differs in the hairs being adpressed, not spreading, in the lobes of the calyx being entire, not ciliately jagged, and in the bracteas being linear-subulate, not almost wanting. Anthers obtuse.

Secund-flowered Clidemia. Shrub 4 to 5 feet.

74 C. INÆQUALIFÒLIA (D. C. l. c.) branches from tetragonal to terete, and are as well as the petioles and panicles clothed with spreading hairs; leaves petiolate, oval, obtuse at the base, ending each in a long, narrow acumen at the apex, serrulated,

5-nerved, bristly above, but clothed with villi beneath, those opposite each other usually of a different size; panicles terminal. ♄. S. Native of Brazil, in woods, in the province of Para. Melástoma inæqualifòlium, Schrank et Mart. mss. Leaves sometimes equal in size, sometimes very unequal, the larger ones 6-7 inches long, and the smaller ones 1-2 inches. Flowers small, 5-cleft. Style filiform, exserted. Anthers not auricled at the base.

Unequal-leaved Clidemia. Shrub 2 to 4 feet.

75 C. LA'CERA (D. C. l. c.) branches terete, and are as well as the petioles and peduncles hispid from long, scattered, spreading bristles; leaves petiolate, oval-lanceolate, acuminated, 5-nerved, denticulated, ciliated, hairy on both surfaces; branches of terminal panicle dichotomous; flowers sessile, secund; calyx with a globose tube: and 5 lobes, which are furnished with palmately disposed bristles at the apex. ♄. S. Native of New Granada, on Mount Quindiu, and at the town of Mariquita. Melástoma lácera, Bonpl. mel. t. 5. Petals oval, white. Berry 3-celled.

Jagged-calyxed Clidemia. Shrub 3 to 6 feet.

76 C. SECU'NDA (D. Don, in mem. wern. soc. 4. p. 308.) leaves oval, acuminated, 5-nerved, crenulated, rounded at the base, very pilose on both surfaces as well as the stems; panicle terminal, divaricate, with bifid, many-flowered bracteas; flowers secund. ♄. S. Native of Peru. Melástoma secúnda, Pav. in herb. Lamb.

Side-flowered Clidemia. Shrub 3 to 4 ft.

77 C. LAMBERTIA'NA (D. C. prod. 3. p. 164.) leaves [illegible] cordate, acute, 3-nerved, crenulated, very pilose [illegible] both surfaces as well as on the stems; pa[illegible]ers sessile; calyx scaly at the base. ♄. S. Native of Peru. Melástoma crenàta, Pav. in herb. Lamb. but not of Vahl. Clidemia crenàta, D. Don, mem. wern. soc. 4. p. 308. Melástoma Lambertiàna. Ser. mss.

Lambert's Clidemia. Shrub.

Cult. The species of *Clidèmia* are by no means showy, and on that account are not very desirable. Their culture and propagation are the same as that for *Melástoma*, see p. 764.

XLIX. MYRIA'SPORA (from μυριας, *myrias*, a myriad, and σπορα, *spora*, a seed; in reference to the innumerable seeds contained in the fruit). D. C. prod. 3. p. 165.

LIN. SYST. *Decándria, Monogýnia.* Calyx very hispid, with an ovate-globose tube; limb closed when in a young state, and therefore constituting an ovate bud, but at length separating into 5 irregular broad lobes. Petals 5. Stamens 10; filaments short; anthers thick, rather obtuse, gibbous at the base. Style filiform. Free part of ovarium beset with bristles. Capsule baccate, ovate-globose, 5-celled. Seeds innumerable, ovate, imbedded in the pulp of the fruit.—Brasilian shrubs. Branches terete, hispid. Leaves petiolate, rather unequal at the base, quintuple-nerved, acuminated, dentately serrated, hispid on the nerves, the rest beset with scattered bristles. Peduncles axillary, 1-3, short. Fruit large, very hispid.

1 M. EGE'NSIS (D. C. prod. 3. p. 165.) leaves oblong; lobes of calyx hispid on both sides. ♄. S. Native of Brazil, in woods, at Ega, in the province of Rio Negro. Melástoma Egénse, Mart. herb. Bláckia Egénsis, Schrank, mss.

Ega Myriaspora. Shrub 3 to 6 feet.

2 M. PAULE'NSIS (D. C. l. c.) leaves oval; lobes of calyx glabrous on the inside. ♄. S. Native of Brazil, in the province of Rio Negro. Melástoma Paulénse, Schrank, mss. Perhaps only a broad-leaved variety of *M. Egénsis.*

St. Paul Myriaspora. Shrub 4 to 6 feet.

Cult. See *Melástoma*, p. 764. for culture and propagation.

L. TOCO'CA (*Tococo* is the name of *T. Guianénsis* by the Indians of Guiana). Aubl. guian. 1. p. 438. D. C. prod. 3. p. 165. Tocòca species, D. Don, in mem. wern. soc. 4. p. 303.—Melástoma species of authors.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx oblong, glabrous, naked at the base; limb urceolate, permanent, 5-lobed: lobes broad, short, obtuse, usually ciliated. Petals 5, obovate. Stamens 10; anthers equal, furnished each with a very short or hardly evident connective, which is biauriculate at the base. Ovarium crowned by a circular line of bristles. Style cylindrical, crowned by a large, orbicularly peltate stigma. Capsule baccate, 5-celled. Seeds ovate, angular, with a linear hylum.—South American shrubs, hispid from thick hairs or bristles. Branches tetragonal. Leaves opposite, equal, 3-5-nerved. Petioles short, bristly, tumid, or inflated at the apex into 2 bladders, which are open at the apex. Flowers white or rose-coloured, disposed in a thyrse composed of racemes.

1 T. GUIANE'NSIS (Aubl. l. c. t. 174.) branches tetragonal or compressed between the nodes, covered with bristles on the angles; leaves broadly ovate, acuminated, hardly crenulated, 5-nerved, bristly on the nerves and margins, and beset with scattered bristles above; petioles inflated above; panicle terminal; calyx rather pilose. ♄. S. Native of Guiana. Melástoma physóphora, Vahl. ecl. 1. p. 45. Poir. suppl. 3. p. 629. Melast. Tocòca, Desr. in Lam. dict. 4. p. 39. Petiole hardly 3 lines long beneath the bladder, which is subglobose. Limb of calyx campanulate, with the teeth broad at the base and acute at the apex, ciliated. Petals concave, rose-coloured. Berry oval, purple. T. Aublètia, D. Don, l. c.

Guiana Tococa. Fl. Aug. Sept. Clt. 1826. Sh. 3 to 4 ft.

2 T. FORMICA'TA (Mart. herb. ex D. C. prod. 3. p. 165.) branches somewhat tetragonally terete, beset with long, scattered bristles; leaves equal, oval, acuminated, 5-nerved, serrated, beset with bristles on the margins and on the nerves beneath, but with scattered bristles above; petioles inflated at the apex; panicle terminal; calyx glabrous. ♄. S. Native of Brazil, in the province of Goyaz, in woods. Very like the preceding species. Leaves 10 inches long. Petiole almost an inch long, beneath the bladder, which is ovate and erect. Lobes of calyx awned.

Insect Tococa. Shrub 3 to 4 feet.

3 T. BULLI'FERA (Mart. et Schrank, mss. ex D. c. l. c.) branches terete, but tetragonal at the apex as well as the rachis, sparingly pilose; leaves elliptic-oblong, acuminated, ciliated, almost quite entire, 5-nerved, membranous, beset with minute, scattered bristles on both surfaces; petiole inflated into an elongated bladder; calyx rather pilose. ♄. S. Native of Brazil, in the province of Para, in woods. The rachis of the simple raceme nearly tetragonal. Petiole 4 lines long, beneath the bladder, which is nearly an inch long.

Blister-bearing Tococa. Shrub 2 to 3 feet.

4 T. VESICULÒSA (D. C. prod. 3. p. 166.) stem beset with spreading pili; leaves hardly unequal, on long petioles, ovate, 5-nerved, acute, bearing 2 bladders at the apex of the petiole; cyme panicled, axillary, pedunculate. ♄. S. Native of Mexico. Melástoma vesiculòsa, Moc. et Sesse, fl. mex. icon. ined. Flowers small, rose-coloured.

Bladdery-petioled Tococa. Shrub 2 feet.

5 T. SANGUI'NEA (D. Don, in mem. wern. soc. 4. p. 305.) the whole plant clothed with blood-coloured hairs; leaves cordate, oval, acuminated, 5-nerved, crenulated, densely clothed with stiff hairs on both surfaces as well as the stem; calyx furnished with scales at the base; filaments glandular; style short. ♄. S. Native of Peru.

Bloody-haired Tococa. Shrub 2 to 3 feet.

Cult. The plants of this genus are remarkable for bearing bladders on their petioles. Their culture and propagation is the same as that recommended for *Melástoma*, see p. 764.

LI. MAIE'TA (the author does not explain the meaning of this name). Aubl. guian. 1. p. 443. but not of Vent. D. C. prod. 3. p. 166.—Tocòca, spec. D. Don.—Melástoma spec. of authors.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx oblong-ovate, more or less hispid, and usually bracteate; lobes 5, subulate. Petals 5, obovate. Stamens 10. Anthers equal, each furnished with a very short connective, which is biauriculated behind. Ovarium glabrous above, and as if it were truncate. Style filiform; stigma capitate. Capsule baccate, 5-celled. Seeds ovate, angular.—American subshrubs, hispid from thick pili. Branches from compressed to terete. Leaves on short petioles, those opposite each other of unequal size, the largest of the two bladdery at the base of the limb; the bladders usually confluent. Flowers solitary or few in the axils of the leaves.

1 M. Guiane'nsis (Aubl. guian. 1. p. 443. t. 176.) branches and petioles beset with spreading bristles; leaves on short petioles, of unequal size, the larger ones ovate, acuminated, somewhat denticulated, 5-nerved, obtuse at the base, bearing a bladder at the base of the limb, the smaller ones oblong, without any bladder; flowers axillary, solitary, on short pedicels; teeth of calyx subulate, elongated; bracteas 4, acuminated. ♄. S. Native of French Guiana, in woods. Melástoma Maièta, Desr. in Lam. dict. 4. p. 34. Tocòca Maièta, D. Don, in mem. soc. 4. p. 303. Flowers white.

Guiana Maieta. Shrub 2 feet.

2 M. hypophy'sica (D. C. prod. 3. p. 166.) branches and petioles beset with a few spreading bristles; leaves of unequal size, on short petioles, the larger ones oval, acuminated, somewhat serrulated, 5-nerved, obtuse at the base, bearing a bladder at the base of the limb, the smaller ones oval-oblong, acuminated, without any bladder; flowers axillary, numerous, almost sessile; teeth of calyx short, subulate; bracteas 1, broad, each ending in a short acumen. ♄. S. Native of Brazil, in woods. Melástoma Maièta and M. hypophýsicum, Schrank et Mart. mss. Very near *M. Guianénsis*, but differs in the branches being more compressed and less bristly, but the calyxes are more bristly and teeth shorter.

Under-bladder-leaved Maieta. Shrub 2 to 3 feet.

3 M. heterophy'lla (D. C. l. c.) branches and petioles hispid from spreading bristles; leaves of unequal size, the larger ones petiolate, bearing 2 bladders at the top of the petiole, oval-oblong, acuminated, the smaller leaves sessile, cordate, and stem-clasping, nearly orbicular, mucronate, not bladdery; cymes axillary, pedunculate, few-flowered. ♄. S. Native of Peru. Melástoma heterophýlla, Desr. in Lam. dict. 4. p. 43. Tocòca heterophýlla, D. Don, l. c.

Variable-leaved Maieta. Shrub 2 to 3 feet.

Cult. See *Melástoma* for culture and propagation, p. 764.

LII. CALO'PHYSA (καλος, *kalos*, pretty, and φυσα, *physa*, a bladder; in reference to stipular bladders at the base of the petioles). D. C. prod. 3. p. 166.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx oblong, enlarging with the fruit, and roundish, and therefore bottle-shaped; lobes 4, broad, short, plumosely ciliated from bristles. Petals 4, obovate. Stamens 8; filaments flat, tapering to the apex. Anthers oblong, without auricles. Style filiform, not capitate at the apex. Capsule baccate, 4-celled. Seeds ovate, angular?—A Brazilian shrub, allied to *Tocòca*, but differs in the bladders not being at the apex of the petiole but at the base, apparently in place of stipulas, in the parts of the flowers being quaternary, not quinary, in the calyx being at length bottle-shaped, in the anthers being without auricles, and in the stigma not being dilated.

1 C. tococoi'dea (D. C. l. c.). ♄. S. Native of Brazil, in shady places. Branches terete, and are as well as the petioles beset with spreading, stiff bristles. Bladders roundish, one on each side at the base of the petiole. Leaves cordate, acute, 7-nerved, toothed, ciliated, beset with scattered bristles above, and with bristles on the nerves beneath, but glandular between the nerves. Cymes few-flowered, axillary, crowded, short.

Tococa-like Calophysa. Shrub.

Cult. See *Melástoma* for culture and propagation, p. 764.

LIII. SONERI'LA (*Soolli Soneri-ila* is the name of *S. maculáta* in the Khassee language). Roxb. fl. ind. 1. p. 180. Wall. pl. asiat. rar. 2. t. 2. Blume in bot. zeit. 1831. no. 27. p. 489.

Lin. syst. *Triándria, Monogýnia.* Tube of calyx oblong or somewhat trigonal, usually muricated, adhering to the ovarium; limb trifid, with the segments deciduous. Petals 3, ovate-lanceolate, acute. Stamens 3. Anthers linear-oblong, straightish, emarginate at the base, opening by 2 pores at the apex, without any appendages. Ovarium truncate at the apex, glabrous. Style filiform; stigma obtuse. Capsule turbinate, crowned by the margin of the calyx, which is thickened on the inside, 3-celled, 3-valved, valves opening only at the apex. Seeds cuneate, angular, of 2 forms.—Usually small shrubs, rarely annual plants. Branches terete. Leaves opposite, rarely scattered, those opposite each other are for the most part unequal in size, one of which is sometimes almost abortive, quite [illegible] toothed, membranous, hairy. Peduncles axillary and terminal, racemose or fasciculate, few or many-flowered. Flowers rose-colour[illegible]ry number of the parts of the flower is sufficient to distinguish this genus from all others of *Melastomaceæ*.

Sect. I. Soneri'læ (see genus for derivation). Blum. l. c. p. 490. Calyx hairy, hardly angular. Petals ovate, acute, broad at the base. Capsule turbinate, opening by 3 valves, which are bipartite at the apex.

1 S. begoniæfòlia (Blum. l. c.) stem herbaceous, hairy; leaves quintuple or septuple-nerved, obliquely cordate at the base, acute, quite entire, ciliated, scabrous above, but beset with small adpressed bristles beneath, those opposite each other unequal in size, one of them almost sessile and heart-shaped; racemes axillary and terminal, many-flowered; flowers sessile. ⊙. S. Native of Java, at the river Tjarvia, in the province of Bantam. Flowers rose-coloured.

Begonia-leaved Sonerila. Pl. 1 foot.

2 S. Molucca'na (Roxb. fl. ind. 1. p. 182.) leaves in pairs, entire, having one minute and nearly round, the other unequally cordate; racemes umbelled. ⊙. S. Native of the Moluccas. Flowers rose-coloured.

Molucca Sonerila. Pl. 1 foot.

3 S. pauciflòra (Blum. l. c. p. 491.) suffruticose; stems beset with stiff hairs; leaves 3-nerved, besides the marginal nervules, oblong, acuminated, auriculately semi-cordate at the base, denticulated, and rather hairy, those opposite each other unequal in size, one of which is cordate and sessile; peduncles axillary, few-flowered. ♄. S. Native of Java, on the mountains. Flowers rose-coloured.

Few-flowered Sonerila. Shrub 1 to 2 feet.

Sect. II. Trigonoca'psæ (from τρεις, *treis*, three, and γωνια, *gonia*, an angle; in reference to the trigonal capsule and calyx). Blum. l. c. Calyx glabrous, trigonal. Petals ovate-lanceolate, acute at both ends. Capsule turbinate, attenuated at the base, trigonal; valves 3, undivided, dehiscent. Leaves opposite, nearly equal, hardly oblique at the base.

4 S. ERE'CTA (Jacq. mal. misc. 1. no. 5. p. 7.) stem fruticulose, with 2 opposite downy lines; leaves 3-nerved, lanceolate, acute at both ends, serrated, hairy; spikes terminal, few-flowered. ♄. S. Native of Pulo-Penang, in woods. Flowers red.

Erect Sonerila. Shrub 1 to 2 feet.

5 S. SQUARRÒSA (Wall. in Roxb. fl. ind. 1. p. 182. and pl. asiat. rar. 2. p. 1. t. 102.) stem suffruticose, erect, glabrous, almost simple, with numerous stipularly soft prickles; leaves crowded towards the top of the plant, cuneate-lanceolate, cuspidately serrated, smooth, tapering into the petioles, which are very short; racemes terminal and axillary; flowers secund. ♃. S. Native of the East Indies, growing among ferns on the Khassee mountains, where it is called *Tearanga*. Petals oval, acute, contracted at the base, rose-coloured. Anthers bilocular, opening on both sides along their whole length. ex Wall. l. c.

Squarrose Sonerila. Pl. ¼ to ⅓ foot.

6 S. ANGUSTIFÒLIA (Roxb. fl. ind. 1. p. 182. Wall. pl. rar. asiat. 2. p. 1. t. 102.) stem suffruticose; leaves ovate-oblong, acuminated, nearly equal, ciliated, acute at the base, beset with simple hairs on both surfaces, as well as on the branches; racemes terminal and lateral, few-flowered. ♃. S. Native of the mountains, on the north-east border of Bengal. Flowers rose-coloured.

Narrow-leaved Sonerila. Pl. ⅓ to 1 foot.

7 S. MACULA'TA (Roxb. fl. ind. 1. p. 180.) stem short; branches recumbent, rooting at the apex, bristly; leaves on long petioles, unequally broad-ovate-cordate, acuminated, setosely serrulated: beset with small, white, elevated specks, fro[illegible] centre of each rises a bristle; racemes axillary, spiral, [illegible] hairy coloured peduncles. ♃. S. Native among the mountains upon the north-east border of Be[illegible], it is used by the natives as a pot-herb. Its vernacular na[illegible] in the Khassee language is *Sootli-Soneri-ila*. Rheed. mal. 9. p. 127. t. 65. Flowers rose-coloured.

Spotted-leaved Sonerila. Pl. recumbent.

8 S. EMACULA'TA (Roxb. fl. ind. 1. p. 181.) leaves unequally narrow-cordate, acute, bristly, but without spots, serrulated, ciliated. ♃. H. Native among the Khassee mountains, on the north-east border of Bengal. It differs from *S. maculàta*, in the leaves being destitute of little round white dots, from which the bristles rise. It is also less robust than that plant, with longer peduncles to the racemes, but the flowers and capsules are alike.

Spotless-leaved Sonerila. Pl. 1 foot.

9 S. TENUIFÒLIA (Blum. l. c.) stem suffruticose, rough; leaves 3-nerved, opposite, one of which is smaller than the other, ovate-lanceolate, acuminated, obtuse, or rather cordate at the base, serrated, beset with scattered bristles above, rather glaucous beneath; peduncles terminal, 1-3-flowered. ♄. S. Native of Java, in woods. Flowers red.

Fine-leaved Sonerila. Sh. 1 to 2 feet.

Cult. For culture and propagation of the stove species, see *Melástoma*, p. 764.; but see *Centradènia*, p. 766. for that of the annual kinds. Rather pretty plants when in flower.

LIV. MEDINI'LLA (meaning unknown to us). Gaud. ined. ex D. C. prod. 3. p. 167. Blum. in bot. zeit. 1831. no. 29. p. 508.

LIN. SYST. *Octo-Decándria, Monogýnia.* Tube of calyx ovate or obovate, ribless, adhering to the ovarium; limb truncate or obsoletely 4-5-toothed, rarely cleft irregularly, continuous with the tube. Petals 4-5, oval or obovate, obtuse or obliquely truncate, rather fleshy. Stamens 8-10, equal, or the alternate ones are smaller; anthers oblong-linear, arched, beaked, and opening by one pore at the apex; their connectives 2-lobed or bifid in front, but spur-formed behind, and confluent with the anthers. Ovarium glabrous at the apex, rarely downy. Style subulate, tumid at the base, crowned by a small obtuse stigma. Berry ovate-oblong, or ovate-globose, crowned by the limb of the calyx, 4-5-celled. Seeds oval, smoothish.—Smoothish shrubs, rarely covered with stellate down, sometimes sarmentose, and sometimes parasitic; branches terete or tetragonal. Leaves opposite or in whorls, petiolate or sessile (branches sometimes with a circle of tomentum or ramentæ at the insertion of the leaves), quite entire, rarely denticulated, nerved. Cymes or umbels simple and few-flowered, or disposed in many-flowered compound panicles or corymbs, axillary or terminal. Flowers very pale red; pedicels reddish.

SECT. I. CAMPTOPLACU'NTIA (from καμπτω, *campto*, to bend, and πλακους πλακουντος, *placous placountos*, a placenta; in reference to the placenta, which is bent). Blum. l. c. p. 509. Tube of calyx ovate; limb cylindrically tubular, somewhat truncate, rarely cleft. Seminiferous receptacle bent in on both sides between the cells.—Smooth shrubs, with whorled petiolate leaves. Cymes few-flowered, axillary; pedicels bractless, and articulated at the base.

* *Flowers octandrous.*

1 M. QUADRIFÒLIA (Blum. l. c. p. 509.) branchlets terete; leaves usually 4 in a whorl, rarely 3 or 5, cuneate-oblong, acute, triple-nerved. ♄. S. Native of Java, on Mounts Gede and Salak, in woods. Melástoma quadrifòlium. Blum. bijdr. p. 1069.

[illegible]ved Medinilla. Sh. 4 to 6 ft.

2 M. RÒSEA (Gaud. in Freyc. voy. pt. bot. p. 484. t. 106.) branches bluntly tetragonal; leaves 3-4 in a whorl, oval, mucronate, triple-nerved. ♄. S. Native of Marianne Island. Tube of calyx obovate, exactly truncate. Peduncles axillary, 6-8-flowered. Flowers and berries rose-coloured.

Rose-coloured-flowered Medinilla. Sh. 4 to 6 ft.

3 M. RADI'CANS (Blum. l. c.) branches terete, rooting; leaves 3-7-nerved, oblong-lanceolate, acuminated at both ends, rather veiny. ♄. S. Native of Java. Melástoma radicans, Blum. bijdr. p. 1069.

Rooting Medinilla. Sh. 4 to 6 ft.

* * *Flowers decandrous.*

4 M. PTEROCAU'LA (Blum. l. c. p. 509.) branches with membranous wings; leaves 4-8 in a whorl, oblong-lanceolate, acuminated, tapering into the petiole at the base, triple-nerved. ♄. S. Native of Java, in the provinces of Buitenzorg, Tjanjor, and Bantam, in woods on the mountains.

Wing-stemmed Medinilla. Sh. 3 to 6 ft.

5 M. CRASSINE'RVIA (Blum. l. c. p. 510.) branches terete; leaves 4 in a whorl, acute, rather cuneated at the base, triple-nerved, fleshy; peduncles usually 1-flowered. ♄. S. Native of the Island of Banda, on Mount Baudao.—Rumph. amb. 5. p. 67.?

Thick-nerved-leaved Medinilla. Sh. 4 to 6 ft.

6 M. MACROCA'RPA (Blum. l. c.) branches nearly terete; leaves 4 in a whorl, oval, acute, cuneated at the base, triple-nerved; limb of calyx irregularly cleft. ♄. S. Native of the Moluccas.—Rumph. amb. 5. p. 67. t. 35. f. 2.

Long-fruited Medinilla. Sh. 4 to 6 ft.

SECT. II. SARCOPLACU'NTIA (σαρξ σαρκος, *sarx sarcos*, flesh, and πλακους πλακουντος, *placous placountos*, a placenta; in reference to the placenta being fleshy). Blum. in bot. zeit. 1831. no. 29. p. 510. Tube of calyx obovate or nearly globose; limb short, truncate, or denticulated. Seminiferous receptacle thick, fleshy, hence the berries are at length pulpy, with the seeds imbedded in the pulp.—Smooth shrubs, with opposite, rarely whorled, petiolate or sessile leaves. Peduncles axillary and terminal, cymose, few or many flowered; pedicels bibracteate in the middle.

* *Flowers few, cymose or subcorymbose.*

7 M. LAURIFÒLIA (Blum. l. c. p. 511.) branchlets terete, warted; leaves opposite, rarely in threes, ovate, attenuated at both ends, triple-nerved, rather fleshy; peduncles axillary, exceeding the length of the petioles, usually 3-flowered; flowers decandrous or dodecandrous. ♄. S. Native of Java, on trees. Melástoma laurifòlium, Blum. bijdr. p. 1069. M. crassifòlium, Reinwdt. ined. M. cárneum, Zippel. ined.

Laurel-leaved Medinilla. Sh. 4 to 6 ft.

8 M. CRASSIFÒLIA (Blum. l. c.) branchlets terete, warted; leaves ovate-oblong, acuminated, obtuse at the base and emarginate, obsoletely 3, rarely 5-nerved; umbels axillary, in simple or trifid corymbs; flowers decandrous. ♄. S. Native of Java, on Mount Salak on trees. Melástoma crassifòlium, Blum. bijdr. p. 1075.

Var. β, diáphana, (Blum. l. c.) leaves larger, thinner, and somewhat 5-nerved. ♄. S. Native along with the species. Melástoma diáphanum, Blum. bijdr. p. 1075.

Thick-leaved Medinilla. Sh. 4 to 6 ft.

9 M. RUBICU'NDA (Blum. l. c. p. 512.) branchlets? leaves opposite, on short petioles, oblong-ovate, acuminated, obtuse at the base, triple-nerved; cymes dichotomous, axillary; flowers octandrous. ♄. S. Native of Sumatra. Melástoma rubicúnda, Jack, in Lin. trans. 14. p. 18. Pedicels and calyxes red. Corolla white.

Reddish-calyxed Medinilla. Sh. 2 to 3 ft.

10 M. HASSE'LTII (Blum. in bot. zeit. 1831. no. 30. p. 513.) branchlets terete, warted; leaves opposite, on short petioles, lanceolate-oblong, acuminated, somewhat cordate at the base, 3-nerved, fleshy; cymes branched, axillary; flowers octandrous. ♄. S. Native of Java, in the province of Bamtam, about Harriang and Levebonger.

Hasselt's Medinilla. Sh. 4 to 6 ft.

11 M. SUCCULE'NTA (Blum. l. c.) branchlets terete, warted; leaves opposite, sessile, ovate-oblong, acuminated, obtuse at the base, triple-nerved, fleshy; cymes branched, axillary; flowers octandrous. ♄. S. Native of Java, on trees, in humid woods. Melástoma succulénta, Blum. bijdr. p. 1070.

Succulent-leaved Medinilla. Sh. 4 to 6 ft.

12 M. HYPERICIFÒLIA (Blum. l. c.) branchlets terete; leaves opposite, sessile, ovate-lanceolate, acuminated, rather cordate at the base; cymes a little branched; flowers decandrous, rarely octandrous. ♄. S. Native of Java, on trees on Mount Salak. Melástoma hypericifòlium, Blum. bijdr. p. 1070. Flowers small.

St. John's-wort-leaved Medinilla. Sh. 4 to 6 ft.

* * *Flowers in terminal and axillary elongated panicles.*

13 M. VERRUCÒSA (Blum. l. c. p. 514.) branches warted, when young tetragonal, when old terete; leaves opposite, sessile, oblong, subcordate, acuminated, finely denticulated towards the apex, quintuple-nerved; panicles terminal or axillary, drooping; flowers decandrous; calyx somewhat truncate. ♄. S. Native of Java, in shady places on Mount Salak. Melástoma verrucòsum, Blum. bijdr. p. 1078.

Warted-branched Medinilla. Sh. 2 to 3 ft.

14 M. ALPE'STRIS (Blum. l. c.) branchlets? leaves opposite, sessile, half stem-clasping, ovate-oblong, crenated, quintuple-nerved, purplish beneath; panicles terminal; flowers decandrous; calyx 5-toothed. ♄. S. Native of Sumatra, on high mountains. Melástoma alpéstris, Jack, in Lin. trans. 14. p. 20. t. 1. f. 3. a. d. Corolla flesh-coloured. Anthers purple.

Alp Medinilla. Sh. 2 to 3 ft.

15 M. KU'HLII (Blum. l. c.) branchlets when young 4-sided; leaves opposite, on short petioles, elliptic-oblong, acuminated, bluntish at the base, triple-nerved, as well as with 2 marginal obsolete nervules; panicles axillary or terminal, elongated; flowers decandrous; calyx obsoletely 5-toothed. ♄. S. Native of Java, on Mount Pangaranghu.

Kuhl's Medinilla. Sh. 4 to 6 ft.

16 M. JAVANE'NSIS (Blum. l. c. p. 515.) branches all 4-sided; leaves opposite, sessile, somewhat cordate, elliptic, rather acuminated, quintuple-nerved, quite entire; panicles terminal or axillary, divaricate, straight; flowers decandrous. ♄. S. Native of Java, in marshes and woods on the higher mountains. Melástoma Javanénsis, Blum. bijdr. p. 1078. M. Epidéndra, Reinwdt. ined.

Java Medinilla. Sh. 4 to 6 ft.

17 M. EXI'MIA (Blum. l. c.) branches irregularly 4-sided; leaves opposite, on short petioles, elliptic-ovate, acute at both ends, quintuple-nerved, quite entire; panicles terminal; flowers octandrous. ♄. S. Native of Sumatra, on the banks of rivers. Melástoma exímia, Jack, in Lin. trans. 14. p. 17. Leaves large. Flowers flesh-coloured, very beautiful; anthers purple, with the appendages yellow.

Choice Medinilla. Sh. 2 to 3 ft.

18 M. SPECIÒSA (Blum. l. c.) branches 4-sided; angles winged; leaves almost sessile, 4 in a whorl, rarely opposite, ovate-oblong, attenuated at both ends, or obtuse at the base, 7-9-nerved, rarely quintuple-nerved; panicles terminal and axillary, nodding; flowers octandrous or decandrous. ♄. S. Native of the interior of Java, in humid woods, rarely parasitical on trunks of old trees; and of the Moluccas. Melástoma eximium, Blu[illegible]2. but not of Jack.

Showy Medinilla. [illegible] 2 to 3 ft.

19 M. INTERME'DIA (Blum. l. c. p. 516.) branchlets obsoletely tetragonal; leaves almost sessile, opposite, elliptic-oblong, acute or acuminated, obtuse at the base, quintuple-nerved; panicles elongated, terminal; flowers octandrous. ♄. S. Native of Java, on Mount Gede, near Tjichanjavar.

Intermediate Medinilla. Sh. 4 to 6 ft.

20 M. CRISPA'TA (Blum. l. c. p. 517.) branches 4-sided; angles winged; leaves sessile, 4 in a whorl, oblong, narrow at the base, quintuple-nerved; cymes subcorymbose, axillary, and lateral from the falling of the leaves; flowers decandrous, rarely dodecandrous. ♄. S. Native of the Moluccas, in valleys and on the banks of rivers. Melástoma crispàtum, Lin. spec. p. 560.—Rumph. amb. 5. p. 66. t. 35. f. 1. Flowers rather large. Fruit round, red.

Curled Medinilla. Sh. 4 to 6 ft.

SECT. III. HYPENA'NTHE (from ὑπηνη, *hypene*, a beard, and *ανθος, anthos*, a flower; in reference to the flower-buds, which are bearded with stellate down on the outside). Blum. bot. zeit. 1831. no. 30. p. 517. Tube of calyx obovate-oblong; limb short, 4-lobed. Petals trapeziform, alternate ones narrower than the others. Free part of the ovarium clothed with stellate down. Seeds roughish.—A shrub, having its branchlets, peduncles, and leaves clothed with stellate tomentum, and with a different habit from the other species.

21 M. VENÒSA (Blum. l. c. p. 518.) branchlets terete; leaves opposite, oval-oblong, those opposite each other usually of a different size, veiny, clothed with furfuraceous tomentum beneath, as well as on the branches; cymes pedunculate, terminal or lateral, involucrated by fugaceous bracteas. ♄. S. Native of Java, on trees on Mount Ternate. Melástoma venòsum, Blume, bijdr. p. 1675. Flowers middle-sized, octandrous, flesh-coloured; pedicels red.

Veiny-leaved Medinilla. Sh. 4 to 6 ft.

SECT. IV. DACTYLIÒTA (apparently derived from δακτυλος, *dactylos*, and ους ωτος, *ous otos*, an ear; but the application is unknown to us). Blum. in bot. zeit. 1831. no. 30. p. 518. Tube of calyx nearly globose; limb short, nearly quite entire. Style girded by an annular nectary.—A shrub, having its branches, peduncles, and under side of leaves clothed with furfuraceous tomentum.

22 M. BRACTEA'TA (Blume, l. c. p. 519:) branchlets terete; leaves opposite, almost sessile, oblong, decurrent at the base, emarginate, finely denticulated, quintuple-nerved; cymes pedunculate, axillary and terminal, twice trifid, bracteate; flowers decandrous. ♄. S. Native of the Moluccas. Axinæ'a bracteàta, Zippel. ined.

Bracteate Medinilla. Shrub 4 to 6 feet.

Cult. The species of *Medinilla* are very pretty when in flower; their culture and propagation are the same as for *Melástoma*, see p. 764. Vegetable mould is the best soil for them.

LV. PACHYCE'NTRIA (from παχυς, *pachys*, thick, and κεντρον, *kentron*, a spur; in reference to the thick fleshy spur-like appendages of the anthers called connectives). Blum. in bot. zeit. 1831. no. 30. p. 519.

LIN. SYST. *Octándria*, *Monogýnia*. Tube of calyx cup-shaped, constricted beneath the middle; limb obsoletely 4-toothed. Petals 4, ovate, acuminated. Stamens 8, equal. Anthers oblong-linear, straightish, beaked, and opening by one pore at the apex, furnished at the base behind with a thick fleshy spur or connective each. Ovarium half adhering to the calyx, the free part conical and angular. Style filiform, fu[illegible]rowed, crowned by a small obtuse stigma. Berry globose, crowned by the constricted tube of th[illegible] t[illegible]ed. Seeds oval, smooth.—Smooth parasitical shrubs. Branchlets terete, but compressed at the ends, besprinkled with brown or dark purple dots, as well as the peduncles. Leaves opposite, petiolate, oblong, 3-nerved or somewhat triple-nerved, quite entire. Flowers in axillary and terminal corymbs, small, rose-coloured; pedicels bibracteate in the middle.

1 P. CONSTRI'CTA (Blum. l. c. p. 520.) leaves oval-oblong, bluntly acuminated, bluntish and rather cordate at the base; panicles terminal or axillary, corymbosely many-flowered. ♄. S. Native of Java, on the roots of trees at the bottoms of the mountains. Melástoma constríctum, Blum. bijdr. p. 1072. Flowers red.

Constricted-calyxed Pachycentria. Sh.

2 P. VARINGIÆFÒLIA (Blum. l. c.) leaves oval or elliptic-lanceolate, attenuated at both ends; corymbs terminal, few-flowered. ♄. S. Native of Java, on trees. Melástoma varingiæfòlium, Blume, bijdr. p. 1071. Flowers red.

Varingia-leaved Pachycentria. Sh.

Cult. Being parasitical shrubs the species had better be treated in the manner of parasitical orchideous plants. Their propagation is the same as that for *Melástoma*, p. 764. by cuttings.

LVI. POGONANTHE'RA (from πωγων, *pogon*, a beard, and ανθηρα, *anthera*, an anther; in reference to the anthers being bearded behind). Blum. in bot. zeit. 1831. no. 30. p. 520.

LIN. SYST. *Octándria*, *Monogýnia*. Tube of calyx cup-shaped, somewhat quadrangular, adhering to the ovarium at the base; limb 4-toothed. Petals 4, lanceolate, acuminated, tumid on both sides in the middle, or furnished with a tooth. Stamens 8, nearly equal; anthers oblong, acute, straight, opening by one pore at the apex, bearded behind. Free part of ovarium conical and hairy. Style filiform; stigma small, obtuse. Berry globose, crowned by the limb of the calyx, 4-celled, pulpy. Seeds oval, smooth.—Shrubs. Branches terete, and are, as well as the peduncles and petioles, dotted from scales or scurf. Leaves opposite, petiolate, ovate-oblong, somewhat auricled at the base, 3 or somewhat 5-nerved, quite entire, glabrous. Flowers small, red, covered with resinous powder, disposed in terminal panicles.

1 P. PULVERULE'NTA (Blum. l. c. p. 521.) leaves ovate, obtuse, furnished with 2 tubercles at the base, 3-nerved, coriaceous; petals furnished with one tooth on each side. ♄. S. Native of Sumatra, in woods. Melástoma pulveruléntum, Jack in Lin. trans. 14. p. 19. but not of Blume.

Powdery-flowered Pogonanthera. Sh. 1 to 2 feet.

2 P. REFLE'XA (Blum. l. c.) leaves elliptic-oblong, bluntly acuminated, biauriculate at the base, somewhat 5-nerved, membranous; petals tumid on both sides. ♄. S. Native of Java, on trees. Melástoma pulverulέntum, Blum. bijdr. p. 1072. Melast. refléxa, Reinwdt. ined.

Reflexed Pogonanthera. Sh.

Cult. See *Pachycéntria* for culture and propagation.

LVII. ALLOMO'RPHIA (from αλλος, *allos*, various, and μορφη, *morphe*, form; habit in different situations). Blum. in bot. zeit. 1831. no. 30. p. 522.

LIN. SYST. *Octándria*, *Monogýnia*. Tube of calyx oblong, tubular, adhering to the ovarium at the base; limb 4-toothed. Petals 4, ovate, acute. Stamens 8, the alternate ones a little shorter than the others. Anthers linear, acute, straight, emarginate at the base, inappendiculate. Style filiform; stigma simple. Fruit dry, ovate-oblong, 4-celled, clothed by the calyx.—Shrub erect. Branches 4-sided, covered with ferruginous [illegible] leaves opposite, on long petioles, ovate, quite entire, glabrous, 5-nerved. Panicle small, terminal, with divaricate branches. Flowers minute, pale red.

1 A. EXI'GUA (Blum. l. c. p. 525.) ♄. S. Native of Pulo-Penang. Melástoma exíguum, Jack in Lin. trans. 14. p. 10.

Small Allomorphia. Sh. ½ to 1 foot.

Cult. For culture and propagation see *Melástoma*, p. 764.

LVIII. HUBE'RIA (dedicated by De Candolle to Francis Huber, author of mémoires sur l'influence de l'air dans la germination, 1 vol. 8vo. Geneva, 1801, and other works; and Peter Huber his son, author of a history of the Formica, and other insects). D. C. prod. 3. p. 167.

LIN. SYST. *Octo-Decándria*, *Monogýnia*. Tube of calyx oblong, constricted at the apex; limb 4-5-lobed. Petals 4-5, obovate. Stamens 8-10; anthers oblong-linear, with 1 or 2 spur-formed bristles, rising from the back at the base. Ovarium adnate to the calyx, with the free part conical. Style filiform, acutish. Capsule baccate, 4-5-celled. Seeds unknown.—Smooth Brazilian shrubs. Young branches compressed or tetragonal. Leaves petiolate, oval, or oblong, 3-nerved. Cymes terminal.

§ 1. *Anthers furnished with one bristle at the base.*

1 H. SEMISERRA'TA (D. C. prod. 3. p. 167.) branches tetragonal; leaves lanceolate, acuminated, 3-nerved, quite entire at the base, serrated in the upper part; raceme simple, terminal; lobes of calyx lanceolate-linear, acute, hardly shorter than the 4-winged tube. ♄. S. Native of Brazil, in the province of St. Paul, in marshes in woods. Rhéxia semiserràta, Schrank et Mart. mss. Petals white, ovate, acuminated. Anthers yellow, equal in length with the filaments. Flowers an inch in diameter. Fruit unknown.

Half-serrated-leaved Hubertia. Sh. 4 to 6 feet.

2 H. LAU'RINA (D. C. l. c.) branchlets compressed; leaves oblong, quite entire, rather coriaceous, 3-nerved, lateral nerves almost marginal; cymes corymbose, many-flowered; tube of calyx with 8 stripes, rather angular; fruit roundish; calyx permanent. ♄. S. Native of Brazil. D. C. coll. mem. 1. t. 9. Melástoma laúrinum, Ser. mss. Leaves size and form of those

of *Laúrus nóbilis*, and at first sight apparently feather-nerved. The fruit is like that of a clove. Flowers white.

Laurel-like Huberia. Sh. 4 to 6 feet.

3 H. ovalifòlia D. C. l. c.) branchlets rather compressed; leaves petiolate, oval, acute, quite entire, 3-nerved, besides the marginal nervules, which are hardly conspicuous; lateral nerves remote from the margin; cymes terminal, corymbose; calyx urceolate, elongated, canescent from rather flocky down; limb bluntly 4-lobed. ♄. S. Native of Brazil, where it was collected by Prince de Neuwied. Petals oblong-obovate, white, according to the dried specimens. Anthers furnished with a bristle-like spur, a little above the base on the back.

Oval-leaved Huberia. Sh. 3 to 6 feet.

§ 2. *Anthers furnished with 2 bristles at the base, rising from the back.—These species probably do not properly belong to Hubèria.*—Maièta, Vent. choix. p. 32. but not of Aubl.

4 H. annula'ta (Vent. choix. t. 32.) stem and branches terete, and a little striated; leaves lanceolate, cordate at the base, somewhat acuminated at the apex, petiolate, glabrous above, puberulous beneath; flowers disposed in panicled corymbs, axillary, few, octandrous; calyx tubular, rather campanulate, with 4 oblong segments, which are about the length of the tube. ♄. S. Native of Java. Maièta annulàta, Vent. choix. t. 32. Petals obovate. Genitals longer than the corolla. Anthers large, acute, falcate. Style filiform, crowned by a stigma, which is hardly thicker. Berry 4-celled.

Annular Huberia. Sh. 3 to 6 feet.

5 H. arge'ntea (D. C. prod. 3. p. 168.) branches from compressed to terete, clothed with brown furfuraceous scales; leaves oblong, attenuated at the base, obtuse at the apex, quite entire, 3-nerved, coriaceous, shining above, and covered with white furfuraceous scales beneath; panicle terminal, coarctate; flowers small, decandrous; calyx cup-shaped, 5-toothed, scurfy on the outside. ♄. S. Native of South America, near Santa Fe de Bogota. Petals 5, yellow. Berry 5-celled, about the size of a coriander seed. Maièta argéntea, Vent. choix. p. 34. in a note.

Silvery Huberia. Sh.

Cult. For culture and propagation see *Melástoma*, p. 764.

LIX. OCHTHO'CHARIS (from οχθος, *ochthos*, a river side, and χαιρω, *chairo*, to delight in; inhabits river banks). Blum. in bot. zeit. 1831. no. 30. p. 523.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx obovate, adhering to the ovarium; limb continuous, with the tube obsoletely 4-toothed, permanent. Petals 5, ovate, acuminated. Stamens 10, equal. Anthers oblong, obtuse at both ends, straight, opening by a pore at the apex, ending in a spur-formed bristle at the base behind. Ovarium truncate and glabrous at the apex. Style subulate; stigma simple. Capsule globose, broadly umbilicated, dry, 3-celled, opening irregularly. Seeds angular, cuneiform.—A glabrous shrub. Branches terete, extreme ones compressed. Leaves opposite, petiolate, oval-lanceolate, denticulated, triple-nerved. Cymes branched, axillary. Flowers small, of a flesh-colour.

1 O. Java'nica (Blum. l. c. p. 523.) ♄. S. Native of the west of Java, at the river Panimbang.

Java Ochthocharis. Sh. 3 to 6 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LX. CALYCOGO'NIUM (from καλυξ, *kalyx*, a calyx, and γωνια, *gonia*, an angle; calyx angular). D. C. prod. 3. p. 168.—Calycópteris, Rich herb. but not of Lam.

Lin. syst. *Octo-Decándria, Monogýnia.* Tube of calyx subglobose, 4-5-gonal; angles acute, continuous with the middle nerve of the lobes, but rather accrete after flowering; lobes 4-5, spreading, oblong-linear, longer than the tube. Petals 4-5, obovate. Stamens 8-10, equal; anthers oblong, opening by one pore at the apex, without any auricles at the base, and with the connectives hardly evident. Stigma dot-formed. Berry roundish, 4-5-angled, crowned by the lobes of the calyx, 4-5-celled. Seeds ovate, angular, with a linear hylum.—Shrubs, natives of St. Domingo. Branches terete, clothed with rufescent soft flocky stellate tomentum, as well as the petioles and under side of the leaves. Leaves 3-5-nerved, on short petioles, ovate-oblong, obtuse and rather cordate at the base, quite entire, glabrous above. Flowers 1-3-together, terminal, white, on short pedicels. Calyx beset with stellate down, appearing as if it were dotted.

1 C. stella'tum (D. C. prod. 3. p. 168.) branches terete, and are, as well as the petioles and under side of the leaves, clothed with crowded white stellate down. ♄. S. Native of St. Domingo. Melástoma calycópteris, Rich. in Bonpl. mel. t. 42. Melast. stellàta, Vahl. ined. Melast. scabròsum, Bert. in herb. Balb. Leaves 3-nerved, rarely somewhat 5-nerved, the 2 inner nerves rising a little above the base, and therefore the leaves are almost triple-nerved. Flowers 4 or 5 cleft in the same specimen.

Stellate-haired Calycogonium. Sh. 1 to 2 feet.

2 C. gla'brum (D. C. l. c.) branches nearly terete, glabrous; leaves petiolate, ovate, acuminated at both ends, somewhat repandly denticulated, triple-nerved, rather coriaceous, glabrous; pedicels terminal, 1-flowered, usually solitary, hardly longer than the petioles; tube of calyx oblong, bluntly tetragonal, scabrous from [illegible]ered down; lobes 4, subulate. ♄. S. Native of the south [illegible] Jamaica, on the high mountains. Melástoma glabràta, Swartz, fl. ind. occ. p. 806. Berry black, 4-celled, crowned by the calyx.

Glabrous Calycogonium. Sh. 1 to 2 feet.

Cult. For culture and propagation see *Melastoma*, p. 764.

LXI. OSSÆ'A (dedicated by De Candolle to Don Antonio de la Ossa, formerly director of the botanic garden at the Havanah, in Cuba). D. C. prod. 3. p. 168.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx ovate, adhering to the ovarium, but not drawn out beyond it; lobes 4, short, acute. Petals 4, lanceolate, acute. Stamens 8, short; anthers hardly auricled at the base. Ovarium smoothish at the apex. Style filiform; stigma simple. Berry 4-celled, crowned by the lobes of the calyx. Seeds ovate, angular.—American shrubs. Leaves 3-5-nerved. Flowers small, rising from the axils of the leaves, or from the old leaves.

* *Flowers axillary, sessile.*

1 O. scа'lpta (D. C. prod. 3. p. 168.) branches terete, and are, as well as the petioles and nerves of leaves, scabrous from powdery branched rufous down; leaves petiolate, oblong, obtuse at the base, acutish at the apex, quite entire, 5-nerved, rather pilose; flowers on short pedicels, few together, axillary; calyx rather globose, covered with powdery grains; petals lanceolate, acuminately awned. ♄. S. Native of St. Domingo. Melástoma acutipétala, Rich. in Bonpl. melast. t. 38. Melast. oxypétalum, Spreng. syst. 3. p. 303. Maièta scálpta, Vent. choix. t. 33. Melast. glomeràta, Vahl. ined. Berry bluish, small, globose, 4-celled. Flowers small. Filaments of stamens broadish.

Scalp Ossæa. Sh. 2 feet.

2 O. scabròsa (D. C. prod. 3. p. 169.) stem hairy; branches terete, hairy; leaves ovate, attenuated, denticulated, 3-nerved, scabrous from papillæ, petiolate; flowers much crowded, sessile, octandrous; calyx hairy, 4-cleft; hind segments subulate

and minute; petals 4, larger than the calyx, lanceolate, acute, white; filaments jointed; stigma blunt; berry minute, roundish, 4-celled, rufous. ♄. S. Native of Jamaica, on the higher mountains. Melástoma scabrósa, Lin. spec. p. 558. Swartz, obs. p. 174.

Scabrous Ossæa. Sh. 1 to 2 feet.

*** Pedicels axillary or lateral, crowded, 1-flowered.*

3 O. lateriflòra (D. C. l. c.) glabrous; branches tetragonal, but at length terete; leaves petiolate, obovate, acuminated, setaceously somewhat serrated, triple-nerved; pedicels aggregate, rising beneath the leaves, short, 1-flowered; calyx truncate, rather strigose; petals 4, ovate, attenuated. ♄. S. Native of Montserrat, on the mountains. Melástoma lateriflòra, Vahl. ecl. Anthers oblong, obtuse. Stigma subcapitate. Berry globose, beset with scattered strigæ.

Side-flowered Ossæa. Sh. 1 to 2 feet.

4 O. sparsiflòra (D. C. l. c.) branches nearly terete, and are, as well as the young leaves, rough from deciduous adpressed strigæ when young, but as the strigæ fall off, the parts soon become glabrous; leaves petiolate, oval-oblong, acuminated at both ends, triple-nerved, with revolute margins; pedicels numerous, 1-flowered, short, rising in fascicles from the axils of the old leaves; calyx truncate; petals 4, lanceolate, acute. ♄. S. Native of Guadaloupe, in woods on the mountains. Melástoma sparsiflòra, Rich. herb. Flowers very small, acute, pale. Calyx dotted from small strigæ.

Scattered-flowered Ossæa. Sh. 3 to 6 feet.

5 O. flave'scens (D. C. l. c.) branches bluntly tetragonal, nearly terete, scabrous from adpressed bristles when young, but at length becoming glabrous; leaves pe[illegible] ovate, acuminated at both ends, quintuple-nerved, crenulated, glabrous, except the nerves, which are bristly beneath; pedicels axillary, 1-flowered, short, quite glabrous, rising in fascicles from the axils of the old leaves; calyxes with repand margins; petals lanceolate, acute, rather velvety on the outside. ♄. S. Native of French Guiana, in woods about Sinemari. Melástoma flavéscens, Aubl. guian. 1. p. 523. t. 164. Leaves yellowish, smooth. Flowers small, white, agreeing in disposition to those of *Lorèya arboréscens.*

Yellowish Ossæa. Sh. 2 to 3 feet.

**** Thyrse axillary. In this section the anthers open by a broad almost 2-celled pore, and therefore nearly agreeing with the genus* Crema'nium.

6 O. multiflòra (D. C. prod. 3. p. 169.) quite glabrous; branches bluntly tetragonal; leaves petiolate, oblong, attenuated, bluntish, triple-nerved, with callous serratures; thyrse axillary, shorter than the leaves; calyx campanulate, hardly 4-toothed; petals 4, oval, acute. ♄. S. Native of St. Domingo. Melástoma multiflòra, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 37. Flowers small, white. Anthers obconical, opening in a bilabiate manner by a pore of 2 cells, which has a bicamerated dissepiment. Stigma dilated.

Many-flowered Ossæa. Sh. 3 to 4 feet.

7 O. acumina'ta (D. C. l. c.) quite glabrous; branches tetragonally compressed; leaves petiolate, oblong, tapering to both ends, very acute, with callous serratures, triple-nerved; thyrse axillary, shorter than the leaves; calyx ovate, hardly 4-toothed; petals 4, lanceolate, acute. ♄. S. Native of St. Domingo. Melástoma micránthum, Bert. herb. but not of Swartz. Very like *O. multiflòra*, but is easily distinguished from that plant in the leaves and petals being acuminated.

Acuminated-leaved Ossæa. Sh. 3 to 6 feet.

8 O. purpura'scens (D. C. l. c.) quite glabrous; branches bluntly tetragonal; leaves petiolate, oblong, tapering to the base and apex, triple-nerved, serrated; serratures small, ciliæformed; thyrse axillary and lateral, tripartite; calyx minutely and acutely 4-toothed; petals 4, roundish. ♄. S. Native of Jamaica, on the high mountains. Melástoma purpuráscens, Swartz, fl. ind. occ. p. 804. Anthers obtuse, perforated at the apex. Stigma blunt, angular. Berry 4-celled.

Purplish Ossæa. Sh. 3 to 6 feet.

9 O. amygda'lina (D. C. l. c.) quite glabrous; branches nearly terete; leaves petiolate, lanceolate, attenuated at the base, acuminated at the apex, denticulated, triple-nerved; cymes loosish, few-flowered, rising from the axils of the old leaves beneath the young leaves; calyx rather globose, bluntly 4-toothed; petals roundish. ♄. S. Native of Porto Rico. Melástoma amygdálina, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 36. where the description is good, but in the figure the berry is represented falsely as 5-celled. It hardly differs from *O. purpuráscens*, unless in the calycine teeth being very obtuse.

Almond-like Ossæa. Sh. 3 to 6 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXII. SAGRÆ'A (dedicated to Don Ramon de la Sagra, of Havanah, in Cuba, director of the Botanic Garden at Havanah). D. C. prod. 3. p. 170.

Lin. syst. *Octándria, Monogýnia* Tube of calyx adhering to the ovarium, but not drawn out beyond it; lobes 4, short, permanent. Petals 4, oval. Stamens 8; anthers hardly auricled at the base. Ovarium smoothish at the apex. Style filiform; stigma obtuse. Capsule baccate, 4-celled. Seeds small, ovate-angular.—American shrubs. Leaves 3-7-nerved. Flowers rising from the axils of the old leaves after they have fallen, as well as from the axils of those that are standing.

** Flowers crowded in the axils of the leaves, sessile, or on short pedicels.*

1 S. columneæfòlia (D. C. prod. 3. p. 170.) branches terete, and are, as well as both surfaces of leaves and calyxes, very villous; leaves nearly sessile, elliptic, bluntish, crenulated, 5-nerved; flowers axillary, sessile, in crowded whorls; calyx tubular, hairy, 4-toothed; petals oblong, obtuse. ♄. S. Native of Peru. Melástoma columneæfòlium, Schrank, mss. Very like the following species, but the leaves are almost obtuse, not acuminated, very hairy on both surfaces.

Columnea-leaved Sagræa. Sh. 2 to 3 feet.

2 S. sessiliflòra (D. C. l. c.) branches terete, densely clothed with rufous hairs; leaves almost sessile, ovate, acuminated, crenulated, 7-nerved, ciliated, densely clothed with stiff hairs above, and with villi beneath; flowers almost sessile, crowded in the axils of the leaves; calyx cylindrical, tubular, hairy; petals oval, obtuse. ♄. S. Native of Brazil and Guiana, in grassy meadows. The down and hairs on every part of the plant are simple, and somewhat incurved. Petals small, rose-coloured. Berry 4-celled. Seeds ovoid. Melástoma rùbra, Rich. in Bonpl. mel. t. 39. and perhaps the same as *Melástoma rùbra.* Aubl. guian. 1. p. 416. p. 161. but he says the flowers are decandrous, which is most probably wrong. Melast. sessiliflòra, Vahl. ecl. amer. 1. p. 49. icon. amer. t. 18. Clidèmia heteromálla, D. Don, in mem. wern. soc. 4. p. 310.

Sessile-flowered Sagræa. Sh. 1 to 2 ft.

3 S. fascicula'ris (D. C. l. c.) branchlets tetragonal, hispid; petioles scabrous from hairs; leaves ovate, acute both at the base and apex, entire, 3-nerved, besides the 2 marginal nervules, scabrous from hairs, but with the nerves hispid on the under surface; pedicels short, 1-flowered, crowded beneath the leaves; teeth of calyx 4, acute, erect, permanent; petals roundish. ♄. S. Native of the interior of Jamaica, in woods on the mountains. Melástoma fasciculàris, Swartz, fl. ind. occ. p.

801. Flowers white. Anthers acuminated. Stigma obtuse. Berry roundish.

Fascicular-flowered Sagræa. Shrub.

4 S. SCA'BRIDA (D. C. l. c.) branches nearly terete, and are, as well as the petioles, beset with crowded bristles; leaves ovate, acute at both ends, triple-nerved, besides the 2 marginal nervules, ciliated, entire, scabrous from bristles on both surfaces, but especially on the nerves; pedicels short, 1-flowered, rising in bundles from the axils of the fallen leaves, and are, as well as the calyxes, quite glabrous; limb of calyx bluntly and broadly 4-toothed. ♄. S. Native of St. Domingo. Melástoma ramiflòrum, Spreng. syst. 2. p. 295. Allied to *S. fasciculàris.*

Scabrous Sagræa. Shrub 1 to 2 feet.

* * *Flowers disposed in axillary cymes or panicles.*

5 S. GUADALUPE'NSIS (D. C. l. c.) branches tetragonal, and are as well as the petioles smoothish, but when young clothed with rufous velvety down; leaves petiolate, ovate, acuminated, quintuple-nerved, serrately ciliated; racemes axillary, erect, capillary, with short, 1-3-flowered branchlets; berry globose, rather pilose, crowned by the 4 erect teeth of the calyx. ♄. S. Native of Guadaloupe, frequent. Perhaps the *Melástoma acinodéndron* of Lin. spec. 558.? but that is said to be decandrous. Compare Plum. ed. Burm. t. 142. f. 2. Fruit violaceous, hardly the size of a red currant.

Guadaloupe Sagræa. Shrub 1 to 2 feet.

6 S. CAPILLA'RIS (D. C. l. c.) branches tetragonal, and are as well as the petioles glabrous, or rather velvety in the young state when examined by a lens; leaves petiolate, oblong, long-acuminated, 3-nerved, quite glabrous, pale beneath, quite entire; peduncles axillary, capillary, 3-flowered, somewhat reclinate; berry ovate, hispid from scattered, short bristles, crowned by the straight, acute lobes of the calyx. ♄. S. Native of Jamaica. Melástoma capillàris, Swartz, fl. ind. occ. p. 808. Flowers small.

Capillary-peduncled Sagræa. Shrub 1 to 2 feet.

7 S. HIRTE'LLA (D. C. prod. 3. p. 171.) branches nearly terete, hispid from scattered bristles; leaves on short petioles, ovate-lanceolate, acuminated, 3-nerved, entire, pale beneath and pilose on the nerves and margins; peduncles axillary, very short, 3-flowered; calyx very minutely 4-toothed; petals lanceolate, acuminated. ♄. S. Native of Jamaica, on the mountains. Melástoma hirtélla, Swartz, fl. ind. occ. p. 810. Anthers oblong and bifid, according to Swartz. Stigma obtuse. Berry 4-celled, hispid, dark purple. Seeds roundish.

Hairy Sagræa. Shrub 3 to 6 feet.

8 S. UMBRÒSA (D. C. l. c.) branches 4-furrowed, and are as well as the petioles hispid from long spreading bristles; leaves petiolate, broadly ovate, acuminated, serrulated, ciliated, 5-7-nerved, very pilose on the nerves, the rest beset with scattered pili; panicles axillary, loose, trichotomous, rather hispid, length of petioles; calyx globose, hairy, with 4 short teeth; petals obovate. ♄. S. Native of the West Indies, particularly in St. Christopher and Trinidad. Melástoma umbròsa, Swartz, fl. ind. occ. 817. Vahl. dec. amer. 2. t. 29. There are varieties of this with hispid and very hispid branches, and middle-sized and large leaves. Berry globose, hairy, blackish, small, 4-celled. Petioles 1 and 1½ inch long.

Shaded Sagræa. Shrub 3 to 6 feet.

9 S. BERTE'RII (D. C. l. c.) branches terete, and are as well as the petioles, panicles, and calyxes densely clothed with loose spreading bristles; leaves ovate, obtuse at the base, acuminated at the apex, 5-7-nerved, serrulated, villous on both surfaces, but especially on the nerves; panicles axillary, longer than the petioles, having their branches whorled; lobes of calyx 4, setaceous, rather longer than the tube. ♄. S. Native of Jamaica. Melástoma umbròsum, Spreng. syst. 2. p. 304. but not of Swartz.

Bertero's Sagræa. Shrub 3 to 6 feet.

10 S. DOMINGE'NSIS (D. C. l. c.) branchlets terete, and are as well as the petioles and peduncles clothed with short, simple, rufescent rather reflexed hairs; leaves petiolate, ovate, acuminated, serrulated, 5-nerved, most hairy on the nerves; panicles axillary, trichotomous, a little longer than the petioles; tube of calyx rather globose, with 4 very short acute teeth. ♄. S. Native of St. Domingo. Melástoma pilòsum, Spreng. syst. 2. p. 304. Flowers small, white.

St. Domingo Sagræa. Shrub 3 to 6 feet.

11 S. TETRAGÒNA (D. C. l. c.) branches acutely tetragonal, and are as well as the petioles thickly clothed with velvety rufescent spreading hairs; leaves petiolate, oval, acuminated, 5-nerved, or perhaps quintuple-nerved, somewhat denticulated, beset with a few scattered bristles above, rather hairy beneath, but especially on the nerves; panicles axillary, racemose, twice the length of the petioles; calyx rather hairy, with a globose tube and 4 very short, acute teeth. ♄. S. Native of Dominique, in woods. Flowers small.

Tetragonal-branched Sagræa. Shrub 3 to 6 feet.

12 S. PILÒSA (D. C. l. c.) branches terete, and are as well as the peduncles and petioles clothed with rusty hairs; leaves petiolate, oblong, acute, 5-nerved, glabrous above and pilose beneath, but especially on the nerves; panicles axillary, racemose, with trifid branchlets; calycine teeth 4, very minute; petals roundish, reflexed. ♄. S. Native of Jamaica, in woods on the mountains. Melástoma pilòsa, Swartz, fl. ind. occ. p. 819. Petals sp [illegible]tted with red at the base. Berry hairy, roundish, 4-celled.

Pilose Sagræa. Shrub 3 to 6 feet.

13 S. MICROPHY'LLA (D. C. l. c.) branchlets tetragonal, and are as well as the petioles hairy; leaves ovate, on short petioles, obtuse, rather denticulated, hispid above, and clothed with rusty tomentum beneath, 3-nerved; peduncles axillary, trifid; calyx hairy, with 4 very short teeth. ♄. S. Native of the south of Jamaica. Melastoma microphýlla, Swartz, fl. ind. occ. p. 813. but not of Spreng. This species comes very near to *S. hirsùta*, but differs in the leaves being obtuse and smaller, in the flowers being smaller, in the pedicels being usually simple, and lastly in the berries being red, not dark purple.

Small-leaved Sagræa. Shrub 2 feet.

14 S. HIRSU'TA (D. C. l. c.) branches terete, and are as well as the petioles, peduncles, and calyxes beset with purplish, stiff hairs; leaves oblong-lanceolate, acuminated, denticulated, 3-nerved, very hairy on the nerves beneath, the rest beset with scattered pili; peduncles axillary, trifid; calyx ovate, with 4 linear teeth. ♄. S. Native of the south of Jamaica, on the mountains. Melástoma hirsùta, Swartz, fl. ind. occ. p. 811. Petals ovate, acute, white, small. Berry dark purple, globose, hairy, 4-celled.

Hairy Sagræa. Shrub 2 feet.

15 S. RARIFLÒRA (D. C. l. c.) branches terete, pubescent; leaves oval, rather cordate, long-acuminated, petiolate, ciliated, usually 7-nerved; racemes axillary, few-flowered; flowers minute, octandrous: calyx pilose, with 4 very short teeth; petals oval; style longer than the stamens; berry minute, globose, 3-celled. ♄. S. Native of South America, in the province of Cumana, at Mount Caripe. Melástoma rariflòra, Bonpl. mel. t. 50. This is a doubtful species, from the flowers being described as octandrous; but in the figure the calyx is 5-lobed, and therefore the flowers would be decandrous. Flowers white.

Few-flowered Sagræa. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Melástoma*, 764.

LXIII. DISSOCHÆ'TA (from διssος, *dissos*, double, and χαιτη, *chaite*, a bristle; in reference to the connectives of the anthers being furnished with 2 bristles on their back, near the base). Blume, in bot. zeit. 1831. no. 28. p. 492.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx oblong, obscurely tetragonal, adhering to the ovarium; limb drawn out beyond the ovarium, for the most part obsoletely 4-toothed, permanent. Petals 4. Stamens 4, but sometimes 8; when this last is the case, the alternate ones are sterile. Anthers oblong-linear, opening by 1 pore, usually beaked and arched, rarely blunt and straight, furnished each with a lamellate, 2-awned, rarely undivided connective on the back, near the base. Style filiform, clavate. Stigma a pruinose dot. Berry elliptic-globose, nearly dry, crowned by the calyx, 4-celled, indehiscent. Seeds cuneated, angular.—Sarmentose shrubs, with the branches, peduncles, and under side of leaves clothed with starry down, sometimes thickly and sometimes thinly, according to the species. Leaves petiolate, elliptic-oblong, quite entire, somewhat 5-nerved, glabrous above, for the most part of a different colour beneath. Inflorescence panicled, terminal, or axillary. Flowers pale red, blue, or white. Habit of the genus *Oxýsporum.*

SECT. I. DISSOCHÆ'TÆ (see genus for derivation). Blum. in bot. zeit. 1831. no. 28. p. 493. Limb of calyx cup-shaped, somewhat 4-toothed. Petals ovate-oblong, obtuse, or bluntish. Anthers fixed by the base or by the back. Connectives bifid or entire. Ovarium rather silky from stellate down at the apex.

* *Flowers tetrandrous.*

1 D. FA'LLAX (Blume, l. c.) leaves 5-nerved, ovate-oblong, acuminated, rather cordate, clothed with rusty, scurfy tomentum beneath; panicles terminal; calyx nearly quite entire; anthers fixed beneath the middle, having their connectives undivided. ♄. S. Native of Sumatra and Java, in woods, and among bushes. Melástoma fállax, Jack, in Lin. trans. 11. p. 13. Melast. Reinwardtiánum, Blume, bijdr. p. 1069. Malast. diffùsa, Reinwardt, ined. Flowers white.

Fallacious Dissochæta. Sh. sarmentose.

2 D. INTERME'DIA (Blum. l. c.) leaves 5-nerved, ovate-oblong, acuminated, somewhat cordate at the base, clothed with pale scurfy ochraceous tomentum beneath; panicles terminal and axillary, much branched; calyx almost quite entire; anthers fixed by the base, having their connectives ending in 2 bristles. ♄. S. Native of Java, in woods, on the chains of mountains called Pangaranghu and Gegerbinting. Flowers white? Melástoma fállax, Blum. bijdr. p. 1068.

Var. β; leaves clothed with rusty tomentum beneath; panicles loose. ♄. S. Native of Java, on the mountains of Megamendong and Puluh-sarie.

Intermediate Dissochæta. Shrub sarmentose.

3 D. MONTI'COLA (Blum. l. c. p. 494.) leaves like those of the preceding species; panicles terminal, simple, hardly branched. ♄. S. Native of Java, on the calcareous mountains of Kuripan and Seribu.

Mountain-born Dissochæta. Shrub sarmentose.

4 D. LEPRÒSA (Blum. l. c.) leaves 5-nerved, ovate-oblong, acuminated, somewhat cordate at the base, clothed with scurfy rusty tomentum beneath; panicles loose, axillary, and terminal; calyx 4-toothed; connectives of anthers furnished with 2 bristles each. ♄. S. Native of Java, on mounts Salak and Gede. Melástoma lepròsum, Blum. bijdr. p. 1068. Flowers larger than those of the preceding species.

Leprous Dissochæta. Shrub sarmentose.

* * *Flowers octandrous, with the alternate anthers sterile.*

5 D. BRACTEA'TA (Blum. l. c. p. 495.) leaves 5-nerved, ovate, acuminated, cordate at the base, clothed with stellate down beneath; panicles terminal; bracteas petiolate, ovate, membranous; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. ♄. S. Native of Pulo Penang. Melástoma bracteàtum, Jacq. in Lin. trans. 14. p. 9. Flowers pale rose-coloured.

Bracteate Dissochæta. Shrub sarmentose.

6 D. VA'CILLANS (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nervules, ovate-oblong, acuminated, rounded at the base, cordate, of the same colour on both surfaces, smoothish above, but with a little scattered, scurfy down beneath; panicles terminal; calyxes quite entire; anthers straight, with their connectives furnished with 2 bristles. ♄. S. Native of Java, in woods on the mountains of Seribu, in the province of Buitenzorg. Flowers rose-coloured, middle-sized.

Var. β; leaves narrower, and with longer taper points; flowers smaller and white. ♄. S. In woods, at the base of Mount Salak.

Vacillating-anthered Dissochæta. Shrub sarmentose.

7 D. FU'SCA (Blum. in bot. zeit. 1831. no. 29. p. 497.) leaves 3 nerved, as well as with 2 marginal nervules, long-acuminated, rounded at the base, clothed with greenish brown, stellate, rather silky down beneath; panicles terminal; calyx nearly quite entire; anthers falcate, having their connectives furnished with 2 bristles each. ♄. S. Native of Java, in woods on mountains of Salak and Gede. Melástoma fúscum var. Blum. bijdr. 1074. var. γ, D. C. prod. 3. p. 150. Flowers small, rose-coloured.

Var. β, ferrugínea (Blum. l. c.) leaves clothed with pale rusty stellate down beneath; panicles axillary and terminal. ♄. S. Native of Java, in the province of Bamtam.

Var. γ, obtùso-acuminàta (Blum. l. c.) leaves terminated by a blunt acumen, clothed with stellate down beneath. ♄. S. Native of Java, in the province of Buitenzorg, about Tjampia.

Fuscous Dissochæta. Shrub sarmentose.

8 D. VELUTI'NA (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nervules, elliptic-oblong, cuspidate, usually obliquely rounded at the base, clothed with stellate and simple ochraceous rather silky down beneath; panicles axillary and terminal, rather corymbose; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. ♄. S. Native of Java, in the province of Bamtam. Panicle more contracted than in *D. vàcillans.*

Velvety Dissochæta. Shrub sarmentose.

9 D. GRA'CILIS (Blum. l. c. p. 498.) leaves 3-nerved, elliptic-oblong, acuminated, rounded at the base, glabrous; panicles terminal, axillary, loose: bracteas linear, caducous; calyxes obsoletely 4-toothed; anthers straight, blunt at the apex, attenuated at the base, having their connectives furnished with 2 bristles each. ♄. S. Native of Sumatra and of Java, in the low lands. Melástoma gràcilis, Jack, in Lin. trans. 14. p. 14. Melast. vàcillans, var. δ, pállens, Blum. bijdr. p. 1074. Melast. álba, Reinw. ined. Flowers pale blue.

Slender Dissochæta. Shrub sarmentose.

10 D. INAPPENDICULA'TA (Blum. l. c. p. 499.) leaves 3-nerved, besides 2 marginal nervules, ovate-oblong, long-acuminated, rounded at the base, brownish-green beneath, and clothed with stellate scurfy pili; panicles terminal; calyx almost quite entire: anthers fixed by the base, each furnished with a triangular, inappendiculate connective. ♄. S. Native of Java, in the western part. Melástoma vàcillans, var. α, Blum. bijdr. p. 1074. D. C. prod. 3. p. 150. Flowers rose-coloured, middle-sized.

Var. β, purpuráscens (Blum. l. c.) leaves densely beset with ochraceous dots beneath, and purplish wool. ♄. S. Java, on Mount Magamendong.

Var. γ, *tomentòsa* (Blum. l. c.) leaves densely clothed with ochraceous tomentum beneath; panicles axillary and terminal. ♄. S. Java, in the province of Bamtam.

Inappendiculated-anthered Dissochæta. Sh. sarmentose.

11 D. RETICULA'TA (Blum. l. c.) leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, acuminated, rounded at the base, or somewhat cordate, reticulated beneath and covered with ochraceous dots; panicles terminal; calyx almost quite entire; anthers fixed by the back, furnished with somewhat rhomboid, inappendiculate connectives. ♄. S. Native of Java, in woods, on the mountains in the province of Bamtam.

Reticulated-leaved Dissochæta. Shrub sarmentose.

12 D. SAGITTA'TA (Blum. l. c. p. 500.) leaves 3-nerved, besides the lateral nervules, oblong or oblong-lanceolate, cuspidate, rounded at the base, clothed with rusty tomentum beneath; panicles axillary and terminal; calyx 4-toothed; anthers fixed by the base, having their connectives sagittate or furnished with 2 short bristles each. ♄. S. Native of Java, in shady woods, in the province of Bamtam.

Sagittate-connectived Dissochæta. Sh. sarmentose.

* * * *Flowers octandrous, with all the anthers fertile.*

13 D. PA'LLIDA (Blum. l. c.) leaves 5-nerved, ovate, acuminated, somewhat cordate at the base, beset with scattered stellate scales; panicles axillary and terminal; anthers fixed above the base, with their connectives furnished with 2 bristles each. ♄. S. Native of the Malay islands. Melástoma pállida, Jack, in Lin. trans. 14. p. 12. Flowers white.

Pale Dissochæta. Shrub sarmentose.

14? D. NEMORÒSA; shrub clothed with rusty villi; leaves ovate-lanceolate, 5-nerved; peduncles axillary, usually solitary; stamens unequal; anthers sessile, furnished with 2 bristles at the base, and with fringed appendages in front; fruit 4-celled. ♄. S. Native of Sumatra and Pulo-Nias. Flowers large, flesh-coloured.

Grove Dissochæta. Shrub 2 feet.

SECT. II. DIPLE'CTRIÆ (from δις, *dis*, twice, and πλεκτρον, *plectron*, a spur; in reference to the anthers being furnished with 2 auricles or 2 spurs behind). Blum. in bot. zeit. 1831. no. 29. p. 501. Limb of calyx cylindrical, truncate, continuous with the tube. Anthers fixed by the base, curled in front, and furnished with 2 short auricles behind. Ovarium glabrous at the apex.

15 D. DIVARICA'TA; leaves 3-nerved, ovate, acute, downy beneath, glabrous and shining in front; branches clothed with rusty tomentum: panicles terminal, divaricate; calyx urceolate, truncate, and is as well as the peduncles tomentose; anthers almost sessile. ♄. S. Native of the East Indies. Melástoma divaricàtum, Willd. spec. 2. p. 596. Berry about the size of a grain of pepper.

Divaricate-panicled Dissochæta. Shrub sarmentose.

16 D. GLAU'CA (Blum. in bot. zeit. 1831. no. 29. p. 501.) leaves 3-nerved, besides the 2 marginal nervules, oblong, cordate, bluntly acuminated, clothed with scurfy, stellate down beneath as well as the branchlets, and panicles which are terminal; stamens 6-8, 4 of which are only fertile. ♄. S. Native of Pulo Penang and of Java. Melástoma glaùca, Jack. in Lin. trans. 14. p. 15. Flowers pale blue.

Glaucous Dissochæta. Shrub sarmentose.

17 D. CYANOCA'RPA (Blum. l. c.) branchlets and petioles beset with scattered simple bristles; leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, acuminated, cordate at the base; stamens 8, the 4 alternate ones barren. ♄. S. Native of Java, in woods, on the higher mountains, where it is called by the natives *Tjalunt-jung-aroy.* Flowers as well as berries blue.

Blue-fruited Dissochæta. Shrub sarmentose.

Cult. For culture and propagation see *Melástoma*, p. 764. The species are all elegant when in flower.

LXIV. APLE'CTRUM (α, priv. and πλεκτρον, *plectron*, a spur; anthers without spurs or connectives). Blum. in bot. zeit. 1831. no. 29. p. 502.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx ovate-globose, adhering to the ovarium; limb drawn out beyond the ovarium, truncate, or obsoletely 4-toothed. Petals 4, ovate, acute, or bluntish. Stamens 8, the 4 alternate ones sterile. Anthers ovate, obtuse at both ends, opening by 1 pore at the apex, inappendiculate at the base. Ovarium glabrous, crowned by 4 crests. Style filiform; stigma a pruinose dot. Berry nearly globose, crowned by the calyx, 4-celled, many-seeded. Seeds cuneiform.—Sarmentose smoothish shrubs, with the habit of *Dissochæ'ta.* Leaves petiolate, elliptic-oblong, quite entire, 5-nerved. Inflorescence panicled, axillary, and terminal. Flowers small, white.

1 A. VIMINA'LE (Blum. l. c.) leaves 5-nerved, cordate-oblong, or ovate, bluntly acuminated, clothed with stellate down beneath; panicles trichotomous, axillary, and terminal; bracteas oblong, ciliated; petioles furnished with 1 or 2 bristles. ♄. S. Native of Java and Sumatra, in shady places. Melástoma viminàle, Jack. in Lin. trans. 14. p. 16. Blum. bijdr. p. 1073.

Twiggy Aplectrum. Shrub sarmentose.

2 A. ROSTRA'TUM (Blum. l. c.) leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, each ending in a long blunt acumen, roun[illegible]e base, glabrous; racemes axillary and terminal, almost simple; bracteas oval, ciliated; petioles often bristly. ♄. S. Native of Java, on the mountains of Seribu. Melástoma rostràtum, Blum. bijdr. p. 1074.

Beaked Aplectrum. Shrub sarmentose.

3 A. STIPULA'RE (Blum. l. c. p. 505.) leaves 5-nerved, ovate-oblong, bluntly acuminated, somewhat cordate at the base, glabrous; panicle terminal, corymbose; bracteas linear; petioles bristly. ♄. S. Native of Java, on the mountains of Salak. Melástoma stipulàre, Blum. bijdr. p. 1075.

Stipular Aplectrum. Shrub sarmentose.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXV. TETRAZY'GIA (from τετρα, *tetra*, four, and ζυγος, *zugos*, a yoke; in reference to the quaternary number of the parts of the flower). Rich. herb. D. C. prod. 3. p. 172.

LIN. SYST. *Tetra-Octándria, Monogýnia.* Tube of calyx globose or urceolate; limb drawn out beyond the ovarium, permanent, with 4 short teeth. Petals 4, obovate. Stamens 4-8, equal. Anthers linear, obtuse at the base, opening by a pore at the apex. Ovarium glabrous. Style filiform. Stigma dot-formed. Capsule baccate, 4-celled. Seeds numerous, cuneated, angular, shining, with a linear hylum.—West Indian shrubs, with the branches, petioles, and under side of leaves scurfy or lepidotted. Leaves ovate or oblong, discoloured beneath, 3-nerved, petiolate. Cyme trichotomous, terminal. Flowers white, bractless.

SECT. I. TETRASTE'MON (from τετρα, *tetra*, four, and στημων, *stemon*, a stamen; stamens 4.). D. C. prod. 3. p. 172. Stamens 4. Thyrse panicle-formed. Perhaps this section is sufficient to constitute a new genus.

1 T. TETRA'NDRIA (D. C. prod. 3. p. 172.) branchlets tetragonal, glabrous, and are as well as the petioles rusty; leaves petiolate, oblong, obtuse, somewhat cordate at the base, acute at the apex, with revolute quite entire margins, 3-nerved, clothed

with small, lepidotted down beneath as well as on the peduncles and calyxes; thyrse panicled, many-flowered. ♄. S. Native of Jamaica, on the highest mountains, and of Guadaloupe. Melástoma tetrándra, Swartz, fl. ind. occ. p. 795. but not *M. tetrándrum* of Spreng. syst. Flowers small, white, tetrandrous.

Tetrandrous Tetrazygia. Shrub 3 to 6 feet.

Sect. II. Octoste'mon (from οκτω, *octo*, eight, and στημων, *stemon*, a stamen; stamens 8.). D. C. prod. 3. p. 172. Stamens 8. Thyrse corymb-formed.

2 T. di'scolor (D. C. prod. 3. p. 172.) branches bluntly tetragonal; petioles, panicles, and under side of leaves clothed with flocky, short, white, stellate down; leaves repandly denticulated, oval, acuminated, 5-nerved; glabrous above; cyme paniculately corymbose, trichotomous, terminal; teeth of calyx short, obtuse; petals oval, retuse. ♄. S. Native of the West Indies, Guadaloupe, Martinico, St. Vincent, Mont Serrat, &c. Melástoma díscolor, Lin. spec. p. 560. Jacq. amer. t. 130. t. 84. Rich. in Bonpl. mel. t. 34. Melast. acuminàta, Vahl. ecl. 1. t. 7. Melast. elæagnoìdes, Sieb. fl. trin. no. 61. Flowers cream-coloured.

Two-coloured-leaved Tetrazygia. Shrub 4 to 6 feet.

3 T. elæagnoìdes (D. C. l. c.) branches nearly terete, and are as well as the petioles and under side of leaves clothed with adpressed, rufescent, lepidotted, rather powdery down; leaves oblong, 3-nerved, attenuated at both ends, glabrous above, rather coriaceous; cymes twice trifid, terminal; limb of calyx urceolate, obscurely 4-toothed. ♄. S. Native of the West Indies. Melástoma elæagnoides, Swartz, fl. ind. occ. p. 815. Vahl. icon. pl. amer. 2. t. 28. Rich. in Bonpl. rhex. t. 13. Petals white, obovate. Berries bluish black, bottle-shaped, from being crowned by the permanent neck of the calyx.

Elæagnus-like Tetrazygia. Shrub 3 to 10 feet.

4 T. angustifòlia (D. C. l. c.) branches terete, and are as well as the petioles and under side of leaves clothed with velvety, minute, stellate down; leaves linear-lanceolate, with revolute, quite entire margins, 3-nerved, beset with yellowish dots above; lateral nerves approximating the margin of leaf; cymes paniculately corymbose, trichotomous; calyx rather globose, with the limb slightly 4-toothed. ♄. S. Native of the West Indies, particularly of Montserrat, Trinidad, Guadaloupe, &c. Melástoma angustifòlia, Swartz, fl. ind. occ. p. 799. Rich. in Bonpl. mel. t. 10. Vahl. dec. amer. 3. t. 26. Petals from white to pale red, obovate. Flowers one-half smaller than those of *T. elæagnoìdes*. Fruit nearly globose, not bottle-shaped.

Narrow-leaved Tetrazygia. Shrub 4 to 6 feet.

5 T. crotonifòlia (D. C. l. c.) branches terete, hispid; leaves sessile, cordate, lanceolate, denticulated, 3-5-nerved, glabrous above, and rather muricated, clothed with white down or tomentum beneath; panicles terminal, few-flowered; calyx rather campanulate, 4-toothed. ♄. S. Native of St. Domingo. Melast. crotonifòlia, Desr. in Lam. dict. 4. p. 43. Petals 4, oval, purple. Fruit ovate, glabrous, crowned by the calyx. The habit of the plant is between that of *Heterótrichum* and *Tetrazýgia*.

Croton-leaved Tetrazygia. Sh. 3 to 6 feet.

Cult. See *Melástoma* for culture and propagation, p. 764.

LXVI. HETEROTRICHUM (from ἑτερος, *heteros*, variable, and θριξ τριχος, *thrix trichos*, a hair; the plants are clothed with variable hairs, some stellate and soft, and others simple and bristly intermixed). D. C. prod. 3. p. 173.

Lin. syst. *Deca-Icosándria, Monogýnia.* Tube of calyx ovate-globose; limb 5-8-cleft, with the lobes permanent and broad at the base, and elongated and subulate at the apex. Petals 5-8, oval. Stamens 12-16, equal; filaments glabrous; anthers oblong, hardly gibbous at the base, opening by one pore at the apex. Ovarium glabrous, umbilicate at the apex. Style cylindrical; stigma a pruinose dot. Capsule baccate, 5-6-celled, globose, crowned by the calyx. Seeds unknown.—Shrubs, natives of St. Domingo. Branches terete, and are, as well as the petioles, panicles, and calyxes beset with stiff bristles and stellate down intermixed. Leaves petiolate, bristly above, and hispid on the nerves beneath, but velvety between the nerves. Cymes terminal, trichotomous, umbellate. Flowers white or purple. The torus in *H. octònum* is easily separated from the calyx, forming a tunic around the ovarium, toothed at the apex. Perhaps in all.

1 H. angustifòlium (D. C. prod. 3. p. 173.) branches, petioles, and peduncles, as well as under side of leaves and calyxes, clothed with short stellate white tomentum, intermixed with stiff rufous spreading bristles; leaves oblong, obtuse at the base, acuminated at the apex, rugosely crenulated, beset with bristles on the upper surface, which are tumid at the base, triple-nerved; cymes divaricate, trichotomous, terminal; tube of calyx ovate, having the lobes of the limb dilated and rounded at the base, and ending each in a subulate mucrone. ♄. S. Native of St. Domingo and Martinique. Melástoma hírta, Desr. in Lam. dict. 4. p. 43. but not of others. Melast. Berteroànum, Ser. mss.—Plum. ed. Burm. t. 141. Perhaps the same as Melast. pállens of Spreng. syst. Petals ovate, acutish. Anthers oblong, bluntly subgibbous at the base. Axils of nerves bearded.

Narrow-leaved Heterotrichum. Sh. 3 to 6 feet.

2 H. ni'veum (D. C. l. c.) branches, petioles, pedicels, and under side of leaves, beset with blackish rigid bristles, intermixed with white stellate down; leaves cordate, acuminated, scabrous from bristles above, 7-nerved; panicle loose; flowers 6-cleft. ♄. S. Native of St. Domingo. Melástoma nívea, Desr. in Lam. dict. 4. p. 42. Very nearly allied to the following species, but differs in the down being white, as in the preceding species, and in the flowers being 6-cleft and dodecandrous.

White Heterotrichum. Sh. 6 to 8 feet.

3 H. pa'tens (D. C. l. c.) branches, petioles, peduncles, and calyxes, beset with glandular bristles, intermixed with stellate down; leaves cordate, acuminated, somewhat denticulated, 7-nerved, rather scabrous above, but clothed with white velvety down beneath; cymes terminal, loose; flowers 6-8-cleft; lobes of calyx spreading. ♄. S. Native of St. Domingo. Melástoma pàtens, Swartz, fl. ind. occ. 2. p. 791. Melast. lappàcea, Desr. in Lam. dict. 4. p. 42. Melast. grandiflòrum, Spreng. in herb. Balb. but not of Aubl. Flowers pale red or whitish. Berry sweet, but insipid.

Spreading Heterotrichum. Shrub 6 feet.

4 H. octònum (D. C. l. c.) branches, petioles, and peduncles beset with long, spreading, reflexed bristles, intermixed with short, stellate down; leaves cordate, acuminated, 5-7-nerved, hispid above from simple, toothed bristles, but clothed with stellate down beneath; thyrse panicled, terminal; teeth of calyx 8, subulate, short, permanent, incurved. ♄. S. Native of South America, on Mount Quindiu, near the river Guada. Melástoma octòna, Bonpl. mel. t. 4. Petals 4, white. Torus separable from the calyx, forming an 8-toothed tunic around the ovarium.

Eight-cleft-calyxed Heterotrichum. Sh. 6 to 9 feet.

5 H. novemne'rvium (D. C. l. c.) branches, petioles, and peduncles beset with glandular bristles, intermixed with grey stellate tomentum; leaves ovate, rather cordate at the base, acuminated at the apex, ciliately serrulated, 9-nerved, rough from blisters above, and velvety beneath from white stellate down; thyrse panicled, loose, terminal; calyx clothed with white tomentum, having 5, erectish lobes. ♄. S. Native of Brazil. Petals oblong.

Nine-nerved-leaved Heterotrichum. Sh. 6 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXVII. CONOSTE'GIA (from κονος, *konos*, a cone, and στεγη, *stege*, a covering; in reference to the conical calyptriform calyx falling off in one piece). D. Don, in mem. soc. wern. 4. p. 316. Ser. mss. D. C. prod. 3. p. 173.—Melástoma calyptràta, Bonpl. mel.—Calycótomus and Bruguièra, Rich. ined.

Lin. syst. *Deca-Icosándria, Monogýnia.* Tube of calyx adnate to the ovarium; limb undivided, conical, form of a calyptra, cut round (f. 112. *b.*), or irregularly ruptured at the base through æstivation, and therefore falling off in one piece (f. 112. *a.*). Petals 5-6. Stamens 10-16. Anthers usually biauriculate at the base. Stigma capitate or peltate. Capsule baccate, 3-8-celled. Seeds ovoid, angular.—Trees or shrubs, for the most part natives of South America. Leaves petiolate. Thyrse panicled, terminal. Flowers usually white.

Sect. I. Eriosté'gia (from εριον, *erion*, wool, and στεγη, *stege*, a covering; calyx woolly). Flower-bud globose, hispid, abruptly acuminated.

1 C. Muti'sii (Ser. mss. ex D. C. prod. 3. p. 174.) branches, petioles, peduncles, and calyxes hairy; leaves large, cordate-oval, rather acuminated, denticulated, 7-9-nerved, glabrous above, but rather pilose on the nerves beneath; peduncles terminal, usually 3-flowered; flower-bud ovate-globose, abruptly acuminated, and regularly cut round at the base. ♄. S. Native of South America, on Mount Quindiu, at the altitude of 2300 feet. Melástoma Mutìsii, Bonpl. mel. 1. p. 136. t. 58. Calyx large, hairy. Bracteas linear-subulate. Petals 5, white, oval. The flowers are said to be polyandrous in the character given by Bonpland, and decandrous in the French description. Stigma simple.

Mutis's Conostegia. Tree 20 feet.

Sect. II. Euconosté'gia (this section contains what are supposed to be the true species of the genus). Flower-bud ovate, blunt at the apex or acutish, glabrous or a little velvety.

2 C. extinctòria (D. Don, in mem. wern. soc. 4. p. 316.) branches bluntly tetragonal, rather terete, and are, as well as the petioles, leaves, and panicles, clothed with adpressed rusty down; leaves oval-oblong, long-acuminated, quintuple-nerved, with repandly denticulated margins, glabrous and shining above; panicle terminal; flower-bud conical and acute at the apex, cut round about in the middle. ♄. S. Native of New Granada, in temperate places near Mariquita. Melástoma extinctòrium, Bonpl. mel. t. 57. Petals 6, obovate, white. Stamens 20. Berry 5-celled.

Spoiled Conostegia. Tree 24 feet.

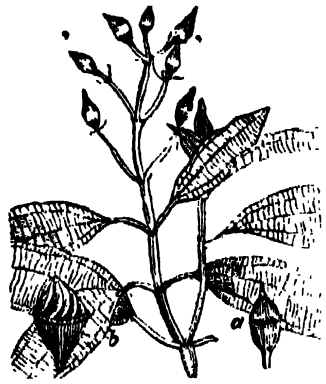
3 C. di'scolor (D. C. prod. 3. p. 174.) branches nearly terete, and are, as well as the petioles, peduncles, and under side of leaves, clothed with short rusty down; leaves oval, attenuated at the base, acuminated at the apex, quite entire, 5-nerved, besides the marginal nervules; thyrse terminal, panicled, loose; calyx glabrous after opening, urceolate, truncate, globose at the base. ♄. S. Native of St. Domingo. Melástoma tetrándrum, Spreng. syst. 2. p. 305. exclusive of the synonymes.

Two-coloured-leaved Conostegia. Tree 12 to 20 feet.

4 C. pro'cera (D. Don, l. c.) glabrous; branches bluntly tetragonal; leaves oval-lanceolate, acuminated, entire, triple-nerved, bearded in the axils of the nerves beneath; thyrse panicled, terminal, loose; flower-bud ovate, acuminated, cut round in the middle. ♄. S. Native of Jamaica, on the mountains. Melast. prócera, Swartz, fl. ind. occ. p. 764. Bonpl. mel. t. 51. Perhaps Swartz's plant under this name is the same as Bonpland's, although Swartz says the leaves of his plant are glabrous, and sometimes rusty beneath, the stigma capitate, and the flowers decandrous; Bonpland says, his plant has dodecandrous flowers, nerves of leaves bearded, and an acute stigma. Flowers white. (f. 112.)

Tall Conostegia. Tree 12 to 30 feet.

FIG. 112.



5 C. Balbisia'na (Ser. mss. ex D. C. prod. 3. p. 174.) quite glabrous; branches bluntly tetragonal; leaves oval, rather oblong, hardly acuminated, quite entire, triple-nerved, besides the marginal nervules; thyrse panicled, terminal, elongated, having its branchlets 3-flowered; flower-bud ovate, acutish, at length cut round about. ♄. S. Native of Jamaica. Flowers twice the size of those of *C. calyptràta.* Perhaps the same as Melástoma prócera, Swartz, but not of Bonpl.? Base of calyx campanulate, rather urceolate, truncate. Stamens 12. Style not thickened at the apex. Berry 8-celled.

Balbis's Conostegia. Tree 20 feet.

6 C. subhirsu'ta (D. C. prod. 3. p. 174.) branchlets tetragonal, and are, as well as the peduncles and nerves of leaves, densely clothed with rusty branched down; leaves oval, somewhat attenuated at the base, abruptly acuminated at the apex, quite entire, 5-nerved, glabrous on both surfaces, except the nerves on the [illegible] surface; thyrse panicled, terminal, few-flowered; calyx ovoid, after separating hemispherical truncate and glabrous at the base. ♄. S. Native of Cuba, about the Havanah, and of Guadaloupe. Bruguièra, Rich. herb. This species is very distinct in the hairiness, form of the leaves and calyxes. Petals 8-10, obovate-oblong. Berry 12-celled. Stigma peltate.

Rather-hairy Conostegia. Tree 20 feet.

7 C. calyptra'ta (D. Don, l. c.) smoothish; branches tetragonal, and are, as well as the petioles, panicles, and nerves of leaves on the under side, clothed with scurfy down; leaves on long petioles, oval-oblong, long-acuminated, glabrous above, somewhat denticulated, 3-nerved, besides the 2 small lateral nervules; thyrse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, cut round about in the middle. ♄. S. Native of mountain woods in Guadaloupe, Martinique, and Montserrat, &c. Melástoma calyptràta, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 46. Vahl. ecl. 1. p. 40. Flowers white.

Calyptrate-calyxed Conostegia. Sh. 6 to 8 feet.

8 C. cornifòlia (Ser. mss. ex D. C. prod. 3. p. 175.) quite glabrous; branches nearly terete; leaves petiolate, oval, short-acuminated, quite entire, 3-nerved, besides the marginal nervules; thyrse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, sometimes cut round about in the middle, and sometimes opening irregularly by 2 valves. ♄. S. Native of Martinique. There is a small-leaved variety found on the mountains, and a large-leaved variety in the woods. Melástoma cornifòlia, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 41. Melast. pícta, Vahl. ecl. 3. p. 15. ex Ser. Petals 5, white, obtuse. Stamens 10. Berry 4-celled.

Dog-wood-leaved Conostegia. Tree 20 feet.

9 C. semicrena'ta (Ser. mss. ex D. C. prod. 3. p. 175.) glabrous; branches nearly terete; leaves oblong, long-acuminated, repandly crenated in the upper part, 3-nerved, rusty beneath in the adult state; thyrse panicled, terminal, loose; flower-bud oval, attenuated at the base, acutish at the apex; tube of calyx

a little striated, with a circumcised or irregularly ruptured limb. ♄. S. Native of Guadaloupe, and of Cuba about the Havanah. Melástoma semicrenàta, Rich. in Bonpl. mel. t. 31. Melástoma acuminàta, Desr. in Lam. dict. 4. p. 54. Melast. elongàta, Vahl. ecl. 3. p. 16. ex Ser. Petals 5, white. Stamens 10. Ovarium 3-celled.

Half-crenated-leaved Conostegia. Tree 20 to 30 feet.

10 C. TUNICA'TA (Ser. mss. in D. C. l. c.) glabrous; branches terete; leaves oval-lanceolate, acuminated at both ends, quite entire, triple-nerved, besides the marginal nervules; thyrse panicled, terminal, short; flower-bud ovate, irregularly ruptured. ♄. S. Native of Peru, on the Andes. Melástoma tunicàta, Bonpl. mel. t. 60. Petals 5, white, oval. Anthers not auricled at the base. Berry 5-celled.

Tunicated Conostegia. Sh. 4 to 6 feet.

11 C. PARVIFLÒRA (D. C. l. c.) glabrous; branchlets terete; leaves oval, attenuately acuminated, repandly crenated, quintuple nerved; thyrse panicled, terminal, with its branches spreading; calyx circumcised. ♄. S. Native of St. Domingo. Melástoma montànum, Spreng. syst. 2. p. 296. This species differs from *C. montàna* in the leaves being oval, not oblong, crenated, not denticulated, quintuple-nerved, not 3-nerved.

Small-leaved Conostegia. Shrub 6 ft.

12 C. MONTA'NA (D. Don, l. c.) smoothish; branchlets tetragonal, clothed with mealy cinereous down; leaves oblong, somewhat denticulated, 3-nerved, besides the marginal nervules, paler beneath; thyrse panicled, terminal, having its branches spreading; flower-bud obtuse, cut round in the middle. ♄. S. Native of the high mountains in the south of Jamaica. Melástoma montàna, Swartz, fl. ind. occ. p. 766. Flowers small. Limb of calyx truncate after opening, urce[illegible] with an unequal edge. Petals oblong-obovate, white. Stamens 10-16; stigma rather capitate.

Mountain Conostegia. Shrub 6 to 8 feet.

13 C. MEXICA'NA (Ser. mss. ex D. C. l. c.) quite glabrous; branchlets terete; leaves oval-lanceolate, tapering to both ends, denticulated, quintuple-nerved; thyrse terminal, panicled, loose; flower-bud ovate-oblong, obtuse, irregularly ruptured. ♄. S. Native in the temperate parts of Mexico. Melástoma Mexicàna, Bonpl. mel. t. 55. Petals 5, white, oval. Stamens 10; stigma obtuse. Berry 5-celled.

Mexican Conostegia. Shrub 6 feet.

14 C. XALAPE'NSIS (D. Don, l. c.) branchlets terete, and are, as well as the petioles, panicles, and under side of leaves, clothed with rusty down; leaves lanceolate, acute at both ends, quintuple-nerved, toothed; thyrse terminal, panicled, ovate; flower-bud ovate, obtuse at both ends, regularly cut round about in the middle. ♄. S. Native of Mexico, near Xalapa. Melástoma Xalapénsis, Bonpl. mel. t. 54. Petals 5, oval, white. Stamens 10; stigma obtuse.

Xalapa Conostegia. Shrub 5 feet.

15 C. LUTE'SCENS (Ser. mss. ex D. C. l. c) branches quite glabrous, obscurely tetragonal above; leaves ovate-lanceolate, attenuated, glabrous, a little toothed on the outer margin, petiolate, 3-5-nerved; racemes terminal, compound; flowers decandrous; peduncles 3-flowered, the middle flower of the three sessile; calyx ovate, acute, at length truncate; style brownish purple, longer than the corolla and stamens. ♄. S. Native of the Island of Montserrat. Melástoma lutéscens, Vahl. ecl. fasc. 3. p. 17. but not of Humb. et Bonpl.

Yellowish Conostegia. Shrub 2 to 3 feet.

16 C. GLA'BRA (D. Don, l. c.) branches nearly terete; leaves oblong, acuminated, somewhat 3-nerved, quite entire, glabrous; panicle terminal; calyx circumcised. ♄. S. Native of the Society Islands. Melástoma glàbra, Forst. prod. no. 194. Willd. spec. 2. p. 584. The whole shrub quite glabrous, the branches purplish, the leaves almost one-nerved, from the marginal nerves being confluent. Cymes corymbose, terminal, trichotomous. Flower-bud obovate, obtuse.

Glabrous Conostegia. Shrub 4 to 6 ft.

† *Species not described.*

17 C. HOLOSERI'CEA (D. Don, mem. soc. wern. 4. p. 316.) ♄. S. Native of Peru. Melástoma holoserícea, Pav. in herb. Lamb. but not of Lin.

Whole-silky Conostegia. Shrub.

18 C. CUCULLA'TA (D. Don, l. c.) ♄. S. Native of Peru. Melástoma cucullàta, Pav. in herb. Lamb.

Cucullate Conostegia. Shrub.

19 C. SUPE'RBA (D. Don, l. c.) ♄. S. Native of South America. Melástoma supérba, Bonpl. ined.

Superb Conostegia. Shrub.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXVIII. DIPLOGE'NEA (from διπλοος, *diploos*, and γενεα, *genea*, generation). Lindl. in Brande's quart. journ. Oct. 1828. p. 121.

LIN. SYST. *Octándria, Monogýnia.* Calyx with a calyptriform conical deciduous limb. Petals 4, lanceolate, inserted in the fleshy disk which covers the ovarium; anthers ovate, bicalcarate at the base, opening by one pore at the apex. Ovarium adnate to the calyx, 4-celled, many seeded, crowned by the large fleshy disk. Style falcate, clavate. Stigma simple.—A smooth parasitical shrub, almost with the habit of *Viscum*. Branches fleshy, dichotomous, compressed in the young state. Leaves oblong, retuse, fleshy, 3-ribbed, veinless, filled with oily receptacles between the parenchyma. Flowers small, white, disposed in short axillary racemes. Tube of calyx replete with oily receptacles.

1 C. VISCOÌDES (Lindl. l. c.) ♄. S. Native of Madagascar at St. Mary's.

Misseltoe-like Diplogenea. Shrub.

Cult. This plant being parasitical, it should be treated in the same manner as tropical orchideous plants. Cuttings will strike root under a hand-glass.

LXIX. DIPLOCHI'TA (from διπλοος, *diploos*, double, and χιτων, *chiton*, an outer covering; in reference to the calyx, which is involved by 2 bracteas while in a young state). D. C. prod. 3. p. 176.– Chitònia, D. Don, in mem. wern. soc. 4. p. 317. but not of Mocino.—Fothergílla, Aubl. guian. 1. p. 441. but not of Lin.

LIN. SYST. *Deca-Dodecándria, Monogýnia.* Calyx adhering to the ovarium at the base, when young involved by 2 bracteas, cylindrical, with the throat usually ciliated after flowering; limb bluntly 5-6-toothed, permanent, drawn out beyond the ovarium. Petals 5-6, usually oblong. Anthers biauriculate at the base, opening by one pore at the apex. Ovarium ovate-oblong, crowned by a callous glabrous disk. Style filiform; stigma peltate or capitate. Capsule dry, indehiscent, 5-celled. Seeds ovate.—Tall South American showy trees or large shrubs, usually clothed with rusty velvety down on the branches, and under side of the leaves. Leaves petiolate, ovate, usually acuminated, obtuse or cordate at the base, smoothish above, with the margins quite entire or crenated. Thyrse terminal, with opposite branches. Flowers white or rose-coloured, but in one of the species yellow. Bracteas 2, oval, large, involving the calyx when young, but at length falling off altogether.

* *Leaves quite entire.*

1 D. FOTHERGI'LLA (D. C. prod. 3. p. 176.) branches compressed when young, but at length becoming terete, and are, as well as the petioles, rachis, and nerves of leaves on the under side, clothed with rufous down; leaves petiolate, oval, acumi-

nated, quite entire, 5-nerved, hardly clothed with velvety white down between the nerves; thyrse panicled, many-flowered; bracteas velvety; calyx quite glabrous in the adult state; stigma dilated, rather peltate. ♄. S. Native of Guadaloupe and Trinidad, Guiana and Brazil. Melástoma Fothergílla, Rich. in Bonpl. mel. t. 32. Melástoma compréssa, Vahl. ecl. 3. p. 23. dec. amer. 2. t. 17. Fothergílla mirábilis, Aubl. guian. 1. p. 441. t. 174. Flowers white.

Fothergill's Diplochita. Clt. 1815. Tree 10 to 20 feet.

2 D. flórida (D. C. l. c) branches terete, and are, as well as the petioles, rachis, and nerves of leaves on the under side, clothed with almost imperceptible rufous down; leaves petiolate, elliptic-oblong, cuneated at the base, acuminated at the apex, 5-nerved, quite entire, glabrous above, but covered with almost imperceptible white down beneath; thyrse terminal, many-flowered; bracteas coloured under the flower, rather velvety; calyxes quite glabrous, with a truncate, bluntly somewhat 5-toothed border. ♄. S. Native of French Guiana. A shewy tree, called by the natives of Guiana *Bois Yaman*. Trunk tall, usually furrowed. Bracteas rose-coloured, as in *Córnus flórida*. Petals, stamens, and style unknown. Berry 3-5-celled. Seeds angular. Perhaps sufficiently distinct from *D. Fothergilla*, and the synonyme of Aublet is perhaps referrible to this plant.

Florid Diplochita. Tree 20 to 30 feet.

3 D. bractea'ta (D. C. l. c.) branches rather compressed when young, and are, as well as the panicles, petioles, and under side of leaves, clothed with whitish brown, adpressed, flocky, stellate down; leaves petiolate, oval, acuminated, obtuse at the base, with the margins quite entire, glabrous on the upper surface; panicles terminal, and there are also racemose peduncles rising from the axils of the upper leaves; calyx tubular, not striated; petals glabrous. ♄. S. Native of Brazil, near Coari, in marshy fields. Melástoma bracteàtum, Mart. et Schrank, mss. Like *D. Fothergilla*, but differs in the margins of the leaves being quite entire, in the calyxes being tomentose, and in the stigmas not being dilated.

Bracteate-flowered Diplochita. Shrub 10 to 20 feet.

4 D. mucrona'ta (D. C. prod. 3. p. 177.) branchlets somewhat compressed, at length terete, and are, as well as the petioles, panicles, and under side of leaves, densely clothed with rufous stellate down; leaves petiolate, broadly oval, abruptly acuminated, almost entire, quite glabrous above, 5-nerved; thyrse somewhat panicled, rising from the top of the branches in an umbellate manner; bracteas and calyxes tomentose; petals 5-6, oblong; stigma dot-formed. ♄. S. Native of French Guiana. Melástoma mucronàta, Desr. in Lam. dict. 4. p. 47. Rich. in Bonpl. mel. t. 18. Calyx furnished with a ring of hairs under the insertion of the stamens. Ovarium toothed at the apex. Berry 4-celled, black. Anthers bluntly auricled at the base. Flowers white.

Mucronate Diplochita. Shrub 6 to 10 feet.

5 D. Swartzia'na (D. C. l. c.) branchlets rather terete, and are, as well as the petioles, peduncles, and under side of leaves, clothed with short hoary rufescent stellate down; leaves oblong-oval, abruptly acuminated, 5-7-nerved, quite entire; thyrse straight; bracteas deciduous; calyxes tomentose, bluntly toothed, not ciliated inside. ♄. S. Native of Jamaica. Melástoma Tamònea, Swartz, fl. ind. occ. p. 783. Melástoma Swartziàna, Rich. in Bonpl. mel. t. 33. Melast. dodecándra, Desr. in Lam. dict. Petals 5-6, oblong, red. Stigma hardly dilated. This species comes very near to *D. acuminàta*, but differs in the want of the ring of hairs under the stamens, and in the ovarium not being toothed at the apex.

Swartz's Diplochita. Clt. 1815. Shrub 10 to 15 feet.

6. D. cauda'ta (D. C. l. c.) leaves broadly elliptic, quite entire, 5-nerved, terminated in a long tail-like point each; flowers glomerate in panicles. ♄. S. Native of Peru. Chitònia candàta, D. Don, in mem. wern. soc. 4. p. 317. but distinct from Melástoma caudàta, Bonpl.

Tailed-leaved Diplochita. Shrub 6 to 10 ft.

7 D. au'rea (D. C. l. c.) leaves ovate-lanceolate, acuminated, triple-nerved, quite entire, acute at the base, glabrous on both surfaces; panicle pyramidal, smooth. ♄. S. Native of Peru. Chitònia aùrea, D. Don, l. c. Flowers golden yellow.

Golden-flowered Diplochita. Shrub 6 to 10 ft.

8 D. bubali'na (D. C. l. c.) leaves ovate-lanceolate, toothed, acuminated, 5-nerved, clothed with fulvous tomentum beneath, as well as on the branchlets; panicle many-flowered; calyx clothed with hoary tomentum. ♄. S. Native of Peru. Melástoma bubalìna, Pav. in herb. Lamb. Chitònia bubalìna, D. Don, l. c. Leaves often a foot long, and 4 inches broad. Flowers small.

Buffalo Diplochita. Shrub 6 to 10 ft.

9 D. macrophy'lla (D. C. l. c.) leaves cordate-oval, acuminated, crenulated, clothed with fulvous tomentum beneath, as well as on the branches; panicle pyramidal; calyx furrowed. ♄. S. Native of Mexico. Melástoma macrophy'lla, Pav. in herb. Lamb. Chitònia microphy'lla, D. Don, l. c. Leaves a hand or a foot long, and 4-5 inches broad.

Long-leaved Diplochita. Shrub 10 feet.

* * *Leaves crenated.*

10 D. leucoce'phala (D. C. l. c.) branchlets bluntly tetragonal, and are, as well as the petioles, peduncles, and under side of leaves, clothed with adpressed rufous powdery down; leaves petiolate, obtuse at the base and rather cordate, oval, acuminated, crenately toothed, 5-nerved, glabrous and glaucous above; panicle terminal; calyxes urceolate, and are, as well as the bracteas, densely clothed with white stellate down; petals clothed with white velvety down on the outside. ♄. S. Native of Cayenne.

White-headed Diplochita. Tree 10 to 20 feet.

11 D. serrula'ta (D. C. l. c.) branchlets compressed, and are, as well as the panicles, petioles, and under side of leaves, densely clothed with short velvety stellate down; leaves petiolate, rather cordate at the base, ovate, acuminated, toothed, 7-nerved, glabrous above; panicle terminal, elongated; branchlets opposite, distant, many-flowered; bracteas and calyxes densely clothed with velvety down; petals 5-6, velvety on the outside; filaments pilose; stigma hardly dilated at the apex. ♄. S. Native of Brazil, in woods. Melas. lasiopétalum, Mart. et Schrank, mss. Leaves nearly a foot long, obtuse at the base, and tapering gradually to an acumen at the apex. Calyx white, striated lengthwise. Down on the branches and petioles brown.

Var. β, latifòlia (D. C. l. c.) leaves broader, cordate at the base, abruptly acuminated. ♄. S. Native of St. Domingo and Cayenne. Melástoma serrulàta, Rich. herb. Melast. Balbisiànum, Ser. mss. Melast. pàtens, Spreng. in herb. Balb. but not of Swartz.

Serrulated-leaved Diplochita. Shrub 6 to 10 feet.

Cult. All the species are fine broad leaved trees and shrubs. Their culture and propagation are the same as for the species of *Melástoma*. p. 764.

LXX. PHY'LLOPUS (from φυλλον, *phyllon*, a leaf, and πους, *pous*, a foot; the pedicels or footstalks bear two leafy bracteas each). D. C. prod. 3. p. 177.

Lin. syst. *Decándria, Monogýnia*. Tube of calyx adnate to the ovarium, turbinately campanulate; limb campanulate, with 5 very short teeth; the teeth ciliated with bristles. Petals 5, unguiculate, broadly ovate, somewhat cordate, terminating each in a bristle. Stamens 10, equal. Anthers with long beaks at the apex, and opening by a pore. Ovarium adnate to the calyx. Style cylindrical, rather velvety at the base. Stigma a pruinose dot. Fruit probably baccate, 5-celled. Seeds unknown.—Brazilian shrubs, having the younger branchlets and petioles clothed with rufous adpressed bristles, but at length becoming smooth. Leaves oblong, elongated, acuminated, 3-nerved, quite entire, with a few scattered bristles above, but covered with pale rufous stellate down beneath. Pedicels axillary, 1-flowered, a little longer than the petioles, bearing 2 linear foliaceous bracteas above the middle. Calyx very hispid. Petals purple.

1 P. Martiu'sii (D. C. prod. 3. p. 178.) ♄. S. Native of Brazil at Coari, and at Cupati in the province of Rio Negro, in fields. Melástoma phýllopus, Schrank et Mart. mss. Leaves 5-6 inches long, and 1 broad.

Martius's Phyllopus. Shrub.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXI. HENRIE'TTEA (*Caca-Henriette* is the name given to the tree by the natives of Cayenne). D. C. prod. 3. p. 178.

Lin. syst. *Decándria, Monogýnia.* Calyx campanulate, 5-lobed; lobes broad, obtuse. Petals 5, velvety, ovate. Stamens 10; anthers thick, bifid at the base, and ending in a beak at the apex opening by one pore. Style cylindrical, hairy, crowned by an obtuse capitate stigma. Berry juicy, 5-celled. Seeds unknown.—Shrubs, native of Guiana, with nearly terete branches, clothed with adpressed strigose down. Leaves on short petioles, oval, acuminated by a mucrone, triple-nerved, green above, and clothed with velvety down beneath. Peduncles 1-flowered, rising, 3-4 together, from the axils of the fallen leaves. Calyx clothed with rufous villi.

. 1 H. succòsa (D. C. prod. 3. p. 17[illegible]ches bluntly tetragonal, but at length becoming terete, and are as well as the petioles rough from adpressed strigose down; leaves on short petioles, quintuple-nerved, oval, acuminated by a mucrone, quite entire, green above, hairy on the nerves, but the rest of leaf scabrous from stiff bristles, and clothed with roughish rusty down beneath; pedicels 3-4 together, 1-flowered, in the axils of the fallen leaves, rusty; calyx rusty, villous, bluntly 5-lobed. ♄. S. Native of Cayenne, in woods, where it is called by the inhabitants *Caca-Henriette.* Melástoma succòsa, Aubl. guian. 1. p. 418. t. 162. Calyx obovate-globose. Petals large, ovate, velvety. Anthers large, obtuse and biauriculate at the base, but tapering into a 1-pored beak at the apex. Style thick, hardly capitate at the apex. Berry violaceous, but with the pulp red.

Juicy-berried Henriettea. Shrub 10 to 12 feet.

† *Doubtful species.*

2 H.? Patrisia'na (D. C. l. c.) branches nearly terete, and are as well as the petioles and nerves of leaves scabrous from adpressed, reddish strigæ; leaves petiolate, oval, obtuse at the base, acute at the apex, ciliated with bristles, triple-nerved, besides the 2 marginal nervules, glabrous on both surfaces, except on the nerves; pedicels crowded in the axils of the old or fallen leaves, very short, 1-flowered, and are as well as the calyxes clothed with adpressed, rufous down; limb of calyx bluntly 5-lobed; petals lanceolate. ♄. S. Native of Cayenne. Leaves 3 inches long. Flowers small, almost sessile. Adult branches glabrous. Style filiform. Stamens not seen. Berry glabrous, globose. Limb of calyx permanent, incurved.

Patris's Henriettea. Shrub 6 to 10 ft.

3 H.? ramiflòra (D. C. l. c.) branches bluntly tetragonal, hispid, but at length becoming glabrous; leaves on short petioles, ovate-lanceolate, acuminated at both ends, entire, 3-nerved, besides the 2 marginal nervules, smooth above, but clothed with roughish rather rusty tomentum beneath; pedicels scattered on the branches beneath the leaves, rather crowded, 1-flowered; calyx urceolate, bluntly 5-toothed; petals ovate. ♄. S. Native of Jamaica, in marshes. Melástoma ramiflòra, Swartz, fl. ind. occ. p. 775. Flowers flesh-coloured. Anthers sagittate, acuminated. Stigma blunt. Leaves of a golden yellow hue above.

Branch-flowered Henriettea. Shrub 6 to 10 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXII. MARU'MIA (in honour of the celebrated vegetable physiologist, Martin Van Marum, author of Dissertationes qua disquiritur quo usque motus fluidorum animalium et plantarum consentiunt, 4to. Groningen, 1773, and other works). Blum. in bot. zeit. 1831. no. 29. p. 503.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx oblong-ovate, adhering at the base to the ovarium, beset with stiff hairs; limb 4-cleft, drawn out beyond the ovarium, with the segments oblong-linear and permanent. Petals 4, unequal-sided. Stamens 8, alternate ones shorter; anthers linear, arched, beaked at the apex, and opening by 1 pore, those of the longer stamens constricted at the base, and furnished with a fascicle of bristles; and those of the shorter ones furnished with fewer bristles at the base. Ovarium conical in the free part and rather villous. Style filiform, thickest at the base. Stigma a clammy dot. Berry ovate, inclosed in the calyx, 4-celled, many-seeded. Seeds linear-cuneiform, angular.—Sarmentose shrubs. Leaves opposite, petiolate, oblong, somewhat 5-nerved, quite entire, discoloured, glabrous above, but clothed with stellate or lepidotted down beneath as well as on the branches and peduncles. Inflorescence axillary, cymose, or subcorymbose, few or many-flowered. Flowers large, rose-coloured, bibracteate.

1 M. muscòsa (Blum. in bot. zeit. 1831. no. 29. p. 504.) leaves somewhat cordate, ovate-oblong, acuminated, clothed with rusty scurfy tomentum beneath; peduncles many-flowered; calyx densely clothed with tomentum, intermixed with soft simple bristles. ♄. S. Native of Java, in mountain woods, where it is called by the natives *Harendong-bulu.* Melástoma muscòsum, Blum. bijdr. p. 1070. Melast. ferruginea, Reinwdt. ined. Flowers large, rose-coloured.

Mossy Marumia. Shrub sarmentose.

2 M. stellula'ta (Blum. l. c. p. 505.) leaves oblong-ovate, rather cordate at the base or roundish, tomentose beneath; peduncles 1-5-flowered; calyx beset with spine-like bristles, which are stellately multifid at the apex. ♄. S. Native of Sumatra and Saloma. Melástoma stellulàtum, Jack, in Lin. trans. 14. p. 6. Flowers large, rose-coloured.

Stellate-spined Marumia. Sh. sarmentose.

3 M. nemoròsa (Blum. l. c.) leaves somewhat lanceolate, cordate, clothed with rusty, leprous down beneath; peduncles 1-3-flowered; calyx covered with simple bristles. ♄. S. Native of Sumatra and Pulo-Nias. Melástoma nemoròsa, Jack, in Lin. trans. 14. p. 149. Flowers large, pale red.

Grove Marumia. Shrub sarmentose.

4 M. Zeyla'nica (Blum. l. c.) leaves ovate-oblong, rather cordate, bluntly acuminated, scurfy beneath; peduncles usually 3-flowered; calyx clothed with simple bristles. ♄. S. Native of Ceylon.

Ceylon Marumia. Shrub sarmentose.

Cult. For culture and propagation see *Melástoma*, p. 764. All the species bear showy flowers, and are therefore worth cultivating.

LXXIII. CREOCHI'TON (from κρεαρ, *crear*, flesh, and χιτων, *chiton*, an outer coat; in reference to the outer coat, that is, the bracteas, being fleshy and inclosing the flower-bud, in its young state). Blum. in bot. zeit. 1831. no. 29. p. 506.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx globose, adhering to the ovarium; limb short, continuous with the tube, obsoletely and repandly 4-toothed, permanent. Petals 4, ovate-roundish, oblique. Stamens 8, equal. Anthers oblong, thick, arched, each furnished with a very short connective in front at the base, and terminating in a short, uniporose beak at the apex. Ovarium glabrous. Style thick, quadrangular; stigma small, blunt. Berry dry, globose, crowned by the tube of the calyx, 4-celled. Seeds innumerable, cuneate-oblong, with a linear hylum.—Climbing shrubs, with terete branchlets. Leaves opposite, petiolate, ovate or elliptic-oblong, quite entire, somewhat 5-nerved, quite glabrous above, but rather scurfy beneath. Peduncles axillary and terminal, dilated at the apex, and umbellately many-flowered. Each flower inclosed within two fleshy bracteas before expansion. Flowers large, and rose-coloured.

1 C. **pudibu'nda** (Blum. in bot. zeit. 1831. no. 29. p. 506.) leaves ovate, bluntish, or obtuse at both ends, clothed beneath with scurfy dots; umbels simple, rarely branched, many-flowered. ♄ . ◡. S. Native of Java, in woods near Kapangdungang, at the foot of Mount Salak, where it is called by the natives *Tjalant-jung*. Melástoma pudibúndum, Blum. bijdr. p. 1071. Flowers large, red.

Blush Creochiton. Shrub cl.

2 C. **bibractea'ta** (Blum. l. c. p. 507.) leaves ovate, rather cordate, bluntish, densely clothed with fulvous leprous tomentum on the nerves beneath, as well as on the branchlets and peduncles; umbels simple, few-flowered. ♄ . ◡. S. Native along with the preceding species, and where it is called by the natives *Harendong-arog*. Melástoma bibracteàtum, Blum. bijdr. p. 1071. Flowers large, red.

Bibracteate Creochiton. Shrub cl.

Cult. See *Melástoma* for culture and propagation, p. 764. Elegant climbing plants, bearing large showy flowers.

LXXIV. PHYLLAGA'THIS (from *φυλλον*, *phyllon*, a leaf, and *αγαθις*, *agathis*, a round heap; the flowers are disposed in heaps or heads, surrounded by leaves or bracteas). Blum. in bot. zeit. 1831. no. 29. p. 507.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx oblong, glabrous, adhering to the ovarium at the base; limb drawn out beyond the ovarium, 4-cleft. Petals 4. Stamens 8, equal. Anthers arched, inappendiculate at the base, beaked at the apex, the beak opening by 1 pore? Style long. Berry 4-celled.——Shrub. Leaves opposite, large, roundish, 7-nerved, beset with rusty dots beneath, standing on very long ciliated petioles. Flowers purplish, densely crowded in axillary pedunculate heads, each head involucrated, or surrounded by 5-6 broad cordate-nerved bracteas.

1 P. **rotundifòlia** (Blum. l. c.). ♄ . S. Native of Sumatra. Melástoma rotundifòlium, Jack. in Lin. trans. 14. p. 11.

Round-leaved Phyllagathis. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXV. LORE'YA (dedicated to — Lorey, author of a Flora of Burgundy). D. C. prod. 3. p. 178.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx campanulate, adhering to the ovarium at the very base, and truncate at the apex. Petals 5, ovate, obtuse, rather cordate at the base. Stamens 10; anthers thick, ovate, obtuse, rather gibbous at the base. Ovarium glabrous at the apex. Style filiform; stigma capitate, almost pentagonal. Berry 5-celled. Seeds unknown. —A glabrous, Guiana shrub. Leaves petiolate, oval, triple-nerved, besides the 2 marginal nervules, quite entire. Cymes lateral, many-flowered.

1 L. **arbore'scens** (D. C. l. c.) glabrous; branchlets bluntly quadrangular, at length terete; leaves petiolate, oval-orbicular, obtuse, or mucronate, entire, 5-nerved, 2 of the nerves rising from the middle a little above the base; lateral racemules 7-8-flowered, cymose; limb of calyx rather truncate; petals 5, rather cordate at the base. ♄ . S. Native of French Guiana, in woods, where it is called *Mele* by the inhabitants. Melástoma arboréscens, Aubl. guian. 1. p. 420. t. 163. Berry yellow, eatable, very like a medlar.

Arborescent Loreya. Tree 30 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXVI. MICO'NIA (in honour of D. Micon, a Spanish botanist). Ruiz et Pav. fl. per. syst. 1. p. 104. prod. p. 60. D. Don, in mem. wern. soc. 4. p. 315. D. C. prod. 3. p. 179.

Lin. syst. *Decándria, Monogýnia.* Tube of calyx adhering to the ovarium; limb short, permanent, 5-toothed; teeth obtuse, furnished with a broad membrane on the inside, usually adpressed and connivent above the ovarium after flowering. Petals 5, obovate, obtuse. Stamens 10; anthers oblong-linear, bluntly and shortly auriculated at the base. Ovarium rather umbilicate at the apex, quite glabrous. Style filiform; stigma obtuse. Capsule baccate, 5-celled. Seeds 3-sided, smooth, with a black linear hylum.—American, branched, smooth, or rather hairy or tomentose shrubs, not as in *Clidemia* hispid. Leaves variable. Flowers in terminal panicles. This genus is perhaps divisible into many genera. Numbers of the species are not well known.

Sect. I. Leiosphæ'ra (from *λειος*, *leios*, smooth, and *σφαιρα*, *sphaira*, a sphere; in reference to the globular smooth fruit) D. C. prod. 3. p. 179. Tube of calyx and fruit globose and quite smooth. Flowers crowded, or in 1 series, disposed in a thyrse on the ends of the branches.

1 M. **racemòsa** (D. C. prod. 3. p. 179.) branchlets bluntly tetragonal, but [illegible] becoming terete, glabrous, but ciliated at the knots; leaves petiolate, oval, attenuated at the base, acutish at the apex, serrulated, and ciliated with bristles, 3-nerved, besides the marginal nervules, nearly glabrous on both surfaces; thyrse panicled, terminal; having the flowers disposed along its branches in 1 row. ♄ . S. Native of Guiana, Porto Rico, and Trinidad, in marshy places of woods. Melástoma racemòsa, Aubl. guian. t. 156. Rich. in Bonpl. mel. t. 27. Melast. decussàta, Vahl. ecl. 1. p. 49. Flowers red.

Racemose-flowered Miconia. Shrub 3 to 6 feet.

2 M. **barbi'gera** (D. C. l. c.) branches bluntly tetragonal, at length becoming terete, glabrous, ciliated at the knots; petioles elongated, bristly at the apex; leaves lanceolate, acuminated, ciliated with bristles, 3-nerved, besides the marginal nervules, glabrous on both surfaces in the adult state; thyrse panicled, terminal, having the flowers disposed in 1 series along its branches. ♄ . S. Native of French Guiana. Inflorescence as in *M. racemòsa*. Leaves nearly as in *M. ciliàta*, but the petioles are about 3-times longer. Flowers white.

Bearded-petioled Miconia. Shrub 3 to 6 feet.

3 M. **purpura'scens** (D. C. l. c.) branches bluntly tetragonal, pilose; leaves petiolate, oblong-lanceolate, acute, serrulately ciliated, pilose; thyrse panicled, terminal; having the flowers disposed in 1 series along its branches. ♄ . S. Native of Guiana, on the banks of rivulets. Melástoma purpuráscens, Aubl. guian. t. 154. but not of Swartz. Melast. purpùrea, Willd. spec. 2. p. 590. but not of Pav. Berry purple. Petals white.

Purplish Miconia. Fl. July. Clt. 1817. Sh. 3 to 6 feet.

4 M. **setinòdis** (D. C. l. c.) branches terete, glabrous, ciliated with bristles at the knots; leaves petiolate, ovate-oblong, acuminated, ciliately serrated, 3-nerved, besides the 2 marginal nervules, glabrous except the axils of the nerves, which are bearded; thyrse terminal, panicled; calyx rather campanulate, bluntly 6-8-toothed. ♄ . S. Native of South America, in shady places on Mount Quindiu. Melástoma setinòdis, Bonpl.

mel. t. 2. Flowers white. Petals 6-8, oval. Anthers blunt, opening by 1 pore at the apex, which is common to the 2 cells.

Bristle-knotted Miconia. Shrub 6 feet.

5 M. CILIA'TA (D. C. l. c.) branchlets nearly terete, glabrous; leaves petiolate, oblong-lanceolate, acuminated, serrated, ciliated with bristles, glabrous on both surfaces, 3-nerved, besides the marginal nervules; thyrse terminal, somewhat spicate; flowers crowded in whorls, the whorls distant. ♄. S. Native of French Guiana, in woods. Melástoma ciliàta, Rich. in act. soc. hist. nat. par. 1791. p. 109. and in Bonpl. mel. t. 26. M. purpuráscens, Vahl. ex Rich. Flowers purple.

Ciliated-leaved Miconia. Shrub 3 to 6 feet.

6 M. PILEA'TA (D. C. prod. 3. p. 180.) branches tetragonal, and are as well as the petioles and leaves more or less hispid, and ciliated from long stiff bristles; thyrse somewhat spicate, terminal; flowers almost sessile, disposed in crowded whorls; whorls distant. ♄. S. Native of Brazil, in woods. Melástoma ciliàtum and pileàtum, Schrank et Mart. mss. A very variable species, sometimes nearly glabrous, and sometimes very hispid. Flowers always glabrous. Seeds ovoid. Nearly allied to *M. congestiflòra*. Bracteas in both ciliated, with bristles at the apex.

Cap Miconia. Shrub 6 feet.

7 M. WYDLERIA'NA (D. C. in herb. Wydler. no. 225. mem. mel. p. 77.) branches bluntly tetragonal, but at length becoming terete, glabrous, but when young as well as the panicles somewhat tubercularly scabrous from rufous hairs; leaves almost sessile, oval, acuminated, obtuse at the base, and somewhat cordate, quite glabrous above, but dotted from tubercular rufous down beneath; thyrse panicled, terminal; flowers almost sessile, in crowded whorls. ♄. S. [illegible] Porto Rico, in the woods. Fruit globose, black.

Wydler's Miconia. Shrub 1 to 2 feet.

8 M. CONGESTIFLÒRA (D. C. l. c.) branchlets tetragonal, and are as well as the panicles and petioles quite glabrous; leaves petiolate, oblong, 5-nerved, glabrous on both surfaces, ciliated with long, stiff hairs; thyrse spicate, terminal; flowers crowded, in distant, many-flowered, opposite bundles. ♄. S. Native of Brazil, in the province of Minas Geraes. Melast. sessiliflòrum, Mart. herb. but not of Vahl. Calyx hemispherical, with 5 broad, small, permanent lobes. Petals obovate, emarginate. Anthers oblong, opening by 1 pore. Style filiform. Ovarium many-celled. Seeds angular.

Crowded-flowered Miconia. Shrub 6 feet.

9 M. BRACHY'PODA (D. C. l. c.) branches bluntly quadrangular, glabrous, villous, and bristly at the knots; petioles short, villous at the apex; leaves oval, attenuated at the base, acute, serrately ciliated, 3-nerved, besides the lateral nervules, pilose on the nerves on both surfaces, and beset with scattered dots of stellate down above; thyrse terminal, spicate, rather continuous. ♄. S. Native of St. Domingo. Melástoma cròceum, from Hispaniola, Spreng. syst. 2. p. 302. exclusive of the synonyms, and the country Peru. Leaves yellowish on the under surface.

Short-petioled Miconia. Shrub 6 feet.

10 M. RUFE'SCENS (D. C. l. c.) branchlets bluntly tetragonal, densely clothed with pili; leaves almost sessile, cordate at the base, ovate, crenulated, scabrous, rather tomentose, 5-nerved; thyrse spicate, terminal, densely clothed with pili; flowers crowded in something like whorls; the whorls distant. ♄. S. Native of Guiana, in fields. Melástoma ruféscens, Aubl. guian. t. 157. Perhaps belonging to a different section.

Rufescent Miconia. Shrub 6 to 9 feet.

SECT. II. ERIOSPHÆ'RA (from *εριον*, *erion*, wool, and *σφαιρα*, *sphaira*, a sphere; in reference to the flower-bud being globose, as well as being clothed with tomentum). D. C. prod. 3. p. 180. Hypoxánthus, Rich. herb. Flower-bud globose, tomentose. Tube of calyx nearly globose; limb very short. Berry globose. Leaves discoloured, glabrous above and tomentose beneath. Panicle terminal, hoary, with opposite branches, and having the flowers sessile and disposed in a secund manner along the branches, rarely crowded at the tops of the branches, or along a nearly simple rachis.

11 M. FU'LVA (D. C. l. c.) branches tetragonal, and are as well as the petioles, panicles, and under side of leaves clothed with whitish, rufescent, adpressed, rather stellate, lepidotted down; leaves opposite, or 3-4 in a whorl, elongated, hardly petiolate, attenuated at the base, and terminating in a long slender acumen at the apex, 3-nerved, glabrous above, with the margins bluntly and repandly crenated; panicle terminal, with its branches opposite or in whorls; rachis tetragonal. ♄. S. Native of Cayenne. Melástoma chrysophýlla, Rich. in act. soc. hist. nat. par. 1792. p. 109. but not of Desr. Melástoma fúlva, Rich. in Bonpl. mel. t. 11. Flower-buds small and globose. Leaves 7-8 inches long and an inch broad. Flowers white.

Var. β, *tinctòria* (Mart. herb. ex D. C. l. c.) branchlets somewhat 2-edged, and are as well as the petioles and under side of leaves clothed with whitish, rufescent, rather stellate, lepidotted, adpressed down; leaves opposite or 3 in a whorl, on short petioles, oblong, tapering to the base, and acuminated at the apex, rather repand, glabrous above in the adult state, 3-nerved, besides the 2 marginal nervules. ♄. S. Native of Brazil. Flowers and fruit unknown. Allied to var. α, but differs in the leaves being much less crenated, and in the branchlets being 2-edged, not tetragonal.

Fulvous Miconia. Shrub 4 to 6 feet.

12 M. LEPIDÒTA (D. C. l. c.) branchlets rather compressed, but at length becoming terete, and are as well as the petioles, panicles, and under side of leaves clothed with rather stellate, small, somewhat rufescent, lepidotted down; leaves petiolate, oval, acuminated, quite entire, 3-nerved, quite glabrous above; panicle many-flowered, terminal, rather loose. ♄. S. Native of Brazil, at Para and the Rio Negro, in woods. Melástoma lepidòtum, Schrank et Mart. mss. Leaves not truly lepidotted, but discoloured from almost imperceptible down. Fruit hardly the size of a large mustard-seed. Teeth of calyx obtuse, very short. Seeds angular. Flowers not seen.

Lepidotted Miconia. Shrub 2 to 3 feet.

13 M. ARGYROPHY'LLA (D. C. prod. 3. p. 181.) branches acutely tetragonal, and are as well as the petioles, panicles, and leaves clothed with white stellate down beneath; leaves petiolate, oval, acuminated, quite entire, glabrous above, 3-nerved, besides the marginal nervules; panicle terminal, raceme-formed; fruit globose, somewhat 10-ribbed. ♄. S. Native of Brazil, at the river Amazon. Melástoma argyrophýlla, Schrank et Mart. mss. Teeth of calyx 5, short, acute. Seeds 3-sided, smooth. Flowers unknown.

Silver-leaved Miconia. Shrub 1 to 2 feet.

14 M. FA'LLAX (D. C. l. c.) branches tetragonal, and are as well as the panicles and under side of leaves clothed with white stellate tomentum; leaves hardly petiolate, oblong, acuminated, coriaceous, quite entire, somewhat 5-nerved, obtuse and somewhat cordate at the base, glabrous and shining above; panicle terminal, elongated, having the flowers sessile and crowded on its branches. ♄. S. Native of Brazil, in the province of Bahia, in woods at the river Peruagua. Habit almost of *M. holoscricea*, but differs in the petioles being shorter, and in the leaves being destitute of dots on the upper surface

Fallacious Miconia. Shrub 6 to 8 feet.

15 M. STENOSTA'CHYA (D. C. l. c.) branches tetragonal, and are as well as the petioles and under side of leaves clothed with

white stellate down; leaves petiolate, oval, acuminated, obtuse at the base, glabrous above, quite entire, 7-nerved, and margined with a slender nerve; panicle terminal, rather spike-formed; having the flowers sessile along its branches. ♄. S. Native of the interior of Brazil. Melástoma stenostáchyum, Schrank et Mart. mss. This species comes very near *M. holosericea* in the flower-bud, but differs in the nerves of the leaves being 7, not 5, nor glandular on the upper surface.

Slender-spiked Miconia. Shrub 2 to 3 feet.

16 M. FERRUGINA´TA (D. C. l. c.) shrubby; branchlets thick, angular, and are as well as the panicles, petioles, and under side of leaves, densely clothed with stellate rather rufescent down; leaves petiolate, oblong, bluntish at both ends, coriaceous, quite entire, 5-nerved, glabrous on the upper surface; panicle terminal, elongated; flowers crowded on the short branches of the panicle; bracteas linear. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Pernambucco. Melástoma ferrugíneum, Schrank et Mart. mss. Leaves when young clothed with stellate velvety down. Calyx rather truncate, with an obscurely 10-ribbed tube. Petals small, white. Fruit almost globose. Petioles rather angular.

Var. β, latifòlia (D. C. l. c.) leaves oval-oblong, acutish. ♄. S. Native of Brazil, in the province of Minas Geraes. Melástoma Plukenètii, Schrank et Mart. mss.

Rusty Miconia. Shrub 6 feet.

17 M. HERPE´TICA (D. C. l. c.) branches terete, and are as well as the petioles, panicles, and under side of leaves, as well as on the upper side of young leaves, densely clothed with stellate, rather rufescent, soft down; leaves petiolate, ovate, acuminated, entire, 5-nerved, or almost quintuple-nerved; panicle terminal, spike-formed: having the flowers crowded on its short branches. ♄. S. Native of Brazil, in mountain fields in the provinces of St. Paul and Minas Geraes. Melast. herpéticum, Schrank et Mart. mss. Nearly allied to *M. detergibilis*, but certainly distinct. Style longer than the stamens, not shorter as in *M. holosericea*.

Herpetic Miconia. Shrub 2 to 3 feet.

18 M. DETERGI´BILIS (D. C. l. c.) branches terete, and are as well as the panicles, under side of leaves, and upper side of the young leaves, densely clothed with soft, short, velvety tomentum; leaves petiolate, ovate-oblong, somewhat acuminated, entire, obtuse at the base, 5-nerved, at length glabrous above and minutely dotted; panicle terminal: having the flowers sessile, and crowded along its branchlets, and axillary. ♄. S. Native of Brazil, in the province of St. Paul, in elevated fields and woods. Melástoma detergíbile, Schrank et Mart. mss. Berry violaceous. Perhaps only a variety of *M. holosericea*, but the flowers are crowded on the shorter as well as on the younger branches, not regularly disposed, as in that plant.

Cleansing Miconia. Shrub 4 to 6 feet.

19 M. HOLOSERI´CEA (D. C. l. c.) branches terete, and are as well as the petioles, panicles, calyxes and under side of leaves, as well as the upper side when young, densely clothed with soft, velvety tomentum; leaves petiolate, oval-oblong, acute, obtuse and rather cordate at the base, 5-nerved, glabrous above but covered with very minute white dots; panicle terminal: having the flowers sessile and disposed in a secund manner along its branches. ♄. S. Native of the West Indies, Guiana, and Brazil. Melástoma holoserícea, Lin. spec. 566., but not of Swartz. Bonpl. mel. p. 52. tt. 23, 24. Melast. álbicans, Swartz, fl. ind. occ. 2. p. 786. ex Smith. Flower-buds and fruit globose. Petals white. Anthers oblong, having their connectives thickish and biauriculate at the base. Branches and leaves usually naked through the summer. Berry 3-4-celled, violaceous. Seeds cuneate, 3-sided.

Var. α, obtusiúscula (D. C. l. c. p. 182.) leaves ovate-oblong.

Var. β, acuminàta (D. C. l. c.) leaves elliptic-oblong, short-acuminated.

Var. γ, oblongàta (D. C. l. c.) leaves oblong, long-acuminated, somewhat crenulately repand. Melástoma, Schrank et Mart. mss. In Brazil, in the province of Goyaz.

Whole-silky Miconia. Shrub 3 to 6 feet.

20 M. ARGE´NTEA, (D. C. prod. 3. p. 182.) branches angular, hoary; leaves petiolate, ovate, short-acuminated, somewhat denticulated, 5-nerved, quite glabrous above, but white from tomentum beneath; panicles terminal, spreading; flowers very numerous, on short pedicels; calyx acutely 5-toothed. ♄. S. Native of the West Indies, on the Mosquito shore. Melástoma argéntea, Swartz, fl. ind. occ. 779. but not of Desr.—Sloane, jam. t. 196. f. 1. ex Swartz. Flowers white, decandrous. Berry subglobose.

Silvery Miconia. Shrub 6 feet.

21 M. SERIA´LIS (D. C. l. c.) branches terete, and are as well as the peduncles, outside of calyxes, under side of leaves, petioles and nerves on the upper side clothed with soft, white, velvety tomentum; leaves approximate, on short petioles, oblong, acuminated at both ends, triple-nerved, quite glabrous, and shining above; thyrse terminal, large, with its branches bifid, and bearing 1 flower in the bifurcation, the rest of the flowers sessile, and disposed in 1 series along the branches. ♄. S. Native of Brazil. A showy species. Lobes of calyx very blunt, glabrous inside.

Row-flowered Miconia. Shrub 6 to 8 feet.

22 M. PIPERICA´RPA (D. C. l. c.) branchlets from compressed to terete, and are as well as the petioles, panicles, and under side of leaves clothed with small, white, velvety, stellate down; leaves petiolate, oblong, acuminated, quite entire, triple-nerved, glabrous above; racemes simple, terminal; bracteas setaceous, under the pedicels. ♄. S. Native of Brazil, in woods. Gallàsia pipericárpa, Mart. herb. Fruit globose, hardly so large as a grain of pepper, a little ribbed. Limb of calyx wanting. Seeds 2-3, smooth, large, obtuse at one end and angular at the other, with a black hylum.

Pepper-fruited Miconia. Shrub 2 to 3 feet.

23 M. MELLI´NA (D. C. l. c.) branches nearly terete, and are as well as the rachis and petioles densely clothed with rufous, scaly, branched down; leaves petiolate, oblong, acuminated, attenuated at the base, 3-5-nerved, serrated on the upper part, densely clothed with stellate tomentum beneath, but at length glabrous above; panicles terminal: having the flowers crowded on the branches; lobes of calyx 5, short. ♄. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, in humid parts of woods. Melástoma mellinum, Schrank et Mart. mss. Petioles 3 lines long. Leaves 3 inches long, and an inch broad. Nearly allied to *M. herpética*.

Honey Miconia. Shrub 6 to 8 feet.

24 M. BRACTEOLA´TA (D. C. l. c.) branches somewhat tetragonal, and are, as well as the petioles, panicles, and young leaves on both surfaces, but in the adult ones only on the under, clothed with rufous stellate down; leaves petiolate, oblong, acuminated, quite entire, 3-nerved, glabrous on the upper surface in the adult state; thyrse spicate, crowded; bracteas linear, much exceeding the flower-bud. ♄. S. Native of South America, between Loxa and Caxamarca. Calyx bluntly 5-toothed. Petals 5, white. Capsule glabrous, 3-celled. Melástoma bracteolàta, Bonpl. mel. t. 62.

Bracteolate Miconia. Shrub 4 to 6 feet.

25 M. LEUCOCA´RPA (D. C. l. c.) branches bluntly tetragonal, and are, as well as the panicles and under side of leaves, clothed with very short granular stellate down; leaves almost sessile, broadly ovate, obtuse, coriaceous, quite entire, 5-nerved, glabrous above; panicle terminal, having the flowers sessile, and

crowded along its branchlets. ♄. S. Native of Brazil, in the elevated plains of Champadada Paranan. Melástoma leucocárpum, Mart. et Schrank, mss. Branches twisted. Berry white, globose. Seeds 3-sided, nearly globose.

White-fruited Miconia. Shrub 6 to 8 feet.

26 M. ELA'TA (D. C. l. c.) branches angularly furrowed, clothed with rusty tomentum; leaves petiolate, oblong, acute, serrulately denticulated, 5-nerved, glabrous above, and of an obscure green, but clothed with rusty tomentum beneath; flowers decandrous, panicled, crowded, sessile, small, white; calyx rather campanulate, minutely toothed; stigma thickened, depressed; berry minute. ♄. S. Native of Jamaica, on the higher mountains, and others of the West India islands. Melástoma elàta, Swartz, fl. ind. occ. 2. p. 781. Leaves from half a foot to a foot long.

Tall Miconia. Tree 30 to 40 ft.

27 M. FERRUGÍNEA (D. C. l. c.) branches terete; branchlets tetragonal, clothed with rusty tomentum; leaves ovate, acute, obsoletely crenated, and somewhat ciliated, 3-nerved, glabrous above, but clothed with rusty tomentum beneath, as well as the petioles; panicles terminal; flowers small, pedicellate. ♄. S. Native of St. Domingo. Melástoma ferrugínea, Desr. in Lam. dict. 4. p. 42. Leaves 3 inches long, and 15 lines broad. Corolla rather rose-coloured. Perhaps a variety of the preceding species.

Ferruginous Miconia. Shrub 8 to 10 ft.

28 M. RUBIGINÒSA (D. C. prod. 3. p. 183.) branchlets terete, and are, as well as the petioles and under side of leaves, densely clothed with rufous down; leaves on short petioles, ovate-lanceolate, somewhat cordate at the base, acuminated at the apex, 5-nerved, or nearly triple-nerved, smoo[illegible]d shining above; thyrse terminal, panicled; calyx globose, with 5 short acutish teeth. ♄. S. Native of South America, on Mount Quindiu. Melástoma rubiginòsa, Bonpl. mel. t. 47. Berry blue, 3-celled. Petals 5, white. Anthers linear, opening by a pore.

Rusty Miconia. Shrub 12 feet.

29 M. CÆLA'TA (D. C. l. c.) branchlets terete, woolly; leaves lanceolate, 3-nerved, and as if they were blistered on the upper surface and glabrous, clothed with rusty wool beneath; flowers crowded, almost sessile; calyx globose, with 5 short teeth, quite glabrous; stamens length of corolla; thyrse straight, longer than the stamens, crowned by a thickish stigma; berry globose, 4-celled. ♄. S. Native of South America, on the cold mountains of Saragura near Loxa. M. cælàta, Bonpl. mel. t. 6. Flowers white.

Engraved-leaved Miconia. Shrub 10 feet.

30 M. BIGLOMERA'TA (D. C. l. c.) branches terete, and are, as well as the petioles, rachis, and nerves of leaves, clothed with small rufous velvety stellate down; leaves lanceolate, acute, 3-nerved, besides the marginal nervules, quite entire, reticulated beneath, and covered with rufous velvety down; thyrse terminal; flowers almost sessile, crowded in whorls; two of the whorls distant. ♄. S. Native of South America, on Mount Duida, at the source of the Orinoco. Melástoma biglomeràta, Bonpl. mel. t. 15. Calyx obovate, velvety, with 5 very blunt teeth. Petals 5, white, small. Berry crowned, 4-celled.

Biglomerate-flowered Miconia. Shrub 6 to 8 feet.

31 M. APLOSTA'CHYA (D. C. l. c.) branches terete; leaves lanceolate, quite entire, 3-nerved, glabrous above, clothed with very fine rufous tomentum beneath; spike terminal, very simple; flowers sessile, decandrous; petals obovate; genitals equal in length to the corolla; anthers rather falcate; berry globose, 3-celled, crowned by the calyx. ♄. S. Native of South America, near the river Orinoco about Atures and Maypures. Leaves like those of *Nèrium Oleánder*. Melástoma aplostàchya, Bonpl. mel. t. 1. Flowers white.

Simple-spiked Miconia. Shrub 4 feet.

SECT. III. EUMICÒNIA (from *eu*, well or good, and *Micònia*; this section contains what are supposed to be the genuine species of the genus). D. C. prod. 3. p. 183. Tube of calyx obovate or turbinate, not globose as in the last section. Flowers not disposed in rows along the branches of the panicle.

* *Leaves sessile, 5-7-nerved.*

32 M. IMPETIOLA'RIS (D. Don, in wern. soc. mem. 4. p. 315.) branches nearly terete, and are, as well as the panicles and under side of leaves, clothed with rufous stellate down; leaves sessile, half stem-clasping, ovate, rather cordate at the base, acuminated at the apex, quite entire, 5-nerved, glabrous above; thyrse panicled, terminal; flowers sessile; calyx globose, with 5 very short teeth. ♄. S. Native of the West Indies, Guadaloupe, St. Domingo, Jamaica, &c. Melástoma impetiolàris, Swartz, fl. ind. occ. p. 788. Rich. in Bonpl. mel. t. 29. Melast. macrophy'lla, Desr. in Lam. dict. 4. p. 44. Berry blue, globose, 3-4-celled. Petals 5, white, orbicular. Anthers biauriculate at the base of the connectives.

Impetiolar-leaved Miconia. Clt. 1822. Shrub 4 to 6 ft.

33 M. IMPETIGINÒSA (D. C. l. c.) branches terete, and are, as well as the rachis, densely clothed with bristles, intermixed with stellate down; leaves sessile, broadly ovate, acuminated, somewhat crenulated, 5-nerved, scabrous from stellate down on both surfaces, netted, the veins elevated beneath, and impressed above; spikes terminal; flowers sessile, bracteate, crowded in distant opposite fascicles. ♄. S. Native of Brazil, at the Rio Negro. Melástoma impetiginòsum, Mart. herb. Calyx very villous, with short lobes. Petals small, oval. Anthers long, opening by one pore, each with a slender biauriculate connective. Style filiform. Inflorescence that of *Leándra*.

Scabby Miconia. Shrub 4 to 6 feet.

** *Leaves cuneated at the base, almost sessile, triple-nerved.*

34 M. TOMENTÒSA (D. Don, l. c.) branches terete, and are, as well as the panicles, calyxes, and under surface of leaves, densely clothed with rufous stellate down; leaves sessile, oval, cuneated at the base, acuminated at the apex, quite entire, glabrous on the upper surface except the nerves, 3-nerved a great way above the base, besides the submarginal nervule; panicle terminal, nearly cylindrical; calyx ovate-urceolate, with 5 erect short permanent ovate lobes. ♄. S. Native of Guiana and Brazil, in woods. Melástoma tomentòsa, Rich. in act. soc. hist. nat. par. p. 109. Bonpl. mel. t. 16. Melast. megalophy'llum, Mart. herb. Flowers white.

Tomentose Miconia. Tree 14 to 15 ft.

35 M. BRU'NNEA (D. C. prod. 3. p. 184.) branches bluntly somewhat tetragonal, and are, as well as the panicles and under surface of leaves, densely clothed with rather bristly short rufous down; leaves almost sessile, ovate, rather cuneated at the base, acutish at the apex, glabrous on the upper surface in the adult state, 3-nerved above the base, besides the submarginal nervule; panicle terminal, with its branches spreading; calyx somewhat urceolate: with its lobes short, obtuse, and cohering. ♄. S. Native of Brazil, in the province of St. Paul, in woods. Melástoma brúnneum, Mart. herb. Flowers sessile, crowded along the branches. Anthers linear, opening by one pore, tapering to the base. Style filiform. The foliage is like that of *M. tomentòsa*.

Brown Miconia. Shrub 6 to 10 ft.

36 M. ALA'TA (D. C. prod. 3. p. 184.) branches tetragonal, having the angles winged, and are, as well as the panicles, under side of leaves, and nerves on the upper surface, clothed with short stellate rather scabrous down; leaves sessile, cuneated at

the base, oval, acute, puberulous above from short scattered simple down, triple-nerved; nerves rising from about the fifth part of the length; panicle terminal, much branched; branches opposite. ♄. S. Native of Guiana; and of Brazil, as in Maranham, provinces of St. Paul and Rio Janeiro. Melástoma alàta, Aubl. guian. 1. p. 410. t. 158. Clidèmia alàta, G. Don, in Loud. hort. brit. p. 174. Leaves large. Lobes of calyx short, blunt. Style long, filiform. Fruit hardly baccate. Flowers white.

Var. β, *Amazónica* (Schrank, mss.) leaves broadly ovate, abruptly cuneated at the base. ♄. S. Native of Brazil, on the banks of the Amazon.

Winged-stemmed Miconia. Shrub 3 to 4 ft.

37 M. CINCHONÆFÒLIA (D. C. l. c.) branches terete, and are, as well as the petioles, nerves of leaves, peduncles, and calyxes, densely clothed with rufous stellate tomentose down; leaves petiolate, oval, quite entire, triple-nerved, glabrous above except on the nerves, but velvety beneath; raceme terminal, simple, spicate: tube of calyx oblong, a little longer than the 5 oblong lobes. ♄. S. Native of Brazil, in dense woods in wet places at the river Tapura. Melástoma cinchonæfòlium, Mart. herb. M. leucándrum, Schrank, mss. Leaves 8-10 inches long, and 2-3 broad. Anthers oblong, with hardly evident connectives. Peduncles usually bearing 3 approximate sessile flowers each. Style filiform, longer than the stamens. Petals linear, white. Seeds small, trigonal, with a linear hylum.

Cinchona-leaved Miconia. Shrub 6 to 10 feet.

38 M. SPONDYLA'NTHA (D. C. l. c.) branches terete, and are, as well as the petioles, covered with adpressed villi; leaves on short petioles, broad-lanceolate, cuneated at the base, acuminated, villous beneath, but only on the nerves on the upper surface, the rest being beset with scattered pili, quite entire, quintuple-nerved, with the nerves distant; thyrse racemose, terminal, nearly simple; peduncles short, very hairy, 3-flowered; tube of calyx globose, bluntly 10-ribbed. ♄. S. Native of Brazil, on the edges of woods, at Ega and Coari; and of French Guiana. Melástoma spondylánthum, Mart. herb. Leaves 9-10 inches long. Flowers unknown. Fruit the size of a coriander seed. Seeds numerous, small, trigonal, with a linear hylum.

Club-flowered Miconia. Shrub 6 to 10 feet.

39 M. DÍSCOLOR (D. C. l. c.) branchlets compressed, at length terete, when young, as well as on the under side of leaves, beset with silvery scale-like dots; leaves oval-oblong, cuneated, sessile, quintuple-nerved, quite entire, glabrous above; thyrse terminal, lepidotted when in a young state, but glabrous in the adult state, as well as the calyxes; fruit ovate, a little striated. ♄. S. Native of Brazil, near Rio Janeiro. This species appears to be intermediate between the second and third sections of the genus, agreeing in the silvery down with *M. argyrophýlla*, and in the form of the leaves with *M. tomentòsa*.

Two-coloured-leaved Miconia. Shrub 4 to 6 ft.

40 M. PUNCTA'TA (D. Don, in soc. wern. mem. 4. p. 315.) branches tetragonal, and are, as well as the peduncles, petioles, and under side of leaves, clothed with small rufous purplish down; leaves on short petioles, oblong-lanceolate, acuminated at both ends, quite entire, triple-nerved, glabrous above, but rusty and dotted beneath; thyrse terminal, panicled; calyx globose, usually 5-toothed. ♄. S. Native of the West Indies, in mountain woods. Melástoma punctàta, Desr. in Lam. dict. 4. p. 50. Rich. in Bonpl. mel. t. 40. Berry 3-celled, few-seeded. Petals 5, white, rather orbicular.

Dotted Miconia. Shrub 4 to 8 ft.

* * * *Leaves on short petioles, disposed in whorls.*

41 M. LONGIFÒLIA (D. C. l. c.) branchlets 8-ribbed, but at length becoming terete, and when young, as well as the petioles and peduncles, covered with rather scabrous stellate down; leaves on short petioles, oblong, attenuated at both ends, almost triple-nerved, glabrous above, but covered with small dot-like down beneath; panicle terminal, branching, immediately above the ultimate whorl of leaves; its branches angular, also disposed in whorls; calyx rather scabrous from stellate down, with 5 very short teeth. ♄. S. Native of Cayenne, on the banks of rivulets; and of Brazil, in woods at the river St. Francisco. Melástoma longifòlia, Aubl. guian. 1. p. 432. t. 170. Flowers white.

Long-leaved Miconia. Clt. 1817. Shrub 4 to 6 ft.

42 M. LAMBERTIA'NA (D. C. prod. 3. p. 185.) branchlets 8-ribbed, and are, as well as the petioles and peduncles, rather scabrous from scattered stellate down, but at length becoming terete and glabrous; leaves on short petioles, oblong, attenuated at both ends, quite entire, 3-nerved, glabrous above, beset with dots of stellate down beneath; panicle terminal, pedunculate, much branched, with its axis tetragonal, and its branchlets angular and in whorls; calyx scabrous from stellate down, with 5 short hardly evident teeth. ♄. S. Native of the Island of St. Vincent. Anthers linear, biauriculate at the base, and opening by one pore at the apex. Style filiform. Fruit unknown. This species differs from *M. longifòlia* in there being an interval between the ultimate whorls of leaves, and the branches of the panicle, and in the flowers being smaller.

Lambert's Miconia. Shrub 4 to 6 ft.

* * * * *Leaves petiolate, opposite, 3-5-nerved.*

43 M. CALVE'SCENS (D. C. l. c.) branches nearly terete, and are, as well as the petioles, panicles, and calyxes, white from short crowded st[illegible] down, which at length falls off; leaves petiolate, oval, abruptly and shortly acuminated, crenated, obtuse at the base, triple-nerved, besides the marginal nervules, having the nerves rising near the base; when young velvety, but glabrous in the adult state except the nerves; panicle terminal, dense, many-flowered, having the flowers crowded on its branchlets. ♄. S. Native of Brazil, in the province of Rio Negro. Melástoma calvéscens, Schrank et Mart. mss. Allied to *M. auriculàta.*

Naked Miconia. Shrub 4 to 6 ft.

44 M. ERIODÓNTA (D. C. l. c.) branchlets bluntly tetragonal, and are, as well as the petioles and panicles, clothed with short rather rufescent hoary tomentose down; leaves petiolate, ovate, obtuse at the base, short-acuminated at the apex, quite entire, 3-nerved, besides the two marginal nervules, quite glabrous above, rather purplish on the nerves beneath; thyrse terminal, rather racemose, with its branchlets bearing 5 or 6 flowers at the apex; fruit globose, 5-furrowed, pubescent; teeth of calyx 5, short, woolly, conniving above the ovarium. ♄. S. Native of Cayenne. Fruit the size of a small pea, probably dry. Seeds angular, with a linear hylum.

Var. β, *oblongifòlia* (D. C. l. c.) leaves oblong. ♄. S. Native of Cayenne.

Hairy-toothed-calyxed Miconia. Shrub 4 to 6 ft.

45 M. AURICULA'TA (D. C. l. c.) branches terete, and are, as well as the panicles, clothed with rufous stellate down, intermixed with bristles; leaves on short petioles, cuneated at the base, curled, oval-oblong, acuminated, ciliately serrated, scabrous on both surfaces from down, which is for the most part simple, quintuple-nerved, besides the submarginal nervules, having the upper nerves rising a little above the base; panicles terminal, having the flowers crowded on the tops of its branches. ♄. S. Native of Brazil, in the province of St. Paul. Melástoma auriculàtum, Mart. herb. Calyx hairy, with 5 short blunt lobes. Petals obovate. Anthers linear, bluntly auricled at the base, opening by one pore at the apex. Style filiform, exserted,

rather dilated at the apex, almost funnel-shaped. Leaves 4 inches long, and 1½ or 2 broad.

Var. β, theæfórmis (D. C. l. c.) leaves paler beneath; branches less hairy. ♄. S. Native of Brazil, in the province of Bahia. Melástoma theæfórme, Schrank et Mart. mss. Leaves a little smaller than those of the species, but similar in form, the branches and panicles less hispid, but more tomentose, without being intermixed by bristles.

Auricled-anthered Miconia. Shrub 4 to 6 ft.

46 M. SEPIA'RIA (D. C. l. c.) branches from compressed to terete, and are, as well as the panicles, whitish from small down, but at length becoming glabrous; leaves hardly petiolate, oval, tapering much to both ends, quintuple-nerved, almost quite entire, glabrous on both surfaces, but with the base of the nerves rather velvety; panicle terminal, oppositely branched; bracteas small; calyx covered with scattered stellate down, with 5 very short teeth. ♄. S. Native of Brazil, in hedges. Melástoma sepiàrium, Mart. herb. Anthers biauriculate at the base, opening by a pore at the apex.

Hedge Miconia. Shrub 4 to 6 ft.

47 M. COLLI'NA (D. C. l. c.) quite glabrous; branchlets rather furrowed, but at length becoming terete; leaves oval, attenuated at the base, acuminated at the apex, triple-nerved, besides the two marginal nervules, with repand margins; panicle terminal, oppositely branched; bracteas small; teeth of calyx 5, obtuse, hardly evident. ♄. S. Native about Porto Rico, in woods on the hills. Petals obovate, small, apparently yellow, spotted with red in the dried state. Anthers linear, opening by one pore, biauriculate at the base. Stigma hardly dilated. Melástoma acuminàta, Balb. herb. Melast. parviflòra, Vahl. herb.

Hill Miconia. Shrub 4 to 6 ft.

48 M. MARTIUSIA'NA (D. C. prod. 3. p. 186.) glabrous; branches from tetragonal to terete; leaves petiolate, ovate-lanceolate, acute, coriaceous, quite entire, 3-nerved, besides the marginal nervules, shining above; panicle terminal: with its branchlets opposite and bearing many flowers at their tops, and knotted at their origin; calycine teeth 5, obtuse, very short. ♄. S. Native of Brazil. Melástoma Martiànum, Schrank, mss. Petals obovate, reflexed. Anthers linear, biauriculate at the base, and opening by one pore at the apex. Style filiform. Stigma hardly dilated. Fruit unknown.

Martius's Miconia. Shrub 4 to 6 ft.

49 M. MAXIMILIA'NA (D. C. l. c.) branches from compressed to terete, and are, as well as the petioles and peduncles, covered with short stellate down, intermixed with a few bristles, but at length becoming glabrous; leaves on short petioles, oval-acuminated, serrulately ciliated, quintuple-nerved, rather bristly on both surfaces, and pale beneath; panicle terminal. ♄. S. Native of Brazil. Melástoma Maximiliànum, Mart. herb. Calyx beset with scattered stellate down, with 5 broad very short teeth. Petals obovate, yellow when dry. Stigma dilated, rather pilose. Anthers linear, biauriculate at the base, and opening by one pore at the apex.

Prince *Maximilian's* Miconia. Shrub 4 to 6 ft.

50 M. LOXE'NSIS (D. C. l. c.) branches nearly terete, and are, as well as the petioles, peduncles, and nerves of leaves on the under surface, clothed with thick flocky curled down; leaves petiolate, oval, hardly obtuse at the base, short-acuminated at the apex, setaceously denticulated, 3-nerved, smoothish beneath except on the nerves; thyrse panicled, terminal, crowded; calyx almost globose, bluntly and shortly 5-toothed. ♄. S. Native of Peru, in temperate places about Loxa. Melástoma Loxénsis, Bonpl. mel. t. 43. Berry blue, 3-celled. Style nearly clavate. Petals 5, roundish, white.

Loxa Miconia. Shrub 5 ft.

51 M. UROPHY'LLA (D. C. l. c.) branches terete, and are, as well as the petioles, clothed with powdery tomentum; leaves petiolate, oblong, quite entire, triple-nerved, clothed with velvety tomentum beneath, but glabrous above, each terminating in a long narrow taper-point; panicle terminal, many-flowered; tube of calyx globose, 10-ribbed; the limb deciduous; fruit dry, 3-celled, few-seeded. ♄. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul. Rhéxia caudàta, Schrank et Mart. mss. Flowers unknown. Pericarp very thin, and perhaps adnate to the calyx. Seeds about 15, shining, triangular, with a long linear black hylum.

Tail-leaved Miconia. Shrub 1 to 2 ft.

52 M. PAU'CIDENS (D. C. l. c.) branchlets terete, and are, as well as the petioles, nerves of leaves on the under side, peduncles, and calyxes, rather velvety, or dotted from scattered small stellate down; leaves oblong, attenuated at the base, acuminated at the apex, with a very few teeth on the margin, smoothish, 3-nerved; thyrse panicled, terminal; fruit globose, bluntly 10-ribbed. ♄. S. Native of Para, in Brazil. Melástoma paúcidens, Schrank et Mart. herb. The serratures are few, and acute at the apex of the leaves.

Few-toothed-leaved Miconia. Shrub 4 to 6 ft.

53 M. CAUDI'GERA (D. C. l. c.) branchlets rather compressed, and are, as well as the petioles, panicles, and under side of leaves, velvety from very minute stellate down; leaves petiolate, oval, 3-nerved, quite entire, glabrous above, each terminating in a long narrow taper-point; panicles terminal, short, having the flowers crowded on its branchlets. ♄. S. Native of Brazil, in shady places in the province of Bahia, near Sincora. Melástoma caudàtum, Schrank et Mart. mss. Petals oval-oblong, white. Nearly allied to *M. caudàtum*, but differs in the leaves being nearly twice the breadth, and in being smooth above.

Tail-bearing-leaved Miconia. Shrub 4 to 6 ft.

54 M. GUAYAQUILE'NSIS (D. Don, in mem. soc. wern. 4. p. 315.) branchlets from tetragonal to terete, and are, as well as the petioles and calyxes, clothed with purplish rather powdery down; leaves on short petioles, oval, bluntly somewhat cordate at the base, acute at the apex, 5-nerved, a little toothed, glabrous; thyrse terminal, panicled; flowers tern, rather aggregate, nearly sessile; calyx bluntly 5-toothed. ♄. S. Native about Guayaquil. Melástoma Guayaquilénsis, Bonpl. mel. t. 49. Petals 5, oval, white. Anthers bluntly biauriculate at the base. Leaves half a foot long. Berry 3-celled, crowned by the limb of the calyx.

Guayaquil Miconia. Shrub 8 to 10 ft.

55 M. ATTENUA'TA (D. C. l. c.) branchlets bluntly tetragonal, and are, as well as the peduncles and petioles, smoothish; leaves on short petioles, oval-oblong, attenuated at both ends, triple-nerved, besides the 2 fine marginal nervules, quite entire, glabrous on both surfaces; thyrse panicled, terminal, with its branchlets spreading; calyx rather velvety; limb with 5 very short teeth. ♄. S. Native of Cayenne. M. parviflòra, Aubl. guian. t. 171. ? but the flowers are one-half smaller in the figure than in the specimen. Flowers white.

Var. β, subquintuplinérvia (D.C. l. c.) leaves almost quintuple-nerved; the nerves are more distinct, especially the 2 marginal ones. ♄. S. Native of Berbice. Berry small, globose, bluntly costate; calyx almost truncate, hardly 5-toothed.

Attenuated-leaved Miconia. Shrub 4 to 6 feet.

56 M. CAUDA'TA (D. C. prod. 3. p. 187.) branches tetragonal, and are, as well as the panicles, hardly velvety, even when examined through a lens; leaves petiolate, ovate, long-acuminated, quite entire, 5-nerved; the outer nerves almost marginal, glabrous above, but clothed with adpressed rusty velvety down beneath; panicle terminal, divaricately and oppositely branched; bractéoles small, deciduous. ♄. S. Native of New Granada, between Mariquita and St. Anna. Melástoma caudàta, Bonpl.

mel. t. 7. Calyx bluntly 5-lobed. Anthers long, falcate. Style hairy at the base; stigma hardly tumid. Flowers rose-coloured. Different from Chitònia caudàta, D. Don.

Tailed-leaved Miconia. Shrub 6 to 12 ft.

57 M. STAMI'NEA (D. C. l. c.) branches compressedly tetragonal, and are, as well as the panicles and young leaves, velvety from short stellate down, but at length becoming glabrous from the down falling off: leaves petiolate, obtuse at the base, oval, acutish, quite entire, 5-nerved, besides the submarginal nervules; branches of the panicle, which is terminal, opposite, 7-9-flowered; bracteas oblong-linear, shorter than the calyx; petals oblong, glabrous; stigma dot-formed. ♄. S. Native of Brazil, in the province of Rio Janeiro, in woods on the mountains. Melástoma staminea, Desr. in Lam. dict. 4. p. 53. Melástoma glabréscens, Schrank et Mart. mss. Calyx tubular, velvety, with a 5-toothed limb; teeth ovate, acutish. Anthers biauriculate at the base.

Var. β, *oblongàta* (D. C. l. c.) leaves oval-oblong. ♄. S. Native of Brazil, in the province of Bahia.

Long-*stamened* Miconia. Shrub 4 to 6 ft.

58 M. AFFÌNIS (D. C. l. c.) branches bluntly tetragonal, and are, as well as the petioles and panicles, rather canescent from almost imperceptible stellate down; leaves oval, obtuse at the base, short-acuminated at the apex, 5-nerved, quite entire, or hardly repand, glabrous above, but beset with scurf on the nerves beneath, and with dot-like down between the nerves; thyrse panicled, terminal, with spreading branches; limb of calyx very short, 5-toothed. ♄. S. Native of Cayenne. This species is difficult to distinguish from *M. staminea*, but differs from it, besides the characters given, in the flowers being one-half smaller, in the limb of the calyx being drawn out less, in the petals being oblong and obtuse, and in the fruit being without ribs, and tapering a little to the apex.

Allied Miconia. Shrub 4 to 6 feet.

59 M. SUBCILIA'TA (D. C. l. c.) branches bluntly tetragonal, and are, as well as the panicles and leaves, glabrous, or when young covered with rather flocky deciduous down; leaves on long petioles, oval, acuminated, obtuse at the base, 5-nerved, with the margins furnished with a few distant crenulæ and ciliæ; panicle oblong, terminal; bracteas oblong, small, shorter than the calyx; calyx somewhat obconical, shortly 5-toothed: petals oblong, rather velvety; stigma dot-formed. ♄. S. Native of Brazil, in woods along the banks of the Rio Negro. Melástoma lævigàtum et M. prócerum, Mart. et Schrank, mss. but not of Willd. Anthers linear. There is a circle of hairs round the peduncles at the base.

Subciliated Miconia. Tr. 12 to 20 ft.

60 M. CORONA'TA (D. C. l. c.) branches acutely tetragonal, and are, as well as the panicles, petioles, and under side of leaves, clothed with powdery down; leaves petiolate, broad-oval, quintuple or septuple-nerved, quite entire, terminating each in a short acumen; panicle terminal, pyramidal; bracteoles small, deciduous; tube of calyx globose, crowned by a 5-toothed limb. ♄. S. Native of South America, on Mount Quindiu. Melástoma coronàta, Bonpl. mel. t. 56. Petals 5, white, oblong. Stigma rather peltate. Berry size of a small pea.

Crowned Miconia. Tree 10 to 20 ft.

61 M. PENDULIFÒLIA (D. C. l. c.) branchlets terete, and are, as well as the petioles, panicles, and under side of leaves, rather velvety from powdery down; leaves petiolate, ovate-lanceolate, acute, 3-nerved, somewhat denticulated, pendulous, glabrous above; panicle terminal, somewhat racemose; bracteoles small, subulate; calyx with 5 very short teeth. ♄. S. Native of Guadaloupe, in woods. Melástoma pendulifòlia, Bonpl. mel. t. 35. Petals 5, white, obovate. Anthers linear. Stigma hardly thicker than the style. Ovarium 3-celled.

Pendulous-leaved Miconia. Shrub 4 to 8 ft.

62 M. HAVANE'NSIS D. C. prod. 3. p. 188.) glabrous; branchlets terete; leaves petiolate, oblong, acuminated, 3-nerved, quite entire, pendulous; panicle terminal, racemose; bracteoles wanting or very small, and deciduous; limb of calyx shortly and bluntly 5-toothed; petals 5, oblong. ♄. S. Native of Cuba, about the Havanah. Very like *M. pendulifòlia*, but differs in the margins of the leaves being quite entire, in the petals being oblong, and in the smoothness of the whole plant. Flowers white. Anthers linear. Stigma hardly dilated.

Havanah Miconia. Shrub 4 to 6 ft.

63 M. PYRAMIDA'LIS (D. C. l. c.) branchlets compressed, and are, as well as the petioles, panicles, and under side of leaves, but especially on the nerves, clothed with flocky scurfy down; leaves oblong-lanceolate, acuminated, 3-nerved, besides the 2 marginal nervules, somewhat denticulated; thyrse panicled, terminal; fruit bluntly ribbed, crowned by the calyx, which is somewhat repand and bluntly 5-toothed. ♄. S. Native of the West India Islands, Guadaloupe, Trinidad, Cuba, &c. Melástoma pyramidàlis, Desr. in Lam. dict. 4. p. 53. Flowers white. Perhaps the same as Melástoma acinodéndron, Lin. spec. 558.? —Pluk. alm. t. 159. f. 1.

Var. β, *ciliolàta* (D. C. l. c.) leaves ciliated at the base, toothed at the apex. ♄. S. Native of Porto Rico, Guadaloupe, and Trinidad. Melástoma Portoricénse, Spreng. neue. entd. 3. p. 61.

Var. γ? *sphærocárpa* (D. C. l. c.) leaves toothed, without ciliæ; fruit globose, crowned by the 5 lobes of the calyx, without any tube. ♄. S. Native on the banks of the Orinoco. Melástoma pyramidàlis, Bonpl. mel. t. 21. Chitònia pyramidàlis, G. Don, i[illegible]. hort. brit. p. 174. Perhaps a proper species.

Pyramidal Miconia. Clt. 1817. Shrub 4 to 8 ft.

64 M. NICOTIANÆFÒLIA (D. C. l. c.) branchlets from compressed to terete, and are, as well as the petioles, panicles, and calyxes, clothed with powdery pruinose small down; leaves petiolate, oval, acuminated, denticulated, 5-nerved, glabrous in the adult state; thyrse panicled, terminal; limb of calyx bluntly 5-toothed, broader than the tube. ♄. S. Native of St. Domingo. Melástoma nicotianæfòlia, Desr. in Lam. dict. 4. p. 53. ex herb. mus. par. Bracteoles 2, small, acute, under each flower. Petals 5, oval, obtuse. Anthers linear, curved, obtuse, opening by a pore at the apex, and bluntly biauriculated at the base. Style filiform. Leaves 6 inches long, with the nerves yellow above. Perhaps the Melástoma acinodéndron of Lin.

Tobacco-leaved Miconia. Shrub.

65 M. FLORIBU'NDA (D. C. l. c.) branches bluntly tetragonal, and are, as well as the petioles, nerves of leaves on the under surface, and calyxes, rather velvety from rusty powdery down; leaves petiolate, oval, acutish at both ends, quite entire, septuple-nerved, glabrous above; panicle terminal, much branched, loose; bracteoles wanting or deciduous; calyx with 5 short teeth. ♄. S. Native of Peru, on the mountains in temperate parts. Melástoma floribúnda, Bonpl. mel. t. 53. Petals rose-coloured, oval, truncate at the base. Filaments beset with glandular hairs at the apex. Anthers thick. Stigma broadly peltate. Berry 5-celled. From the anthers and the form of the stigma, this plant does not well accord with the other species of this genus.

Bundle-flowered Miconia. Tree 20 to 30 ft.

66 M. LÆVIGA'TA (D. C. l. c.) branchlets terete, and are, as well as the petioles and peduncles, rather velvety from short stellate down, but at length becoming glabrous; leaves petiolate, oval, obtuse at the base, acuminated at the apex, ciliately serrated, 5-nerved, glabrous on both surfaces; cyme panicled, trichotomous at the base, terminal; branches of cyme

bifid; flowers sessile, secund along the branches, and with a solitary one in each fork; calyx nearly globose, bluntly 10-ribbed, with 5 short obtuse bent in lobes. ♄. S. Native of the West Indies. Melástoma lævigàta, Desr. in Lam. dict. 4. p. 52. Flower-bud small, nearly globose, velvety. Capsule globose, 5-celled, umbilicate from the calyx, and adhering to it. Seeds ovate, shining, with a basilar black hylum. Ker. bot. reg. t. 363. Flowers whitish.

Smooth Miconia. Clt. 1815. Shrub 6 to 8 ft.

67 M. TRICHÓTOMA (Desr. in Lam. dict. 4. p. 53.) branchlets nearly terete, and are, as well as the petioles and panicles while young, rather velvety from short down, but at length becoming glabrous; leaves petiolate, broadly oval, short-acuminated, 3-5-nerved, glabrous on both surfaces in the adult state; panicle corymbose, trichotomous, many-flowered, much branched; fruit globose, bluntly 10-ribbed. ♄. S. Native of Martinique. Melástoma trichótoma, Desr. in Lam. dict. 4. p. 53. Seeds ovate, angular, with a black hylum. A congener of *M. lævigàta*. Compare it with Melástoma nígricans, Vahl. ecl. 3. p. 26. ex Ser.

Trichotomous-panicled Miconia. Shrub 4 to 6 ft.

68 M. PRA'SINA (D. C. l. c.) glabrous; branchlets somewhat tetragonal; leaves petiolate, broad-lanceolate, quite entire, triple-nerved, glabrous on both surfaces; thyrse panicled, terminal, with spreading filiform branches; teeth of calyx 5, erect, short, permanent. ♄. S. Native of Jamaica and Hispaniola, in woods. Melástoma prásina, Swartz, fl. ind. occ. p. 777. exclusive of the synonyme of Aubl. This plant differs from the figure given by Aublet, now M. microcárpa, in the leaves being triple-nerved, not 5-nerved, quite entire, not somewhat denticulated, in being glabrous on both surfa[illegible]ot velvety on the under surface, and in the teeth of the calyx being permanent, not deciduous, &c.

Leek-green Miconia. Clt. 1817. Shrub 4 to 6 ft.

69 M. MICROCA'RPA (D. C. prod. 3. p. 189.) branchlets bluntly tetragonal, but at length becoming terete, and are, as well as the panicles, petioles, and nerves of leaves on the under surface, velvety from almost imperceptible stellate down; leaves petiolate, ovate-lanceolate, acuminated, somewhat attenuated at the base, 5-nerved, repandly denticulated, glabrous above, but beset with scattered dot-like down between the nerves on the under surface; thyrse panicled, terminal, much branched, loose; fruit globose, bluntly 10-ribbed; limb of calyx deciduous, very short, toothed, truncate. ♄. S. Native of Brazil, in woods in the provinces of Para and Rio Negro; and probably of Guiana, if M. lævigàta, Aubl. guian. 1. p. 412. t. 59. is referrible to this species, which is most likely the case. Flowers white.

Small-fruited Miconia. Shrub 4 to 6 ft.

70 M. AMBÍGUA (D. C. l. c.) branchlets terete, glabrous? leaves petiolate, oblong-oval, acuminated, acute at the base, 5-nerved, somewhat denticulately serrated, membranous, powdery on the nerves beneath; thyrse terminal, panicled, loose-flowered, powdery; limb of calyx 5-toothed, permanent. ♄. S. Native of South America, in Cumana, at Caripe. Melástoma ambígua, Bonpl. mel. t. 25. Petals 5, white, roundish. Berry globose, 3-celled. The teeth of the calyx are connivent above the ovarium after flowering.

Ambiguous Miconia. Shrub 6 ft.

71 M. CEANOTHÌNA (D. C. l. c.) branchlets from compressed to terete, and are, as well as the petioles, panicles, and nerves of leaves, and both surfaces of leaves while young, clothed with small flocky velvety stellate down; leaves petiolate, ovate-lanceolate, acuminated, obtuse at the base, almost quite entire, glabrous above in the adult state, 3-nerved, besides the 2 marginal nervules; thyrse panicled, terminal; berries globose, usually 10-ribbed, crowned by 5 obtuse conniving teeth. ♄. S. Native of Guadaloupe, Trinidad, Cuba, &c. Nearly allied to *M. ambígua*. Flowers white.

Ceanothus-like Miconia. Shrub 4 to 6 ft.

72 M. MINUTIFLÒRA (D. C. l. c.) quite glabrous; branches nearly terete; leaves petiolate, lanceolate, quite entire, 5-nerved, membranous; thyrse terminal, panicled, loose; calyx short, campanulate, hardly 5 crenate. ♄. S. Native of Cumana, near the monument called Guacharo. Melástoma minutiflòra, Bonpl. mel. t. 22. Calyx nearly entire. Flowers minute, white; petals roundish. Ovarium nearly free, 3-celled. According to Bonpland's figure the nerves are rufescent beneath, and probably from down.

Minute-flowered Miconia. Shrub 6 ft.

73 M. CORIA'CEA (D. C. l. c.) branches tetragonal, and are, as well as the petioles and nerves of leaves, beset with simple hairs, which are rather glandular at the apex, intermixed with rough minute fascicles of down; leaves petiolate, oval, callously serrated, coriaceous, terminating in a stiff point, wrinkled, smoothish, with revolute margins; thyrse terminal, panicled, with crowded flowers, having its branches and rachis tetragonal; calyx turbinate, with obtuse permanent lobes, which are furnished with one bristle each on the outside. ♄. S. Native of Guadaloupe, on the top of the Sulphur Mountain. Melástoma coriàcea, Swartz, fl. ind. occ. p. 790. Melast. cymbifòlia, Rich. in Bonpl. mel. t. 26. Flowers yellowish. Stigma obtuse. Berry cinereous, 3-celled. Leaves concave beneath and convex above.

Coriaceous-leaved Miconia. Shrub 3 to 6 ft.

74 M. SIEBE'RI (D. C. l. c.) quite glabrous; branches tetragonal; leaves petiolate, oval, with stiff points, coriaceous, callously serrated, 5-nerved, flattish; thyrse terminal, panicled, crowded with flowers, having its rachis and branches tetragonal; bracteas oblong, membranous, under the branches of the panicle. ♄. S. Native of the island of Trinidad. Sieb. fl. trin. no. 260. Habit of *M. coriàcea*, but is distinguished from that plant in the smoothness.

Sieber's Miconia. Shrub 4 to 6 feet.

75 M. LUTE'SCENS (D. C. l. c.) branchlets bluntly tetragonal, and are as well as the petioles, nerves of leaves on the under surface, and rachis yellowish; leaves petiolate, oblong, acute at the base, and acuminated at the apex, glabrous above, but clothed with white, deciduous, woolly down beneath when young, 3-nerved, toothed; thyrse terminal, panicled, many-flowered; calyx globose, with 5 very short, acute teeth. ♄. S. Native of Peru, near Loxa, on Mount Saraguru. Melástoma lutéscens, Bonpl. mel. t. 17. Petals roundish-obovate, white. Anthers opening by 1 pore. Stigma obtuse. Berry globose, 3-celled, crowned.

Yellowish Miconia. Shrub 4 to 6 feet.

76 M. THOMASIA'NA (D. C. l. c.) glabrous; branchlets terete; leaves petiolate, oval, bluntish, triple-nerved, with quite entire, rather revolute edges, coriaceous; cymes terminal, trifid at the base, with its branches somewhat racemose; tube of calyx turbinate, covered with scurfy stellate down, with 5 broad obtuse lobes; fruit globose, hispid from a few bristles. ♄. S. Native of the Island of St. Thomas. Melástoma coriàcea. Juss. in herb. mus. par. Stamens 10; anthers without auricles. Petals 5, oval. Seeds trigonal, cuneated, shining, with a linear concave hylum. Flowers yellowish.

St. Thomas Miconia. Shrub 2 to 3 feet.

77 M. ASTROLA'SIA (D. C. prod. 3. p. 190.) branches terete, and are as well as the panicles, under side of leaves, and petioles densely clothed with rufous stellate down; leaves on short petioles, ovate, obtuse at the base, and acute at the apex, quite entire, 5-nerved, beset with dots of stellate down above, but at length becoming smoothish; panicle terminal, much branched. ♄. S. Native of St. Domingo. Melástoma astrolàsion, Spreng.

neue. entd. 3. p. 68. and syst. 2. p. 296. Flowers small. Branches of panicle disposed in whorls.

Starry Miconia. Shrub 4 to 6 feet.

78 M. LANCEOLA'TA (D. C. l. c.) branches somewhat tetragonal, and are as well as the petioles, under side of leaves, and panicles velvety from short, rufous, stellate down; leaves petiolate, oblong-lanceolate, denticulated, 3-nerved; panicles terminal; flowers sessile, on the tops of the branches of the panicle. ♄. S. Native of St. Domingo. Melástoma lanceolàta, Desr. in Lam. dict. 4. p. 43. Flowers small.

Lanceolate-leaved Miconia. Shrub 4 to 6 feet.

79 M. MACROSTA'CHYA (D. C. l. c.) branches nearly terete, and are as well as the petioles, tetragonal rachis, and under side of leaves velvety from rufescent, short, soft down; leaves petiolate, oblong-linear, attenuated at the base, bluntish, but mucronate at the apex, 3-nerved, quite entire, quite glabrous above; thyrse spicate, terminal, very long; flowers crowded, in whorls; tube of calyx obovate, scurfy, with 5 short obtuse lobes. ♄. S. Native of Brazil

Long-spiked Miconia. Shrub 4 to 6 feet.

80 M. PULVERULE'NTA (Ruiz et Pav. syst. 1. p. 104.) branches bluntly tetragonal, and are as well as the petioles, panicles, calyxes, and under side of leaves white from soft, scurfy, stellate down; leaves oval, obtuse at the base, 5-nerved, somewhat acuminated at the apex, and rather serrulated, glabrous above in the adult state; thyrse terminal, panicled; flowers with 5-8 petals; tube of calyx turbinate. ♄. S. Native of Peru, in woods. Pomereùla tomentòsa, Domb. herb. Ovarium glabrous at the base. Calyx drawn out beyond the ovarium. Petals 5, obtuse, obovate. Stamens short.

Powdery Miconia. Shrub 4 to 6 feet.

81 M. TRIPLENE'RVIS (Ruiz et Pav. l. c. p. 105.) leaves oblong, triple-nerved, acuminated, quite entire. ♄. S. Native of Peru, on mountains towards Cuchero, and in the tract of Guayabal.

Triple-nerved-leaved Miconia. Tree 20 feet.

82 M. LANUGINÒSA (Ruiz et Pav. l. c.) leaves oblong, 5-nerved, quite entire, bluntly acuminated. ♄. S. Native of Peru, at Cuchero, in groves near Cassape and Cassapillo.

Woolly Miconia. Tree 18 feet.

83 M. EMARGINA'TA (Ruiz et Pav. l. c. p. 106.) leaves cordate, emarginate, 5-nerved. ♄. S. Native of Peru, in groves at Chinchao. Ruiz et Pav. fl. per. ined. 4. t. 394.

Emarginate-leaved Miconia. Shrub 10 to 18 feet.

Cult. For culture and propagation see *Melástoma.* Many of the species are worth cultivating for the sake of their fine foliage, but none of them for their flowers, which are always insignificant.

LXXVII. OXYME'RIS (from ὀξυς, *oxys*, sharp, and μερις, *meris*, a part; in reference to the pointed petals and calycine teeth). D. C. prod. 3. p. 190.

LIN. SYST. *Decándria, Monogýnia.* Calyx quite glabrous, with an obovate, turbinate tube: and 5 very short, callous teeth. Flower-bud conical. Petals lanceolate, acuminated. Stamens 10, equal; anthers oval-oblong, obtuse, opening by 1 pore at the apex, but tapering to the base: each furnished with a short filiform connective, which is rather bigibbous at the base. Style filiform, crowned by a dot-formed stigma. Ovarium quite glabrous. Capsule baccate, 3-4-celled. Seeds unknown.—Quite glabrous, Brazilian shrubs. Leaves petiolate, oblong, quite entire, 3-nerved. Panicle terminal. Bracteas subulate. Flowers whitish or yellowish.

1 O. QUI'NQUE-DENTA'TA (D. C. prod. 3. p. 190.) quite glabrous, branched, between terete and compressed, sulcately subtetragonal at the tops; leaves petiolate, oval-oblong, attenuated at both ends, 3-nerved, quite entire; panicle terminal, beset with small, rather resinous dots; bracteas small, linear; calyx obovate, with 5 short teeth; petals lanceolate, ending in a callous acumen. ♄. S. Native of Brazil; in the province of Minas Geraes. Melástoma oxypétalum, Schrank et Mart. mss. Habit of a species of *Gentiàna*, and of a yellowish hue when dried.

Five-toothed-leaved Oxymeris. Shrub.

2 O. QUINQUE'NODIS (D. C. l. c.) quite glabrous; branches bluntly tetragonal or compressed; leaves petiolate, long-lanceolate, acuminated at both ends, quite entire, 5-nerved; panicle terminal; bracteas linear-subulate; tube of calyx globose, with 5 grain-formed callous lobes. ♄. S. Native of Brazil, in woods in the province of Minas Geraes, at Mount Serra da Carassa. Melástoma quinquénode, Schrank et Mart. mss. Flowers small, white, numerous. Nodes or grain-formed lobes of calyx yellowish.

Five-knotted-calyxed Oxymeris. Shrub.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXVIII. CREMA'NIUM (κρεμαω, *kremao*, to suspend; because most of the plants contained in this genus climb on trees). D. Don, in mem. soc. wern. 4. p. 310. D. C. prod. 3. p. 191.

LIN. SYST. *Decándria, Monogýnia.* Tube of calyx campanulate or obovate, adhering to the ovarium: limb permanent, 4-5-toothed. Petals 4-5, obovate. Stamens 10, equal. Anthers short, rather cuneated at the base, without auricles; opening by 2 pores at the apex. Style filiform; stigma orbicularly peltate. Capsule baccate, 3-5-celled. Seeds angular or ovate, with a linear hylum.—American, branched shrubs. Leaves petiolate, rather coriaceous, quite entire, or somewhat serrated. Panicle terminal. Bracteas small, at the base of the branchlets. Flowers for the most part white, small, and bractless.—Some of the species of this genus will perhaps, on future investigation, prove to belong to *Micònia.*

* *Flowers octandrous.*

1 C. ROTUNDIFÒLIUM (D. Don, mem. soc. wern. 4. p. 311.) stem creeping; branches tomentose; leaves cordate, orbicular, quite entire, green, hispid on both surfaces; flowers usually 4 together, on short pedicels. ♄. S. Native of Peru. Flowers large, white.

Round-leaved Cremanium. Shrub creeping.

2 C. NI'TIDUM (D. Don, l. c.) stem rooting; branches glabrous, spreading; leaves ovate, acute, glabrous, shining, with rather winged, toothed margins; racemes glabrous, nodding; filaments beset with glandular hairs. ♄. S. Native of Peru. Flowers white.

Shining Cremanium. Shrub creeping.

3 C. THYRSOI'DEUM (D. Don, l. c.) stem rooting; branches tomentose; leaves lanceolate, acute, 3-nerved, quite entire, glabrous, shining, pilose on the nerves beneath; flowers drooping, crowded into a compound thyrse. ♄. S. Native of Peru. Flowers white, not half the size of those of *C. nitidum.*

Thyrsoid-flowered Cremanium. Shrub creeping.

4 C. LATIFÒLIUM (D. Don, l. c.) branchlets pilose; leaves ovate, cordate, acute, serrulated, naked, and shining above, but pilose beneath; panicle terminal, many-flowered. ♄. S. Native of Peru. Flowers small, white.

Broad-leaved Cremanium. Shrub.

5 C. VACCINOÌDES (D. Don, l. c. p. 312.) glabrous; branchlets tetragonal, slender; leaves oval, obtuse, quite entire, hardly 3-nerved, the lateral nerves being so slender as hardly to be discernible; racemules 5-flowered, terminal, drooping a little, simple; pedicels solitary, 1-flowered, lower ones axillary; limb of calyx repand, 4-toothed, obtuse. ♄. S. Native of Peru, on the Andes above Caxamarca. Melástoma vaccinoìdes, Bonpl. mel. t. 8. Leaves pale beneath. Petals white, spotted with

yellow. Filaments short, flat. Anthers opening by 2 pores. Berry 3-celled.

Whortle-berry-like Cremanium. Shrub 3 to 6 feet.

6 C. RU'BENS (D. C. prod. 3. p. 191.) quite glabrous; branchlets tetragonal, furrowed; leaves petiolate, ovate-lanceolate, acuminated, denticulated, 3-nerved; panicle terminal, somewhat racemose; branchlets tetragonal, opposite; flowers dioecious, octandrous, and decandrous, crowded. ♄. S. Native of the south of Jamaica, on the hills. Melástoma rùbens, Swartz, fl. ind. occ. p. 707. Branches blood-red. Berry small, blue. The parts of flowers are quaternary or quinary, but most frequently quaternary. Petals roundish, small, white.

Reddish-stemmed Cremanium. Shrub 3 to 6 feet.

7 C. ELÆODE'NDRUM (D. C. l. c.) quite glabrous; branchlets from compressed to terete; leaves petiolate, oblong, elongated, tapering to both ends, triple-nerved, and as if they were appendiculated beneath at the origin of the lateral nerves; panicle terminal, much branched; lobes of calyx 4, obtuse, short. ♄. S. Native of Brazil. Flowers small; petals oval. Anthers narrowed at the base, and opening by 2 wide pores at the apex. Stigma peltate.

Olive-tree Cremanium. Shrub 2 to 3 feet.

8 C. GLANDULÒSUM (D. C. l. c.) branches bluntly tetragonal, clothed with whitish tomentum while young; leaves ovate, 3-nerved, entire, strigose above, and beset with glandular rough hairs beneath; racemes terminal; flowers crowded, almost sessile, octandrous, minute. ♄. S. Native of Jamaica, on the mountains. Melástoma glandulòsa, Swartz, fl. ind. occ. p. 799.

Glandular Cremanium. Shrub 3 to 6 ft.

* * *Flowers decandr*[illegible]

9 C. ME'DIUM (D. Don, in mem. wern. soc. 4. p. 313.) stem erect; branchlets pilose; leaves elliptic, acute, serrulated, naked, and shining above, but pilose beneath; thyrse compound; flowers drooping. ♄. S. Native of Peru. Flowers small, white.

Intermediate Cremanium. Shrub.

10 C. CALOPHY'LLUM (D. Don, l. c.) stem erect; leaves cuneate-oblong, coriaceous, glabrous, quite entire, marginate, shining above, but feather-nerved, and finely reticulated beneath; panicle terminal, much branched. ♄. S. Native of Peru. Melástoma obovàta, Pav. in herb. Lam. Leaves like those of a myrtle. Flowers very small, white. Style twice the length of the stamens.

Beautiful-leaved Cremanium. Shrub.

11 C. LAU'RINUM (D. Don, l. c.) stem erect; branchlets pilose; leaves lanceolate, obtuse, quite entire, 3-nerved, glabrous above and pilose beneath; panicle racemose; flowers drooping. ♄. S. Native of Peru. Flowers small, white.

Laurel-like Cremanium. Tree.

12 C. CŒRU'LEUM (D. Don, l. c.) stem climbing? branchlets very pilose; leaves lanceolate, acuminated, quite entire, 3-nerved, rough above, but very pilose beneath; panicle brachiate, hispid. ♄. S. Native of Peru. Melástoma cœrùlea, Pav. in herb. Lamb. Flowers small, white. Berry small, globose, blue.

Blue-berried Cremanium. Shrub cl.

13 C. CŒLE'STE (D. Don, l. c.) stem erect; branchlets powdery; leaves ovate-lanceolate, acuminated, crenulated, 3-nerved, powdery on the under surface; panicle brachiate; flowers glomerate. ♄. S. Native of Peru. Melástoma cœlèstis, Pav. in herb. Lamb. Flowers small, white. Style twice the length of the stamens.

Sky-blue-berried Cremanium. Shrub.

14 C. SERRULA'TUM (D. Don, l. c.) stem erect; leaves elliptic-oblong, acute, serrulated, 3-nerved, glabrous; panicle brachiate; flowers glomerate; style about half the length of the stamens. ♄. S. Native of Peru. Melástoma serrulàtum, Pav. in herb. Lamb. Flowers small, milk-coloured.

Serrulated-leaved Cremanium. Shrub.

15 C. HISPIDI'SSIMUM (D. C. prod. 3. p. 192.) branchlets terete, and are as well as the petioles, peduncles, and calyxes hispid from long, stiff, spreading bristles; leaves petiolate, ovate, short-acuminated, 5-nerved, ciliated, pilose on both surfaces; thyrse panicled, terminal; having its branches spreading. ♄. S. Native of Peru. A very showy species. Lobes of calyx feathered by bristles. Petals 5, oval, obtuse, yellow in a dried state. Filaments and style beset with glandular bristles. Anthers arched, obtuse, opening by 2 confluent pores, and ending in 2 short bristles at the base.

Very-hispid Cremanium. Shrub 2 to 3 feet.

16 C. PAPILLÒSUM (D. C. l. c.) branchlets terete, and are as well as the petioles and rachis velvety from rather flocky, short, stellate, crowded down; leaves ovate, bluntish, 7-nerved, ciliately crenulated, beset with bristles above, which are swollen at the base, but reticulated and covered with hairs beneath; panicle terminal, many-flowered; calyx velvety, hardly 5-toothed; stigma peltate; anthers 2-celled? ♄. S. Native of Peru. Melástoma papillòsa, Desr. in Lam. dict. 4. p. 48.

Papillose Cremanium. Shrub 4 to 5 ft.

17 C. RECLINA'TUM (D. C. l. c.) quite glabrous and bushy; branchlets reclinate at the apex; leaves petiolate, oval, 3-5-nerved, quite entire; thyrse terminal, few-flowered; calyx campanulate, hardly 5-toothed. ♄. S. Native of Peru, on Mount Saraguru, in temperate places. Melástoma reclinàtum, Bonpl. mel. t. 48. Petals small, white, obovate. Anthers wedge-shaped, furnished with a simple, membranous appendage behind, and opening by 2 pores at the apex. Stigma capitate, depressed. Berry 3-celled.

Reclinate-branched Cremanium. Shrub 3 to 5 feet.

18 C. QUADRANGULA'RE (D. C. l. c.) branches smoothish, tetragonal; leaves petiolate, ovate-lanceolate, acuminated, entire, 3-nerved, stiff, glabrous above and rusty beneath; thyrse panicled, terminal, straight, with its branches opposite and angular; calyx ovate, cinereous from stellate down, with its lobes ovate, obtuse, and membranous; stigma capitate. ♄. S. Native of Jamaica, on the mountains. Melástoma quadrangulàris, Swartz, fl. ind. occ. p. 770. The branches, and probably the peduncles, are clothed with minute velvety down when young. Leaves yellowish above; nerves thick, the lateral ones almost marginal. Anthers opening by 2 pores, according to Swartz.

Quadrangular-branched Cremanium. Shrub 3 to 6 feet.

19 C.? GRANULÒSUM (D. C. l. c.) branches bluntly tetragonal, and are as well as the petioles, panicles, and under side of leaves densely clothed with rusty, powdery, velvety, flocky down; leaves petiolate, oblong-oval, with somewhat revolute margins, hardly toothed, 3-5-nerved, glabrous above; panicle terminal: having its branchlets opposite, with the flowers crowded at their tops. ♄. S. Native of New Granada, in shady woods near Ybague. Melástoma granulòsum, Bonpl. mel. t. 12. Limb of calyx 5-toothed, drawn out beyond the ovarium; having the teeth spurred on the outside. Petals oval, white. Anthers bearing 2 short auricles at the base, but bluntish and opening by 2 pores at the apex. Stigma capitate. Ovarium a little toothed at the apex. Allied to *C. quadrangulàre.*

Granular Cremanium. Shrub 10 to 15 feet.

20 C.? ASPERGILLA'RE (D. C. prod. 3. p. 193.) branchlets terete, and are as well as the petioles, panicles, and under side of leaves clothed with rufous stellate tomentum; leaves on short petioles, oblong-oval, serrulated, 3-nerved, glabrous above; panicle short, thyrsoid; having its branches opposite, and bearing the flowers in tufts at their tops. ♄. S. Native of Quito,

between Delay and Cuenca. Melástoma aspergillàris, Bonpl. mel. t. 19. Calyx bluntly 5-toothed. Petals roundish, white. Anthers oval, opening by 2 pores? at the apex. Stigma thickish. Berry 3-celled.

Roughish Cremanium. Shrub 3 to 6 feet.

21 C. LEDIFÒLIUM (D. C. l. c.) branchlets terete, and are as well as the petioles, peduncles, and under side of leaves densely clothed with stellate down; leaves hardly petiolate, oblong, with revolute edges, and hence nearly linear, obtuse, coriaceous, 1-nerved, glabrous on the upper surface, except on the nerve; thyrse spike-formed, axillary, and terminal, few-flowered; calyx campanulate, rather velvety, bluntly 5-toothed. ♄. S. Native of Chimboraco. Petals small, obovate. Anthers 2-celled. Stigma hardly dilated.

Ledum-leaved Cremanium. Shrub 2 to 3 feet.

22 C. GLABE′RRIMUM (D. C. l. c.) quite glabrous; branches nearly terete; leaves oval or obovate, triple-nerved, quite entire, beset with glandular dots above, each terminating in a very short acumen; panicle terminal; bracteas small, linear; calyx globose, with 5 short, acute teeth. ♄. S. Native of Brazil, in woods between Lorena and St. Paul. Melástoma dimórphum, Schrank et Mart. mss. Habit of *C. milleflòrum.* Dots on leaves, elongated, yellow, small, and scattered. Flowers small, white. Anthers oblong, obtuse, opening by 2 pores at the apex, each furnished with a slender connective. Style dilated and rather tube-formed at the apex.

Very smooth Cremanium. Shrub 6 to 8 feet.

23 C. MINUTIFLÒRUM (D. C. l. c.) glabrous, except in the young parts, which are furnished with scattered dots of white flocky down; branches obscurely tetragonal; leaves elliptic-oblong, acuminated, rather serrulated, 3-nerved, besides the marginal nervules; panicle terminal. ♄. S. Native of Brazil, in woods at Capoeira. Melastomà minutiflòrum, Schrank et Mart. mss. but not of Bonpl. The leaves are yellowish when in a dry state. Anthers oval, obtuse, opening by 2 pores. Style short, dilated at the apex. Flowers small; petals oval. Habit of the following species.

Minute-flowered Cremanium. Shrub 4 to 6 feet.

24 C. MILLEFLÒRUM (D. C. l. c.) quite glabrous; leaves petiolate, obovate, short-acuminated, 3-nerved, quite entire at the base, but serrulated in the upper part; panicle terminal, much branched. ♄. S. Native of Brazil, in the province of St. Paul, in marshes. Melástoma milleflòrum, Schrank et Mart. mss. Branches tetragonal. Leaves $1\frac{1}{2}$ inch long. Herb yellowish when dried. Flowers hardly the size of those of a *Gàlium*, white or red. Calyx with a hemispherical tube, and 5 small teeth. Petals obovate, obtuse. Genitals exserted a little; articulation of connective hardly evident. Anthers 10, clavate, truncate, beakless, opening by 2 pores.

Thousand-flowered Cremanium. Shrub 2 to 3 feet.

25 C. OLIGÒTRICHUM (D. C. l. c.) branches bluntly somewhat tetragonal; leaves oval, acute, 3-nerved, besides the marginal nervules, glabrous on both surfaces in the adult state, and very bluntly crenated, ciliated from bristles, which rise from the notches; petioles bearing a few bristles at the apex; panicle terminal, many-flowered. ♄. S. Native of Mexico. The leaves, when young, are covered with scattered, stellate down on the under surface. Petals retuse, nearly emarginate. Calyx dotted, when examined by a lens, with the teeth very short.

Few-haired Cremanium. Shrub 4 to 6 feet.

26 C. TINCTÒRIUM (D. C. l. c.) quite glabrous; branches nearly terete, furnished with crowded bristles at the knots; leaves petiolate, oval-oblong, rather acuminated, serrulated, 3-nerved, coriaceous, shining; thyrse panicled, terminal, crowded; petals 6, orbicular. ♄. S. Native of Peru. The leaves are yellowish, and the whole shrub is used for dyeing yellow by the Peruvians. Calyx bluntly 6-toothed. Stamens rather shorter than the petals. Anthers short, cuneated, very blunt, opening by 2 wide pores at the apex. Stigma peltate. Berry or capsule hardly baccate. Seeds ovate, angular, with a linear hylum.

Dyer's Cremanium. Shrub 4 to 6 feet.

27 C. CRÒCEUM (D. C. prod. 3. p. 194.) branches terete, glabrous; leaves petiolate, ovate, a little serrated at the apex, 5-nerved, glabrous, 3 of the nerves are larger than the other two, and bearded at their origin; petioles rather pilose; panicles terminal, trichotomous; calyx turbinate, 5-toothed. ♄. S. Native of Peru. Melástoma cròcea, Desr. in Lam. dict. 4. p. 55. Spreng. syst. 2. p. 302. exclusive of the variety from Hispaniola.

Copper-coloured Cremanium. Shrub.

28 C. THE′EZANS (D. C. l. c.) quite glabrous; branchlets terete; leaves petiolate, lanceolate-oval, a little toothed, 5-nerved; thyrse terminal, having its branchlets crowded with flowers; calyx campanulate, hardly erose. ♄. S. Native of temperate places about Popayan. Melástoma Thèezans, Bonpl. mel. t. 9. Flowers white, scented in the evening. Petals 5, oval. Anthers opening by 2 pores, and minutely appendiculated at the base. At Popayan the leaves of this plant are infused and drank in place of tea by the inhabitants.

Tea Cremanium. Tree 12 to 20 ft.

29 C. LATECRENA′TUM (D. C. l. c.) smoothish; branches nearly terete; leaves petiolate, broad-lanceolate, acuminated, broadly and bluntly crenated, 5-nerved, beset with stellate powdery down on the nerves beneath; panicle terminal, clothed with powdery tomentum; calyx with a globose tube and a 5-toothed deciduous limb. ♄. S. Native of Brazil, in the province of Bahia, in bogs on hills. Very like *Melástoma pyramidàle*, Bonpl. t. 21. but the crenæ of the leaves are broad and beardless, not acute and ciliated. Melástoma pyramidàle, Mart. et Schrank, mss.

Broad-crenated-leaved Cremanium. Shrub 3 to 6 feet.

30 C. INÆQUA′LIS (D. C. l. c.) branchlets from compressed to terete, and are as well as the panicles velvety from short, deciduous, stellate down when young, but at length becoming glabrous; leaves petiolate, oblong, acuminated, sharply and unequally serrated, but entire at the base and apex, 3-nerved; panicle terminal, much branched; branches opposite. ♄. S. Native of Brazil, in dark woods in the province of St. Paul. Melástoma biserràtum, Schrank et Mart. mss. Fruit globose, furrowed, a little larger than a mustard seed. Style short, crowned by an orbicular peltate stigma. Seeds angular.

Unequal-leaved Cremanium. Shrub.

31 C. PUSILLIFLÒRUM (D. C. l. c.) branchlets at first rather compressed, but at length terete, and are as well as the petioles and under side of leaves rather scabrous from distant, deciduous tufts of small, stellate down, the rest glabrous; leaves petiolate, oblong, acuminated, membranous, nearly quite entire, 3-nerved, besides the marginal nervules, glabrous; panicle terminal, divaricate, much branched; lobes of calyx 5, short, acute, deciduous. ♄. S. Native of Brazil, in woods. Melástoma pusilliflòrum, Mart. et Schrank, mss. Flowers small, white. Anthers oblong, obtuse, each with a slender connective. Style filiform. Fruit globose. Seeds smooth, angular.

Small-flowered Cremanium. Shrub 2 to 3 feet.

32 C.? PANICULA′TUM (D. C. l. c.) branchlets compressed, at length terete, and are as well as the petioles and nerves of leaves, when young, rather scabrous from small, distant, stellate tufts of down; the rest glabrous; leaves petiolate, oblong, acuminated, nearly quite entire, almost glabrous, 3-nerved, besides the marginal nervules; panicle terminal, loose, oblong; calyx beset with rather scabrous down: the lobes 5, acute, narrowed, erect, permanent. ♄. S. Native of Brazil, near Villa Ricca. Me-

lástoma paniculàtum, Schrank et Mart. mss. Very like *C. pusilliflòrum*. Petals seen but not the genitals.

Panicled-flowered Cremanium. Shrub 2 to 3 feet.

33 C. ligustroìdes (D. C. l. c.) smoothish, or the parts while young are beset with small, stellate tufts of down; branchlets compressed, but at length becoming terete; leaves on short petioles, rather coriaceous, ovate, hardly acuminated, quite entire, or rather repand at the apex, 3-nerved, besides the marginal nervules; panicle terminal, much branched; lobes of calyx 5, very short, blunt, and deciduous; berry globose. ♄. S. Native of Brazil, in the province of Bahia, among bushes. Melástoma densifróns, nítens, ligústrinum, and repándulum, Schrank et Mart. Limb of calyx very short. Petals obovate. Anthers obtuse, opening widely at the top, with the opening separated by a dissepiment into 2 divisions. Stigma capitately peltate. Seeds few, angular.

Privet-like Cremanium. Shrub 4 to 6 feet.

34 C. cinnamomifòlium (D. C. l. c.) quite glabrous; branches bluntly tetragonal, but at length terete; leaves petiolate, oval, or somewhat ovate, acuminated, 3-nerved, quite entire; thyrse contracted, terminal, with its branches angular and opposite; teeth of calyx 5, very short, or almost wanting. ♄. S. Native of Brazil. Melástoma cinnamomifòlium, Mart. herb. but not of Jacq. This species is very nearly related to *C. rùbens*, but differs in the flowers being 5-cleft, not 4-cleft, and in the leaves being less attenuated at the base. Stamens seen but not the style.

Cinnamon-leaved Cremanium. Shrub.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXIX. BLA'KEA (dedicated to Ma[illegible]lake, of Antigua, by Dr. Patrick Browne, a great promoter of useful knowledge). Lin. gen. no. 810. Juss. gen. 328. D. Don, in mem. wern. soc. 4. p. 323. D. C. prod. 3. p. 195.—Topòbea, Aubl. guian. 1. p. 476.—Valdèria, Ruiz et Pav. prod. p. 67. t. 11. syst. 1. p. 121.—Bellùcia, Neck. elem. 2. no. 833. Drepanándrum, Neck. elem. no. 793.?

Lin. syst. *Dodecándria, Monogýnia.* Calyx campanulate, girded by 4-6 broad scales, which are either disposed in a cruciate manner or in 3 series; limb permanent, membranous, 6-lobed or 6-toothed. Petals 6. Stamens 12. Anthers large, concatenated into a ring, obtuse at the apex, and opening by a twin pore, each furnished with a short spur-like process at the base. Capsule baccate, crowned by the calyx, 6-celled. Seeds ovate, angular.—Trees or shrubs. Leaves petiolate, 3-5-nerved, coriaceous, glabrous above and shining, but usually densely clothed with rusty tomentum beneath. Peduncles axillary, terete, 1-flowered, naked, opposite, or solitary, shorter than the leaves, usually clothed with brown tomentum. Flowers large, showy, red.

§ 1. *Calyx 6-lobed, girded at the base by 4, rarely by 6 scales.*

1 B. trinervia (Lin. spec. 635.) leaves oval-oblong, 3-nerved, glabrous, and shining on both surfaces in the adult state, and when young serrulated; petioles and branchlets clothed with rusty tomentum; peduncles solitary, longer than the petioles; scales longer than the calyx. ♄. S. Native of Jamaica; very common on the Port Royal mountains, along with various species of *Meriània*. Sims, bot. mag. t. 451.—P. Browne, jam. p. 323. t. 35. Roots issuing from the branches and stems. Flowers large, of a rose colour.

Three-nerved-leaved Blakea. Fl. June, July. Clt. 1789. Shrub 4 to 8 feet.

2 B. Mexica'na (D. Don, in mem. wern. soc. 4. p. 325.) leaves elliptic, acute, 5-nerved, denticulated, pilose beneath; peduncles usually 3 together; scales longer than the calyx. ♄. S. Native of Mexico. Flowers large, rose-coloured.

Mexican Blakea. Shrub 4 to 6 feet.

3 B. ròsea (D. Don, l. c.) leaves oval-lanceolate, acuminated, glabrous; peduncles twin; scales longer than the calyx; petals mucronate. ♄. S. Native of Peru. Valdèsia ròsea, Ruiz et Pav. fl. per. ined. t. 408. Flowers rose-coloured.

Rose-coloured-flowered Blakea. Shrub or tree.

4 B. ova'lis (D. Don, l. c.) leaves oval, acuminated, naked on both surfaces, shining, 3-nerved; peduncles twin; scales longer than the calyx; petals obtuse. ♄. S. Native of Peru. Valdèsia ovàlis, Ruiz et Pav. syst. 121, fl. per. ined. t. 406. Flowers red.

Oval-leaved Blakea. Tree 10 to 20 feet.

5 B. re'pens (D. Don, l. c.) leaves lanceolate, acuminated, 3-nerved, pilose beneath; peduncles twin; scales shorter than the calyx; petals mucronulate. ♄. S. Native of Peru. Valdèsia rèpens, Ruiz et Pav. syst. p. 121. fl. per. ined. t. 405. Roots issuing from the branches. Flowers red.

Creeping Blakea. Shrub.

6 B. latifòlia (D. Don, l. c.) leaves large, oval, 3-nerved, acuminated, glabrous; peduncles solitary; scales longer than the calyx. ♄. S. Native of Peru. Valdèsia latifòlia, Ruiz et Pav. fl. per. ined. t. 407. Flowers red.

Broad-leaved Blakea. Shrub or tree.

§ 2. *Calyx 6-toothed, girded by 4 scales.*

7 B. quinquene'rvis (Aubl. guian. 1. p. 525. t. 210.) leaves elliptic, acuminated, naked, and shining on both surfaces, 5-nerved, the 2 outer nerves near the margin of the leaf, and the other 2 rising above the base of the leaf; peduncles twin, shorter than the petioles; scales longer than the calyx; anthers 16-18; filaments much dilated at the apex; stigma peltate. ♄. S. Native of Guiana and Trinidad, as well as of Brazil, in woods. B. triplenérvia, Lin. fil. suppl. Apatìtia blakeoìdes, Desv. in Hamilt. prod. no. 42. Flowers large, flesh-coloured, with white disks. Petals 8-9, unguiculate. Berry large, round, yellow, eatable.

Five-nerved-leaved Blakea. Clt. 1820. Sh. 10 to 16 ft.

8 B. multiflòra (D. Don, l. c. p. 326.) leaves oval-oblong, short-acuminated, 5-nerved, pilose beneath; peduncles usually 3 together; scales 3-times shorter than the calyx. ♄. S. Native of Peru. Flowers red.

Many-flowered Blakea. Shrub.

9 B. rotundifòlia (D. Don, l. c.) leaves large, roundish, 5-nerved, densely clothed with rusty tomentum beneath, as well as on the branches; peduncles solitary; scales longer than the calyx. ♄. S. Native of Peru. Leaves 4-7 inches long and 4-6 broad. Flowers red.

Round-leaved Blakea. Shrub.

10 B. macrophy'lla (D. Don, l. c.) leaves large, oval, 5-nerved, naked on both surfaces; peduncles solitary; scales longer than the calyx. ♄. S. Native of Mexico. Leaves a foot long and 7 inches broad. Flowers red.

Long-leaved Blakea. Shrub or tree.

11 B. parasi'tica (Don, l. c. p. 327.) leaves roundish, cordate, 5-nerved, mucronate, glabrous and shining above; peduncles short, usually 3 together; scales about equal in length to the calyx. ♄. ◡. S. Native of Guiana and Maranham. Topòbea parasítica, Aubl. guian. 1. p. 476. t. 189. Shrub climbing and rooting on trees. Flowers red.

Parasitic Blakea. Shrub cl.

12 B. lævigа'ta (D. Don, l. c.) leaves oval, quite entire, 3-nerved, and are as well as the branches glabrous; peduncles solitary, shorter than the petioles; scales connate at the base,

shorter than the calyx. ♄. S. Native of Mexico. B. trinérvis, Pav. in herb. Lamb. Flowers red.

Smooth Blakea. Shrub.

† *Species hardly known.*

13 B.? pulverule'nta (Vahl. symb. 3. p. 61.) calyx without scales; leaves elliptic, glabrous, triple-nerved; racemes terminal. ♄. S. Native of South America. See E. Meyer, in act. bonn. 12. p. 797.

Powdery Blakea. Shrub.

14 B.? Ca'catin (D. Don, l. c.) branches bluntly quadrangular; leaves ovate, acuminated, 3-nerved; petioles very long, thick both at the base and apex; flowers and fruit unknown. ♄. S. Native of Guiana, on the banks of rivers. Melástoma Cácatin, Aubl. guian. 1. p. 437. t. 172. *Cacatin* is a name given to the plant by the Indians of Guiana.

Cacatin Blakea. Shrub 8 to 10 ft.

Cult. The species of this genus are all worth cultivating for the sake of the fine broad foliage, and large showy rose-coloured flowers. They thrive well in peat earth, or a mixture of loam and peat, and require to be liberally supplied with water, particularly in spring and summer. Cuttings should be taken from shoots that are quite ripe, otherwise they are apt to rot; and if planted in a pot of sand, and plunged in a moist heat under a hand-glass, they strike root freely.

Suborder II. Charia'nthеæ (plants agreeing with *Charíanthus* in the anthers opening longitudinally by 2 chinks). Ser. mss. ex D. C. prod. 3. p. 196. Anthers 2-celled (f. 113. *e.*), opening longitudinally by a double chink (f. 113. *e.*). Fruit fleshy. Seeds cuneate, angular.

LXXX. KIBE'SSIA

(*Kibessie* is the name given to this plant by the Javanese). D. C. prod. 3. p. 196. Blume, in bot. zeit. 1831. no. 30. p. 524.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx nearly hemispherical, muricated from branched bristles, adnate to the ovarium; limb undivided, calyptriform, cut round about at the base, and falling off in one piece. Petals 4, obovate. Stamens 8, equal. Anthers ovate, opening by a longitudinal double chink, fleshy on the back and without any appendage. Style filiform, tapering to the apex; stigma simple. Fruit nearly globose, depressed at the apex, and hence umbilicate, indehiscent, 4-celled. Seeds cuneated, angular.—A large, glabrous shrub, with terete branchlets, but rather tetragonal towards the apex. Leaves opposite, on short petioles, oval-oblong, tapering to both ends, 3-nerved, quite entire. Peduncles axillary and terminal, solitary, or in few-flowered fascicles; pedicels bibracteate in the middle. Flowers large, blue.

1 K. azu'rea (D. C. prod. 3. p. 196. Blum. l. c.). ♄. S. Native of Java, in woods on the mountains. Melástoma azúreum, Blum. bijdr. p. 1079.

Blue-flowered Kibessia. Shrub 10 feet.

Cult. This shrub is worth cultivating for its showy, large, blue flowers and fine foliage. Its culture and propagation are the same as that recommended for *Blàkea*.

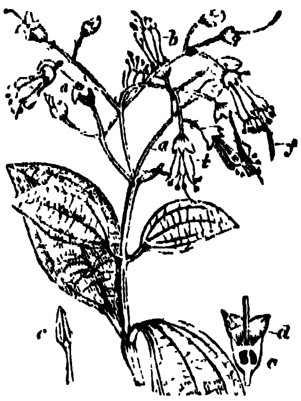
LXXXI. CHARIA'NTHUS

(from χαριεις, *charieis*, beautiful, and ανθος, *anthos*, a flower; flowers very shewy). D. Don, in wern. soc. mem. 4. p. 327. D. C. prod. 3. p. 191.—Chænanthèra, Rich. herb.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx ovate, rather urceolate (f. 113. *a.*); limb spreading, bluntly 4-lobed, permanent. Petals 4, erect, oval. Stamens 8, nearly equal; filaments linear (f. 113. *b.*); anthers continuous with the filaments (f. 113. *e.*), oblongly club-shaped, naked at the base, opening longitudinally by a double chink (f. 113. *e.*). Ovarium adnate to the calyx (f. 113. *c.*). Style filiform, exserted. Capsule baccate, globose, umbilicate, 4-celled, opening a little at the apex by the valves. Placentas lunate. Seeds ovate, with a large lateral hylum. Albumen none. Embryo straight, with thick cotyledons, and a long, inferior radicle.—Erect, West Indian shrubs, with petiolate, 5-nerved leaves, and purple flowers, which are disposed in trichotomous, corymbose cymes.

1 C. cocci'neus (D. Don, l. c.) all parts of shrub rather pubescent when young, but at length becoming quite glabrous; branches nearly terete; leaves oval, acuminated, quite entire, 5-nerved, beset with flocky down beneath or small dots. ♄. S. Native of Guadaloupe and Cayenne, on the higher mountains, in sphagnous places. Melástoma coccínea, Rich. in act. soc. hist. nat. par. 109. and in Bonpl. mel. t. 44. Melast. alpìna, Swartz, fl. ind. occ. 2. p. 800. The dots on the lower surface of leaves are the cicatrices, occasioned by the falling off of the tufts of stellate down. Calyx dotted from flocky down when young, but quite glabrous in the adult state. Flowers scarlet.

FIG. 113.



Scarlet-flowered Charianthus. Shrub 4 to 6 feet.

2 C. glabe'rrimus (D. C. prod. 3. p. 196.) shrubby, quite glabrous in every part; branchlets bluntly tetragonal; leaves oval, acuminated, [illegible] entire, 5-nerved, dotless. ♄. S. Native of Martinique, Trinidad, and Guadaloupe. Melástoma corymbòsa, Vahl. ecl. 3. p. 25. Melast. Berteriànum, Spreng. in herb. Balb. Chenanthèra mucronàta, Rich. herb. Chariánthus Berteroànus, Ser. mss. Perhaps only a smooth variety of the preceding species, but the leaves are longer. Flowers purplish red.

Quite-glabrous Charianthus. Shrub 4 to 6 feet.

3 C. tinifòlius (D. Don, l. c.) leaves ovate, coriaceous, obtuse, short-acuminated, 5-nerved, quite entire, glabrous on both surfaces, as well as on the branches. ♄. S. Native of the West India Islands. Flowers blood-coloured. Lateral nerves of leaves almost obsolete.

Laurestinus-leaved Charianthus. Shrub 4 to 6 feet.

4 C. purpu'reus (D. Don, l. c.) branches and petioles hispid from bristles; leaves oval, short-acuminated, cordate at the base, quite entire, 5-nerved, pilose beneath and on the margins. ♄. S. Native of the Island of Montserrat. Melástoma coccínea, Vahl. ecl. 1. p. 48. icon. amer. t. 16. but not of Rich. Flowers purplish red.

Purple-flowered Charianthus. Shrub 4 to 6 feet.

5 C. cilia'tus (D. C. prod. 3. p. 197.) branches hispid from bristles; leaves ovate, coriaceous, short-acuminated, glabrous on both surfaces, 5-nerved, serrated, with the serratures callous and ciliately toothed. ♄. S. Native of Trinidad. Sieb. pl. trin. no. 279. Tetrazýgos ciliàtus, Rich. herb. Melástoma Dodandiàna, Hamilt. prod. p. 37. Flowers purple.

Ciliated-leaved Charianthus. Shrub 3 to 6 feet.

Cult. All the species of *Chariánthus* are worth cultivating for their showy cymes or corymbs of purple or scarlet flowers. Their culture and propagation are the same as recommended for *Blàkea*, see p. 801.

LXXXII. CHÆNOPLEU'RA

(from χαινω, *chaino*, to open, and πλευρα, *pleura*, a side). Rich. herb. ex D. C. prod. 3. p. 197.

Lin. syst. *Decándria, Monogýnia.* Calyx adnate to the ovarium; limb bluntly 5-toothed. Petals 5, roundish. Stamens 10, hardly longer than the petals. Anthers opening longitudinally by 2 chinks: having their connectives biauriculate at the base. Style clavate, crowned by an orbicular, somewhat umbilicate stigma. Berry? 3-4-celled. Seeds unknown.—Glabrous shrubs, with the habit of the section *Leosphæ'riæ* of *Micònia.* Leaves petiolate, oblong-lanceolate, obtuse at the base, acuminated at the apex, denticulated from hair-formed, distant serratures, 3-nerved or almost triple-nerved. Thyrse terminal, elongated, having its branchlets opposite and almost racemose. Flowers from white to flesh-coloured. Bracteoles and segments of calyx ciliated.

1 C. STENÓBOTRYS (D. C. prod. 3. p. 197.). ♄. S. Native of Hispaniola, on the mountains, and probably of Jamaica. Melástoma stenóbotrys, Rich. in Bonpl. mel. t. 30. exclusive of the synonym of Swartz.

Narrow-racemed Chænopleura. Sh. 4 to 6 feet.

Cult. For culture and propagation see *Melástoma*, p. 764.

LXXXIII. EWY'CKIA (dedicated by Dr. Blume to Van Ewyck, a patron of natural history). Blum. in bot. zeit. 1831. no. 30. p. 524.

LIN. SYST. *Octándria, Monogýnia.* Tube of calyx hemispherical, adhering to the ovarium; limb continuous with the tube, obsoletely 4-toothed. Petals 4, ovate, acute. Stamens 8, equal. Anthers oblong, obtuse at both ends, opening by a double chink, furnished behind at the base with a fleshy connective. Style filiform; stigma acute. Berry globose, crowned by the limb of the calyx, 4-celled. Seeds cuneated, angular. —A smooth shrub or small tree. Bra[illegible] terete, but thickened at the knots. Leaves opposite, on short petioles, elliptic, acuminated at both ends, quite entire, 3-nerved. Racemules axillary, few-flowered; pedicels bibracteate in the middle. Flowers small, blue.

1 E. CYA'NEA (Blume, l. c. p. 524.). ♄. S. Native of Amboyna. Melástoma azùreum. Zippel, ined.

Blume-flowered Ewyckia. Shrub.

Cult. For culture and propagation, see *Blàkea*, p. 801.

LXXXIV. ASTRO'NIA (from *αστρον*, *astron*, a star; flowers and fruit). Blume, bijdr. p. 1080. bot. zeit. 1831. no. 30. p. 256.

LIN. SYST. *Deca-Dodecándria, Monogýnia.* Tube of calyx hemispherical, adnate to the ovarium; limb 5-6-toothed. Petals 5-6, obovate, obtuse. Stamens 10-12, equal. Anthers linear-oblong, opening by a double chink, inappendiculate, adnate to the thick, triangularly-compressed connectives. Style filiform; stigma peltate. Capsule dry, 2-4-celled, crowned by the limb of the calyx, opening irregularly lengthwise. Seeds straight, paleaceous, enwrapped in fine aril.—Glabrous trees. Branches tetragonal, beset with small, brownish scales or dots at the tops as well as on the petioles, peduncles, and calyxes. Leaves opposite, on longish petioles, oblong, acuminated, quite entire, 3-nerved or triple-nerved, discoloured. Inflorescence panicled, terminal, and axillary. Flowers small, purplish, unisexual from abortion.

1 A. SPECTA'BILIS (Blum. l. c.) leaves 3-nerved, oblong, acuminated, obtuse at the base, thickly beset with rust-coloured scales or dots beneath. ♄. S. Native of Java, in woods on the higher mountains, where it is called *Kihariendung.*

Showy Astronia. Tree.

2 A. PAPETA'RIA (Blum. in bot. zeit. l. c.) leaves 3-nerved, oblong, acuminated, attenuated at the base, thickly beset with rufous dots beneath. ♄. S. Native of Amboyna. A. spectábilis, Zippel ined. Pharmàcum papetàrium, Rumph. amb. 4. p. 134. t. 69. *Ocbat papeba* is the Malay name of the tree.

Papetaria Astronia. Shrub.

3 A. MACROPHY'LLA (Blum. l. c.) leaves triple-nerved, beset with fugaceous scattered down beneath. ♄. S. Native of Java and the Moluccas.

Var. β, discolor; leaves 3-nerved or obscurely triple-nerved. Java.

Var. γ, cóncolor (Blum. in bot. zeit. l. c.) leaves nearly of the same colour on both surfaces, beset with very small dots beneath and on the branchlets. ♄. S. A. cóncolor, Zippel, ined.

Long-leaved Astronia. Tree.

Cult. For culture and propagation see *Blàkea*, p. 801.

† *The structure of the following Mèlastomaceous plants is not known, and therefore they are ranged here according to the names they have first received.*

§ 1. *Plants referred by authors to Rhéxia, from the fruit being capsular.*

* *Flowers decandrous.*

1 R. FU'LVA (Spreng. syst. 2. p. 308.) shrubby; branches dichotomous, pubescent; leaves oblong, minute, almost nerveless, beset with hispid bristles; flowers decandrous, terminal, solitary; calycine lobes subulate. ♄. S. Native of Brazil.

Fulvous Rhexia. Shrub.

2 R. FASCICULA'TA (Spreng. neue. entd. 3. p. 62. et syst. 2. p. 308.) racemes rather dichotomous, terminal; leaves linear-oblong, in fascicles, quite glabrous, nerveless, with 1 tooth on each side; corolla blood-coloured; calyx 10-striped, strigose. ♄. S. Native of Brazil. Perhaps a species of *Cambessedèsia.*

Fascicled-leaved Rhexia. Pl.

* * *Flowers octandrous.*

3 R. HE'LVOLA (Spreng. syst. 2. p. 309.) suffruticose; leaves crowded, sessile, oval, quite entire, nerved, beset with pale red, stiff hairs or bristles on both surfaces; peduncles axillary, cymose; flowers octandrous; calyxes very hispid. ♄. S. Native of Brazil.

Pale-red-haired Rhexia. Shrub.

4 R. TRICHÓTOMA (Rottb. diss. pl. rar. 9. t. 5.) shrubby; branches tetragonal; angles hairy; leaves sessile, lanceolate, hairy; flowers sessile, axillary, and terminal. ♄. S. Native of Surinam. Vahl. symb. p. 48.

Trichotomous Rhexia. Shrub.

5 R. STRIGÒSA (Willd. herb. ex Spreng. syst. 2. p. 309.) suffruticose; leaves ovate, 3-nerved, strigose; peduncles axillary, corymbose; flowers octandrous; calyxes hairy. ♄. S. Native of Cayenne.

Strigose Rhexia. Shrub.

§ 2 *Plants referred by authors to Melástoma, from their fruit being fleshy.*

* *Flowers octandrous.*

1 M. MELANOPHY'LLUM (Spreng. neue. entd. 2. p. 171.) branches knotted, nearly terete, glabrous; leaves ovate, acuminated, quite glabrous on both surfaces, 3-nerved, quite entire; shining above; panicles lateral; flowers octandrous; calyx with 4 minute teeth, covered with stellate scales. ♄. S. Native of Brazil.

Black-leaved Melastoma. Shrub.

2 M. SE'SSILE (Spreng. syst. 2. p. 303.) branches twiggy; leaves half stem-clasping, roundish-cordate, acute, quite entire, obsoletely triple-nerved, beset with glandular villi on both surfaces; flowers almost sessile, axillary, octandrous. ♄. S. Native of Brazil. Perhaps a species of *Sagræ'a.*

Sessile-flowered Melastoma. Shrub.

3 M. VIRGA'TUM (Swartz, prod. p. 72. fl. ind. occ. 2. p. 816.)

branches twiggy, tetragonal, glabrous; leaves ovate-lanceolate, acuminated, 3-nerved, entire; flowers white, octandrous; calyx 4-toothed, the teeth subulate; petals oblong, longer than the calyx; filaments jointed under the anthers; stigma acute. ♄. S. Native of Jamaica, in woods on the mountains.

Twiggy Melastoma. Shrub.

4 M. Matu'ba (Spreng. neue. entd. 3. p. 61.) leaves ovate-oblong, 3-nerved, acuminated, glabrous, quite entire; panicle terminal, with trichotomous, erect branches; calyx terete, truncate. ♄. S. Native of Guadaloupe and Antigua.

Matuba Melastoma. Shrub.

5 M. micra'nthum (Swartz, prod. p. 71. fl. ind. occ. 2. p. 803.) branches twiggy, terete, glabrous; leaves oblong, acuminated at both ends, glabrous, 3-nerved, denticulated, petiolate; racemes axillary, reclinate towards the tops of the branches; flowers white, octandrous; calyx 4-toothed; petals 4, acuminated, with a blood-coloured spot at the base of each; berry 8-sided, 4-celled, white and pellucid at maturity. ♄. S. Native of Jamaica, on the mountains. Perhaps a species of *Ossæ'a.*

Small-flowered Melastoma. Shrub.

6 M. triflòrum (Vahl. ecel. fasc. 1. p. 46.) branches, petioles, and calyxes strigose; leaves elliptic-lanceolate, quite entire, 3-nerved: flowers axillary, octandrous, somewhat pedunculate, tern; calyx turbinate, obscurely 4-toothed; petals ovate, exceeding the stamens. ♄. S. Native of the West Indies.

Three-flowered Melastoma. Shrub.

7 M. tripline'rvia (Link, et Otto. icon. pl. rar. hort. berol. t. 24.) stems branched; leaves oval, bluntish, somewhat feather-nerved towards the apex, tapering into the petiole at the base; hairs adpressed; panicles terminal; calyx with 4 acuminated lobes. ♄. S. Native of Mexico, at Xalapa. Flowers white. Leaves, petals, and sepals ciliated.

Triple-nerved-leaved Melastoma. Fl. June, Aug. Clt. 1827. Shrub 2 to 4 feet.

8 M. ecosta'tum (Ait. hort. kew. ed. 3. p. 46.) leaves ovate-lanceolate, acuminated, denticulated, without ribs, triple-nerved, pilose above, but smoothish beneath; corymbs terminal, trichotomous; branchlets, peduncles, and calyxes clothed with powdery tomentum; flowers octandrous. ♄. S. Native of Jamaica.

Ribless Melastoma. Shrub 1 to 2 feet.

9 M. sali'cinum (Ser. mss. in D. C. prod. 3. p. 199.) branches terete, and are as well as the petioles, nerves of leaves, peduncles, and calyxes clothed with long, rufous, rather adpressed bristles; leaves oblong-lanceolate, acuminated at both ends, 3-nerved, with the margins revolute; thyrse terminal; lobes of calyx 4, narrow, acuminated. ♄. S. Native of Brazil. Perhaps a proper genus, belonging to Tribe *Miconieæ.* It is not a *Clidèmia,* from the ovarium being glabrous at the apex: nor a *Micònia,* from the calyx being 4-cleft.

Willowy Melastoma. Shrub 3 to 6 feet.

10 M. pi'ctum (Rudolph, in Schrad. neues. journ. vol. 2. pt. 2. p. 293.) branches nearly terete, smooth; branchlets hoary; leaves ovate, acuminated, obsoletely denticulated, 5-nerved, covered with strigæ above, and reticulately tomentose beneath; panicles terminal, divaricate; flowers octandrous; calyx 4-toothed; petals oblong, purple, with undulated margins; anthers acuminated. ♄. S. Native of Jamaica, on the mountains.

Painted Melastoma. Shrub 3 to 6 feet.

11 M. crini'tum (Vahl. ecl. fasc. 3. p. 28.) branches terete, glabrous below, leafless at the apex, hispid from white pili; leaves oval-oblong, denticulated, hispid on both surfaces; flowers octandrous; tube of calyx short, tetragonal; angles acutish, gibbous at the base; calycine segments 4, awned beneath the apex; genitals length of corolla. ♄. S. Native of Martinico, on the mountains. Perhaps a species of *Clidèmia.*

Hairy Melastoma. Shrub.

* * *Flowers decandrous.*

A. *Species natives of the West Indies.*

12 M. expa'nsum (Vahl. eclog. fasc. 3. p. 21.) branches terete, glabrous below; leaves oblong-ovate, attenuated, setaceously denticulated, glabrous, 5-nerved; racemes compound, powdery; flowers decandrous; pedicels dichotomous; calyx campanulate, obscurely striated, 5-toothed; petals 5, linear-oblong, obtuse; stamens longer than the corolla. ♄. S. Native of the Island of Montserrat. Perhaps a species of *Micònia,* allied to *M. pyramidàle.*

Expanded Melastoma. Shrub.

13 M. capita'tum (Vahl. eclog. amer. fasc. 1. p. 45.) branches tetragonal, compressed towards the apex; leaves broad-lanceolate, quite entire, obtuse at the base, acuminated at the apex, 5-nerved, pilose, petiolate; heads of flowers terminal, involucrated; bracteas membranous, lanceolate, pilose on the back, about the length of the calyx, calyx glabrous, tubular, pilose at the base: having lanceolate, ciliated segments; petals oblong, longer than the calyx; filaments with 2 appendages each: ovarium elongated, beset with setaceous pili at the apex. ♄. S. Native of the West Indies. Perhaps a species of *Chætogástra.*

Capitate-flowered Melastoma. Shrub.

14 M. nervòsum (Smith in Rees' cycl. vol. 23.) stem terete, bristly; leaves elliptic-oblong, acute, crenated at the base and apex, 5-nerved, villous; flowers in glomerated spikes. ♄. S. Native of Jamaica. Allied to *Micònia alàta* according to Smith.

Nerved-leaved [illegible]stoma. Shrub.

15 M. sple'ndens (Swartz, prod. p. 70. fl. ind. occ. p. 789.) branches nearly terete, glabrous; branchlets rusty; leaves oblong, acuminated, glabrous on both surfaces, 5-nerved, entire, shining above; flowers in umbellate panicles, small, almost sessile; calyx 5-toothed; petals 5, ovate, white; stigma capitate, depressed; berry blue, minute. ♄. S. Native of Jamaica, in woods on the mountains. Plum. ed Burm. t. 140. ex Swartz. Perhaps a species of *Micònia.*

Splendent Melastoma. Shrub.

16 M. favòsum (Desr. in Lam. dict. 4. p. 47.) branchlets clothed with rufous rather scurfy tomentum; leaves ovate, rather cordate, denticulated, 5-nerved, large, lacunose beneath, and with many angled tubercles above; flowers corymbose, terminal; calyx rounded at the base, 10-angled, bluntly 5-toothed; petals red, longer than the calyx. ♄. S. Native of St. Domingo. Perhaps a species of *Clidèmia.*

Pitted-leaved Melastoma. Shrub.

17 M. piluli'ferum (Vahl, eclog. fasc. 3. p. 15.) branches obscurely tetragonal, glabrous, spreading; branchlets compressed, clothed with rufous powdery down; leaves lanceolate-elliptic, quite entire, glabrous, petiolate; flowers spicate, decandrous; spikes bipartite, in a somewhat compound raceme; bracteas setaceous; calyx 5-toothed, striated; stamens longer than the corolla; berries globose, twice the size of a mustard seed. ♄. S. Native of Martinico. Perhaps a species of *Micònia.*

Pill-bearing Melastoma. Shrub.

18 M. trine'rvium (Swartz, fl. ind. occ. p. 774.) quite glabrous; branches somewhat tetragonal; leaves petiolate, oblong, attenuated at both ends, 3-nerved, without any marginal nervules; thyrse terminal, loose, panicled; racemules bipartite; flowers crowded, sessile, decandrous. ♄. S. Native of Jamaica, on the mountains. Calyx, petals, fruit, and genitals un described.

Three-nerved-leaved Melastoma. Shrub.

19 M. vire'scens (Vahl, eclog. fasc. 3. p. 18.) branches

terete, greenish, glabrous, rather compressed above, and beset with rather powdery villi; leaves obovate-lanceolate, denticulated, glabrous, smooth, 3-5-nerved; spikes terminal, racemose, bipartite; flowers secund, decandrous; calyx somewhat campanulate, 5-toothed, powdery; anthers linear, curved, furnished at the base on one side with a short brown auricle; style length of stamens, but longer than the corolla; berry globose, about the size of a mustard seed. ♄. S. Native of the Island of Trinidad.

Greenish Melastoma. Shrub small.

20 M. RI'GIDUM (Swartz, prod. p. 69. fl. ind. occ. 2. p. 768.) shrub with very straight tetragonal branches, clothed with rusty scurfy down towards the apex; leaves ovate, cordate, denticulated, petiolate, 3-nerved, stiff, rather membranous, glabrous, brittle; racemes terminal, many-flowered, beset with rusty hairs; flowers decandrous; calyx ovate, hairy, 5-toothed; teeth short, obtuse, stiff; petals ovate, white; stamens longer than the corolla; filaments keeled on the back; style short, thick, striated; stigma obtuse; berries roundish, clothed with rusty farina. ♄. S. Native of Jamaica, on the highest mountains.

Stiff Melastoma. Shrub.

21 M. CHRISTOPHORIA'NUM (Hamilt. prod. fl. ind. occ. p. 37.) stems bushy, glabrous, erect; leaves obovate, acute, quite entire, green above and white beneath, triple-nerved; flowers decandrous, panicled, terminal; peduncles rather trichotomous. ♄. S. Native of the Island of St. Christopher. Flowers small, red.

St. Christopher Melastoma. Shrub.

22 M. SESSILIFLÒRUM (Lin. spec. 558.) leaves oblong-spatulate, sessile, entire, 3-nerved, tomentose beneath; fascicles of flowers scattered. ♄. S. Native of Ja[illegible]a.—Pluk. phyt. t. 249. f. 2.

Sessile-flowered Melastoma. Shrub small.

23 M. BRACHIA'TUM (Vahl, eclog. fasc. 3. p. 24.) branches smooth, terete; branchlets compressed, clothed with rusty powdery down; leaves elliptic, attenuated, denticulated, glabrous, 5-nerved; nerves powdery beneath; spikes bipartite, racemose, secund; calyx about the size of a black pepper, sulcated, globose when the fruit is ripe; petals small, obovate; flowers decandrous. ♄. S. Native of Montserrat.

Armed Melastoma. Shrub 4 to 6 feet.

24 M. STRIA'TUM (Vahl, eclog. fasc. 3. p. 14.) branches glabrous, powdery and compressed towards the top; leaves ovate-oblong, attenuated, glabrous, toothed, 3-5-nerved; racemes terminal, compound; pedicels 3-flowered; calyx glabrous, truncate or 5-lobed; lobes rounded; petals 5, wedge-shaped; stamens length of the petals. ♄. S. Native of Montserrat.

Striated Melastoma. Shrub 4 to 6 feet.

B. *Species natives of Guiana.*

25 M. PLEUROCA'RPUM (E. Meyer, in act. bonn. 12. p. 795.) branches terete, a little striated; leaves oblong, acuminated, serrulated, ciliated, truncate at the base, 5-nerved, rather pilose; panicle terminal; flowers glomerate, decandrous; calyx glabrous, 10-ribbed, 5-toothed; anthers with long beaks, bicallous at the base; berry 3-celled, crowned by an entire margin. ♄. S. Native of Surinam. Petals obovate, concave.

Ribbed-fruited Melastoma. Shrub.

26 M. FRA'GILE (Lin. fil. suppl. 236.) leaves ovate, serrated, rather petiolate, 5-nerved, smooth, ciliated, very brittle; lower peduncles trifid; pedicels usually 2-flowered; flowers decandrous, rather secund; berry pea-formed, glabrous. ♄. S. Native of Brazil, Mexico, and Surinam.

Brittle-leaved Melastoma. Shrub.

27 M. BRU'NNEUM (Vahl, eclog. fasc. 3. p. 19.) shrub with terete branches, and tetragonal branchlets; leaves oval, ciliated, scabrous above, but hoary beneath, petiolate, 3-5-nerved; flowers decandrous, aggregate beneath the leaves, rather pedunculate and strigose; calyx oblong, with rufescent stripes, and with 5 ovate obtuse segments; petals roundish, length of the segments of the calyx; stamens length of corolla; style clavate, crowned by an obtuse stigma. ♄. S. Native of Guiana.

Brown-calyxed Melastoma. Shrub.

28 M. GROSSULARIOÌDES (Lin. spec. 558.) leaves roundish-ovate, acuminated, denticulated, 3-nerved, glabrous on both surfaces; flowers decandrous. ♄. S. Native of Surinam.—Pluk. alm. 40. t. 249. f. 4.

Gooseberry-like Melastoma. Shrub.

29 M. ICOSA'NDRUM (Swartz, herb. ex Wikst. fl. guad. in acad. sc. stockh. 1827.) leaves ovate or lanceolate, acuminated, crenulated, 3-nerved, glabrous; branches of panicle 3-parted; flowers icosandrous. ♄. S. Native of Guadaloupe.

Icosandrous Melastoma. Shrub.

30 M. PUNCTULA'TUM (Swartz, herb. ex Wikst. l. c.) leaves opposite, ovate, acuminated, quite entire, 5-nerved, glabrous, full of elevated dots beneath; cymes terminal, contracted, few-flowered; calyx glabrous, 5-crenated. ♄. S. Native of Guadaloupe.

Dotted-leaved Melastoma. Shrub.

31 M. FARINULE'NTUM (Swartz, herb. ex Wikst. l. c.) leaves scattered, ovate, attenuated, quite entire, 3-nerved, beset with adpressed dots beneath, rather mealy; raceme straight, trifidly 3-parted; flowers pedicellate, decandrous. ♄. S. Native of Guadaloupe.

Mealy Melastoma. Shrub.

C. *Species natives of Brazil.*

32 M. RA'DULUM (Hoffmanns. verz. 1826. p. 159.) stem terete, somewhat articulated, bluntly 4-winged; leaves petiolate, ovate, acuminated, 3-nerved, somewhat denticulated, rough above, and beset with decumbent hairs beneath; flowers cymose; calyx ovate, somewhat pentagonal, beset with somewhat imbricate tubercles and adpressed hairs. ♄. S. Native of Brazil. Perhaps a species of *Lasiándra* or *Macaírea*.

Rasp-leaved Melastoma. Shrub.

33 M. BRASILIE'NSE (Spreng. syst. 2. p. 297.) leaves lanceolate, acuminated, quite entire, hoary beneath, as well as the branches and calyxes from stellate down; branches of panicle divaricate. ♄. S. Native of Brazil.

Brazilian Melastoma. Shrub.

34 M. SERRULA'TUM (Spreng. syst. 2. p. 300. but not of Pav.) leaves oblong, acute, serrulately ciliated, clothed with fulvous hairs on both surfaces, and on the branches; panicle terminal, trichotomous, with divaricate branches. ♄. S. Native of Brazil.

Serrulated-leaved Melastoma. Shrub.

35 M. HETERONEU'RUM (Schrank et Mart. mss.) shrubby, glabrous, rufescent, with terete branches; leaves oval-oblong, tapering much into the petiole, acuminated at the apex, triple-nerved or almost quintuple-nerved; flowers almost sessile, crowded, axillary; fruit globose; calycine lobes 5-6, deciduous. ♄. S. Native of Brazil, in the woods of Tapura. The nerves on the lower leaves are nearly marginal, and those on the upper leaves are as in *Micònia spondylántha*, rising far above the base, and somewhat alternate. Petals and stamens unknown. Perhaps a proper genus.

Variable-nerved Melastoma. Shrub.

D. *Species natives of New Grenada.*

36 M. SQUAMULÒSUM (Smith in Rees' cycl. vol. 23.) leaves elliptic, obtuse, 3-nerved, entire, smooth above, but covered with scale-like hairs beneath; flowers panicled, terminal, dense;

calyx turbinate, 10-ribbed, bluntly 5-toothed, scaly; petals roundish, yellow; berry furrowed, villous. ♄. S. Native of New Granada. Perhaps a species of *Dàvya*.

Scaly Melastoma. Shrub.

37 M. LIGU'STRINUM (Smith in Rees' cycl. vol. 23.) stem and branches glabrous; leaves oval, obtuse, entire, 3-nerved, glabrous, petiolate, shining above, yellowish beneath; flowers terminal, panicled, dense; calyx hemispherical, glabrous, striated, broadly and bluntly toothed; petals obtuse, small, white or reddish; anthers obtuse; style obtuse; stigma hollow; berry small, yellow. ♄. S. Native of New Granada. Allied to M. squamulòsa ex Smith.

Privet-like Melastoma. Shrub.

38 M. GRÓSSUM (Lin. fil. suppl. 236.) branches stiffish, terete, hispid; leaves quite entire, 5-nerved, rather cordate, covered with scabrous tomentum; flowers large, terminal; calyx strigose; petals rather pilose on the outside. ♄. S. Native of New Granada.

Large Melastoma. Shrub.

39 M. IBAGUE'NSE (Humb. et Bonpl. mel. 1. p. 105. t. 45.) stems weak, flexuous; leaves lanceolate, awnless, ciliated, 3-nerved, clothed with scurfy down and rufescent hairs beneath, as well as on the branchlets; raceme terminal, loose, few-flowered; flowers decandrous; calyx rather globose, with 5 little teeth; berry small, globose, 3-celled. ♄. S. Native of New Granada, on Mount Quindiu, near Ibague. Genitals unknown. Perhaps a species of *Clidèmia* or *Tschùdya*.

Ibague Melastoma. Shrub 10 feet.

40 M. GLOBIFLÒRUM (Cham. et Schlecht. in Linnæa. 5. p. 564.) clothed with hairy tomentum; branches terete; leaves petiolate, 5-nerved, ovate-elliptic, acuminated, hairy above, but yellowish beneath; racemes terminal; its branches bearing bundles of flowers at their tops; calyx urceolate, 5-toothed; petals 5, emarginate; stamens 10; anthers opening by one pore, without appendages; ovarium glabrous; style thickish; stigma dot-formed; berry 5-celled, many-seeded, crowned by the teeth of the calyx; seeds yellowish, 3-sided, with a blackish hylum. ♄. S. Native of Mexico, in woods about Jalapa. Tomentum on the stem, tops of branches, and under side of the leaves stellate, and on the upper side simple. Berry hairy.

Globe-flowered Melastoma. Shrub 4 to 6 feet?

41 M. SCORPIOÌDES (Cham. et Schlecht. in Linnæa. 5. p. 564.) leaves on short petioles, membranous, obovate, acuminated, glabrous above, but clothed with scurfy down beneath, 5-nerved or triple-nerved; racemes terminal, elongated, constantly composed of twisted cymes; flowers almost sessile, secund, small, decandrous; anthers opening by one pore, shortly auricled at the base; stigma peltately funnel-shaped. ♄. S. Native of Mexico, at Cuesta Grande de Chiconquiaco. Down on the branches and lower surface of leaves rather scurfy, intermixed with a few fine stellate down.

Scorpion-like Melastoma. Shrub.

42 M. CORNOÌDES (Cham. et Schlecht. Linnæa. 5. p. 563.) glabrous; branches terete; leaves petiolate, oval-lanceolate, acuminated, 5-nerved, puberulous, ciliated, membranous; cymes axillary, or nearly terminal, trichotomous, loose, and few-flowered, having the branches filiform, bibracteolate; berries globose, 5-ribbed; ribs running down from the teeth of the calyx. ♄. S. Native of Mexico, near Jalapa in woods. Habit of *Clidèmia agréstis*. Seeds small, yellowish, with a black nearly linear hylum. Stamens 10; anthers not appendiculated, opening by one pore at the apex. Perhaps a species of *Clidèmia*.

Dogwood-like Melastoma. Shrub 2 to 3 ft.?

43 M. FURFURA'CEUM (Vahl, eclog. fasc. 3. p. 13.) leaves oblong, glabrous, smooth, quite entire, petiolate, 3-nerved, acuminated; branches and peduncles clothed with scurfy tomentum; racemes simple; pedicels 3-flowered; flowers almost sessile, decandrous; calyx 5-toothed; teeth minute; petals 5, oblong; style length of the stamens. ♄. S. Native of South America.

Scurfy Melastoma. Shrub.

* * * *The number of stamens and parts of the flower are unknown in the following species.*

44 M. MYRICOÌDES (Desr. in Lam. dict. 4. p. 51.) smoothish; branches tetragonal, knotted at the joints; leaves ovate, smoothish, somewhat acuminated, denticulated, 3-5-nerved, small, almost sessile, rather villous beneath; flowers trichotomously panicled; fruit globose, glabrous, granular. ♄. S. Native of the Antilles.

Myrica-like Melastoma. Shrub.

45 M. THYRSOI'DEUM (Vahl, eclog. fasc. 3. p. 13.) glabrous; leaves oblong-ovate, attenuated at both ends, glandularly denticulated, 3-nerved; racemes terminal, decompound; peduncles tetragonally compressed; flowers small; bracteas linear; calyx globose, truncate. ♄. S. Native of Montserrat.

Thyrse-like-flowered Melastoma. Shrub.

46 M. CU'PREUM (Smith in Rees' cycl. vol. 23.) leaves oval-elliptic, acute, entire, on short petioles, 3-nerved, smoothish above, but clothed with rufous tomentum beneath, as well as the petioles and peduncles; flowers dichotomously panicled, very numerous, and very minute; calyxes glabrous. ♄. S. Native about the Caraccas?

Copper-coloured Melastoma. Shrub.

47 M. ADSCE'NDENS (Swartz, fl. ind. occ. 2. p. 772.) shrub sarmentose, twining, rooting; branches tetragonal, pubescent; leaves ovate, acute, glabrous, 3-nerved, denticulated; raceme ovate, terminal; racemules bearing the flowers on one side; calyx tubular, with its limb membranous and 4-5-sided, and with 4-5 truncate teeth; petals oblong, obtuse; stamens 8-10; anthers opening by 2 pores at the apex, and sheathed at the base; fruit oblong, 5-celled. ♄. ⌒. S. Native of Jamaica, in mountain woods. M. scándens, Swartz, prod. p. 69. but not of Aubl. Perhaps a proper genus allied to *Meriània*.

Ascending Melastoma. Shrub cl.

48 M. NODÒSUM (Desr. in Lam. dict. 4. p. 55.) blackish; branches somewhat tetragonal, knotted; leaves elliptic, serrulately ciliated, 5-nerved, coriaceous; flowers in trichotomous corymbs, bracteate; peduncles hispid; calyx campanulate, angular at the base, crenated, length of the corolla. ♄. S. Native of the Antilles.

Knotted Melastoma. Shrub.

49 M. PARADÓXUM (Mart. herb. ex D. C. prod. 3. p. 202.) shrubby, quite glabrous; branches much compressed between the knots; leaves petiolate, coriaceous, oval, somewhat cordate at the base, 5-nerved, with the margins nerve-formed, pale beneath; panicle terminal; fruit globose. ♄. S. Native of Brazil, on Mount Arara-coara. Seeds 3-sided, smooth. Habit of *Tocòca*, but the bladders on the petioles are wanting. The calyx is 4-sided.

Paradoxical Melastoma. Shrub.

§ 3. *Alternifòliæ. The leaves being alternate in the following species, it is therefore evident that it should be excluded from the order altogether.*

1 RHE'XIA JUSSIÆOÌDES (Lin. fil. suppl. 215.) pubescent; leaves lanceolate, alternate? ribbed, with the margins scabrous from very minute serratures; flowers solitary, axillary, octandrous; calycine segments 4, lanceolate, acute; petals ovate, exceeding the calyx, yellow; genitals inclinate, shorter than the corolla; filaments short; stigma warted; capsule somewhat

tetragonal, 4-celled. ♄. S. Native of Surinam. This plant most probably belongs to some genus of *Onagràriæ*.

Jussiæa-like Rhexia. Shrub.

† *An additional species of Arthrostémma.*

3 Arthroste'mma nítida (Graham in ed. phil. journ. dec. 1831. Hook. bot. mag. 3142.) stems shrubby, erect, and are, as well as the branches, tetragonally winged, beset with coloured hairs; leaves ovate, acute, serrulated, glabrous on both surfaces, shining above, but glandularly hispid on the nerves beneath; peduncles axillary towards the tops of the branches, 3-flowered, longer than the petioles; petals obovate, retuse; anthers dissimilar, with their connectives short and biauriculate. ♄. S. Native of Buenos Ayres. Flowers lilac.

Shining Arthrostemma. Fl. Ju. Jul. Clt. 1829. Sh. 2 to 3 ft.

Order XCIX. ALANGIE'Æ (see genus for derivation). D. C. prod. 3. p. 103. Tube of calyx egg-shaped, rather constricted at the apex; limb campanulate, 5-10-toothed. Petals 5-10, linear, spreadingly reflexed. Stamens much exserted, double or quadruple the number of the petals; filaments free, filiform, very villous at the base. Anthers adnate, linear, 2-celled, bursting inwards by a longitudinal double chink, often barren. Disk fleshy at the base of the limb of the calyx. Drupe oval, somewhat crowned, fleshy, a little ribbed, and somewhat tomentose, containing a valveless 1-celled nut, the bone or stone having a hole at its apex. Seed one (or 3, ex Rheede), inverted, ovate, with fleshy friable albumen. Embryo straight, with a long ascending radicle, and flat foliaceous ovate-cordate cotyledons.—Shewy Indian trees, with the branches often spinescent. Leaves alternate, exstipulate, ovate-lanceolate, acuminated, feather-nerved, quite entire, dotless, similar to those of *Grèwia*. Flowers few, sessile, in axillary fascicles. Fruit eatable.

This order is only composed of one genus, whose place in the natural system is very doubtful. It differs from *Myrtàceæ* in the greater number of petals, in the adnate anthers, in the one-celled fruit, and in the albuminous pendulous seeds. It agrees with *Combretàceæ* in the tube of the calyx being constricted at the apex, in the one-celled fruit, and the pendulous seed; but differs in the greater number of petals, in the adnate anthers, in the albuminous seeds, and in the flat cotyledons. In the form of the anthers, and in the one-celled fruit, it differs from *Melastomàceæ* and *Onagràriæ*. It agrees in some degree with *Haloràgeæ* in the fabric of the seed, but differs from it in habit, in the one-celled fruit, and single style. The properties are said by the Malays to be purgative and hydrogogue, and their roots aromatic.

1. ALA'NGIUM (*Alangi* is the Malabar name of the first species). Lam. dict. 1. p. 174. Vahl. symb. 1. p. 61. Corr. ann. mus. 10. p. 161. D. C. prod. 3. p. 203.—Angòlam, Adans. fam. 2. p. 85.—Angolàmia, Scop.

Lin. syst. *Icosándria, Monogýnia.* Being no other genus the character is the same as that of the order.

1 A. decape'talum (Lam. dict. 1. p. 174.) flowers of 10 petals; branches glabrous, spinescent; leaves oblong-lanceolate. ♄. S. Native of Malabar, on rocky mountains, where it is called *Alangi* or *Angolam* by the natives. Rheed. mal. 4. t. 17. Grèwia salvifòlia, Lin. fil. suppl. 409. ex Vahl, symb. 1. p. 61. Berry or drupe rather tomentose, 2-3-seeded. Stamens 23, ex Vahl. The petals are either 10 or 12, and the stamens are double that number. Flowers white, with a grateful scent, solitary or 2-3-together in the axils of the leaves. The pulp of the fruit has a grateful sweet taste.

Ten-petalled Alangium. Clt. 1779. Tree 30 ft.

2 A. hexape'talum (Lam. l. c.) flowers of 6-7 petals; branches glabrous, hardly spinescent; leaves ovate-lanceolate, acuminated. ♄. S. Native of Malabar, among rocks, where it is called by the natives *Kara-Angolam* and *Namidou*. Stamens 10-12, but 26 according to Rheed. mal. 4. t. 26. but in the specimen examined by De Candolle, the petals were 7, and the stamens 28, therefore the stamens are thrice the number of the petals. Leaves velvety beneath, and on the petioles. Berry or drupe with a purple tomentose coriaceous rind, and red juicy clammy pulp, which has a rather acid taste; the nut one-seeded.

Six-petalled Alangium. Clt. 1823. Tree 30 ft.

3 A. tomentòsum (Lam. dict. l. c.) flowers unknown; branches unarmed, velvety when young, as well as the petioles and nerves of leaves; leaves oblong, bluntly acuminated, reticulated with little veins beneath. ♄. S. Native of the East Indies. Berry or drupe pubescent, with a woody coriaceous livid-purple rind.

Tomentose Alangium. Tree 20 ft.

Cult. The species of *Alángium* thrive well in a mixture of loam and peat, or any light rich soil; and cuttings root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

Order C. PHILADE'LPHEÆ (plants agreeing with *Philadélphus* in important characters). D. Don, in edinb. phil. journ. 1826. April. p. 133. D. C. prod. 3. p. 205.—Myrtàceæ, gen. Juss.

Tube of calyx turbinate, adhering to the ovarium; limb 4-10-parted. Petals (f. 114. *d.*) alternating with the lobes of the calyx, and therefore equal to them in number, convolutely imbricate in æstivation. Stamens 20-40, inserted into the throat of the calyx in 1 or 2 series. Styles sometimes nearly distinct and at others more or less joined together in one; stigmas many. Capsule half adhering to the calyx, 4 (f. 114. *b.*) -10-celled, many-seeded. Seeds scobiform, subulate, smooth, heaped together at the angles of the cells on the angular placenta, covered by loose, membranous aril. Albumen fleshy. Embryo inverted, almost the length of the albumen (f. 114. *e.*), with oval, obtuse, flattish cotyledons, and a nearly terete radicle, which is longer than the cotyledons.—This order consists of hardy ornamental shrubs. Leaves opposite, dotless, nerved, toothed, or nearly entire, exstipulate. Peduncles opposite, axillary, or terminal, trichotomously cymose, or somewhat panicled. Flowers white, in most cases fragrant. *Philadélpheæ* is more closely allied to *Saxifrágeæ* than to *Myrtàceæ;* from the former, however, it differs widely in habit, but in the fructification differing chiefly in the numerous cells of the fruit, and in the indefinite stamens. From *Myrtàceæ* it differs in the arillate albuminous seeds, in the styles being more or less distinct, and in the toothed, dotless leaves. De Candolle points out an approach to *Hydrángeæ*, and that it is a link connecting it with *Vibúrnum*, agreeing almost equally with *Philadélpheæ* and *Vibúrneæ* in habit and fructification.

Synopsis of the genera.

1 **Philade′lphus.** Limb of calyx 4-5-parted. Petals 4 (f. 114. *d.*) -5. Stamens 20-40. Styles 4-5, joined or distinct. Capsule 4 (f. 114. *b.*), -5-celled.

2 **Decuma′ria.** Limb of calyx 7-10-toothed. Petals 7-10. Stamens thrice the number of the petals. Style 1, crowned by 7-10 stigmas. Capsule 7-10-celled.

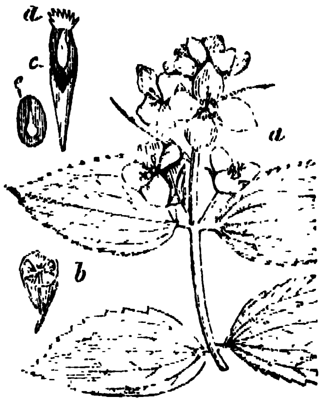
3 **Deu′tzia.** Limb of calyx 5-6-cleft. Petals 5-6. Stamens 10-12; filaments tricuspidate. Styles 3-4. Capsule 3-4-celled.

I. PHILADE′LPHUS (the φιλαδελφος of Aristotle is a tree not now known; it is said to be from Ptolemy Philadelphus, King of Egypt). Lin. gen. no. 614. Gærtn. fruct. 1. p. 173. t. 35. D. C. prod. 3. p. 205. Syringa, Tourn. inst. t. 389. but not of Lin.

Lin. syst. *Icosándria, Tetra-Pentagýnia.* Tube of calyx obovate-turbinate; limb 4-5-parted. Petals 4 (f. 114. *d.*) -5. Stamens 20-40, free, shorter than the petals. Styles 4-5, sometimes connected, and sometimes more or less distinct. Stigmas 4-5, oblong or linear, usually distinct, rarely joined. Capsule 4 (f. 114. *b.*) -5-celled, many-seeded. Seeds scobiform, inclosed in a membranous arillus (f. 114. *c.*), which is fringed at one end (f. 114. *d.*).—Shrubs, with pedicellate, white, usually sweet-scented flowers, disposed in corymbose cymes, or somewhat panicled, rarely axillary and bracteate.

§ 1. *Stems stiff, straight. Flowers in racemes.*

FIG. 114.



1 P. coronа′rius (Lin. spec. 671.) leaves ovate, acuminated, serrately denticulated, triple-nerved, smoothish, but hairy at the veins beneath: flowers racemose; lobes of calyx acuminated; styles almost distinct from the base, not exceeding the stamens. ♄. H. Native of the south of Europe. Curt. bot. mag. 391. The leaves have the taste of cucumbers. The flowers are white, and have a strong scent, which, at a distance, resembles that of orange flowers, but near it is too powerful for most persons. The primary flowers are 5-cleft, but the rest are 4-cleft.

Var. a, vulgàris (D. C. prod. 3. p. 205.) shrub strong; leaves oval-oblong, large, rather distant. ♄. H. Schkuhr. handb. t. 121. Lam. ill. t. 420.

Var. β, nànus (Mill. dict. no. 2.) shrub 1-2 feet high; leaves and branchlets crowded; flower-bearing branches incurved. ♄. H. Native country unknown. This variety is sometimes to be found in gardens with double flowers.

Var. γ, flòre-plènus; flowers double.

Var. δ, variegàtus; leaves edged with white or yellow.

Garland or Common Syringa or Mock-orange. Fl. May, June. Clt. 1596. Shrub 2 to 10 feet.

2 P. **Zeyhe′ri** (Schrad. diss. with a figure, ex D. C. prod. 3. p. 205.) leaves ovate, acuminated, serrately denticulated, rounded at the base, triple-nerved, hairy at the veins beneath; flowers somewhat racemose; lobes of calyx long-acuminated; style profoundly 4-cleft. ♄. H. Native of North America. This species is of more humble habit than *P. coronàrius*, and differs chiefly from it in the leaves being rounded at the base, and in the flowers being fewer, larger, and scentless.

Zeyher's Syringa or Mock-orange. Fl. May, June. Clt.? Shrub 3 to 4 feet.

3 P. floribu′ndus (Schrad. diss. with a figure, ex D. C. l. c.) leaves ovate-oval, long-acuminated, serrate-toothed, triple-nerved, clothed with hairy pubescence beneath; flowers somewhat racemose; lobes of calyx ending in a long acumen each; style 4-cleft at the apex. ♄. H. Native of North America. Flowers white, 5-7, showy, sweet-scented.

Bundle-flowered Syringa or Mock-orange. Fl. May, June. Clt.? Shrub 4 to 8 feet.

4 P verrucòsus (Schrad. diss. with a figure, ex D. C. l. c.) leaves elliptic-ovate, acuminated, denticulated, clothed with hairy pubescence beneath; flowers racemose; lobes of calyx acuminated; style 4-cleft at the apex. ♄. H. Native of North America. Philadélphus grandiflòrus, Lindl. bot. reg. 570. Pursh. fl. sept. amer. but not of Willd. The leaves on the ribs and primary veins beneath, as well as the peduncles, pedicels, and calyxes, are beset with hair-bearing warts. Flowers large, white, scentless.

Warted Syringa or Mock-orange. Fl. May, June. Clt.? Shrub 4 to 6 feet.

5 P. latifòlius (Schrad. diss. ex D. C. prod. 3. p. 506.) leaves broad-ovate, acuminated, toothed, somewhat quintuple-nerved, clothed with hairy pubescence beneath; flowers racemose; lobes of calyx acuminated; style 4-cleft at the very apex. ♄. H. Native of North America. P. latifòlius, Hortul. P. pubéscens, Cels. hort. Lois. herb. amat. t. 208. This species is known by its white bark, and by the leaves being broad ovate, beset with hairs, which are naked at the base, not with warts, as well as the young branches.

Broad-leaved Syringa or Mock-orange. Fl. May, June. Clt.? Shrub 4 to 6 feet.

6 P. tomentòsus (Wall. cat. 3653.) leaves ovate, acuminated, denticulated, tomentose beneath; raceme terminal; pedicels opposite; lobes of calyx ovate, acute. ♄. H. Native of Nipaul and Kamaon. P. Nipaulénsis, Loud. hort. brit. p. 196.

Tomentose Syringa or Mock-orange. Clt. 1822. Shrub 3 to 6 feet.

§ 2. *Stems more slender, twiggy, loose. Flowers solitary or 3 together.*

7 P. grandiflòrus (Willd. enum. 1. p. 511.) leaves ovate, long-acuminated, denticulated, triple-nerved, hairy at the veins beneath, and with fascicles of pili in the axils of the veins; flowers solitary, or by threes; lobes of calyx long-acuminated; styles joined in one, longer than the stamens, crowned by 4 linear stigmas. ♄. H. Native of North America. Guimp. abb. holz. t. 14. Schrad. diss. with a figure. P. inodòrus, Hortul. Branches covered with a castaneous blood-coloured epidermis. Flowers large, scentless.

Great-flowered Syringa or Mock-orange. Fl. June, July. Clt. 1811. Shrub 6 to 8 feet.

8 P. speciòsus (Schrad. diss. with a figure, ex D. C. l. c.) leaves ovate, rarely oval-ovate, long-acuminated, sharply serrate-toothed, clothed with hairy pubescence beneath; flowers solitary, or by threes; lobes of calyx with very long acumens; style deeply 4-cleft, exceeding the stamens. ♄. H. Native of North America. P. grandiflòrus of German gardeners. P. grandiflòrus β, láxus of other gardeners. Tube of calyx nearly terete. Capsule 8-valved, ex Schrad., but more likely 4-valved, with the valves becoming 2-parted at maturity. Flowers large, white, scentless?

Showy Syringa or Mock-orange. Fl. June. Clt.? Shrub 10 to 14 feet.

9 P. la′xus (Schrad. diss. with a figure, ex D. C. l. c.) leaves oval-ovate, long-acuminated, toothed, clothed with hairy pu-

bescence beneath; flowers solitary and by threes; lobes of calyx ending each in a very long acumen; style 4-cleft; stigmas about equal in length to the stamens. ♄. H. Native of North America. P. láxus and P. hùmilis, Hortul. Humbler than the preceding plant.

Loose Syringa or Mock-orange. Fl. Ju. Clt.? Sh. 4 to 6 ft.

10 P. hirsu'tus (Nutt. gen. amer. 1. p. 301.) leaves oblong-ovate, acute, toothed, 5-nerved, hairy on both surfaces, white beneath; flowers solitary and by threes; styles joined to the apex; stigmas undivided. ♄. H. Native of North America, in Tennessee, at French River; frequent among rocks. Flowers white, scentless?

Var. β, gràcilis (Schrad. l. c.) branches more slender; leaves 3-nerved. ♄. H. Native of North America. P. gràcilis, Hortul. Lodd. cat. ex Loud. hort. brit. p. 196.

Hairy Syringa or Mock Orange. Shrub 2 to 3 ft.

11 P. Lewísii (Pursh, fl. amer. sept. 1. p. 329.) leaves ovate, acute, almost entire, with ciliated margins; style length of the stamens, trifid at the apex. ♄. H. Native of North America, at Clark's river, in watery places. Flowers smaller than those of the following species.

Lewis's Syringa or Mock-orange. Fl. June. Clt.? Shrub 6 to 8 ft.

12 P. inodórus (Lin. spec. p. 671.) leaves broad-ovate, acuminated, quite entire, triple-nerved, or nearly feather-nerved; flowers solitary, and by threes; style cleft at the apex into 4 oblong stigmas. ♄. S. Native of South Carolina, very rare, on the banks of rivers.—Pursh, fl. amer. sept. 1. p. 329. Sims, bot. mag. t. 1478. Syrínga inodòra, Mœnch.—Catesb. car. 2. t. 84. Flowers white, scentless, large.

Scentless Syringa or Mock-orange. F[illegible]ne. Clt. 1738. Shrub 4 to 6 ft.

Cult. All the species of *Philadélphus* or *Syringa* are very desirable plants for shrubberies, the flowers being showy, and of many of the species sweet-scented. They grow in any common soil; and are readily increased by laying down the branches.

II. DECUMA'RIA (from δεκυμα, *decuma*, a tenth; in reference to the tenfold structure of some of the flowers). Lin. gen. no. 597. Lam. ill. t. 403. D. C. prod. 3. p. 206.—Forsỳthia, Walt. but not of Vahl.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx campanulate; limb 7-10-toothed. Petals oblong, equal in number to the teeth of the calyx, and alternating with them. Stamens thrice the number of the petals, disposed in one series, 2 in front of each petal, and one between each. Style one, very thick, expanded at the apex into a disk, bearing 7-10 radiating stigmas. Capsule ovoid, connate with the calyx to above the middle, which is 7-10-nerved, and toothless, crowned by the style and stigmas, valveless, 7-10-celled, opening irregularly near the prominent nerves of the calyx. Seeds numerous, oblong, inclosed in a membranous aril, fixed obliquely by their centre.—Sarmentose shrubs. Leaves opposite, glabrous, entire or toothed at the apex, dotless. Flowers white, sweet-scented, disposed in terminal corymbs, sometimes they are to be found dioecious in gardens. Leaf-buds beset with short rufous pili.

1 D. ba'rbara (Lin. spec. 1668.) leaves ovate-oblong, acute at both ends. ♄. H. Native of Lower Carolina, in shady places. D. radicans, Mœnch. meth. p. 17. D. Forsỳthia, Michx. fl. bor. amer. 1. p. 282. Flowers like those of the lime tree, very sweet-scented.

Var. β, sarmentòsa (Bosc, act. soc. hist. nat. par. 1. p. 76. t. 13.) lower leaves roundish, upper ones ovate-lanceolate. ♄. H. Native of Virginia and Carolina, in humid shady places. Forsỳthia scándens, Walt. car. p. 154. D. prostràta, Lodd. cat. ex Loud. hort. brit. 188.

Barbarous or Climbing Decumaria. Fl. July, Aug. Clt. 1785. Shrub sarmentose or cl.

Cult. *Decumària* is a very proper shrub for training against a wall or on trellis work, to form bowers, for which it is well adapted from its sweet-scented flowers. It thrives well in any common soil, and is easily increased by laying down the branches or by cuttings.

III. DEU'TZIA (in honour of John Deutz, a Dutch naturalist). Thunb. nov. gen. 19. jap. p. 10. Juss. gen. 431.

Lin. syst. *Decándria, Trigýnia.* Tube of calyx campanulate, tomentose; limb 5-6-cleft. Petals 5-6, oblong. Stamens 10; filaments tricuspidate. Styles 3-4, longer than the corolla; stigmas simple, club-shaped. Capsule globular, truncate, perforated, somewhat 3-cornered, scabrous, awned from the permanent bases of the styles, 3-4-valved, 3-4-celled, small, opening at the base. Seeds several in each cell.—Much branched shrubs, with the branches purplish and villous. Leaves opposite, petiolate, ovate, acuminated, serrated, wrinkled, and veined, scabrous from stellate fascicles of down. Flowers in compound panicles. Peduncles and pedicels tomentose and scabrous.

1 D. sca'bra (Lin. syst. p. 425. Thunb. jap. 185. t. 24.) leaves ovate, acuminated, serrated, scabrous from stellate down; flowers in compound panicles; peduncles and pedicels scabrous; calycine lobes short and bluntish. ♄. H. Native of Japan, where the leaves are used by joiners in smoothing and polishing.

Scabrous Deutzia. Fl. May, June. Shrub 4 to 6 ft.

2 D. stami'nea (R. Br. mss. ex Wall. pl. rar. asiat. 2. p. 82. t. 191.) young branches clothed with stellate tomentum, old ones glabrous; leaves quite entire, scabrous, lanceolate, acuminated, cuspidately serrated, white from tomentum beneath; cymes trichotomous; peduncles 3-flowered; pedicels and calyxes beset with stellate tomentum outside. ♄. H. Native of Nipaul, on the high mountains near the Great Valley. Philadélphus or Leptospérmum stamíneum, Wall. Flowers white, sweet-scented. Styles 4-5, length of the stamens; teeth of filaments shorter than the anthers; teeth of calyx lanceolate, acute.

Long-stamened Deutzia. Shrub 3 to 4 ft.

3 D. corymbòsa (R. Br. in Wall. cat. 3652.) glabrous; leaves ovate, acuminated, cuspidately serrated; panicles corymbose, trichotomous; panicle and outside of calyx dotted; teeth of calyx short and rounded; teeth of filaments shorter than the anthers. ♄. H. Native of Kamaon. Philadélphus corymbòsus, Wall. Flowers white.

Corymbose-flowered Deutzia. Shrub 3 to 4 ft.

4 D. Brunonia'na (Wall. cat. 3650.) leaves ovate, acuminated, cuspidately serrated, clothed with hoary tomentum beneath, as well as the peduncles and calyxes; peduncles axillary; lobes of calyx subulate; petals narrow; cusps of filaments longer than the anthers. ♄. H. Native of Kamaon. Leptospérmum scàbrum, Wall. Flowers white. Fruit small.

Brown's Deutzia. Shrub 4 to 5 ft.

Cult. Any common soil will suit these shrubs, and they may easily be increased by laying down the branches or by cuttings.

Order CI. MYRTA'CEÆ (plants agreeing with *Mýrtus* in important characters). R. Brown, gen. rem. p. 14. D. C. dict. class vii. and not. 1826. prod. 3. p. 207.—Mýrti, Juss. gen. p. 323.—Mýrteæ, Juss. dict. sc. nat. 34. p. 79.—Myrtíneæ, D. C. theor.—Myrtoìdea, Vent. tabl. Batsch. p. 13.—Myrteàceæ, Nees, nov. act. bonn. 11. p. 113.—Hesperídeæ, Lin. ord. nat. 19. but not of Vent.

Calyx superior, 4-5-cleft (f. 115. *a.* f. 117. *b.*), rarely 6-cleft, sometimes falling off like the cap, in consequence of the cohesion at the apex; tube adnate to the ovarium (f. 115. *a.* f. 123. *a.*). Petals equal in number to the lobes of the calyx, inserted in the calyx, rarely wanting; but when present with a quincunical æstivation (f. 122. *b.*). Stamens inserted along with the petals (f. 115. *e.* f. 123. *b.*), and are either twice their number or indefinite (f. 119. *e.* f. 123. *b.*), usually disposed in many series; filaments distinct (f. 123. *b.*), or connected into several parcels (f. 117. *e. e.*); curved inwards before flowering; anthers ovate, 2-celled, small, bursting lengthwise (f. 120. *c.*). Ovarium inferior, 2-4-5 or 6-celled; style simple (f. 119. *c.*). Stigma simple. Fruit either dry (f. 119. *d.*) or fleshy (f. 121. *e.*), dehiscent or indehiscent. Seeds usually indefinite, variable in form. Embryo exalbuminous, straight or curved, with its cotyledons and radicle distinguishable, or conferruminated into a solid mass.—Trees or shrubs. Leaves usually opposite (rarely alternate, as in *Barringtònia*,), entire, full of transparent dots, feather-nerved, the nerves usually running into each other towards the margin, and forming a vein running parallel with the margin. Inflorescence variable, sometimes on 1-flowered axillary pedicels, sometimes on axillary 3-flowered trichotomous cymose peduncles, or the peduncles are furnished with many opposite flowers, and terminated by one flower; sometimes the flowers are sessile and spicate; always with 2 opposite bracteas under each flower. Flowers white, red, occasionally yellow, but never blue.

Myrtàceæ is one of the most natural among the tribes of plants, and the most easily recognised. Its opposite exstipulate clothed entire leaves, with a marginal vein, are a certain indication of it, with the exception of a few plants, which probably do not belong to the order, although at present placed in it. It is closely allied to *Rosàceæ*, *Lythrarièæ*, *Onagràriæ*, *Combretàceæ*, and *Melastomàceæ*, but cannot well be confounded with them or any other tribe. It is distinguished from *Lythrarièæ* in the calyx being adnate to the ovarium, from *Combretàceæ* in the many-celled ovarium, in the erect or horizontal seeds, not pendulous, and in the cotyledons not being convolute; from *Melastomàceæ* in the filaments not being bent abruptly, nor received in vacuities below the recesses of the calyx, as in that order, and in the form of the stamens; from *Onagràriæ* in the stamens being usually indefinite. The order offers a curious instance of the facility with which the calyx and corolla can take upon themselves the same functions of transformation. In *Eucalýptus*, as is well known, the sepals are consolidated into a cup-like lid, called the operculum. In *Eudésmia*, a nearly related genus, the calyx remains in its normal state, while the petals are consolidated into the operculum. The pellucid dottings of the leaves, and other parts, indicate the presence of a fragrant aromatic or pungent volatile oil, which gives the principal quality to the products of the order. To this are to be attributed the grateful perfume of the *Guàva* fruit, the powerful scent of the flower-buds of *Caryophýllus aromáticus*, called in England cloves, and the balsamic odour of the eastern fruits called the *Jamsorade* and the *Rose-apple*. The fruit of various *Eugenias* are found by travellers in the forests of Brazil to bear very agreeable fruit. A fruit of Brazil, called *Japoticabieras*, brought from the forests to the towns of St. Paul and Tejuco, belongs to this order; it is said to be delicious. (St. Hil. pl. usual. p. 29.) The young flower-buds of *Calyptránthes aromática* have the flavour and quality of cloves, for which they might be advantageously substituted, according to M. Auguste St. Hilaire, pl. usual. no. 14. The volatile oil of cajeputi, or cajeput oil, is distilled from the leaves of *Melaleùca leucodéndron* and *M. cajepùti*, and is well known as a powerful sudorific; and is a useful external application in chronic rheumatism. (Ainslie, 1. p. 260.). It is considered carminative, cephalic, and emmenagogue, and is no doubt a highly diffusible stimulant, antispasmodic and diaphoretic, and on that account is used in the cure of cholera. It has also the power of dissolving caoutchouc. (Ibid.) The root of *Stravàdium racemòsum* has a slightly bitter, but not unpleasant taste. It is considered by the Hindoo doctors valuable on account of its aperient, deobstruent, and cooling properties; the bark is supposed to possess properties similar to *Cinchòna*. (Ibid. 2. p. 65.). A kind of gum is yielded by *Eucalýptus resinífera*, which is occasionally sold in the medicine bazaars of India. (Ibid. 1. p. 185.) Other species of *Eucalýptus* yield a large quantity of tannin, which has been even extracted from the trees of New Holland, and sent to the English market. The leaves of *Glaphýria nítida*, called by the Malays the *tree of long life*, probably from the other trees of the forest having ceased to exist, afford at Bencoolen a substitute for tea, and it is known by the natives by the name of *tea plant*. (Lin. trans. 14. p. 129.).

[illegible]nopsis of the genera.

TRIBE I.

CHAMÆLAUCIEÆ. *Lobes of calyx* 5 (f. 115. *b.*). *Petals* 5. *Stamens disposed in one series, fertile and sterile mixed* (f. 115. *e. e.*). *Fruit dry,* 1-*celled. Ovula numerous, erect from the base, fixed to the centre or to the somewhat exserted central placenta.*—*Heath-like shrubs, all natives of New Holland. Leaves opposite, dotted. Flowers small, on short pedicels. Bracteas* 2 *under each flower, free or joined.*

1 CA'LYTHRIX. Calyx drawn out into a cylindrical tube (f. 115. *a.*); lobes ending in a long bristle each (f. 115. *g.*). Stamens 10-30, free. Fruit dry, indehiscent, 1-celled.

2 DARWI'NIA. Tube of calyx drawn out into a membranous deciduous limb, with its throat dilated. Lobes roundish, cordate. Stamens 10-15, free. Ovarium 1-celled, 1-ovulate.

3 VERTICO'RDIA. Flowers before expansion girded by 2 free or concrete bracteas; lobes of calyx palmately parted into 5-7-lobules. Stamens 20, of which 10 are sterile and ligulate. Stigma feathered. Fruit 1-seeded, 1-celled when mature.

4 CHAMÆLAU'CIUM. Flowers girded by 2 concrete bracteas, which terminate each in a dorsal mucrone; lobes of calyx undivided, petaloid. Stamens 20, 10 of which are sterile and ligulate. Stigma capitate. Ovarium 1-celled, 5-6-ovulate.

5 GENETY'LLIS. Flowers girded by 2 distinct bracteas; lobes of calyx short, obtuse, entire. Stamens 20, many of which are sterile, all filiform. Stigma bearded. Ovarium 1-celled, 5-6-ovulate.

6 PILEA'NTHUS. Flowers inclosed in a 1-leaved calyptriform involucrum before expansion; limb of calyx 10-parted; lobes rounded. Stamens 20, all fertile, some simple, others bifurcate. Ovarium 1-celled, 5-7-ovulate. Stigma obtuse.

TRIBE II.

LEPTOSPE'RMEÆ. *Calyx 4-6-lobed* (f. 116. *b.* f. 117. *b.*). *Petals* 4 (f. 116. *b.*) -6. *Stamens free* (f. 119. *e.*) *or polyadelphous* (f. 117. *e.*). *Fruit dry, many-celled. Seeds exarillate and exalbuminous.—Shrubs or trees, natives of New Holland. Leaves opposite or alternate, usually full of pellucid dots. Inflorescence variable; sometimes cymose and centrifugal, with pedicellate flowers* (f. 118.); *sometimes spicate and centripetal, with sessile flowers* (f. 116. f. 117.).

SUBTRIBE I. **MELALEU'CEÆ.** *Stamens polyadelphous* (f. 116. *c.* f. 117. *e.*).

7 **ASTA'RTEA.** Limb of calyx 5-parted; lobes orbicular. Bundles of stamens alternating with the petals. Stigma capitate. Capsule 3-celled, 3-valved, many-seeded, half adhering to the calyx. Flowers pedicellate.

8 **TRISTA'NIA.** Calyx 5-cleft. Bundles of stamens opposite the petals. Capsule 3-celled, many-seeded. Flowers pedicellate.

9 **BEAUFÓRTIA.** Limb of calyx 5-parted; lobes acute. Bundles of stamens opposite the petals. Capsule adhering to the tube of the calyx, 3-celled; cells 1-seeded. Flowers sessile.

10 **CALOTHA'MNUS.** Calyx 4-5-toothed (f. 116. *b.*). Bundles of stamens opposite the petals (f. 116. *c.*). Capsule covered by the calyx, 3-celled, many-seeded. Flowers sessile.

11 **MELALEU'CA.** Limb of calyx 5-pa[illegible] (f. 117. *b.*). Bundles of stamens elongated, opposite the petals (f. 117. *c.*). Capsule covered by the calyx (f. 117. *a.*), and adnate to the base of the branches, 3-celled, many-seeded. Flowers sessile.

12 **LAMA'RCHEA.** Limb of calyx 5-parted. Petals campanulately conniving. Stamens monadelphous at the base, but dividing into 5 polyandrous parts at the apex. Capsule covered by the chartaceous calyx, 3-celled, opening by 3 valves at the apex, globose, woody, many-seeded. Flowers axillary, solitary, sessile.

13 **EUDE'SMIA.** Limb of calyx 4-toothed. Petals joined into a deciduous operculum. Bundles of stamens 4, alternating with the teeth of the calyx. Capsule 4-celled, 4-valved. Flowers pedunculate.

SUBTRIBE II. **EULEPTOSPE'RMEÆ.** *Stamens free.* (f. 119. *c.*)

14 **EUCALY'PTUS.** Limb of calyx lid-formed, falling off in one piece (f. 118. *b.*). Petals none. Stamens numerous. Capsule 4-celled (f. 118. *c.*), or from abortion only 3-celled, many-seeded.

15 **ANGÓPHORA.** Limb of calyx 5-toothed. Stamens numerous. Capsule covered by the calyx, 3-celled, 3-valved; cells 1 or few-seeded. Flowers corymbose.

16 **CALLISTE'MON.** Limb of calyx 5-parted; lobes obtuse. Stamens numerous (f. 119. *e.*). Capsule 3-celled (f. 119. *b.*), many-seeded, incrusted by the calyx. Flowers sessile.

17 **METROSIDE'ROS.** Limb of calyx 5-6-cleft (f. 120. *a.*). Stamens 20-30, very long. Capsule 2-3-celled; cells many-seeded. Flowers pedicellate.

18 **LEPTOSPE'RMUM.** Limb of calyx 5-cleft; lobes triangular. Stamens 20-30, shorter than the petals. Capsule 4-5-celled. Flowers solitary, pedicellate.

19 **BILLÓTIA.** Limb of calyx 5-cleft; lobes triangular. Stamens 20-30, shorter than the petals. Berry 3-celled. Flowers sessile, in globose heads.

20 **FABRI'CIA.** Limb of calyx 5-cleft; lobes valvate. Stamens numerous. Capsule many-celled, adnate to the calyx; cells opening at the apex. Seeds winged. Flowers on short pedicels.

21 **BÆ'CKEA.** Limb of calyx 4-cleft. Stamens 5-10, shorter than the petals. Capsule 2-5-celled, many-seeded, inclosed in the calyx. Flowers pedicellate.

TRIBE III.

MY'RTEÆ. *Calyx 4-5-parted* (f. 121. *b.* f. 122. *d. a.*). *Petals* 4-5. *Stamens free* (f. 123. *b.*). *Fruit fleshy, baccate, many-celled* (f. 121. *c.*).—*Trees or shrubs. Leaves opposite, full of pellucid dots, or opaque, quite entire. Peduncles axillary, sometimes 1-flowered, sometimes in trichotomous cymes, and sometimes branched and approximating into a terminal panicle.*

22 **SONNERA'TIA.** Calyx adhering to the ovarium at the base, 4-6-cleft. Stamens numerous. Berry adnate to the calyx at the base, the rest girded by it, 10-15-celled. Seeds curved, imbedded in fleshy pulp. Flowers large, terminal, solitary. Leaves dotless.

23 **NE'LITRIS.** Calyx 4-5-toothed. Stamens numerous. Ovarium 4-10-celled. Berry crowned by the calyx, few or many-seeded. Flowers pedicellate. Leaves dotless.

24 **CAMPOMANE'SIA.** Limb of calyx 5-parted; lobes ovate. Stamens numerous. Berry many-seeded, globose, pulpy, 7-10-celled. Seeds rather reniform. Peduncles 1 or many-flowered. Leaves dotted.

25 **PSI'DIUM.** Tube of calyx rather contracted at the apex, limb at first undivided, but at length cleft into 1-5 parts (f. 121. *b.*). Stamens numerous. Ovarium 5-20-celled. Berry many-seeded (f. 121. *c.*), crowned by the lobes of the calyx. Seeds imbedded in pulp. Leaves dotless.

26 **JOSSI'NIA.** Limb 4-parted even to the base; lobes open in æstivation. Stamens numerous. Fruit fleshy, crowned by the calycine lobes, many-seeded. Peduncles 1-flowered.

27 **MY'RTUS.** Limb of calyx 5-parted, rarely 4-parted. Stamens numerous. Berry 2-3-celled, crowned by the limb of the calyx. Seeds incurved, many in each cell, rarely solitary. Pedicels 1-flowered. Leaves dotted.

28 **MY'RCIA.** Limb of calyx 5-parted (f. 122. *a. d.*). Stamens numerous. Ovarium 2-3-celled; cells many-ovulate. Berry when mature usually 1-2-celled, and 1-3-seeded. Seeds nearly globose. Peduncles axillary and terminal, many-flowered. Leaves dotted.

29 **CALYPTRA'NTHES.** Limb of calyx falling off in one piece. Petals wanting, or 2-3 very small. Stamens numerous. Ovarium 2-3-celled; cells 2-seeded. Berry 1-celled, 1-4-seeded. Peduncles axillary, many-flowered.

30 **SYZY'GIUM.** Limb of calyx almost entire, or repandly lobed. Petals 4-5, concrete, falling off in the shape of a calyptra. Stamens numerous. Ovarium 2-celled; cells few-ovulate. Berry 1-celled, 1 or few-seeded. Seeds globose. Peduncles axillary and terminal, in cymose corymbs.

31 **CARYOPHY'LLUS.** Limb of calyx 4-parted (f. 123. *d.*).

Petals 4, cohering at the apex, as in *Syzygium*. Stamens free (f. 123. *b*.), disposed in 4 bundles, inserted near the teeth of the calyx. Ovarium 2-celled (f. 123. *a*.); cells many-ovulate. Berry 1-2-celled, 1-2-seeded from abortion. Cymes terminal, or in the forks of the branches. Leaves dotted.

32 Acme'na. Limb of calyx truncate, when young involute. Petals 5, small, distant. Stamens numerous. Berry 1-seeded. Cymes 3-flowered, disposed in a terminal panicled thyrse.

33 Euge'nia. Limb of calyx 4-parted even to the ovarium. Stamens numerous. Ovarium 2-3-celled; cells many-ovulate. Berry nearly globose, crowned by the calyx; when mature 1, rarely 2-celled, 1-2-seeded. Seeds large, roundish.

34 Jambòsa. Tube of calyx drawn out beyond the ovarium (f. 124. *a*.); limb 4-parted. Stamens very numerous (f. 124. *c*.). Ovarium many-celled and many-ovulate. Fruit 1-2-seeded, umbilicate at the apex. Seeds angular. Leaves dotted. Cymes lateral and terminal.

Tribe IV.

Barringtonie'æ. *Calyx 4-6-toothed. Petals 4-6. Stamens numerous, disposed in many series; filaments monadelphous a short way at the base. Fruit baccate or dry, many-celled. Cotyledons large, fleshy.—Trees, with dotless, alternate, or nearly opposite leaves, or crowded in whorls, quite entire or serrated. Flowers in racemes or panicles.*

35 Barringtònia. Limb of calyx 2-3-parted. Petals 4. Stamens numerous, long. Ovarium 4-celled; cells 2-ovulate. Berry large, crowned by the limb of the calyx, 1-celled at maturity, and 1-seeded. Trees, with dotless leaves.

36 Strava'dium. Limb of calyx 4-parted. Ovarium semi-bilocular; cells 2-ovulate. The rest as in *Barringtònia*.

37 Gusta'via. Limb of calyx entire, or 4-6-8-lobed (f. 126. *b*.). Petals 4-6-8. Stamens numerous. Ovarium 4-6-celled; cells many-ovulate. Capsule 3-6-celled; cells few-seeded.—Trees, with dotless leaves.

† *Genera belonging to Myrtàceæ, and probably for the most part to tribe Myrteæ, from the fruit being baccate; but from the seeds being unknown it is doubtful what place they should occupy in the order.*

38 Cati'nga. Limb of calyx 4-toothed. Petals? Stamens numerous. Berry crowned by the limb of the calyx, 1 celled, 1-seeded. Leaves dotted.

39 Petalotòma. Limb of calyx 8-cleft; the segments acute. Petals 6-8, unguiculate, with the limbs cut. Stamens 16, inserted in the fleshy crenated disk. Stigma 4-5-cleft. Berry round, crowned by the limb of the calyx, 1-seeded.

40 Fœtídia. Limb of calyx 4-parted; lobes valvate in æstivation. Petals wanting. Stamens numerous, in many series, free. Stigma 4-cleft. Berry dry, indehiscent, bluntly tetragonal, 4-celled; cells 1-2-seeded. Leaves alternate, dotless.

41 Coupou'i. Limb of calyx 5-lobed. Petals, stamens, and style unknown. Berry ovate, 1-celled, 1-seeded, crowned by the calyx. Seed large. Leaves alternate.

42 Care'ya. Limb of calyx 4-parted. Petals 4 (f. 127. *b*.). Stamens numerous (f. 127. *g*.), free, outer ones sterile. Stigma capitate (f. 127. *c*.), obscurely 4-toothed. Berry globose (f. 127. *d*.), crowned by the lobes of the calyx; when young 4-celled (f. 127. *e*.), pulpy, and many-seeded. Seeds compressed. Leaves alternate, dotless.

43 Glaphy'ria. Limb of calyx 5-lobed. Petals 5. Berry 5-celled, many-seeded. Seeds fixed by 2 series in each of the cells. Leaves alternate, minute, stipulate.

44 Crossóstylis. Calyx 4-angled, adnate to the ovarium at the base, permanent, 4-cleft beyond the middle. Petals 4, unguiculate. Stamens about 20; filaments connate into a ring at the base, intermixed with sterile threads. Stigma 4-lobed; lobes trifid at the apex. Berry striated, 1-celled, many-seeded.

45 Grìas. Tube of calyx adhering to the ovarium; limb 4-cleft. Petals 4. Stamens numerous, inserted in a square disk; filaments joined in 5 series, inner ones very short. Style none. Stigma cruciate. Drupe 8-furrowed, crowned by the calyx, containing an oblong nut. Leaves very long. Flowers large.

Tribe I.

CHAMÆLAUCIEÆ (plants agreeing with the genus *Chamælaùcium* in important characters). D. C. dict. class. vol. 11. and not. 1826. prod. 3. p. 208. Lobes of calyx 5 (f. 115. *g*.). Petals 5 (f. 115. *h*.). Stamens disposed in one series, free (f. 115. *e*.), or somew[illegible]polyadelphous, with some sterile ones mixed among the fertile. Fruit dry, 1-celled. Ovula numerous, erect from the base, fixed to the centre, or to the somewhat exserted central placenta.—Heath-like shrubs, all natives of New Holland. Leaves opposite, full of dots. Flowers small, on short pedicels. Bracteoles 2 under each flower; they are either free or joined together at the base, sometimes in the form of an operculum.

I. CA'LYTHRIX (from καλυξ, *kalyx*, a calyx, and θριξ *thrix*, a hair; in reference to the lobes of the calyx, which end in a long hair each). Labill. nov. holl. 2. p. 8. t. 146. R. Br. in bot. reg. no. 409. D. C. prod. 3. p. 208.

Lin. syst. *Deca-Icosándria, Monogýnia*. Tube of calyx adhering to the ovarium at the base, but drawn out at the apex into a long slender cylindrical tube; limb 5-parted (f. 115. *g*.), permanent, lobes ovate at the base, but each ending in a bristle at the apex (f. 115. *g*.), which is longer than the corolla. Petals 5 (f. 115. *h*.), deciduous. Stamens 10-30, free (f. 115. *e*.); anthers roundish. Style filiform, length of the stamens. Fruit dry, indehiscent, 1-celled; when young biovulate, but when mature 1-seeded.—Australian heath-like shrubs. Leaves scattered, crowded, terete, and rather angular, usually on very short petioles, which are furnished with 2 small stiff filiform stipulas. Flowers axillary, solitary, almost sessile, propped by 2 membranous keeled bracteas, which are connate at the base. Petals purple or white, but yellowish when dried.

1 C. gla'bra (R. Br. l. c.) icosandrous; leaves petiolate, stipulate, glabrous in the adult state, as well as the bracteas. ♄. G. Native of New Holland, near Port Jackson. Lodd. bot. cab. t. 586. Leaves when fresh terete, but when dry triangular. Petals pale reddish.

Glabrous Calythrix. Fl. Ap. Ju. Clt. 1818. Sh. 2 to 3 ft.

2 C. pube'scens (Sweet, ex Loud. hort. brit. p. 199.) icosandrous; leaves petiolate, stipulate, pubescent in the adult state, as well as the bracteas. ♄. G. Native of New Holland. Leaves terete.

Pubescent Calythrix. Shrub 2 to 3 ft.

3 C. tetra'ptera (Labill. l. c.) icosandrous; leaves petiolate, stipulate, glabrous in the adult state, as well as the bracteas; branchlets villous. ♄. G. Native of New Holland, in Van Lewin's Land. Petals yellowish according to the dried specimen. (f. 115.)

Four-winged Calythrix. Shrub 2 to 3 ft.

4 C. sca'bra (D. C. prod. 3. p. 208.) icosandrous; leaves petiolate, with 2 very short stipulas, scabrous in the adult state, as well as the bracteas; branchlets villous. ♄. G. Native of New Holland, on the eastern coast. C. glàbra, Sieb. fl. nov. holl. exsic. no. 285. but not of R. Br.

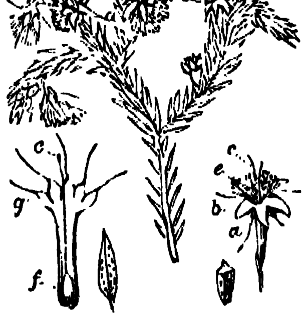
Scabrous Calythrix. Shrub 2 to 3 ft.

5 C. ericoìdes (Cunning. in Fields' new south wales, p. 350.) icosandrous; leaves scattered, petiolate, stipulaceous, glabrous; stipulas deciduous; bracteas one-half shorter than the tube of the calyx. ♄. G. Native of New Holland, in pine ridges, at Bathurst.

Heath-like Calythrix. Clt. 1824. Shrub 4 to 6 ft.

Cult. The species grow well in a mixture of loam, peat, and sand; and young cuttings strike root readily in sand under a hand-glass. All the species are singular.

FIG. 115.



II. DARWI'NIA (in honour of the c[illegible]ated Dr. Darwin, author of the botanic garden, a Poem). Rudge, in Lin. trans. 11. p. 299. t. 22. D. Don, in edinb. phil. journ. July, 1829.

Lin. syst. *Deca-Icosándria, Monogýnia.* Tube of calyx adhering to the ovarium from the middle downwards, the other half membranous and deciduous, with the throat dilated; limb 5-cleft; lobes roundish-cordate, concave, full of pellucid dots, imbricate in æstivation. Petals wanting. Stamens indefinite, from 10-15, inserted in the limb of the calyx, usually approximating by threes; filaments very short, flat, glabrous; anthers inserted by their bases. Ovarium 1-celled, 1-ovulate; ovulum erect. Style tapering to the top, and bearded at the apex; stigma a pruinose dot.—Seed pentagonal, scrobiculate on the outside.—Australian decumbent leafy shrubs. Leaves scattered, narrow, full of pellucid dots, articulated to the branches. Flowers in terminal fascicles, red or white, interspersed with chaffy leaves or bracteas.

1 D. fascicula'ris (Rudge, in Lin. trans. 11. p. 299. t. 22.) leaves acerose; receptacle chaffy; style thrice the length of the flower. ♄. G. Native of New Holland. Calyx red.

Fascicled-flowered Darwinia. Fl. May, July. Clt. 1820. Shrub decumbent.

2 D. taxifòlia (Cunning. in Fields' new south wales, p. 352.) leaves acinaciform; style shorter than the flower. ♄. G. Native of New Holland. Calyx white.

Yew-leaved Darwinia. Fl. May, July. Clt. 1824. Shrub decumbent.

Cult. The species of *Darwínia* are singular plants; their culture and propagation are the same as that recommended for *Cálythrix*.

III. VERTICO'RDIA (meaning unknown to us). D. C. dict. class. vol. ii. and not. 1826. prod. 3. p. 208.—Chamelaùcium species of Desf. in ann. mus. 5. p. 29. and p. 271.

Lin. syst. *Icosándria, Monogýnia.* Flower girded by 2 free or concrete involucrum-formed bracteas before evolution. Lobes of calyx 5, each palmately parted into 5-7 lobules. Petals 5. Stamens 20, of which 10 are sterile and ligulate, the other 10 fertile and equal among themselves. Style filiform, exserted. Stigma bearded. Ovarium 1-celled, inclosing 5-6 ovula, which are erect and fixed to the centre. Fruit 1-seeded. Seed globose.—Australian shrubs, with the habit of *Pileánthus.* Leaves opposite, linear, somewhat triquetrous. Flowers on longish pedicels, rising from the axils of the upper leaves, disposed in a terminal corymb.

1 V. Fontaine'sii (D. C. prod. 3. p. 209.) calycine lobes linear, ciliated; bracteas concrete on one side, and separating lengthwise on the other; leaves acutish. ♄. G. Native of New Holland, at King George's Sound. Chamelaùcium plumòsum, Desf. in mem. mus. 5. p. 42. t. 4.

Desfontaine's Verticordia. Shrub 1 to 2 ft.

2 V. Brównii (D. C. l. c.) calycine lobes linear-subulate, bearded, and ending each in an awn; bracteoles distinct; leaves obtuse, adpressed. ♄. G. Native of New Holland. Chamelaùcium Brównii, Desf. in mem. mus. 5. p. 272. t. 19.

Brown's Verticordia. Shrub 1 to 2 ft.

Cult. For culture and propagation see *Cálythrix.*

IV. CHAMÆLAU'CIUM (we suppose this name to be from χαμαιλευκη, an humble poplar; but the application is unknown to us). D. C. prod. 3. p. 209.—Chamelaùcium, Desf. in mem. mus. 5. p. 39.

Lin. syst. *Icosándria, Monogýnia.* Flower girded by 2 concave bracteas before evolution, each terminating in a dorsal mucrone, afterwards separating transversely. Lobes of calyx 5, undivided, petaloid. Petals 5. Stamens 20, of which 10 are sterile and ligulate, and the other 10 fertile and alternately shorter. Style inclosed; stigma capitate. Ovarium 1-celled, inclosing 5-9 erect ovula, which are inserted in the central placenta.—Australian shrub, with the habit of *Pileánthus.* Leaves opposite, crowded, linear, triquetrous. Flowers axillary, white, on short pedicels.

1 C. cilia'tum (Desf. l. c. p. 40. t. 3. f. B.) ♄. G. Native of New Holland, at King George's Sound. Tube of calyx striated, glabrous, with the lobes roundish and ciliated.

Ciliated-calyxed Chamælaucium. Shrub 1 to 2 ft.

Cult. For culture and propagation see *Cálythrix.* A singular shrub.

V. GENETY'LLIS (meaning unknown to us). D. C. dict. class. vol. 2. and not. 1826. prod. 3. p. 209.

Lin. syst. *Icosándria, Monogýnia.* Bracteoles 2, distinct, girding the flower; limb of calyx 5-cleft; lobes very short, obtuse, entire. Petals 5, ovate, acutish, permanent, rather scarious. Stamens 20, short; of these many are sterile and filiform, not strap-formed. Style filiform, exserted; stigma bearded. Ovarium 1-celled, bearing 5-6 seeds at the base.—Australian shrubs, with the habit of *Pileánthus.* Leaves crowded, linear-triquetrous, full of glandular dots, but the upper or floral ones are linear, flat, and rather membranous. Flowers bibracteolate, capitate, white, sessile in the axils of the bracteas. The calyx is like that of *Chamælaùcium;* the style is like that of *Verticórdia,* but differs from both in the sterile stamens not being ligula-formed, but filiform.

1 G. diosmoìdes (D.C. diss. with a figure). ♄. G. Native of New Holland, on the eastern coast. D. C. coll. 3. with a figure.

Diosma-like Genetyllis. Shrub 1 foot.

Cult. For culture and propagation see *Cálythrix,* p. 812.

VI. PILEA'NTHUS (from πιλεος, *pileos,* a cap, and ανθος, *anthos,* a flower; in reference to the flower, which is inclosed within a 1-leaved involucrum before expansion). Labill. nov.

holl. 2. p. 11. t. 149. Juss. ann. mus. 19. p. 432. D. C. prod. 3. p. 209.

LIN. SYST. *Icosándria, Monogýnia.* Flowers inclosed in a 1-leaved involucrum before evolution, which is closed on all sides, but at length is circumcised at the base, and falls off in one piece, leaving a campanulate base. Limb of calyx 10-parted; lobes roundish. Petals 5. Stamens 20, all fertile; filaments free, some simple and others bifurcate at the apex; the anthers are therefore of 2 approximate or of 2 separated cells. Ovarium 1-celled, 5-6-ovulate; the ovulas erect, and fixed to the base of the fruit. Stigma obtuse. Mature fruit unknown.—An Australian shrub, with the leaves and branches opposite. Flowers axillary, nearly terminal, white, on short pedicels.

1 P. LIMA'CIS (Labill. l. c.). ♄. G. Native of New Holland, in Van Lewin's Land. Desf. ann. mus. 5. t. 3. f. A. Leaves terete, and rather clavate, crowded at the tops of the branches. Lobes of calyx white.

Limax-like Pileanthus. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Calýthrix*, p. 812.

Tribe II.

LEPTOSPE'RMEÆ (plants agreeing with *Leptospérmum* in important characters). D. C. dict. class. vol. ii. and not. 1826. prod. 3. p. 209. Lobes of calyx 4-5 (f. 116. *b.* f. 117. *b.*). Petals 4-5. Stamens free (f. 119. *e.*) or polyadelphous (f. 117. *c.*). Fruit dry, many-celled. Seeds exarillate and exalbuminous.—Shrubs and trees, all natives of New Holland, with the exception of a few from the neighbouring regions. Leaves opposite or alternate, usually full of pellucid dots. Inflorescence variable: sometimes cymose and centrifugal, with pedicellate flowers (f. 118.); sometimes spicate and centripetal, with sessile flowers (f. 116. f. 117.), which are as if they were somewhat immersed in hollows in the branches; but are sometimes produced in leafy spikes at the tops of the branches.

SUBTRIBE I. MELALEU'CEÆ (plants agreeing with *Melaleùca* in the stamens being polyadelphous). D. C. prod. 3. p. 210. Stamens polyadelphous (f. 116. *c.* f. 117. *c.*).

VII. ASTA'RTEA (a mythological name; Astarte, in Syriac, Venus). D. C. dict. class. vol. 2. and not. 1826. p. 210.

LIN. SYST. *Polyadélphia, Polyándria.* Tube of calyx hemispherical; limb 5-parted; lobes semi-orbicular. Petals 5. Bundles of stamens alternating with the petals, and shorter than them. Style short; stigma capitate. Capsule half adhering to the calyx, 3-celled, 3-valved, many-seeded.—An Australian shrub, with opposite, linear, fleshy leaves, which, when young, are disposed in axillary fascicles; and pedicellate, solitary, axillary flowers. Habit of *Bæ'ckea*, but differs from it in the stamens being polyadelphous, and from *Melaleùca* in the bundles of the stamens being alternate with the petals, not opposite to them, and in the flowers being pedicellate, not adnate to the branches.

1 A. FASCICULA'RIS (D. C. prod. 3. p. 210.). ♄. G. Native of Van Dieman's Land. Melaleùca fasciculàris, Labill. nov. holl. 2. p. 29. t. 170.

Fascicled-leaved Astartea. Shrub 6 to 9 feet.

Cult. For culture and propagation, see *Cálythrix*, p. 812.

VIII. TRISTA'NIA (*τρεις, treis*, three, and *σταω, stao*, to stand; disposition of flowers and leaves). R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 417. but not of Poir. D. C. prod. 3. p. 210.

LIN. SYST. *Polyadélphia, Polyándria.* Calyx 5-cleft, permanent; tube turbinate. Petals 5. Bundles of stamens 5, opposite the petals, and hardly longer than them. Anthers incumbent. Capsule 3-celled, many-seeded, half exserted, or inclosed. Seeds wingless.—Australian shrubs, with lanceolate leaves and pedunculate sub-corymbs of flowers.

1 T. NERIIFÒLIA (R. Br. l. c.) leaves opposite, lanceolate, glaucescent beneath; bundles of stamens triandrous or pentandrous. ♄. G. Native of New South Wales. Bonpl. nav. t. 3. Rchb. gart. mag. 1. t. 17. Melaleùca neriifòlia, Sims, bot. mag. t. 1058. Melaleùca salicifòlia, Andr. bot. rep. 485. In each branch of the corymb there are 3 pedicellate flowers, one of which is quadrifid, and the other 2 quinquefid. Petals and stamens yellow.

Oleander-leaved Tristania. Fl. June, Sept. Clt. 1804. Tr. 10 to 30 feet.

2 T. LAU'RINA (R. Br. l. c.) leaves alternate, cuneate-lanceolate; branchlets and calyxes pubescent; capsules half superior. ♄. G. Native of New South Wales. Sieb. nov. holl. exsic. no. 220. Melaleùca laúrina, Smith, in Lin. trans. 3. p. 275. Teeth of calyx shorter than the capsule. Habit almost of *Dáphne Lauréola.* Flowers yellow.

Laurel-like Tristania. Shrub 5 to 10 feet.

3 T. PERSICIFÒLIA (Cunningh. in Fields' new south wales, p. 350.) leaves opposite, lanceolate, attenuated, acute, smooth, glaucous beneath, with undulately crenated or quite entire margins; calycine segments ovate, acute. ♄. G. Native of New Holland, in ravines in spring wood. Allied to *T. neriifòlia.*

Peach-leaved Tristania. Shrub 12 to 16 feet.

4 T. CONFE'RTA (R. Br. l. c.) leaves alternate, lanceolate-elliptic, acute, those at the tops of the branches crowded; segments of calyx acute, foliaceous. ♄. G. Native of New South Wales. Leaves almost of *Pittósporum.*

Crowded-leaved Tristania. Fl. Jul. Sep. Clt. 1805. Sh. 4 to 6 ft.

5 T. SUAVE'OL[illegible] (Smith, in Rees' cycl. vol. 36. no. 2.) leaves alternate, elliptic; calyx somewhat hemispherical, with a repand margin. ♄. G. Native of New Holland, at Endeavour River. Melaleùca suavèolens, Gærtn. fruct. 1. p 173. t. 35. Smith, in Rees' cycl. 23. no. 4. Flowers yellow. Calyx villous.

Sweet-scented Tristania. Tree.

6 T. A'LBENS (Link. et Ott. in hort. berol. ex D. C. prod. 3. p. 210.) leaves elliptic, ciliated, rather hairy on the nerves on both surfaces. ♄. G. Native of New Holland?

Whitish Tristania. Tree.

7 T. DEPRE'SSA (Lodd. cat. ex Link. enum. 2. p. 273.). ♄. G. Native of New Holland. This species is not described.

Depressed Tristania. Clt. 1820. Shrub.

Cult. *Tristània* is a genus of fine-leaved trees or shrubs. The species grow well in an equal mixture of peat, loam, and sand; and cuttings, not too ripe, strike root readily if planted in a pot of sand, and placed under a hand or bell-glass.

IX. BEAUFO'RTIA (so named in compliment to Mary Duchess of Beaufort, a botanical patroness). R. Br. in Ait. hort kew. ed. 2. vol. 4. p. 418. D.C. prod. 3 p. 411.

LIN. SYST. *Polyadélphia Polyándria.* Tube of calyx turbinate; limb 5-parted; lobes acute. Petals 5. Bundles of stamens 5, opposite the petals. Anthers inserted by the base, bifid at the apex; lobes deciduous. Style filiform. Capsule corticate, incrusted to the tube of the calyx, 3-celled; cells 1-seeded.—Elegant Australian shrubs, with sessile, opposite, or scattered leaves, and scarlet flowers.

1 B. DECUSSA'TA (R. Br. l. c.) leaves opposite, decussate, ovate, or oval, many-nerved; bundles of stamens on very long claws; filaments radiating. ♄. G. Native of New Holland, on the south-west coast. Ker. bot. reg. t. 18. Sims, bot. mag. 1733. Colla, hort. ripul. p. 20. t. 22. Flowers scarlet. Styles usually flexuous.

Decussate-leaved Beaufortia. Fl. May, July. Clt. 1800. Shrub 3 to 10 feet.

2 B. SPA'RSA (R. Br. l. c.) leaves scattered, oval, many-nerved. ♄. G. Native along with the preceding species. Flowers red.

Scattered-leaved Beaufortia. Shrub 3 to 10 feet.

3 B. CARINA'TA (Cunningh. mss. ex Loud. hort. brit. p. 319.) leaves opposite, decussate, many-nerved, keeled on the back, ovate or oval, glaucous. ♄. G. Native of New Holland. Flowers scarlet.

Keeled-leaved Beaufortia. Shrub 2 to 4 feet.

N.B. There are two other species, which were detected by Mr. Brown; but they still remain unpublished.

Cult. This is a splendid genus of plants, and therefore the species are desirable objects in every collection of greenhouse plants; they are also very suitable for conservatories, being free growers and abundant flowerers. Their culture and propagation is the same as that recommended for the species of *Tristània*, p. 813.

X. CALOTHA'MNUS (from καλος, *kalos*, beautiful, and θαμνος, *thamnos*, a shrub; in reference to the elegance of the shrubs, from their scarlet flowers and terete leaves). Labill. nov. holl. 2. p. 25. R. Br. in Ait. hort. kew. 4. p. 417.—Baudínia, Leschen. ined.

LIN. SYST. *Polyadélphia Polyándria.* Calyx permanent, 4-5-toothed (f. 116. *b.*), with a hemispherical tube. Petals 4-5 (f. 116. *b.*). Bundles of stamens equal in number to the petals (f. 116. *c. a.*), and opposite them. Anthers inserted by the base. Style filiform. Capsule corticate from the calyx, 3-celled, many-seeded.—Elegant Australian shrubs, with scattered, crowded, terete leaves, and axillary, solitary, scarlet flowers, which are sessile, and the fruit is therefore adnate to [illegible] branches.

* *Flowers quadrifid.*

1 C. SANGUI'NEA (Labill. l. c. t. 154.) 2 of the bundles of stamens bearing 12-16 anthers, and joined together on one side; the other two free, sterile, monandrous; adult leaves, as well as fruit glabrous. ♄. G. Native of New Holland, in Van Lewin's Land. Flowers scarlet.

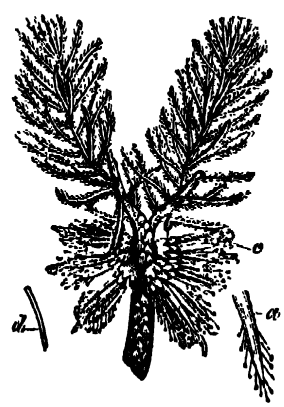
Bloody-flowered Calothamnus. Shrub 2 to 6 feet.

2 C. QUADRI'FIDA (R. Br. in Ait. hort. kew. 4. p. 418.) bundles of stamens 4, distinct, equal, bearing 12-15 anthers each; adult leaves as well as flowers glabrous. ♄. G. Native of New Holland, on the south-west coast. Rchb. gart. mag. 1. t. 9. upper figure. Sims, bot. mag. 1506. Anthers inserted by the base. Flowers scarlet, somewhat secund.

Quadrifid Calothamnus. Fl. July, Sept. Clt. 1803. Shrub 2 to 4 feet.

* * *Flowers quinquefid.*

FIG. 116.



3 C. VILLÒSA (R. Br. l. c.) bundles of stamens equal, distinct, polyandrous; adult leaves as well as fruit villous. ♄. G. Native of New Holland, on the south-west coast. Lindl. bot. reg. t. 1099. Rchb. gard. mag. 1. t. 9. lower figure. Colla, hort. ripul. app. 2. p. 328. t. 15. Flowers scarlet. (f. 116.)

Villous Calothamnus. Fl. Jul. Sept. Clt. 1823. Sh. 2 to 4 ft.

4 C. GRA'CILIS (R. Br. l. c.) bundles of stamens equal, triandrous; leaves very long, and are as well as the exserted fruit, glabrous; stem branched. ♄. G. Native of New Holland, on the south-west coast. Leaves stiff, acute, terete.* Flowers scarlet.

Slender Calothamnus. Fl. July, Sept. Clt. 1803. Shrub 3 to 6 feet.

5 C. CLAVA'TUS (Cunningh. mss. ex Loud. hort. brit. p. 319.) bundles of stamens equal, polyandrous; adult leaves as well as fruit downy. ♄. G. Native of New Holland. Leaves terete, clavate at the apex. Flowers scarlet.

Clavate Calothamnus. Fl. Jul. Sept. Clt. 1824. Sh. 2 to 6 ft.

Cult. The species of *Calothámnus* deserve a place in every collection of greenhouse plants, for the splendour of their blossoms. Their culture and propagation is the same as that recommended for *Tristània*, see p. 813. The glass placed over the cuttings requires to be taken off and wiped occasionally, to prevent damp.

XI. MELALEU'CA (from μελας, *melas*, black, and λευκος, *leucos*, white; the trunk is black, and the branches are white). Lin. mant. 14. Smith, in Lin. trans. 3. p. 273. R. Br. in Ait. hort. kew. 4. p. 410. D. C. prod. 3. p. 211.—Càju-pùti, Adans. fam. f. 2. p. 84.

LIN. SYST. *Polyadélphia, Polyándria.* Tube of calyx somewhat hemispherical (f. 117. *a.*); limb 5-parted (f. 117. *b.*). Petals 5. Bundles of stamens 5 (f. 117. *e. g.*), elongated, opposite the petals. Style filiform (f. 117. *c.*); stigma obtuse. Anthers incumbent. Capsules connate, inclosed in the thickened tube of the calyx, and adnate to the branches by the base, 3-celled, many-seeded. Seeds angular.—Trees and shrubs, for the most part natives of New Holland, and a very few of the East Indies. Leaves alternate, or opposite, equal at the base. Flowers always sessile, or somewhat adnate to the branches, spicate or capitate, white, yellow, or purple.

* *Leaves alternate.*

1 M. LEUCODE'NDRON (Lin. mant. 105.) leaves alternate, long, lanceolate, acuminated, falcate, 3-5-nerved; flower-bearing branches pendulous; flowers in spikes, rather distant, and are as well as the rachis quite glabrous. ♄. S. Native of the East India Islands, where it is called *Caju-puti* by the natives.—A tree with a black trunk, white branches, and white flowers. Rumph. amb. 2. p. 72. t. 16. Mýrtus leucodéndron, Lin. fil. suppl. Melaleùca leucodéndron latifòlia, Lin. fil. suppl. p. 342. M. leucodéndron, Hayne, arzn. gew. 10. t. 9. From the leaves of this tree is distilled the volatile, green, aromatic oil called Cajeput, from *Caju-puti*, a white tree, which is the Malay name, whence also Linnæus gave to it the name of *Leucodéndron.* The oil has the taste of peppermint, but stronger and colder, and a smell of turpentine, but it seldom comes to Europe unadulterated. It is a powerful sudorific, and an useful external application in chronic rheumatism. Ainslie, 1. p. 260. It is considered carminative, cephalic, and emmenagogue, and is, no doubt, a highly diffusible stimulant, antispasmodic, and diaphoretic, and is much used in the cure of cholera morbus, from its antispasmodic powers. It has also the power of dissolving caoutchouc. A decoction of the leaves is much used in China as a tonic. The bark is very serviceable in caulking boats, covering houses, &c.

White-tree or Cajeput-tree. Clt. 1796. Tr. 15 to 20 ft.

2 M. MÌNOR (Smith, in Rees' cycl. vol. 23. no. 2.) leaves alternate, elliptic-lanceolate, acutish, rather falcate, 3-5-nerved; flowers rather distant, in spikes; rachis and calyxes villous. ♄. S. Native of Amboyna, and other East India islands, where it is called in the Malay language *Caju-puti* and *Caju-kilee.* Rumph. amb. 2. p. 74. t. 17. f. 1. and probably f. 2. M. Cajupùti, Roxb. hort. beng. p. 59. M. salígna, Gmel. syst. 793. is referrible to this species, according to the synonyms given to it. M. Cajapùti of gardeners is totally distinct from this

species. The trunk is black, and the branches and flowers white, as in the last species. Cajeput oil is also distilled from the leaves of this tree; probably in greater quantity than from the last.

Smaller Cajeput-tree. Clt. 1800. Tree 10 feet.

3 M. VIRIDIFLÒRA (Gærtn. fruct. 1. p. 173. t. 35.) leaves alternate, elliptic-lanceolate, equal-sided, 5-nerved, acute at both ends; flowers approximate, in spikes; calyxes, rachis, and branchlets pubescent; claws of the bundles of stamens shorter than the segments of the calyx, or obsolete. ♄. G. Native of New South Wales, and of New Caledonia. Smith, et R. Br. l. c. no. 2. M. leucodéndron angustifòlia, Lin. fil. suppl. p. 342. M. angustifòlia, Gærtn. Metrosidèros quinquenérvia, Cav. icon. 4. t. 333. Metrosidèros coriàcea, Poir. suppl. 3. p. 685. but not of Salisb. Metrosidèros álbida, Sieb. pl. exsic. nov. holl. no. 349 Flowers pale greenish yellow.

Greenish-flowered Melaleuca. Clt. 1777. Tr. 10 to 20 ft.

4 M. PALUDÒSA (R. Br. in Ait. hort. kew. 4 p. 410.) leaves alternate, linear-lanceolate, elongated, equal-sided, straight, 3-nerved; lateral nerves approximating the margin, which is scabrous; rachis of the spike, which is cylindrical, as well as the tube of the calyx, clothed with silky down; claws of the bundles of stamens very short. ♄. G. Native of New Holland, on the south-west coast. Flowers red.

Marsh Melaleuca. Fl. July, Sept. Clt. 1803. Sh. 4 to 6 ft.

5 M. GLOBÍFERA (R. Br. l. c.) leaves alternate, oblong, 5-nerved, equal-sided, tapering to the base; heads spherical; capsules connate. ♄. G. Native of New Holland, on the south coast. Flowers greenish yellow?

Globe-bearing Melaleuca. Fl. July, Sept. Clt. 1803. Sh. 4 to 10 feet.

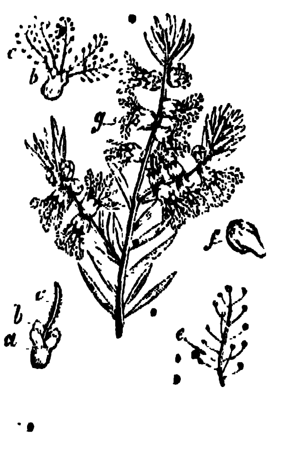
6 M. DIOSMIFÒLIA (Andr. bot. rep. t. 476. and R. Br. l. c.) leaves alternate, oval, or lanceolate, obsoletely 1-nerved, petiolate, flat, crowded, and are as well as the branchlets quite glabrous; spikes oblong, glabrous; bundles of stamens pentandrous. ♄. G. Native of New Holland, on the south-west coast. M. chlorántha, Bonpl. nav. p. 22. t. 8. M. foliòsa, Dum. Cours. bot. cult. 5. p. 373. Flowers greenish yellow.

Diosma-leaved Melaleuca. Fl. June, July. Clt. 1794. Sh. 3 to 10 feet.

7 M. STYPHELOÌDES (Smith, in Lin. trans. 3. p. 275.) leaves alternate, ovate, acuminated, ending in a pungent mucrone, many-nerved, sessile, glabrous; spikes pubescent; segments of calyx acute, nerved. ♄. G. Native of New South Wales. R. Br. in Ait. hort. kew. 4. p. 411. M. obliqua, Hort. ex Steud. Flowers white, surrounding the lower part of the branches. This plant has altogether the habit of *Styphèlia*, from its stiff harsh leaves. M. epacrídea, Hort.

Styphelia-like Melaleuca. Fl. May, July. Clt. 1793. Sh. 4 to 10 feet.

FIG. 117.



8 M. GENISTIFÒLIA (Smith, exot. bot. 1. t. 55.) leaves alternate, linear-lanceolate, flat, 3-nerved, dotted, and are as well as the branches glabrous; bundles of stamens polyandrous, with their claws about equal in length to the petals. ♄. G. Native of New South Wales, and where it is called by the English *White tea-tree*. Flowers with reddish petals and yellow stamens. (f. 117.)

Broom-leaved Melaleuca. Fl. June, July. Clt. 1793. Shrub 6 to 20 feet.

9 M. LANCEOLÀTA (Otto. hort. berol. 36.) leaves scattered, lanceolate, acute, almost nerveless, 3-veined, almost dotless, recurved at the apex, and are as well as the branchlets glabrous; spikes loose, naked; bundles of stamens polyandrous, with their claws about equal in length to the petals. ♄. G. Native of New Holland. Flowers yellowish. Very like *M. genistifòlia*.

Lanceolate-leaved Melaleuca. Fl. June, Aug. Clt. 1816. Shrub 3 to 4 feet.

10 M. STRIÀTA (Labill. nov. holl. 2. p. 26. t. 165.) leaves alternate, lanceolate-linear, acute, obsoletely striated, stiff, almost sessile; spikes oval or oblong; tube of calyx woolly; bundles of stamens usually decandrous, with their claws twice the length of the petals. ♄. G. Native of New Holland, on the south coast. R. Br. l. c. Fruit crowded, nearly globose. Margin of calyx repand. Flowers white.

Striated-leaved Melaleuca. Fl. June, July. Clt. 1803. Sh. 6 to 9 feet.

11 M. PENTAGÒNA (Labill. nov. holl. 2. p. 27. t. 166.) leaves alternate, linear-lanceolate, acuminated, thickish, rather 3-nerved; spikes ovate-globose; tube of calyx glabrous, globose, pentagonal; bundles of stamens pentandrous. ♄. G. Native of New Holland, in Van Lewin's Land. Fruit crowded, in a globose head. Stamens joined together to the middle in bundles. Flowers white?

Pentagonal-fruited Melaleuca. Shrub 4 to 6 feet.

12 M. ACERÒSA; leaves alternate, acerose, villous, full of pellucid dots; bundles of stamens polyandrous, with their claws very long. ♄. G. Native of New Holland. Billòtia aceròsa, Coll. hort. rip. 1. p. 21. t. 23. Flowers purple.

Acerose-leaved Melaleuca. Fl. June, July. Clt.? Shrub 3 to 6 feet.

13 M. THYMOÌ[illegible] (Labill. l. c. t. 167.) leaves alternate, lanceolate, or oblong, 3-nerved, petiolate, and are as well as the branchlets quite glabrous; heads of flowers globose or oval; segments of the calyx acute, 3-nerved; bundles of stamens usually decandrous, with their claws shorter than the petals. ♄. G. Native of New Holland, in Van Lewin's Land, and on the south-west coast. R. Br. in hort. kew. 4. p. 412. Flowers purplish. Perhaps the same as *M. lucidula* of Hort.

Thyme-like Melaleuca. Fl. June, July. Cl. 1803. Shrub 4 to 6 feet.

14 M. SQUÀMEA (Labill. l. c. p. 28. t. 158.) leaves lanceolate-ovate, acuminated, 3-nerved, when young villous as well as the branchlets; heads of flowers globose, pubescent; bundles of stamens bearing 5-9 anthers each, with very short claws. ♄. G. Native of Van Dieman's Land. R. Br. in hort. kew. 4. p. 412. Ker. bot. reg. t. 477. Flowers lilac, much crowded. Fruit corticate by the scaly spongy calyx. Leaves becoming black on drying.

Scaly-calyxed Melalenca. Fl. June, July. Clt. 1805. Tr.

15 M. NODÒSA (Smith, exot. bot. 1. p. 67. t. 35.) leaves alternate, linear-subulate, mucronate, stiff, 1-nerved, flat, and rather spreading; heads globose; segments of the calyx membranous, glabrous; bundles of stamens bearing 3-6-8 anthers, with the claws very short. ♄. G. Native of New Holland, on the eastern coast, at Port Jackson. Vent. malm. t. 112. R. Br. in Ait. hort. kew. 4. p. 413. Metrosidèros, Gærtn. fruct. 1. p. 172. t. 34. Cav. icon. 4. p. 19. t. 334. Metrosidèros púngens, Reich. in Sieb. pl. exsic. no. 316. Flowers pale yellowish. Fruit disposed in a small globose head.

Knotted Melaleuca. Fl. Ju. Jul. Clt. 1790. Sh. 3 to 6 ft.

16 M. TENUIFÒLIA (D. C. prod. 3. p. 213.) leaves alternate, subulate, nearly terete, mucronate, stiff, strictly erect, villous when young, but glabrous in the adult state, as well as the branches; heads of fruit globose, dense; calyxes rather velvety, with deciduous truncate lobes. ♄. G. Native of New Holland, on the east coast. Flowers unknown. Allied to *M. no-*

dòsa, but differs in the leaves being 3 times longer, about 15-16 inches long.

Fine-leaved Melaleuca. Shrub 3 to 6 ft.

17 M. ERICÆFÒLIA (Smith, exot. bot. t. 34.) leaves alternate, linear-subulate, nerveless, awnless, spreading or somewhat recurved; spikes of flowers oval, glabrous; bundles of stamens octandrous or decandrous, with their claws hardly exceeding the petals. ♄. G. Native of New South Wales. M. nodòsa, Link, enum. 2. p. 273. Sieb. pl. exsic. nov. holl. no. 318. and no. 549. Flowers pale yellow.

Heath-leaved Melaleuca. Fl. July, Sept. Clt. 1788. Shrub 4 to 6 ft.

18 M. ARMILLA'RIS (Smith, in Lin. trans. 3. p. 277.) leaves alternate, linear-subulate, mucronate, recurved at the apex; spikes cylindrical, quite glabrous; bundles of stamens polyandrous, with their claws exceeding the petals. ♄. G. Native of New South Wales. M. ericæfòlia, Andr. bot. rep. t. 175. Vent. malm. t. 76. Wendl. coll. 1. t. 29. but not of Smith. Metrosidèros armillàris, Gærtn. fruit. 1. p. 171. t. 43. Cav. icon. 4. t. 335. Flowers white.

Bracelet Melaleuca. Fl. June, July. Clt. 1788. Shrub 6 to 8 ft.

19 M. UNCINA'TA (R. Br. in Ait. hort. kew. 4. p. 414.) leaves alternate, angular, filiform, mucronate, erect, uncinately recurved at the apex; branchlets twiggy; heads of flowers ovate, with the rachis woolly; bundles of stamens pentandrous and hexandrous, with their claws exceeding the petals. ♄. G. Native of New Holland, on the south coast. Flowers yellowish.

Hooked-leaved Melaleuca. Fl. Feb. Sep. Clt. 1803. Shrub 4 to 6 ft.

20 M. SCA'BRA (R. Br. l. c.) leaves alternate, nearly terete, mucronulate, scabrous, crowded; heads of flowers globose; bundles of stamens bearing 4-6 anthers, with their claws about equal in length to the petals. ♄. G. Native of New Holland, on the southern coast. Sweet, fl. austr. t. 10. Flowers purplish. Perhaps the same as M. muricàta, Hort.

Scabrous Melaleuca. Fl. Feb. Sep. Clt. 1803. Sh. 2 to 3 ft.

21 M. JUNIPEROIDES (D. C. prod. 3. p. 213.) leaves alternate, terete, stiff, mucronate, glabrous in the adult state; heads of flowers globose, with the rachis villous; bundles of stamens bearing 4-6 anthers, with their claws about equal in length to the petals. ♄. G. Native of New Holland. Metrosidèros juniperoìdes, Rchb. in Sieb. pl. exsic. nov. holl. no. 317. Flowers yellowish, in small heads. Branchlets and young leaves rather villous.

Juniper-like Melaleuca. Shrub 2 to 4 ft.

22 M. ERUBE'SCENS (Otto, hort. berol. p. 37.) leaves alternate, linear-subulate, flat above, and mucronulate at the apex; spikes cylindrical, and are, as well as the branchlets, quite glabrous; bundles of stamens polyandrous, with their claws exceeding the petals. ♄. G. Native of New Holland. Rchb. gart. mag. 1. t. 82. M. diosmifòlia, Dum. Cours. bot. cult. 5. p. 373. Leaves nearly like those of *M. ericæfòlia.* Flowers less crowded. Petals pale yellowish. Stamens rose-coloured.

Reddish-stamened Melaleuca. Fl. June, July. Clt. Shrub 3 to 6 ft.

23 M. PULCHE'LLA (R. Br. in Ait. hort. kew. 4. p. 414.) leaves scattered or nearly opposite, oval or oblong, obtuse, obsoletely 3-nerved; flowers usually solitary, and are, as well as the branches glabrous; bundles of stamens polyandrous, petaloid on the outside, bearing the stamens from the base to the apex on the margins inside, exceeding the petals. ♄. G. Native of New Holland, on the south coast. Lodd. bot. cab. t. 200. Rchb. gart. mag. 1. t. 8. f. 2. M. dénsa, Colla, hort. ripul. append. 1. p. 815. t. 4. but not of R. Br. M. serpyllifòlia, Dum. Cours. bot. cult. 5. p. 374. Flowers reddish.

Neat Melaleuca. Fl. Ju. Sept. Clt. 1803. Sh. 2 to 3 ft.

** *Leaves opposite.*

24 M. THYMIFÒLIA (Smith, exot. bot. 1. t. 36.) leaves opposite, lanceolate, nerveless; spikes few-flowered; bundles of stamens polyandrous, with the claws branched on the inside even to the middle. ♄. G. Native of New South Wales. R. Br. l. c. Rchb. gart. mag. 1. t. 8. f. 1. Sims, bot. mag. 1869. M. gnidiæfòlia, Vent. malm. t. 7. M. coronàta, Andr. rep. t. 278. M. parvifòlia, Otto, hort. berol. t. 37. M. díscolor, Sieb. pl. exsic. nov. holl. no. 329. Metrosidèros calýcina, Cav. icon. t. 336. f. 2. Bundles of stamens lilac or purple, and somewhat petaloid.

Thyme-leaved Melaleuca. Fl. June, Sep. Clt. 1792. Shrub 2 to 3 ft.

25 M. DECUSSA'TA (R. Br. l. c. p. 415.) leaves opposite, decussate, oval-lanceolate, 3-nerved; spikes oval, quite glabrous; bundles of stamens polyandrous, with the claws very short. ♄. G. Native of New Holland, on the south-west coast. Sims, bot. mag. t. 2268. Colla, hort. rip. 86. t. 15. M. pùmila, Otto, in litt. and M. parviflòra, Otto, hort. berol. p. 37. Rchb. gart. mag. 1. t. 31. Flowers crowded, lilac.

Decussate-leaved Melaleuca. Fl. July, Sep. Clt. 1803. Sh. 3 to 6 ft.

26 M. CUTICULA'RIS (Labill. nov. holl. 2. p. 30. t. 171.) leaves opposite, crowded, oblong-linear, obtuse, veinless; flowers solitary, axillary, glabrous; bundles of stamens dodecandrous, having their claws the length of the petals. ♄. G. Native of New Holland, in Van Lewin's Land. The cuticle of the trunk and branches of the tree are separable. Perhaps the same as the *M. fimbriàta* of gardens, but differs in the leaves being spreading and narrower.

Cuticular Melaleuca. Tree 10 to 20 ft.

27 M. FU'LGENS (R. Br. l. c.) leaves opposite, lanceolate-linear, acute, 1-nerved; spikes of flowers oval, quite glabrous; bundles of stamens polyandrous, palmately many-cleft, having their claws the length of the petals. ♄. G. Native of New Holland. Ker. bot. mag. 103. Flowers larger than those of any other species of the genus. Bundles of stamens scarlet, more than an inch long. Fruit glabrous, nearly globose. Lobes of calyx roundish, blunt.

Fulgent Melaleuca. Fl. July, Sept. Clt. 1803. Sh. 6 to 20 ft.

28 M. LINEARIFÒLIA (Smith, exot. bot. t. 56.) leaves opposite, lanceolate-linear, acute, 3-nerved at the base, dotted; spikes of flowers oblong, glabrous, as well as the branchlets; bundles of stamens polyandrous, pinnate-parted, exceeding the petals. ♄. G. Native of New South Wales. R. Br. l. c. Metrosidèros hyssopifòlia, Cav. icon. 4. t. 336. f. 1. Fruit globose. Calycine lobes small, acutish, deciduous. Flowers cream-coloured.

Toad-flax-leaved Melaleuca. Fl. Ju. Aug. Clt. 1793. Tr. 20 to 30 ft.

29 M. ABIETI'NA (Smith in Rees' cyc. vol. 23. no. 15.) leaves opposite, elliptic-oblong, concave, obtuse, 3-nerved; flowers few, glabrous at the tops of the branches; bundles of stamens polyandrous, having elongated claws, but not exceeding the petals, multifid at the apex. ♄. G. Native of New Holland, at King George's Sound. This species is remarkable in having terminal flowers.

Fir-like Melaleuca. Tree 20 to 30 ft.

30 M. HYPERICIFÒLIA (Smith in Lin. trans. 3. p. 249.) leaves opposite, decussate, elliptic-oblong, 3-nerved, the lateral nerves are obsolete, approximating the margin, which is recurved; spikes cylindrical, quite glabrous; bundles of stamens polyandrous, unguiculate, elongated; filaments radiating. ♄. G. Native of New South Wales. Andr. bot. rep. t. 200. Wendl. coll.

1. t. 18. R. Br. l. c. 4. p. 415. Vent. cels. t. 10. Metrosidèros hypericifòlia, Salisb. prod. p. 351. Flowers of a splendid scarlet-colour.

St. John's-wort-leaved Melaleuca. Fl. June, Aug. Clt. 1792. Shrub 10 to 20 ft.

31 M. elli'ptica (Labill. nov. holl. 2. p. 31. t. 173.) leaves opposite, elliptic, blunt at both ends, 1-nerved in the middle, with the veins pinnate, and confluent at the margins; spikes of flowers cylindrical, pubescent; bundles of stamens polyandrous, with their claws exceeding the petals. ♄. G. Native of New Holland, in Van Lewin's Land. Flowers scarlet, rather smaller than those of the preceding species. Fruit globose, glabrous. Lobes of calyx acutish, permanent.

Elliptic-leaved Melaleuca. Shrub 4 to 6 ft.

32 M. squarròsa (Smith in Lin. trans. 6. p. 300.) leaves opposite, ovate, acute, 5-7-nerved, on short petioles, glabrous; branchlets villous; spikes cylindrical; bracteas foliaceous; lobes of calyx blunt and nerveless; bundles of stamens dodecandrous, with their claws very short. ♄. G. Native of New Holland and Van Dieman's Land. Labill. nov. holl. 2. t. 169. Smith, bot. mag. t. 1935. M. myrtifòlia, Vent. malm. t. 47. M. cajpùtti, Hort. Flowers yellowish.

Squarrose Melaleuca. Fl. Ju. Aug. Clt. 1794. Tr. 20 to 40 ft.

33 M. gibbòsa (Labill. nov. holl. 2. p. 30. t. 172.) leaves opposite, decussate, crowded, ovate, obtuse, 3-nerved; spikes few-flowered, and are, as well as the branches and calyxes, glabrous; bundles of stamens polyandrous, with their claws the length of the petals; fruit appearing as if they were sunk in the branches at the base. ♄. G. Native of Van Dieman's Land and of New Holland on the south coast. M. imbricàta, Hort. There is a variety of this species with 3 leaves in a whorl.

Gibbous Melaleuca. Clt. 1820. Shrub 6 to 12 ft.

34 M. sprengelioìdes (D. C. prod. 3. p. 215.) leaves opposite, decussate, sessile, crowded, roundish, mucronate, 5-nerved; heads of flowers nearly globose, crowded, glabrous; bundles of stamens bearing 7-10 anthers, with their claws the length of the petals; fruit nearly globose, with a truncate, somewhat inflexed limb. ♄. G. Native of New Holland. Allied to *M. gibbòsa*, but very distinct.

Sprengelia-like Melaleuca. Shrub 6 to 8 ft.

35 M. calycìna (R. Br. in Ait. hort. kew. 4. p. 416.) leaves opposite, ovate-lanceolate, 3-5-nerved, nearly sessile; glomerules few-flowered; segments of the calyx acute, nerveless; bundles of stamens polyandrous, with their claws shorter than the petals. ♄. G. Native of New Holland, on the southern coast. Flowers purple.

Large-calyxed Melaleuca. Fl. June, Aug. Clt. 1803. Shrub 3 to 6 feet.

* * * *Leaves in whorls.*

36 M. de'nsa (R. Br. l. c.) leaves scattered, 3 in a whorl or opposite, obovate, 3-nerved; spikes oblong or oval. ♄. G. Native of New Holland, on the south-west coast. Flowers reddish.

Dense-leaved Melaleuca. Fl. June, Aug. Clt. 1803. Shrub 2 to 6 ft.

37 M. inca'na (Rr. Br. in bot. reg. t. 410.) leaves 3 in a whorl, linear-lanceolate, clothed with hoary down on both surfaces, as well as the branches; spikes oval or oblong. ♄. G. Native of New Holland. M. tomentòsa, Colla, hort. rip. 87. t. 37. M. lanàta, Nois. M. canéscens, Link et Otto, hort. berol. p. 87. abbild. t. 81. M. lanígera, Wendl. Bundles of stamens bearing each 5-7 anthers, with their claws shorter than the petals. Flowers pale yellow.

Hoary Melaleuca. Fl. Ju. Aug. Clt. 1817. Shrub 3 to 8 ft.

† *Species not sufficiently known.*

38 M. microphy'lla (Smith in Rees' cycl. vol. 23. no. 9.) leaves alternate, imbricate, cylindrical, obtuse, somewhat spatulate; spikes oval on the upper part of the branches; calyxes glabrous. ♄. G. Native of New Holland, at King George's Sound. From the flowers being pedicellate, and the bundles of stamens not exceeding the petals, it is therefore perhaps a species of *Tristània* or *Astártea*.

Small-leaved Melaleuca. Shrub.

39 M. tetragòna (Lodd. ex Otto, hort. berol. p 37.) leaves opposite, decussate, ovate-elliptic, 3-nerved. ♄. G. Native of New Holland. Allied to *M. decussàta*, but the leaves are broader, much less dotted, more remote, and more spreading. Flowers unknown.

Tetragonal Melaleuca. Clt. 1820. Shrub 4 to 6 ft.

† † *Species only known by name. Many of them may prove identical with some of those described above.*

1 *M. divaricàta*, Donn. 2 *M. híspida*, Wendl. 3 *M. perforàta*, Rœusch. 4 *M. stricta*, Smith. 5 *M. trinérvia*, Smith. 6 *M. pendulìna*, Lodd.

Cult. The greater part of the species of *Melaleùca* are desirable green-house or conservatory plants, their foliage being neat, and in some the blossoms are splendid. Their culture and propagation are the same as recommended for *Tristània*, see p. 813.

XII. LAMA'RCHEA (dedicated to A. M. Lamarche, a captain in the French navy, formerly lieutenant of the ship Uranie, under captain Freycenet in his voyage round the world; and a particular friend of Gaudichaud's). Gaud. in Freyc. voy. part. bot. p. 483. t. 110.

Lin. syst. *Icosándria, Monogýnia.* Calyx hemispherical, with a 5-parted regular deciduous limb. Petals 5, inserted in the limb of the ca[illegible], obovate-spatulate, ciliately fringed at the apex, campanulately conniving, exceeding the limb of the calyx. Stamens numerous, inserted with the petals, monadelphous, exceeding the corolla. Staminiferous tube a little arched, divided into 5 polyandrous parts even to the middle. Ovarium globose, free. Style crowned by a subcapitate stigma. Capsule globose, chartaceous, 3-celled, dividing into 3 valves at the dissepiments; placentas 3, fixed to the axis of the capsule. Seeds numerous, cuneated or lanceolate, arched triangular, erectly ascending.—An unarmed tree, with scattered, linear-lanceolate, quite entire, 3-nerved, coriaceous leaves. Flowers axillary, solitary, sessile, brownish purple, lateral after the leaves have fallen.

1 L. hakeæfòlia (Gaud. l. c. t. 484. t. 110.) ♄. G. Native of the Sandwich Islands ?

Hakea-leaved Lamarchea. Tree.

Cult. For culture and propagation see *Tristània*, p. 813.

XIII. EUDE'SMIA (from ευ, *eu*, well, and δεσμη, *desme*, a bundle; in reference to the stamens being connected into 4 bundles). R. Br. in gen. rem. p. 67. t. 3. D. C. prod. 3. p. 216.

Lin. syst. *Polyadélphia, Polyándria.* Tube of calyx turbinate; limb 4-cleft. Petals closely joined into 4-striped deciduous hemispherical operculum. Stamens indefinite, joined into 4 polyandrous bundles, which alternate with the teeth of the calyx, and therefore opposite the petals. Capsule 4-celled, 4-valved, opening at the apex.—A New Holland shrub, with tetragonal branches. Leaves nearly opposite, broad-lanceolate, coriaceous, glaucous. Peduncles axillary, bearing umbels of white flowers.

1 E. tetragòna (R. Br. l. c.) ♄. G. Native of New Holland, at Lucky Bay. Sweet, fl. austr. t. 21. Lindl. bot. reg. with a figure.

Tetragonal-branched Eudesmia. Fl. July. Clt. 1824. Tree 10 to 20 feet.

Cult. For culture and propagation see *Tristània*, p. 813.

SUBTRIBE II. EULEPTOSPE'RMEÆ (from *eu*, well, and *leptospermum*; this subtribe contains plants agreeing with *Leptospérmum* in the free stamens). D.C. prod. 3. p. 216. Stamens free.

XIV. EUCALY'PTUS (from ευ, *eu*, well, and καλυπτω, *kalypto*, to cover, as with a lid; in reference to the limb of the calyx covering the flower before expansion, and afterwards falling off in one piece, in the shape of a lid or cover (f. 118. *b*.). Lher. sert. angl. 18. D.C. prod. 3. p. 216.

LIN. SYST. *Icosándria*, *Monogýnia*. Tube of calyx permanent, obovate or globose (f. 118. *a*.), cup-shaped; limb in the form of a lid, entire, cut round regularly at the base, and falling off in one piece (f. 118. *b*.). Petals wanting. Stamens numerous (f. 118. *d*.), free. Capsule 4-celled (f. 118. *c*.), or only 3-celled from abortion, opening at the apex, many-seeded.—Tall trees, natives of New Holland. Leaves quite entire, coriaceous, usually alternate, rarely opposite, very variable even in the same tree, quite glabrous except in a very few of the species. Peduncles axillary, bearing an umbel of from 3-15 flowers. Flowers white. The operculum of the calyx in some, according to Mr. Brown, (gen. rem. p. 68.) is double, the outer in the form of a calyx, and the inner the form of a corolla. There are about 100 species in New Holland (R. Br. gen. rem. p. 15.), of which hardly a half are rightly known. In Van Dieman's Land a manufactory has been established for the preparation of extract of tannin from the bark of various species of *Eucalýptus*. A considerable quantity of the substance has been recently imported into England, and it has been said by tanners to be twice as powerful in its operation as oak-bark.

§ 1. *Alternifòliæ* (from *alternus*, alternate, and *folium*, a leaf). *Leaves alternate.*

* *Operculum conical, longer than the calycine cupula.*

1 E. CORNU'TA (Labill. voy. 1. p. 403. t. 20. nov. holl. 2. t. 221.) operculum cone-formed, 5 times longer than the cupula; base of style permanent; flowers capitate at the tops of the terete peduncles; leaves linear-lanceolate. ♄. G. Native of New Holland, in Van Lewin's Land.

Horned Eucalyptus. Clt. 1803. Tree 30 ft.

2 E. TERETICÓRNIS (Smith in Lin. trans. 3. p. 284. nov. holl. 41.) lid conical, terete, quite smooth and membranous, broader, and 3 times longer than the cupula; umbels lateral; leaves lanceolate, oblique at the base. ♄. G. Native of New Holland.

Terete-horned Eucalyptus. Clt. 1804. Tree.

3 E. RESINÍFERA (Smith in Whit. voy. p. 331. t. 25. ex exot. bot. 2. p. 49. t. 84.) lid conical, terete, coriaceous, twice the length of the cupula; peduncles of umbel somewhat compressed, a little longer than the petioles; leaves ovate-lanceolate, long-acuminated, attenuated at the base, marginate by a nerve. ♄. G. Native of New Holland. Andr. bot. rep. t. 400. Hayn. arzn. gew. 10. t. 5. Metrosidèros gummífera, Gærtn. fruct. 1. p. 173. t. 34. f. 1. Leaves full of minute dots. A resin something like kino has been produced from this species, and for all medical purposes full as efficacious.

Resin-bearing Eucalyptus or Red Gum-tree. Fl. Apr. July. Clt. 1788. Tree.

4 E. LONGIFÒLIA (Link, enum. 2. p. 29. Link et Otto, abbild. t. 45.) lid of calyx conical; leaves lanceolate, unequal at the base, long-acuminated, having the acumen incurved, full of pellucid dots, and margined by a nerve; peduncles longer than the petioles. ♄. G. Native of New Holland. Lindl. bot. reg. 941. E. glaucophýlla, Hoffm. berz. 1826. p. 114.? Branches red. Leaves usually deflexed. Allied to *E. resinífera*, but differs in the peduncles being longer.

Long-leaved Eucalyptus. Fl. June. Tree.

* * *Operculum conical, equal in length to the cupula.*

5 E. ROBU'STA (Smith in Lin. trans. 3. p. 283. spec. nov. holl. p. 39. t. 13.) operculum conical, constricted in the middle, length of the cup, and broader than it; peduncles lateral and terminal, 2-edged; pedicels short, compressed; leaves ovate. ♄. G. Native of New Holland.

Var. β, *rostràta* (Cav. icon. 4. t. 342.) leaves ovate-lanceolate, acuminated, coriaceous, girded by a marginal parallel nerve. ♄. G. Native of New Holland. E. robústa, Sieb. pl. exsic. nov. holl. no. 480.

Robust Eucalyptus. Fl. Aug. Sep. Clt. 1794. Tr. 100 ft.

6 E. MARGINA'TA (Smith in Lin. trans. 6. p. 302.) lid of calyx conical, length of cup; umbels lateral; leaves ovate, with thickened margins. ♄. G. Native of New Holland. Margin of leaves cartilaginous and reddish. Operculum not constricted as in *E. robústa*, to which it is very nearly allied.

Marginate-leaved Eucalyptus. Fl. April, June. Clt. 1794. Tree.

7 E. INCRASSA'TA (Labill. nov. holl. 2. p. 12. t. 150.) lid of calyx conical, somewhat constricted nearly the length of the cupula; peduncles axillary, 2-edged, as well as the pedicels, which are short; leaves oblong-lanceolate, thickish, rather acuminated, girded by a thin nerve, which is parallel with the margin. ♄. G. Native of New Holland, in Van Lewin's Land. Marginal nerve of leaf visible beneath. Lower surface of leaves pale.

Thickened Eucalyptus. Clt. 1818. Shrub 6 ft.

8 E. PERSICIFÒLIA (Lodd. bot. cab. t. 501.) lid of calyx conical, a little shorter than the cupula; peduncles axillary, 2-edged, length of the petiole; pedicels short, compressed; leaves oblong, attenuated at the base, acuminated at the apex, marked with a nearly parallel, very thin nerve on the margin. ♄. G. Native of New Holland. Lodd. bot. cab. 501. Umbels 8-10-flowered. Leaves 3 inches long and 6 lines broad.

Var. β; leaves a little broader; peduncles shorter. Eucalýptus, Sieb. pl. exsic. nov. holl. no. 593.

Var. γ; leaves a little longer; peduncles exceeding the petioles a little. E. incrassàta, Sieb. pl. exsic. nov. holl. no. 477. E. multiflòra, Poir. suppl. 2. p. 594.

Peach-leaved Eucalyptus. Fl. July. Clt. 1817. Tree.

9 E. PUNCTA'TA; lid of calyx conical, longer than the cupula; peduncles axillary at the tops of the branches, shorter than the petioles, and are, as well as the pedicels, 2-edged; leaves oblong, attenuated at the base, acuminated at the apex, dotted beneath, and girded by a nerve, which is parallel to the margin. ♄. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 623. Leaves more distinctly margined than the preceding. Operculum not constricted in any way. Umbels 4-8-flowered. Dots on the under surface of the leaves blackish. Leaves 3 inches long, and 7-8 lines broad.

Dotted-leaved Eucalyptus. Tree.

10 E. ACE'RVULA (Sieb. pl. exsic. nov. holl. p. 469.) lid of calyx conical, length of the cupula; peduncles lateral, shorter than the petioles, and are, as well as the pedicels, 2-edged; leaves ovate-lanceolate, oblique at the base, and very much cut on one side, acuminated at the apex. ♄. G. Native of New Holland. Leaves 4-5 inches long, and about an inch broad. Umbels 5-10-flowered. Alabastrum or flower-bud 3 lines long.

Little-horned Eucalyptus. Tree.

11 E. VIRGA'TA (Sieb. l. c. no. 467.) lid of calyx conical, length of the cupula; peduncles axillary and lateral, hardly longer than the petioles, and are 2-edged, as well as the pedicels; leaves oblong-linear, acuminated at both ends, thickish, coriaceous, and nearly veinless. ♄. G. Native of New Holland. Leaves 4-6 inches long, and about 6-9 lines broad.

Twiggy Eucalyptus. Tree.

12 E. MICRA'NTHA (D. C. prod. 3. p. 217.) operculum conical, length of the cup; peduncles angular, length of the petioles,

axillary and nearly terminal; umbels 15-20-flowered; leaves oblong, coriaceous, attenuated at the base, long-acuminated, with the nerves confluent in front of the margins. ♄. G. Native of New Holland. Sieb. pl. exsic. no. 497. Leaves shining on both surfaces, 6-7 inches long, and 1 broad, having the veins feathered. Alabastrum ovoid, smaller than that of any other species.

Small-flowered Eucalyptus. Tree.

13 E. STELLULA'TA (Sieb. l. c. no. 487.) lid conical, length of the cupula; peduncles lateral, very short, nearly terete; umbels 15-20-flowered; leaves oblong, tapering to both ends, 3-5-nerved at the base. ♄. G. Native of New Holland. Petioles and peduncles 3 lines long. Leaves 3 inches long, and half an inch broad, rather coriaceous, and a little shining. Flower-bud oblong, tapering to both ends, 2 lines long.

Starry Eucalyptus. Tree.

14 E. OBLÓNGA (D. C. prod. 3. p. 217.) lid of calyx conical, length of the cupula; peduncles lateral and axillary, compressed, length of the petioles; umbels 8-12-flowered; leaves oblong, unequal at the base and attenuated, mucronate at the apex, coriaceous, veinless. ♄. G. Native of New Holland. Sieb. pl. exsic. no. 583. Flower-bud oblong, attenuated at both ends, nearly sessile on the tops of the peduncles, and a little shorter than them. Leaves 3-4 inches long, and 9 lines broad.

Oblong-leaved Eucalyptus. Tree.

15 E. VIMINA'LIS (Labill. nov. holl. 2. p. 12. t. 151.) operculum conical, hardly acute, length of the cupula; peduncles axillary and lateral, compressed, shorter than the petioles; flowers sessile, 3 on the top of each peduncle; leaves linear-lanceolate. ♄. G. Native of Van Dieman's Land. Capsule hemispherical. Leaves 3 inches long, and 4-5 lines broad. Intermediate between the first and second division of the genus.

Twiggy Eucalyptus. Clt. 1810. Tree.

16 E. CAPITELLA'TA (Smith in White, voy. p. 226. icon. nov. holl. t. 42.) lid of calyx conical, bluntish, length of the cup, which is angular, and somewhat 2-edged; peduncles lateral; flowers capitate; leaves ovate-lanceolate, stiff, oblique. ♄. G. Native of New Holland. E. triántha, Link, enum. 2. p. 20. and perhaps of Spreng. syst. 2. p. 501.

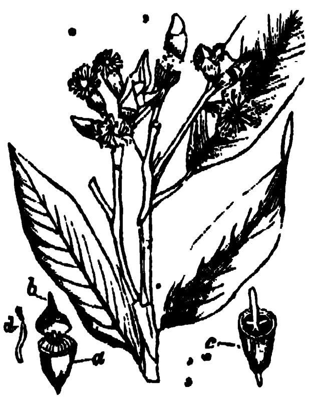
Headed-flowered Eucalyptus. Clt. 1804. Tree.

17 E. SALI'GNA (Smith in Lin. trans. 3. p. 285.) operculum acute, and is, as well as the cup angularly 2-edged; peduncles lateral, short; flowers capitate; leaves linear-lanceolate. ♄. G. Native of New Holland. Flowers small. Calyx biangular. Fruit turbinate. E. angustifòlia, Link, enum. 2. p. 30. ex Spreng.

Willowy-leaved Eucalyptus. Clt. 1804. Tree.

*** *Operculum nearly conical or hemispherical, shorter than the cupula.*

FIG. 118.



18 E. OVA'TA (Labill. l. c. p. 13. t. 153.) lid of calyx hemispherical, mucronulate, shorter than the cup; peduncles axillary, and somewhat terminal, nearly terete, shorter than the petioles; flowers 3-5-together, capitate; leaves ovate, mucronate, a little crenated. ♄. G. Native of New Holland, in Van Lewin's Land. Leaves coriaceous, some entire, and others irregularly crenated. E. mucronàta, Link, enum. 2. p. 30. E. androsemifòlia, Hoffm. verz. 1826. Petioles half an inch long. Limb of leaves 3-4 inches long, and 1-2 broad.

Ovate-leaved Eucalyptus. Clt. 1820. Shrub 6 to 8 ft.

19 E. SCA'BRA (Dum. Cours. bot. cult. 7. p. 280.) operculum rather conical, a little shorter than the cup; peduncles axillary, angularly compressed, equal in length to the petioles, or longer; flowers capitate; leaves lanceolate, unequal at the base, those on the sterile branches curled, on the fertile flat; when young usually velvety, as well as the branches. ♄. G. Native of New Holland. E. eugenioìdes, Sieb. pl. nov. holl. exsic. no. 479. E. penicellàta, Hort. Branches and leaves bearing crowded fascicles of short hairs, which at length fall off, and the leaves become glabrous; sometimes glabrous even in the young state. Petioles 4 lines long. Leaves unequal at the base, oval or oblong-lanceolate, acuminated. The peduncles, in Sieber's specimens, are 4-5-flowered, and about equal in length to the petioles, but in the plant cultivated by Noisette, they are 15-20-flowered, and twice the length of the petioles.

Scabrous Eucalyptus. Clt. 1810. Tree.

20 E. PILULA'RIS (Smith in Lin. trans. 3. p. 284.) lid of calyx conical, rather hemispherical at the base, a little shorter than the cup; peduncles lateral, very short, rather angular; flowers 6-7 in a head; leaves linear-lanceolate, acuminated; veins confluent at the tops, forming a nerve, which is parallel with the margin. ♄. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 474. Sieber's plant is most probably the same as Smith's, but that of Sprengel is perhaps different, from the flowers being corymbose. Flower-bud about the size of a grain of millet. Peduncles 2-3 lines long, nearly one-half shorter than the petioles. Leaves 3 inches long, and 5 lines broad.

Pill-bearing Eucalyptus. Clt. 1804. Tree.

21 E. RADIA'TA [illegible]eb. pl. exsic. nov. holl. no. 425.) lid of calyx hemispherical, mucronate, shorter than the cupula; peduncles axillary and lateral, rather angular, and rather shorter than the petioles; flowers 15-20-together in an umbel, on short pedicels; leaves linear-lanceolate, veins very fine, confluent at the apex, and forming a nerve, which is parallel with the margin. ♄. G. Native of New Holland. Fruit globose, 3 lines in diameter. Petioles 4 lines long. Leaves 4 inches long, and 6-7 lines broad.

Ray-nerved Eucalyptus. Tree.

22 E. STRÍCTA (Sieb. l. c. no. 472.) operculum hemispherical, mucronate, shorter than the cupula; peduncles lateral, nearly terete, a little longer than the petioles; flowers 5-6 in a head; leaves stiff, linear-lanceolate, coriaceous, acuminated. ♄. G. Native of New Holland. Fruit globose, 3 lines in diameter. Petioles a line and a half long. Peduncles 3 lines long. Leaves 3 inches long, and 4 lines broad, rather shining, having the middle nerve hardly prominent, and the rest veinless.

Straight Eucalyptus. Tree.

23 E. HÆMA'STOMA (Smith in Lin. trans. 3. p. 285.) operculum hemispherical, mucronulate, shorter than the cupula; peduncles axillary, and nearly terminal, rather angular, longer than the petioles, some bearing one umbel at the apex, and others bearing many umbels disposed in a racemose manner; flowers pedicellate, 5-10 in each umbel; leaves linear-lanceolate, acuminated. ♄. G. Native of New Holland. E. racemòsa, Cav. icon. 4. p. 24. no. 377. White, trav. p. 226. with a figure. Leaves rather unequal at the base, 3 inches long, and 6 lines broad.

Bloody-mouthed Eucalyptus. Clt. 1803. Tree.

24 E. LIGU'STRINA (D. C. prod. 3. p. 219.) operculum hemispherical, mucronate, shorter than the cup; peduncles axillary, compressed, length of the petioles; flowers 6-8 in a head; leaves linear-lanceolate, very unequal at the base and attenuated, acuminated at the apex. ♄. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 617. Leaves 2 inches long, and 4-5

lines broad. Petioles and peduncles 3-4 lines long. Perhaps the same as E. salicifòlia, Cav. icon. 4. p. 376.

Privet-like Eucalyptus. Tree.

25 E. AMYGDA'LINA (Labill. nov. holl. 2. p. 14. t. 154.) lid hemispherical, nearly mutic, shorter than the cup; peduncles axillary and lateral, nearly terete, length of the petioles; umbels 6-8-flowered, nearly capitate; leaves linear-lanceolate, attenuated at the base, and acuminately mucronate at the apex. ♄. G. Native of Van Dieman's Land. Metrosidèros salicifòlia, Gærtn. fr. 1. p. 171. t. 24. f. 3. a. but not b. E. globulàris, Hort. Leaves 3 inches long, and 3 lines broad, some unequal at the base, and some equal. Petioles and peduncles 3 lines long. Fruit globose, size of a grain of pepper.

Almond-like Eucalyptus. Clt. 1820. Tree.

26 E. AMBIGUA (D. C. prod. 3. p. 219.) lid hemispherical, mucronulate, shorter than the cupula; peduncles axillary, compressed, length of the petioles; umbels capitate, 8-9-flowered; leaves lanceolate, rather coriaceous, unequally attenuated at the base, and acuminately mucronate at the apex. ♄. G. Native of New Holland. Allied to *E. ligústrina* and *E. amygdálina*, but the fruit is nearly globose, and twice the size. Petioles and peduncles 2-3 lines long. Leaves 2-3 inches long, and 6-12 lines broad, stiffish; lateral veins hardly evident.

Ambiguous Eucalyptus. Tree.

27 E. LINDLEYA'NA (D. C. prod. 3. p. 219.) operculum hemispherical, nearly mutic; peduncles nearly terete; flowers 3-5 in an umbel; leaves linear-lanceolate, some petiolate and cuneated at the base, others sessile and obtuse at the base. ♄. G. Native of New Holland. E. longifòlia, Lindl. bot. reg. t. 947.

Lindley's Eucalyptus. Fl. June. Tree.

28 E. BOTRYOÌDES (Smith in Lin. trans. 3. p. 286.) lid of calyx hemispherical, rather mucronate, shorter than the cupula; peduncles lateral, compressed, 4-6-flowered, capitate; leaves lanceolate, oblique. ♄. G. Native of New Holland. E. platýpodos, Cav. icon. 4. p. 23. t. 341. Fruit turbinate, ex Smith, but cylindrical according to Cav.

Botrys-like Eucalyptus. Fl. Apr. July. Clt. 1803. Tree.

29 E. PIPERÌTA (Smith, l. c.) operculum hemispherical, mucronate, shorter than the cup; peduncles axillary and lateral, compressed, shorter than the petioles; umbels 3-5-flowered; branchlets angular; leaves lanceolate, coriaceous, acuminated, 1-nerved, and somewhat many-nerved at the base. ♄. G. Native of New Holland. White, trav. p. 226. with a figure. Rchb. gart. mag. t. 42. Petioles 8 lines long. Peduncles 4 lines long. Leaves 4-6 inches long, and an inch broad, shining on both surfaces.

Var. β, *pauciflòra* (Sieb. pl. exsic. no. 470.) leaves longer; umbels fewer-flowered. ♄. G. Native of New Holland.

Peppery Eucalyptus. Clt. 1788. Tree.

30 E. PA'LLENS (D. C. prod. 3. p. 219.) lid of calyx hemispherical, nearly awnless, shorter than the cupula; peduncles axillary, compressed, length of the petioles; umbels 5-7-flowered; branches angular; leaves lanceolate, acuminated, rather coriaceous, feather-nerved; veins confluent in front of the margins. ♄. G. Native of New Holland. Sieb. pl. exsic. no. 606. Petioles 5 lines long. Leaves 5 inches long, hardly oblique at the base, and nearly an inch and a half broad, white on both surfaces.

Pale-leaved Eucalyptus. Tree.

31 E. OBLÌQUA (Lher. sert. angl. p. 18.) lid of calyx hemispherical, mucronate, shorter than the cupula; peduncles axillary and lateral, and are, as well as the branches, nearly terete, length of the petioles; umbels 9-12-flowered; leaves broad, lanceolate, acuminated, very unequal at the base, feather-nerved. ♄. G. Native of New Holland. Lam. ill. t. 422. Salisb. par. lond. 15. Smith, nov. holl. 13. Leaves 6-7 inches long, and 2 inches broad. Petioles and peduncles an inch long.

Oblique-leaved Eucalyptus. Fl. July, Aug. Clt. 1774. Tr. 100 ft.

32 E. CORYMBÒSA (Smith in Lin. trans. 3. p. 287. nov. holl. p. 43.) operculum hemispherical, mucronate, shorter than the cup; peduncles angular, disposed in a terminal corymb; leaves lanceolate, equally attenuated at the base, coriaceous. ♄. G. Native of New Holland. Cav. icon. t. 340. Fruit turbinate. Petioles half an inch long. Leaves 4 inches long, and one broad. Veins feathered, hardly evident. The *E. corymbòsa* of the gardens is probably distinct from this, but the flowers have not been seen.

Corymbose-flowered Eucalyptus. Clt. 1788. Tree.

33 E. PANICULA'TA (Smith, l. c.) operculum hemispherical, mucronate, shorter than the cup, which is angular; peduncles angular, lower ones axillary, the rest disposed in a terminal panicle; leaves lanceolate, equally attenuated at the base, coriaceous. ♄. G. Native of New Holland. Fruit turbinate, angular. Leaves 3 inches long, and 5-6 lines broad. Petioles 5 lines long.

Panicled-flowered Eucalyptus. Clt. 1804. Tree.

34 E. CNEORIFÒLIA (D. C. prod. 3. p. 220.) lid of calyx hemispherical, nearly mutic, shorter than the cupula, which is turbinate; peduncles nearly terete, axillary, length of the petioles; flowers 5-7 in a head; leaves linear-lanceolate or oblong-lanceolate, unequally attenuated at the base, coriaceous. ♄. G. Native of New Holland, on the eastern coast. Alabastrum with the lid or operculum about 4 lines long, obtuse. Flowers sessile on the tops of the peduncles. Petioles 4 lines long. Leaves 2 inches long, and 6 lines broad. The middle nerve is only prominent or even evident.

Widow-wale-leaved Eucalyptus. Tree.

35 E. OBTUSIFÒLIA (D. C. prod. 3. p. 220.) operculum hemispherical, very blunt, shorter than the cup, which is obovate; peduncles rather angular, axillary, length of the petioles; flowers 4-5 in each head; leaves lanceolate, mucronate, unequally attenuated at the base, coriaceous. ♄. G. Native of New Holland, on the eastern coast. Very like the preceding species, but differs in the flowers being larger, in the cup of the calyx being obovate, in the operculum being blunter, and in the leaves being broader. The mucrones of the leaves are deciduous as in the preceding species.

Blunt-leaved Eucalyptus. Tree.

* * * * *Operculum hemispherical, much broader than the cupula.*

36 E. GOMPHOCE'PHALA (D. C. prod. 3. p. 220.) operculum hemispherical, obtuse, rather striated, much broader than the cup, and a little longer; peduncles 2-edged, length of the petioles, nearly terminal; flowers 3-4 in each head or umbel; leaves lanceolate, acuminated, coriaceous. ♄. G. Native of New Holland. Petals wanting. Stamens very numerous. Fruit angularly compressed, rather turbinate, 4-celled. Petioles an inch long, terete. Leaves glaucous, veinless, 5 inches long, and one broad.

Club-flowered Eucalyptus. Tree.

* * * * * *Mature operculum depressed in the centre, where it is umbonate, shorter than the cupula.*

37 E. GLÓBULUS (Labill. voy. 1. p. 153. t. 13. nov. holl. 2. p. 121.) operculum conical, when young length of the cup, which is tetragonal, but in the adult state it is depressed, and mucronate in the centre; peduncles axillary, short, 1-flowered; leaves alternate, lanceolate, nearly falcate. ♄. G. Native of Van

Dieman's Land and New Holland. Petioles an inch long. Leaves 7-8 inches long, and one broad. Fruit an inch in diameter, flat on the top. E. globulàris, Hort. is probably distinct from this in the leaves.

Globuled Eucalyptus. Clt. 1810. Tree 150 ft.

§ 2. *Oppositifòliæ* (from *oppositus*, opposite, and *folium*, a leaf). *A series of the leaves are opposite and sessile, and others petiolate and alternate.*

38 E. DIVERSIFÒLIA (Bonpl. nav. 1. p. 35. t. 13) operculum conical, length of the cup, which is turbinate; peduncles axillary, terete; flowers 5-7 in each tuft; lower leaves opposite, sessile, ovate, obtuse; upper ones alternate, petiolate, lanceolate, acuminated by a mucrone. ♄. G. Native of New Holland, in Kanguru Island. E. connàta, Dum. Cours. bot. cult. 7. p. 280.? E. piperìta, hort. berol. Fruit hemispherical, 5 lines in diameter, flat at the top. Pericarp cross-formed at the apex. Leaves 2-3 inches long, lower ones an inch and a half broad, but the upper ones are only half an inch broad. Branches terete, but when very young compressed. E. heterophýlla, Sweet?

Diverse-leaved Eucalyptus. Tree.

39 E. PULVI'GERA (Cunningh. in Field's new south wales, p. 350.) leaves opposite, sessile, rather connate at the base, nearly orbicular, retuse, cuspidate at the apex, with thickened undulated margins; umbels axillary, pedunculate, 3-flowered; pedicels very short, terete. ♄. G. Native of New Holland, near Cox's River. Operculum hemispherical, acute.

Powder-bearing Eucalyptus. Clt. 1824. Tree.

40 E. CORDA'TA (Labill. nov. holl. 2. p. 13. t. 152.) operculum with the margin depressed, and the middle umbonate, shorter than the cup, which is obovate; peduncles axillary and terminal, short, and rather angular; flowers 3-4 in each head, leaves for the most part opposite, sessile, cordate, usually crenated; branchlets terete. ♄. G. Native of New Holland, at Cape Van Dieman. Lodd. bot. cab. t. 328. Fruit nearly globose, 4-5 lines in diameter. Branches and young leaves glaucous. Leaves usually obtuse, 2 inches long and an inch and a half broad.

Cordate-leaved Eucalyptus. Fl. June. Clt. 1816. Tr. 60 ft.

41 E. PULVERULE'NTA (Sims, bot. mag. t. 208.) operculum hemispherical; peduncles short, axillary; flowers 3 in each head; leaves opposite, ovate-orbicular, rather mucronate, cordate, covered with glaucous powder, quite entire; branches terete. ♄. G. Native of New Holland. E. cordàta, Hort. berol. Perhaps distinct from the preceding species. Perhaps the operculum is truly hemispherical.

Powdery Eucalyptus. Clt. 1816. Tree.

† *Doubtful species, in consequence of the flowers being unknown. Many of which are probably identical with some of those described above, especially among those with alternate leaves.*

* *Leaves opposite.*

42 E. GLAU'CA (D. C. prod. 3. p. 221.) operculum unknown; leaves glaucous and powdery; lower ones opposite, sessile, stem-clasping, cordate, ovate, mucronate; middle ones on short petioles, and about opposite; upper ones alternate, petiolate, lanceolate, and acuminated; branches 4-winged or quadrangular. ♄. G. Native of New Holland. E. perfoliàta, Hort. E. pulverulénta, Link, enum. 2. p. 31. Leaves very variable on the same plant, both with regard to size and shape.

Glaucous Eucalyptus. Clt. 1820. Tree.

43 E. PURPURA'SCENS (Link, enum. 2. p. 31.) leaves opposite, stem-clasping, lanceolate, long-acuminated, glaucous beneath. ♄. G. Native of New Holland. Branches and nerves of leaves purplish. Leaves 4 inches long and 10 lines broad. Perhaps the two following varieties are the same, only differing in the shape of the leaves from the age of the plants.

Var. β, petiolulàta (D. C. l. c.) leaves on short petioles, linear-lanceolate, acuminated.

Var. γ, petiolàris (D. C. l. c.) leaves on long petioles, broad-lanceolate. E. oppositifòlia, Desf. hort. par. 1804. p. 422. Branchlets terete, and are as well as the petioles and nerves of leaves brownish purple. Leaves 3-4 inches long and an inch broad, unequally attenuated at the base, girded by a nerve at the margin.

Purplish-nerved Eucalyptus. Clt. 1823. Tree.

44 E. TUBERCULA'TA (Parm. h. engh. ex Otto. hort. berol.) leaves opposite, sessile, stem-clasping, oblong-linear, acute, membranous, glabrous; branches filiform, tubercular. ♄. G. Native of New Holland. E. verrucòsa, Hort. ex Loud. hort. brit. p. 198.

Tuberclcd-branched Eucalyptus. Clt. 1822. Tree.

45 E. CUNNINGHA'MI; leaves linear-lanceolate, rather falcate, acute, with thickened margins; umbels many-flowered, and are as well as the leaves crowded. ♄. G. Native of New Holland, forming bushes upon the more elevated of the mountains. E. microphýlla, Cunningh. in Field's new south wales, p. 350.

Cunningham's Eucalyptus. Clt. 1824. Shrub.

46 E. RI'GIDA (Hoffmans. verz. 1826. p. 114.) leaves stiff and hard, lower ones sessile, opposite, ovate, rather cordate, obtuse, upper ones petiolate, scattered, lanceolate, acute, and somewhat apiculated; stem and branches terete. ♄. G. Native of New Holland. Flowers and fruit unknown. Perhaps the same as *E. diversifòlia.*

Stiff-leaved Eucalyptus. Tree.

47 E. HYPERIC[illegible]LIA (Dum. Cours. bot. cult 7. p. 279.) leaves opposite, lanceolate-oblong, acute, glaucescent beneath; branches filiform. ♄. G. Native of New Holland. Petioles half an inch long. Leaves 6 inches long and an inch and a half broad. Lateral nerves of leaves parallel, connected in front of the margin. E. hypericifolia of Link. enum. 2. p. 30. has alternate, nearly linear leaves, which are acuminated at both ends, coriaceous, standing on short petioles, dotted when examined by a lens, but perhaps only the same plant.

St. John's-wort-leaved Eucalyptus. Clt. 1823. Tree.

* * *Leaves alternate.*

48 E. MICROPHY'LLA (Willd. enum. p. 515.) leaves alternate, ovate-oblong, cuspidate, glaucescent beneath. ♄. G. Native of New Holland. Petioles 4 lines long. Leaves an inch and a half long, falcate at the apex, small, crowded on the branchlets. Link, enum. 2. p. 30.

Small-leaved Eucalyptus. Clt.? Tree.

49 E. STENOPHY'LLA (Link, enum. 2. p. 30.) leaves alternate, linear, attenuated at the base, bluntish, veiny, dotted, with the lateral nerves connected before the margin. ♄. G. Native of New Holland. Petioles 4 lines long. Leaves 3 inches long, and 4 lines broad.

Narrow-leaved Eucalyptus. Clt. 1823. Tree.

50 E. MYRTIFÒLIA (Link, enum. 2. p. 30.) leaves alternate, on long petioles, ovate, acute, reticulated, dotted; lateral nerves connected before the margins. ♄. G. Native of New Holland. Petioles 3-4-lines long. Leaves 20-21 lines long, and nearly an inch broad.

Myrtle-leaved Eucalyptus. Clt. 1823. Tree.

51 E. ELONGA'TA (Link, l. c.) leaves alternate, lanceolate, reticulately veined, coriaceous, ending in a filiform acumen each. ♄. G. Native of New Holland. Petioles 8 lines long. Leaves 4-5 inches long, and 10-12 lines broad. Perhaps the same as *E. cornùta*, or perhaps *E. persicifòlia.*

Elongated Eucalyptus. Clt. 1823. Tree.

52 E. me'dia (Link, l. c.) leaves alternate, lanceolate, long-acuminated, obovate, and oblique at the base, with the nerves parallel beneath. ♄. G. Native of New Holland. Petioles half an inch long. Leaves 6-7 inches long, and from 1-2 inches broad.

Intermediate Eucalyptus. Clt. 1823. Tree.

53 E. reticula'ta (Link, l. c.) leaves alternate, lanceolate, acuminated, somewhat ovate at the base, oblique, reticulately veined beneath. ♄. G. Native of New Holland. Leaves 6-7 inches long and 2 or more broad.

Reticulated-leaved Eucalyptus. Clt. 1823. Tree.

54 E. umbella'ta (Dum. Cours. bot. cult. 7. p. 279.) leaves alternate, ovate, rather crenated, mucronate, stiffish. ♄. G. Native of New Holland. Branches terete, brown. Leaves 4-5 inches long and 2-5 inches broad. Nearly allied to *E. ovàta.*

Umbellate-flowered Eucalyptus. Tree.

† *The following names occur in the gardens, but they are all perhaps synonymous with those described above.*

1 *E. orbiculàris*, Lodd. 2 *E. pulchélla*, Lodd. 3 *E. albicaúlis*, Hort. 4 *E. cotinifòlia*, Lodd. 5 *E. undulàta*, Hort. 6 *E. alàta*, Hort.

Cult. For culture and propagation see *Tristània*, p. 813.

XV. ANGO'PHORA (from αγγος, *angos*, a vessel, and φορεω, *phoreo*, to bear; form of fruit). Cav. icon. 4. p. 21. D. C. prod. 3. p. 222.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx turbinate, marked with 5 prominent ribs; limb of 5 permanent teeth. Petals 5. Stamens indefinite, free; anthers ovate. Style filiform. Capsule covered by the corticate [illegible]x, obovate, truncate, 3-celled, 3-valved. Seeds solitary, or few in the cells.—Australian shrubs, with opposite leaves, rarely with the rameal ones ternate. Flowers white.

1 A. cordifòlia (Cav. l. c. t. 338.) leaves sessile, ovate, cordate at the base, and are glabrous as well as the branches; peduncles and branchlets clothed with bristles or stiff hairs. ♄. G. Native of New Holland, near Port Jackson. Metrosidèros híspida, Smith, in Lin. trans. 3. p. 267. Sieb. pl. exsic. no. 471. Sims. bot. mag. t. 1960. Metrosidèros hirsùta, Andr. bot. rep. t. 281. Metros. anómala, Vent. malm. t. 2. Met. cordifòlia and M. híspida, Pers. ench. 2. p. 25. Eucalýptus hirsùta, Link, enum. hort. berol. 2. p. 31. Flowers rather large, yellowish or whitish.

Heart-leaved Angophora. Fl. May, Aug. Clt. 1789. Sh. 7 to 10 feet.

2 A. interme'dia (D. C. prod. 3. p. 222.) leaves on short petioles, elliptic-oblong, and are as well as the branches glabrous; peduncles hispid from bristles. ♄. G. Native of New Holland. Flowers one half smaller than those of the preceding species.

Intermediate Angophora. Shrub 4 to 6 feet.

3 A. lanceola'ta (Cav. l. c. t. 339.) leaves petiolate, lanceolate, acuminate, glabrous, as well as the branches and peduncles. ♄. G. Native of New Holland, near Port Jackson. Metrosidèros spléndens, Gærtn. fr. 1. p. 171. t. 34. f. 7. Melaleùca costàta, Rœusch. Metrosidèros costàta and lanceolàta, Pers. ench. 2. p. 25. Like the two preceding species, this varies with opposite and alternate leaves.

Lanceolate-leaved Angophora. Fl. May, Aug. Clt. 1816. Shrub 4 to 6 feet.

Cult. See *Metrosidèros* for culture and propagation.

XVI. CALLISTE'MON (καλλιστος, *kallistos*, beautiful, and στημων, *stemon*, a stamen; in most of the species the stamens are of a beautiful scarlet colour). R. Br. in bot. reg. no. 393. D. C. prod. 3. p. 222.—Metrosidèros species of authors.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx half spherical; limb 5-parted, with the lobes obtuse. Petals 5 (f. 119. *b*). Stamens numerous (f. 119. *e.*); filaments free. Style filiform. Stigma capitate (f. 119. *c.*). Capsule 3-celled (f. 119. *f.*), many-seeded, inclosed, and connate with the thickened tube of the calyx, which is adnate to the branches.—New Holland shrubs, having the inflorescence rising from the old branches in crowded spikes, as in the species of *Melaleùca;* but with the stamens free, as in *Metrosidèros.* Leaves elongated, stiff, alternate, usually lanceolate.

* *Filaments of stamens yellowish.*

1 C. pinifòlium (D. C. prod. 3. p. 223.) leaves linear-filiform, acerose, stiff, mucronate, channelled, scabrous; calyxes glabrous. ♄. G. Native of New Holland. Metrosidèros pinifòlia, Wendl. coll. 1. p. 53. t. 16. Willd. enum. 513. Metro. viridiflòra, Cels. Nois. but not of Sims. Petals greenish, oval. Stamens of a dirty yellowish green colour, thrice the length of the petals.

Pine-leaved Callistemon. Fl. June, Jul. Clt. ? Sh. 4 to 6 ft.

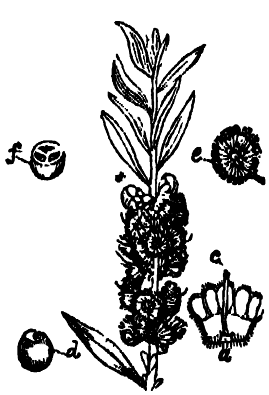
2 C. viridiflòrum (D. C. l. c.) leaves linear-lanceolate, stiff, pungent, beset with scabrous dots, rather villous when young as well as the branches; calyx glabrous. ♄. G. Native of New Holland, on the east coast. Metrosidèros viridiflòra, Sims, bot. mag. 2602. Petals and stamens greenish yellow. Filaments deflexed, 4-times the length of the corolla, ex Sims. Fruit globose; limb of calyx deciduous.

Green-flowered Callistemon. Fl. June, Aug. Clt. 1818. Shrub 4 to 6 feet.

3 C. sali'gnum (D. C. l. c.) leaves lanceolate, acuminated at both ends, mucronate, glabrous in the adult state, with the middle nerve feather-veined, and the lateral nervules approximating the margins; calyxes glabrous. ♄. G. Native of New Holland. Metrosidèros salígna, Smith, in Lin. trans. 3. p. 272. Vent. hort. cels. t. 70. Bonpl. nav. t. 4. Sieb. pl. exsic. no. 320. Flowers pale yellow. Stamens hardly 3-times the length of the petals, which are roundish.

Willowy Callistemon. Fl. May, July. Clt. 1788. Shrub 4 to 6 feet.

FIG. 119.



4 C. lopha'nthum (Sweet, fl. aust. t. 29.) leaves lanceolate, attenuated at both ends, mucronate, 1-nerved, and feather-veined, glabrous in the adult state, but villous when young as well as the branches; flowers distinct, spicate, nearly terminal; calyx pilose; petals rather pubescent, ciliated; ovary densely clothed with down; capsule distinct. ♄. G. Native of New Holland. Metrosidèros lophántha, Vent. hort. cels. t. 69. Metro. salígna, Sims, bot. mag. 1821. Flowers straw-coloured.

Crest-flowered Callistemon. Fl. June, Aug. Clt. 1806. Shrub 4 to 6 ft.

5 C. leptosta'chyum (Sweet, fl. aust. no. 29.) leaves lanceolate, acute, mucronate, attenuated at both ends, full of dots, 1-nerved, and feather-veined, glabrous in the adult state, when young clothed with silky tomentum as well as the branches; spikes long, slender; calyx pilose; petals pubescent, ciliated; ovaries smoothish; capsules crowded. ♄. G. Native of New Holland. Flowers greenish yellow.

Slender-spiked Callistemon. Fl. June, Aug. Clt. 1820. Shrub 4 to 6 feet.

6 C. PA'LLIDUM (D. C. prod. 3. p. 223.) leaves obovate-oblong, glaucous, mucronate, glabrous in the adult state, with the lateral nerves hardly evident; calyxes glabrous. ♄. G. Native of New Holland. Metrosidèros pállida, Bonpl. nav. p. 101. t. 41. Metro. austràlis, R. Br. mss. Very like the preceding species, and hardly distinct. Flowers pale yellowish green.

Pale-flowered Callistemon. Shrub 4 to 6 feet.

7 C. SIEBE'RI (D. C. l. c.) leaves linear, almost nerveless, and with the midrib hardly prominent, clothed with silky villi when young, but glabrous in the adult state; the lateral nerves wanting; calyxes pubescent. ♄. G. Native of New Holland. Myrtàcea, Sieb. pl. exsic. no. 637. Stamens a little longer than the petals.

Sieber's Callistemon. Shrub 4 to 6 feet.

* * *Filaments of stamens scarlet.*

8 C. RI'GIDUM (R. Br. in bot. reg. t. 393.) leaves linear or lanceolate, flat, stiff, very acute, mucronate, smooth; calyxes pubescent. ♄. G. Native of New Holland. Metrosidèros lineàris, Willd. enum. p. 513. but not of Willd. spec. Metros. viminàlis, Hort. berol. Perhaps the same as Metros. viminàlis, Gærtn. fruct. 1. p. 171. t. 34. Lam. ill. t. 421. f. 6. Smith, in Lin. trans. 3. p. 273. Flowers crimson.

Stiff Callistemon. Fl. May, June. Clt. 1800. Sh. 4 to 8 ft.

9 C. LINEA'RE (D. C. prod. 3. p. 223.) leaves linear, stiff, acute, keeled beneath. channelled above, villous while young; calyxes clothed with velvety pubescence. ♄. G. Native of New Holland. Metrosidèros lineàris, Smith, in Lin. trans. 2. p. 273. Willd. spec. 2. p. 953. Melaleùca lineàris, Wendl. et Schrad. sert. hann. t. 11. Metrosidèros calyculàtus, Sieb. pl. nov. holl. exsic. no. 545. Callistèmon púngens, Hort. Style longer than the stamens. Lobes of calyx almost orbicular, falling off after flowering. Fruit globose.

Linear-leaved Callistemon. Fl. June, July. Clt. 1788. Sh. 4 to 6 feet.

10 C. RUGULÒSUM (D. C. l. c.) leaves linear-lanceolate, stiff, mucronate, flat, tubercled on the disk, and scabrous on the margins, 3-nerved; lateral nerves approximating the margin of the leaf; fruit glabrous. ♄. G. Native of New Holland. Metrosidèros rugulòsa, Willd. enum. suppl. p. 31. without a description. Metrosidèros scàbra, Coll. hort. ripul. p. 71. Metro. glandulòsa, Desf. hort. par. M. macro-punctàtum, Dum. Cours. bot. cult. 7. p. 277. Callistèmon scàbrum, Lodd. bot. cab. 1283. Stamens scarlet.

Roughish-leaved Callistemon. Fl. Mar. June. Cl. 1821. Sh. 4 to 6 feet.

11 C. LINEARIFÒLIUM (D. C.) leaves linear-lanceolate, stiff, mucronate, flat, having the middle nerve finely feather-nerved: the lateral nerves confused with the entire margin of the leaves; tube of calyx villous. ♄. G. Native of New Holland. Metrosidèros linearifòlia, Link, enum. 2. p. 26. Stamens scarlet.

Linear-leaved Callistemon. Fl. Mar. June. Clt. 1820. Sh. 5 to 8 feet.

12 C. LANCEOLA'TUM (D. C. l. c.) leaves lanceolate, mucronate, attenuated at both ends; having the midrib rather prominent and feather-nerved; the lateral nerves approximating the margins of the leaves; calyxes pubescent. ♄. G. Native of New Holland. Metrosidèros lanceolàta, Smith, in Lin. trans. 3. p. 272. Pers. ench. 2. p. 24. no. 15. but not no. 11. Metro. cítrina, Curt. bot. mag. 260. Stamens scarlet.

Lanceolate-leaved Callistemon. Fl. June, Nov. Clt. 1788. Shrub 5 to 10 feet.

13 C. MARGINA'TUM (D. C. prod. 3. p. 224.) leaves lanceolate, stiff, flat, acute at both ends, 3-nerved; the middle nerve rather prominent; and the lateral ones approximating the margin; calyxes glabrous. ♄. G. Native of New Holland. Metrosidèros marginàta, Cav. icon. 4. p. 18. t. 332. Stamens scarlet.

Marginate-leaved Callistemon. Fl. June, Aug. Clt. 1816. Shrub 6 to 8 feet.

14 C. SPECIÒSUM (D. C. l. c.) leaves lanceolate, mucronate, flat, having the middle nerve rather prominent, and the lateral ones approximating the margin; calyxes villous; capsule 4-celled, tomentose at the apex. ♄. G. Native of New South Wales. Metrosidèros speciòsa, Sims, bot. mag. t. 1761. Leaves when young rather silky from adpressed caducous villi, and reddish. Stamens scarlet.

Var. β, *glaúcum* (D. C. l. c.) leaves glaucescent. ♄. G. Metrosidèros glaúca, Bonpl. nav. 1. p. 86. t. 34. Perhaps the same as *Metrosidèros semperflòrens*, Lodd. bot. cab. t. 523. Callistèmon formòsum, Hort.

Showy Callistemon. Fl. Mar. Ju. Clt. 1823. Sh. 5 to 10 ft.

† *A species not sufficiently known.*

15 C. HY'BRIDUM (D. C. l. c.) leaves linear, stiff, marginate by a nerve, acuminately mucronate, almost pungent, glabrous. ♄. G. Native country unknown. Metrosidèros hýbrida, Otto. hort. berol.

Hybrid Callistemon. Shrub 4 to 6 feet.

Cult. All the species of *Callistèmon* are worth cultivating in every collection of greenhouse plants for the neatness of their foliage, and the beauty of their blossoms, but especially those belonging to the last division of the genus, for the splendour of their flowers, which are either scarlet or crimson; and are therefore well adapted for a conservatory. The soil best suited for them is a mixture of loam, peat, and sand. Ripened cuttings of them strike root in sand, under a hand-glass. They may be also raised from seeds, which are frequently produced in this country on large plants. Plants raised from cuttings, taken from flowering plants, come into flower when small, but those raised from seeds do not flower till they become large.

XVII. METROSIDE'ROS (from *μητρα*, *metra*, the heart of a tree, and *σιδηρος*, iron; the wood and pith of the trees are very hard). R. Br. gen. rem. p. 15. D. C. prod. 3. p. 224.—Metrosidèros species, Gærtn. Smith and Ait.—Nàni, Adans. fam. 2. p. 88.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx not angular, adhering to the ovarium; limb 6-cleft (f. 120. *a.*). Stamens 20-30, free, very long, and exserted. Style filiform; stigma simple. Capsule 2, but usually 3-celled; cells many-seeded. Seeds wingless.—Trees or shrubs. Leaves opposite or alternate. Flowers pedicellate, not adnate to the branches, as in the genus *Melaleùca* and *Callistèmon*. The genera *Angóphora* and *Callistèmon* have been separated from *Metrosidèros* as it formerly stood; these genera are very natural, but the present genus requires to be still further divided into other genera, for as it now stands it is a heterogeneous mass of plants; but from the fruit of the greater part of the species being unknown, this is altogether impracticable at present.

* *Leaves opposite.*

1 M. VE'RA (Rumph. amb. 3. p. 16. t. 7. Lindl. coll. t. 18.) leaves opposite, on short petioles, ovate-lanceolate, acuminated, quite glabrous; cymes axillary, pedunculate, many-flowered. ♄. S. Native of Amboyna and Java, among rocks. Nàni Valent. æst. ind. 220. t. 53. ex Rumph. Eugènia Amboynénsis, Hort. Flowers yellow. Stamens 30. Ovarium 2-celled. This species differs from all the others in habit, and is probably the only true species of *Metrosidèros*. The Chinese make rudders and anchors of the wood; and among the Japanese it is very scarce and valuable. The bark is used as a remedy for fluor albus and

diarrhœa, being mixed with pinang and a small quantity of cloves and nutmegs.

True Iron-wood. Fl. Mar. Ju. Clt. 1819. Tr. 10 to 20 ft.

2 M. DIFFU'SA (Smith, in Lin. trans. 3. p. 268.) leaves opposite, ovate, veiny, glabrous on both surfaces; panicles axillary or terminal; pedicels opposite. ♄. G. Native of New Zealand and the Island of Otaheite. Melaleùca diffùsa, Forst. prod. no. 213. Melaleùca lùcida, Lin. fil. suppl. t. 342. Flowers yellow. Leaves 3-nerved beneath at the base. Fruit unknown.

Diffuse Iron-wood. Tree.

3 M. VILLÒSA (Smith, l. c.) leaves opposite, ovate, veiny, pubescent beneath; thyrse axillary or terminal, opposite, villous; flowers sessile, crowded. ♄. G. Native of the Sandwich Islands. Flowers reddish. Melaleùca villòsa, Lin. fil. suppl. p. 342. Melaleùca æstuòsa, Forst. prod. no. 215. Mel. spectábilis, Gærtn. fr. 1. p. 172. t. 34. f. 9.?—Leptospérmum collìnum, Forst. gen. 36. no. 2. appears to differ from this, according to the description, in the leaves being glabrous on both surfaces, in the petioles being velvety, and in the calyx being truncate from the limb being deciduous; it is therefore perhaps a different species.

Villous Iron-wood. Tree.

4 M. FLÓRIDA (Smith, l. c.) leaves opposite, obovate-oblong, glabrous, veiny; thyrse terminal; calyx turbinate, nakedish. ♄. G. Native of New Zealand. Melaleùca flórida, Forst. prod. 114. Leptospérmum scándens, Forst. gen. 36. no. 1. but not of Gærtn. Calyx elongated, as in the above, silky from almost imperceptible adpressed down. Flowers yellowish. Stamens twice the length of the petals. Style length of stamens. Ovarium 3-celled.

Flowering Iron-wood. Tree.

5 M. GLOMULÍFERA (Smith, in Lin. trans. 3. p. 268.) leaves opposite, ovate, reticulately veined, pubescent beneath; heads lateral, pedunculate, and are as well as the bracteas tomentose. ♄. G. Native of New Holland. Branches opposite. Petioles short. Flowers greenish yellow. Heads of flowers bibracteate. Fruit unknown.

Heap-bearing Iron-wood. Fl. May, June. Clt. 1805. Tr. 15 to 20 feet.

6 M. ANGUSTIFÒLIA (Smith, l. c.) leaves opposite, linear-lanceolate, naked; peduncles axillary, umbellate; bracteas lanceolate, glabrous. ♄. G. Native of the Cape of Good Hope. Mýrtus angustifòlia, Lin. mant. 74. Houtt. pfl. syst. 3. t. 25. f. 2. Leptospérmum salicifòlium, Lam. dict. 3. p. 467. ex herb. Juss. Branches tetragonal. Leaves resembling those of *Phillýrea*. Stamens long. Fruit capsular, 3-celled. Flowers yellowish.

Narrow-leaved Iron-wood. Clt. 1787. Tr. 20 ft.

7 M. UMBELLA'TA (Cav. icon. 4. p. 20. t. 337.) leaves opposite, elliptic-lanceolate, glabrous; peduncles umbellate, short, rising from the axils of the upper leaves, rather downy; umbels few-flowered; petals oblong. ♄. G. Native of New Holland. Melaleùca umbellàta, Ræusch. Leaves nearly of *Philly'rea angustifòlia*, but differ in being dotted beneath, and revolute at the margins. Lobes of calyx 5, acute, and are as well as the tube glabrous at length. Stamens distinct, much exserted, scarlet. Capsule 3-celled.

Umbellate-flowered Iron-wood. Shrub 8 to 10 feet.

8 M. OPERCULA'TA (Labill. sert. cal. p. 61. t. 60.) leaves opposite, linear-lanceolate, glabrous, but when young rather villous; corymbs nearly terminal; petals orbicular, somewhat adhering to each other at the apex, and separating in the manner of an operculum. ♄. G. Native of New Caledonia. Petals opening almost as in *Vìtis*. Stamens about 70, 5-times the length of the petals. Capsule 3-celled.

Operculate-petalled Iron-wood. Shrub 9 feet.

9 M. OBOVA'TA (Hook, in Beech. bot. p. 63. t. 12.) leaves opposite, obovate, coriaceous, very blunt, veiny, glabrous, tapering into the peticle, which is short, with the margins rather revolute; corymbs axillary and terminal; calyx glabrous, full of elevated dots. ♄. G. Native of Gambier Island.

Obovate-leaved Iron-wood. Tree.

10 M. POLYMÓRPHA (Gaud. in Freyc. voy. part. bot. p. 482. t. 108. and 109.) leaves opposite, of various forms, coriaceous, glabrous on both surfaces, but covered with a little silky tomentum beneath; peduncles 3 or many-flowered, terminal and axillary, corymbose; calyxes and branchlets glabrous, or clothed with silky tomentum. ♄. G. Native of the Sandwich Islands, at the elevation of 900 to 1800 feet.

Var. α; leaves roundish-elliptic, cordate.

Var. β; leaves ovate or ovate-elliptic, rounded at the base.

Var. γ; leaves oblong, acute at the base.

Var. δ; leaves lanceolate.

Polymorphous Iron-wood. Tree.

* * *Leaves alternate.*

11 M. CILIA'TA (Smith, l. c. Labill. sert. cal. p. 60. t. 59.) leaves scattered or nearly opposite, elliptic, obtuse, coriaceous, ciliated at the base when young, as well as the branchlets; flowers in dense corymbs. ♄. G. Native of New Caledonia. Melaleùca ciliàta, Forst. prod. p. 217. Leptospérmum ciliàtum, Forst. gen. 36. no. 3. Leaves like those of *Celástrus buxifòlius*. Flowers purple. Lobes of calyx 5, acute, permanent. Capsule 3-celled.

Ciliated-leaved Iron-wood. Shrub 6 feet.

12 M. CAPITA'TA (Smith, l. c.) leaves scattered, obovate, mucronate; heads of flowers dense, terminal; calyxes and branchlets pilose. ♄. G. Native of New Holland. Melaleùca eriocéphala, Sieb. pl. exsic. nov. holl. no. 322. Callistèmon or Callistémma capitàtum, Rchb. hort. bot. 1. t. 84. Leaves 3-4 lines long, rather villous when young, but in the adult state the margins are scabrous from glands. Heads of flowers globose. Flowers lilac. Stamens a little longer than the petals. Stigma rather capitate.

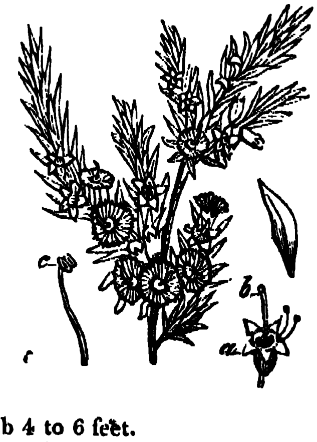
Capitate-flowered Iron-wood. Clt. 1824. Sh. 5 to 6 ft.

13 M. ERICIFÒLIA (Smith, in Rees' cycl. vol. 23. no. 16.) leaves alternate, imbricate, linear, acute, pilose, channelled above, convex beneath; heads of flowers terminal. ♄. G. Native of New Holland, at King George's Sound. Said to be allied to the preceding species.

Heath-leaved Iron-wood. Shrub.

14 M. CORIFÒLIA (Vent. malm. t. 46.) leaves alternate, linear, recurved at the apex; flowers axillary; calyxes smoothish, with the lobes lanceolate; stigma capitate. ♄. G. Native of New Holland, on the eastern coast. Leptospérmum ambíguum, Smith, exot. bot. t. 59. Flowers white. Leaves crowded on the branches. Stamens a little longer than the petals. From the stigma being capitate (f. 120. *b.*) in this as well as in *M. capitàta* and *M. ericifòlia*, these plants will form a distinct genus, which might be called *Gynocéphala*.

FIG. 120.



Coris-leaved Iron-wood. Shrub 4 to 6 feet.

15 M. JUNIPE'RINUS; leaves subulately-filiform, mucronate, stiff, glabrous, tubercled; peduncles woolly; spikes capitate. ♄. G. Native of New Holland. Metrosidèros junipérinus, Rchb. ex Spreng. syst. app. p. 194.

Juniper-like Metrosideros. Shrub 4 to 6 feet.

16 M. PU'NGENS (Sieb. ex Spreng. syst. add. p. 194.) leaves linear, mucronate, spreading, nerved, glabrous; peduncles woolly; spikes capitate. ♄. G. Native of New Holland.

Pungent Metrosideros. Shrub.

† *Species not sufficiently known.*

* *Leaves and flowers unknown.*

17 M.? SALICIFÒLIA (Gærtn. fruct. 1. p. 171. f. 3.). Two species of *Eucalýptus* are confused under this name.

Willow-leaved Iron-wood. Tree.

18 M.? EXCE'LSA (Gærtn. fruct. 1. p. 172. t. 34. f. 8.). This is perhaps a species of *Leptospérmum*.

Tall Iron-wood. Tree.

19 M.? SPECTA'BILIS (Gærtn. l. c. f. 9.). Probably a species of *Leptospérmum*.

Showy Iron-wood. Shrub.

20 M.? SCA'NDENS (Gærtn. l. c. f. 10.). Probably a species of *Leptospérmum*.

Climbing Iron-wood. Shrub.

21 M.? ALBIFLÒRA (Gærtn. l. c. f. 11.). Probably a species of *Leptospérmum*.

White-flowered Metrosideros. Shrub.

22 M. MYRTIFÒLIA (Gærtn. l. c. f. 12.). Probably a species of *Leptospérmum*.

Myrtle-leaved Iron-wood. Shrub.

* * *Flowers and fruit unknown.*

23 M.? AROMA'TICA (Salisb. prod. p. 351.) leaves alternate, broad-ovate, acuminated, thin, glaucous beneath. ♄. G. Native about Port Jackson.

Aromatic Iron-wood. Shrub.

24 M.? PRÒCERA (Salisb. l. c.) leaves alternate, ovate-lanceolate, green beneath, coriaceous, with divaricating nerves. ♄. G. Native at Port Jackson.

Tall Iron-wood. Tree.

25 M.? PROPI'NQUA (Salisb. l. c.) leaves alternate, ovate-lanceolate, glaucous beneath, coriaceous, with divaricating nerves. ♄. G. Native at Port Jackson.

Allied Iron-wood. Shrub.

26 M.? APOCYNIFÒLIA (Salisb. l. c.) leaves nearly opposite, elliptic, marginate, coriaceous, with parallel nerves. ♄. G. Native at Port Jackson.

Apocynum-leaved Iron-wood. Shrub.

27 M.? CORIA'CEA (Salisb. l. c.) leaves alternate, ovate-lanceolate, glabrous on both surfaces, very coriaceous. ♄. G. Native at Port Jackson.

Coriaceous-leaved Iron-wood. Shrub.

28 M.? DECÒRA (Salisb. l. c.) leaves alternate, dense, on very short petioles, lanceolate, mucronulate, coriaceous, glabrous on both surfaces in the adult state. ♄. G. Native at Port Jackson.

Neat Iron-wood. Shrub.

29 M.? SCARIÒSA (Horn. hort. hafn. suppl. p. 139.) leaves scattered, lanceolate, with scarious margins; branchlets pubescent. ♄. G. Native country unknown.

Scarious-leaved Iron-wood. Shrub.

* * * *Species entirely undescribed.*

30 *M. connàta*, Desf. hort. par. 31 *M. pliniæfòlia*, Desf. l. c. 32 *M. nàna*, Gmel. hort. Carls.

N.B. *Metrosidèros macrophýlla* of Lam. ill. t. 421. f. 1. Poir. suppl. 3. p. 686 is the same as *Sarcolæ'na multiflòra*, see vol. 1. p. 562. or a nearly allied species.

Cult. For culture and propagation see *Callistèmon*, p. 823.

XVIII. LEPTOSPE'RMUM (from λεπτος, *leptos*, slender, and σπερμα, *sperma*, a seed; in reference to the seeds being small and narrow). Forst. gen. p. 36. Gærtn. fruct. 1. p. 174. t. 35. Smith, in Lin. trans. 3. p. 260. Cav. icon. 4. p. 16. Leptospérmum, sect. 2. Euleptospermum, D. C. prod. 3. p. 227.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx rather turbinate; limb 5-cleft, with the lobes triangular and valvate. Petals 5. Stamens 20-30, free, shorter than the petals. Style filiform; stigma capitate. Capsule 4-5-celled. Seeds oblong, small.—New Holland shrubs, with alternate, quite entire, dotted, small leaves. Flowers pedicellate, solitary, scattered, white.

1 L. EMARGINA'TUM (Wendl. fil. ex Spreng. syst. 2. p. 491.) leaves linear-oblong, emarginate, obscurely 5-nerved; calycine teeth membranous, coloured. ♄. G. Native of New Holland. Melaleùca nervòsa, Hort. ex Link, enum. 2. p. 25.

Emarginate-leaved Leptospermum. Fl. Ju. Jul. Clt. 1818. Shrub 4 to 6 feet.

2 L. OBOVA'TUM (Sweet, fl. aust. t. 36.) leaves obovate, emarginate, obscurely 3-5-nerved, glabrous; branches angular, a little winged; calyxes glabrous; with the teeth coloured. ♄. G. Native of New Holland. Flowers white.

Obovate-leaved Leptospermum. Fl. July, Aug. Clt.? Sh. 3 to 6 feet.

3 L. SERI'CEUM (Labill. nov. holl. 2. p. 9. t. 147.) leaves obovate, mucronate, 3-5-nerved, silky on both surfaces as well as the calyxes; lobes of calyx permanent. ♄. G. Native of Van Dieman's Land. Flowers white.

Silky Leptospermum. Fl. Ju. Jul. Clt. 1818. Sh. 4 to 6 ft.

4 L. TUBERCULA'TUM (Poir. suppl. 3. p. 338.) leaves ovate or oblong-lanceolate, dotted beneath and finely 3-nerved, glabrous in the adult state, but clothed with silky pubescence when young, as well as the branchlets; calyxes silky, but when in fruit glabrous. ♄. G. Native of New Holland, about Port Jackson. L. stellàtum, Cav. icon. 4. p. 16. t. 330.? The margin of the calyx is said to be entire by Cavanilles, in his diagnosis, but from his description, as well as from the figure, it is acutely 5-cleft. The petals are yellow, according to Cav., but according to the specimen white.

Var. β, subenérve (D. C. prod. 3. p. 227.) leaves 1-nerved, or almost nerveless.

Tubercular Leptospermum. Fl. June, Jul. Clt. 1816. Sh. 4 to 6 feet.

5 L. GRANDIFLÒRUM (Smith, in Lin. trans. 6. p. 299.) leaves lanceolate, narrowed at both ends, mucronate; calyxes villous, with coloured teeth; bracteas gemmaceous, permanent. ♄. G. Native of New Holland. Sims, bot. mag. t. 1810. Lodd. bot. cab. t. 701. Flowers large, white, about the size of those of *Fabrícia lævigàta*. Leaves pubescent when young, but glabrous in the adult state.

Great-flowered Leptospermum. Fl. June, July. Clt. 1803. Shrub 4 to 6 feet.

6 L. LANÍGERUM (Ait. hort. kew. ed. 2. vol. 3. p. 182. but not of Willd.) leaves oblong or oval, mucronate, pubescent on both surfaces or only beneath, obsoletely 3-nerved; branchlets villous; calyxes very villous, from spreading pili. ♄. G. Native of Van Dieman's Land and New Holland. Lodd. bot. cab. t. 1192. Philadélphus lániger, Ait. hort. kew. ed. 1. vol. 2. p. 156. Flowers white.

Var. β, pubéscens (D. C. prod. 3. p. 227.) leaves smaller, and rather oblique. ♄. G. Gathered with the species. Philadélphus lániger β, pilíger. Ait. hort. kew. ed. 1. vol. 2. p. 156. L. pubéscens, Willd. spec. 2. p. 650. Not differing from the species, unless in the leaves being rather smaller. Both have their leaves sometimes nearly glabrous in the gardens; but always to be known by the hairy calyx.

Wool-bearing Leptospermum. Fl. Ju. Jul. Clt. 1774. Sh. 3 to 6 feet.

7 L. TRINE'RVE (White, journ. 229. with a figure) leaves ovate-lanceolate, 3-nerved; calyx clothed with adpressed silky villi; calycine teeth foliaceous, permanent. ♄. G. Native of New Holland. Leptospérmum lanígerum, var. Smith, in Lin. trans. 3. p. 263. Willd. spec. 2. p. 949. Flowers white.

Three-nerved-leaved Leptospermum. Shrub 4 to 6 ft.

8 L. SCOPA'RIUM (Smith, in Lin. trans. 3. p. 262.) leaves ovate, mucronate, obsoletely 3-nerved; calyxes glabrous; calycine teeth membranous, coloured. ♄. G. Native of New Zealand and New Holland, on the sea-shore. Andr. bot. rep. 622. Philadélphus scopàrius, Ait. hort. kew. ed. 1. vol. 2. p. 156. Melaleùca scopària, Wendl. sert. hann. p. 25. t. 15. Flowers white. The leaves of this species were used by Captain Cook's ships' crews as tea, whence they named it the tea-plant. They have a very agreeable bitter flavour, with a pleasant smell when fresh, but lose something of both when dry. A strong infusion of them proved emetic to some, in the same manner as green tea. They were also used with spruce leaves in equal quantity to correct their astringency, in brewing beer from them, and they rendered the beer exceedingly palateable.

Var. α, linifòlium (D. C. prod. 3. p. 227.) leaves lanceolate. ♄. G. Native of New Zealand. L. scopàrium, Forst. gen. 36. trav. 1. t. 22. Melaleùca scopària diosmatifòlia, Wendl. l. c. f. 1. L. squarròsum, Gærtn. fruct. 1. p. 174.

Var. β, myrtifòlium (D. C. l. c.) leaves ovate-elliptic. ♄. G. Native of New Holland. Wendl. l. c. f. 2. Philadélphus floribúndus, Rœm. et Ust. mag. 7. t. 2.

Var. γ, rubricaúle (D. C. prod. 3. p. 227.) leaves flattish, hardly 3-nerved. ♄. G. R. rubricaúle, Link, enum. 2. p. 25.

Broom Leptospermum or New Zealand Tea. Fl. June, July. Clt. 1772. Shrub 4 to 6 feet.

9 L. FLAVE'SCENS (Smith, l. c. Ait. hort. kew. ed. 2. vol. 3. p. 181.) leaves linear-lanceolate, obtuse, 1-nerved, dotted; calyxes glabrous; calycine teeth membranous, at length deciduous. ♄. G. Native of New Holland. L. théa, Willd. L. flavéscens, Willd. spec. 2. p. 949. Hook, bot. mag. 2695. Melaleùca thèa, Wendl. sert. hann. 1. p. 24. t. 14. L. polygalæfòlium, Salisb. prod. p. 3. Flowers white, but yellowish in a dried state. Wendlend says the leaves are 3-nerved, and in the Hortus Kewensis they are said to be nerveless, but in the specimens examined they are 1-nerved, as in the figure of Wendland.

Yellowish Leptospermum. Fl. May, July. Clt. 1788. Sh. 4 to 6 feet.

10 L. GNIDIÆFÒLIUM (D. C. prod. 3. p. 228.) leaves linear-lanceolate, acutish, 3-nerved, dotless; calyxes covered with silky villi; calycine teeth smoothish, and coloured a little. ♄. G. Native of New Holland. L. péndulum, Sieb. Flowers white.

Gnidia-leaved Leptospermum. Shrub 4 to 6 feet.

11 L. POROPHY'LLUM (Cav. icon. 4. p. 17. t. 330. f. 2.) leaves oblanceolate, acutish, 1-nerved, densely dotted, glabrous; calyxes silky, with the teeth acute. ♄. G. Native of New Holland. In the figure of this plant, given by Cavanilles, the teeth of the calyx are deciduous, and the pubescence of the calyx is not taken any notice of, but it is probably the same. Flowers white.

Porous-leaved Leptospermum. Fl. June, July. Clt. 1800. Shrub 3 to 6 feet.

12 L. PARVIFÒLIUM (Smith, in Lin. trans. 3. p. 263.) leaves oblong-obovate, nerveless, dotted, glabrous; calyxes villous, with the teeth membranous and coloured. ♄. G. Native of New Holland. L. eriocàlyx, Sieb. pl. exsic. nov. holl. no. 313. Branches villous when young, but at length becoming glabrous. Leaves 2 lines long. Flowers white.

Small-leaved Leptospermum. Fl. June, July. Clt. 1789. Shrub 4 to 6 feet.

13 L. MYRTIFÒLIUM (Sieb. pl. exsic. nov. holl. no. 314,) leaves obovate-oblong, 3-nerved, dotted, rather pubescent while young; calyxes clothed with silky villi; with the lobes membranous, coloured, and pubescent. ♄. G. Native of New Holland. Flowers solitary, sessile, yellowish when in a dry state.

Myrtle-leaved Leptospermum. Shrub 3 to 6 feet.

14 L. ATTENUA'TUM (Smith, in Lin. trans. 3. p. 262.) leaves linear-lanceolate, acute, 3-nerved; calyx clothed with silky villi; with the teeth membranous, coloured, and nearly glabrous. ♄. G. Native of New Holland. Flowers for the most part 2 on a short silky peduncle. Perhaps *L. glomeràtum*, Wendl. in flor. 1819. p. 678. and *L. resiniferum*, Bertol. amœn. p. 28. differs from the present plant. Flowers white.

Attenuated-leaved Leptospermum. Fl. May, Jul. Clt. 1795. Shrub 3 to 6 feet.

15 L. MULTIFLÒRUM (Cav. icon. 4. p. 17. t. 331. f. 1.) leaves linear, attenuated, acuminated, 1-nerved, dotless; calyxes glabrous, with the lobes deciduous. ♄. G. Native of New Holland. Flowers white.

Many-flowered Leptospermum. Shrub 6 to 8 feet.

16 L. THYMIFÒLIUM (Cunningh. in Field's new south wales, p. 349.) rather villous; leaves oval, obtuse, flattish; flowers axillary, solitary, or twin; segments of the calyx deciduous. ♄. G. Native of New Holland, growing in swampy forest land on the Macquarie River.

Thyme-leaved Leptospermum. Clt. 1824. Shrub.

17 L. MULTICAU'LE (Cunning. l. c.) silky; leaves oval, or ovate-lanceolate; teeth of calyx coloured. ♄. G. Native of New Holland, in barren bushy hills, near Bathurst.

Many-stemmed Leptospermum. Clt.? Shrub.

18 L. OBLI'QUUM (Coll. hort. ripul. append. 2. p. 351.) leaves oblique, sessile, linear-lanceolate, attenuated at the base, and mucronate at the apex, dotted, pale beneath; stem reddish, branched. ♄. G. Native of New Holland. Nearly allied to *L. multiflòrum*. Flowers white.

Oblique-leaved Leptospermum. Fl. June, July. Clt. 1800. Shrub 4 to 6 feet.

19 L. JUNIPE'RINUM (Smith, in Lin. trans. 3. p. 263.) leaves linear-lanceolate, pungent, 1-nerved, silky while young as well as the branchlets; calyx glabrous, with membranous, coloured teeth. ♄. G. Native of New Holland. Vent. malm. t. 89. L. recurvifòlium, Salisb. prod. p. 350. Melaleùca tenuifòlia, Wendl. obs. p. 50. ex Willd. Flowers white.

Juniper-like Leptospermum. Fl. June, July. Clt. 1790. Shrub 4 to 5 feet.

20 L. BACCA'TUM (Smith, l. c.) leaves linear-lanceolate, pungent, 1-nerved, but 3-nerved at the very base; branches hairy; calyxes glabrous: with coloured, pubescent teeth; capsule baccate. ♄. G. Native of New Holland. L. juniperifòlium, Cav. icon. 4. p. 18. t. 331. f. 2. Flowers white.

Berry-fruited Leptospermum. Fl. July. Clt. 1790. Shrub 4 to 5 feet.

21 L. ARACHNOÍDEUM (Smith, l. c.) leaves subulate, pungent; branchlets hairy; tube and teeth of calyx villous; capsule 5-celled. ♄. G. Native of New Holland. L. arachnoídes, Gærtn. fruct. 1. p. 174. t. 35. f. 3. Lam. dict. 3. p. 466. Melaleùca arachnoídea, Ræusch. Flowers white.

Cobwebbed Leptospermum. Fl. May, Jul. Clt. 1795. Sh. 2 to 3 feet.

22 L. TRILOCULA'RE (Vent. malm. t. 84.) leaves linear, pungent, dotted, ciliated; calyx clothed with silky villi, both on tube and teeth; capsule 3-5-celled; stamens 15. ♄. G. Native of New Holland. Lodd. bot. cab. t. 791. Bracteas gemmaceous, permanent, glabrous. Leaves usually twisted obliquely, 1-nerved, hardly 3-nerved at the base. Flowers white.

Three-celled-fruited Leptospermum. Fl. June, July. Clt. 1800. Shrub 2 to 3 feet.

23 L. du'bium (Spreng. syst. 2. p. 492.) leaves linear, very narrow, bluntish; teeth of calyx glabrous, green. ♄. G. Native of New Holland. The rest unknown.

Doubtful Leptospermum. Shrub.

24 L. pe'ndulum (Sieb. pl. exsic. nov. holl. no. 312.) leaves linear, acute, when young silky, but glabrous in the adult state, dotted, 1-nerved; calyx clothed with silky villi, both on the tube and lobes. ♄. G. Native of New Holland. Branches twiggy, flexile, glabrous.

Pendulous Leptospermum. Fl. Ju. Jul. Clt.? Sh. 2 to 4 ft.

25 L. squarrò̀sum (Sieb. pl. exsic. nov. holl. ex Spreng. syst. addend. p. 194.) leaves lanceolate, acute, squarrose, stiff, glabrous, but when young silky beneath; calyx sessile, glabrous, coloured, obtuse. ♄. G. Native of New Holland.

Squarrose Leptospermum. Shrub 4 to 6 ft.

26 L. ericoca'lyx (Sieb. pl. exsic. nov. holl. ex Spreng. syst. add.) leaves small, spatulate, quite glabrous, dotted; calyxes nearly sessile, clothed with silky wool. ♄. G. Native of New Holland.

Hairy-calyxed Leptospermum. Shrub 4 to 6 ft.

† *Species not sufficiently known.*

27 L.? umbella'tum (Gærtn. fruct. 1. p. 174. t. 35. f. 3.) flowers umbellate; capsule girded by a circular margin in the middle. ♄. G. Native of New Holland. Perhaps this plant does not belong to the present genus, but it is not sufficiently known.

Umbellate flowered Leptospermum. Shrub.

28 L.? imbrica'tum (Smith, in Lin. trans. 6. p. 300.) leaves obovate, imbricate, nerveless; branches and calyxes glabrous; calycine teeth membranous, coloured, keeled. ♄. G. Native of New Holland. Perhaps a species of *Bæ'ckea.* Flowers white.

Imbricate-leaved Leptospermum. Fl. June, Jul. Clt. 1823. Shrub 4 to 5 feet.

29 L. Amboine'nse (D. C. prod. 3. p. 229.) leaves linear-lanceolate; flowers pedicellate, solitary; calycine lobes deciduous. ♄. S. Native of Amboyna. Myrtus Amboinénsis, Rumph. amb. 2. t. 18. Perhaps a species of *Bæ'ckea*, but the leaves are said to be scattered, and the stamens 23 in number.

Amboyna Leptospermum. Shrub.

Cult. For culture and propagation, see *Callistèmum*, p. 823. All the species are pretty shrubs when in flower.

XIX. BILLO'TIA (dedicated to Madame Tecaphila Billoti, of Turin, a famous botanical artist). R. Br. but not of Colla. hort. rip. t. 23. Leptospérmum, sect. 1. Acònis, D. C. prod. 3. p. 226.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx rather turbinate; limb 5-cleft; lobes valvate. Petals 5. Stamens 10-30, free, shorter than the petals. Style filiform; stigma capitate. Capsule 3-celled.—New Holland shrubs, with alternate, entire, dotted, small leaves. Flowers white, sessile, densely crowded into globose heads.

1 B. margina'ta; flowers capitate; leaves obovate-oblong, edged with white, ciliated, 3-nerved; lateral nerves obsolete at the apex, distant from the margin. ♄. G. Native of New Holland, in Van Lewin's Land, at the Straits of d'Entrecasteaux. Leptospérmum marginàtum, Labill. nov. holl. 2. p. 10. t. 148. Stamens 10, but the habit of the shrub is like that of the other species.

Var. β, glabràta (D. C. prod. 3. p. 226.) leaves nearly glabrous. ♄. G. Fabricia angustifòlia, Otto. in litt.

Marginate-leaved Billotia. Fl. June, July. Clt. 1820. Sh. 4 to 6 feet.

2 B. flexuòsa; flowers capitate; leaves linear-lanceolate, acuminated at both ends, glabrous, 3-nerved; lateral nerves approximating the margin even to the apex; branches flexuous, glabrous. ♄. G. Native of New Holland, on the east coast, at Geography Bay and in Kangaroo Island. Leptospérmum flexuòsum, Spreng. nov. prov. 25. no. 51. Link, enum. hort. berol. 2. p. 26. Coll. hort. ripul. append. 1. p. 111. t. 2. Metrosidèros flexuòsa, Willd. enum. p. 514. Flowers white.

Flexuous-branched Billotia. Fl. May, July. Clt. 1823. Sh. 4 to 6 feet.

3 B. linearifòlia; flowers capitate; leaves linear-lanceolate, acute at both ends, nearly nerveless, glabrous in the adult state, but when young villous as well as the branches. ♄. G. Native of New Holland, on the eastern coast, in Decre's Island. Leptospérmum linearifòlium, D. C. prod. 3. p. 226. Flowers white.

Linear-leaved Billotia. Shrub 3 to 6 feet.

Cult. For culture and propagation see *Fabrícia.*

XX. FABRI'CIA (in honour of J. C. Fabricius, the celebrated Danish entomologist). Gærtn. fruct. 1. p. 175. t. 35. Smith, in Lin. trans. 3. p. 265. D. C. prod. 3. p. 229.

Lin. syst. *Icosándria, Monogýnia.* Calyx semi-superior, 5-cleft; with a campanulate tube and valvate lobes. Petals 5, sessile. Stamens indefinite, free. Stigma capitate. Capsule many-celled, girded by the adnate, permanent calyx; cells opening at the apex. Seeds few, winged.—Australian shrubs, with alternate, glaucescent, obovate, dotted leaves; and axillary, solitary, white flowers, on short pedicels.

1 F. myrtifo'lia (Gærtn. l. c.) cells of capsule 2-3-seeded; calycine teeth nearly orbicular; leaves silky when young. ♄. G. Native of New S[illegible]h Wales. Sims, bot. mag. t. 1304. Sieb. pl. exsic. nov. holl. no. 309. F. sericea, Nois.

Myrtle-leaved Fabricia. Fl. May, June. Clt. 1788. Shrub 6 to 10 feet.

2 F. lævigà'ta (Gærtn. l. c.) cells of capsule 5-8-seeded; calycine teeth triangular; leaves glabrous when young. ♄. G. Native of New Holland, about Port Jackson.

Smooth Fabricia. Fl. May, Jul. Clt. 1788. Sh. 3 to 6 ft.

3 F. stri'cta (Lodd. bot. cab. t. 1219.) the figure and description of this plant are so insufficient, as not to admit of us giving a description of it; and the plant is now lost in the gardens. ♄. G. Native of New Holland.

Straight Fabricia. Fl. April, Ju. Clt. 1827. Sh. 2 to 4 ft.

Cult. The species of *Fabricia* are well fitted for a conservatory, as they do not flower until they have attained a considerable size. A mixture of loam and peat is the best soil for them. Cuttings taken from young wood root readily, if planted in a pot of sand, with a bell-glass placed over them.

XXI. BÆ'CKEA (in honour of Abraham Bæck, a Swedish physician, and much esteemed friend of Linnæus, who received the *B. frutéscens* from him). Lin. gen. 191. R. Br. gen. rem. 16. D. C. prod. 3. p. 229.—Bæ'ckea and Júngia, Gært. fruct. 1. p. 157. and 175.—Imbricària and Bæ'ckea, Smith, in Lin. trans. 3. p. 258.—Móllia, Gmel.

Lin. syst. *Penta-Decándria, Monogýnia.* Tube of calyx turbinate; limb 5-cleft, permanent. Petals 5. Stamens 5-10, shorter than the petals. Style filiform; stigma capitate. Capsule 2-5-celled, many-seeded, inclosed in the calyx.—Shrubs, with opposite, glabrous, dotted leaves. Flowers pedicellate, small, white. In *B. virgàta* the filaments are glandular at the tops and probably in the others.

1 B. frute'scens (Lin. spec. p. 514.) leaves linear, awnless; pedicels axillary, 1-flowered; calycine teeth membranous, coloured. ♄. G. Native of China. Osbeck, trav. p. 251. t. 1.

Smith, in Lin. trans. 3. p. 260. B. Chinénsis, Gærtn. fruct. 1. p. 157. t. 31. Capsule 3-celled.

Shrubby Bæckea. Fl. Sept. Dec. Clt. 1806. Sh. 2 to 3 ft.

2 B. PA'RVULA (D. C. prod. 3. p. 229.) leaves elliptic-oblong, obtuse, rather mucronate; peduncles axillary, umbelliferous. ♄. G. Native of New Caledonia. Leptospérmum párvulum, Labill. sert. caled. p. 62. t. 61. Capsule 3-celled. Stamens 10.

Small Bæckea. Shrub 1 foot.

3 B. VIRGA'TA (Andr. bot. rep. t. 598.) leaves linear-lanceolate; peduncles axillary, umbelliferous. ♄. G. Native of New Caledonia. Sims, bot. mag. 2127. Lodd. bot. cab. t. 341. Colla, hort. ripul. t. 6. Leptospérmum virgàtum, Forst. gen. p. 36. Smith, in Lin. trans. 3. p. 265. Melaleùca virgàta, Lin. fil. suppl. t. 343. Stamens 5-10.

Twiggy Bæckea. Fl. Aug. Oct. Clt. 1806. Sh. 2 to 3 ft.

4 B. PINIFÒLIA (D. C. l. c.) leaves long, linear, acuminated, nerveless; peduncles axillary, 3-flowered, longer than the leaves. ♄. G. Native of New Caledonia. Leptospérmum pinifòlium, Labill. sert. caled. p. 63. t. 62. Stamens 10. Capsule 3-celled.

Pine-leaved Bæckea. Shrub 1 to 2 feet.

5 B. LINIFÒLIA (Rudge, in Lin. trans. 8. p. 297. t. 12.) leaves linear, long, mucronate; pedicels short, axillary, 1-flowered. ♄. G. Native of New Holland, about Port Jackson. B. trichophýlla, Sieb. pl. exsic. nov. holl. no. 280. Leaves 6-8 lines long, distant.

Flax-leaved Bæckea. Fl. July, Aug. Clt. 1818. Shrub 2 to 3 feet.

6 B. DIFFU'SA (Sieb. pl. exsic. nov. holl. no. 276.) leaves linear, ciliately crenulated, nerveless, acutish; pedicels axillary, 1-flowered, about the length of the leaves, with 2 bracteoles under the flower. ♄. G. Native of New Holland. The 2 bracteoles are just under the flower-bud at first, but at last in the middle of the peduncle, in consequence of its elongation. Segments of calyx obtuse, and ciliately crenulated.

Var. β, striàta (D. C. prod. 3. p. 230.) leaves striated lengthwise. ♄. G. Native of New Holland. Perhaps a proper species. Habit stiffer.

Diffuse Bæckea. Shrub 1 to 2 ft.

7 B. DENSIFÒLIA (Smith in Lin. trans. 3. p. 260.) leaves linear-subulate, acerose, crowded on the branches, quadrifariously imbricated, each terminated by a short, somewhat deflexed deciduous mucrone. ♄. G. Native of New Holland. Bæ'ckea fasciculàta, Sieb. pl. exsic. nov. holl. no. 260. Leaves 2-3 lines long. Calyx not ciliated.

Dense-leaved Bæckea. Fl. Aug. Oct. Shrub 1 to 2 ft.

8 B. GRA'CILIS (Cunningh. in Field's new south wales, p. 349.) leaves linear, obtuse, imbricated in 4 rows; stem branched, erectish; flowers capitate, terminal, and lateral. ♄. G. Native of New Holland, in arid rocky situations. A slender shrubby plant.

Slender Bæckea. Clt. 1826. Shrub 1 to 2 ft.

9 B. RAMOSI'SSIMA (Cunningh. in Field's new south wales, p. 249.) much branched, diffuse; leaves lanceolate-linear, acutish, spreading, with scabrous margins; teeth of calyx coloured, ciliated; flowers solitary, axillary, pedunculate, bibracteate. ♄. G. Native of New Holland, on the Blue Mountains.

Much-branched Bæckea. Clt. 1824. Shrub 1 to 2 ft.

10 B. PULCHE'LLA (D. C. prod. 3. p. 230.) leaves linear, acute, crowded in the axils and on the branchlets; pedicels axillary, 1-flowered, bractless, length of the leaves. ♄. G. Native of New Holland, on the eastern coast. Leaves crowded, spreading. Flowers innumerable.

Neat Bæckea. Shrub 1 to 2 ft.

11 B. DIOSMIFÒLIA (Rudge in Lin. trans. 8. p. 298. t. 13.) leaves oblong, rather cuneated, keeled, acute, crowded, imbricate, and are, as well as the calyxes, ciliated; flowers axillary, solitary, approximate, sessile. ♄. G. Native of New Holland. Myrtàcea, Sieb. pl. exsic. nov. holl. no. 585.

Diosma-leaved Bæckea. Fl. Aug. Oct. Clt. 1824. Shrub 1 to 2 ft.

12 B. CAMPHORA'TA (R. Br. ex Sims, bot. mag. t. 2694.) quite glabrous; leaves loosely imbricated in 4 rows, obovate-lanceolate, flat, dotted, finely marginate, on short petioles; flowers axillary, twin or solitary, pedicellate; stamens 15. ♄. G. Native of New Holland.

Camphor-scented Bæckea. Fl. July, Aug. Clt. 1818. Shrub 2 to 3 ft.

13 B. MICROPHY'LLA (Rudge ex Sieb. pl. exsic. nov. holl. no. 282.) leaves triquetrous, short, obtuse, glabrous, imbricated; flowers axillary, solitary, sessile; tube of calyx 5-furrowed; calycine segments ciliated and membranous. ♄. G. Native of New Holland, on the eastern coast. Imbricària ciliàta, Smith in Lin. trans. 3. p. 176. and therefore Escallònia ciliàta, Rœm. et Schultes. Stereóxylum ciliàtum, Poir. Júngia tenélla, Gærtn. Stamens 5.

Small-leaved Bæckea. Shrub 1 to 2 ft.

14 B. BREVIFÒLIA (D. C. prod. 3. p. 230.) leaves triquetrous, very short, obtuse, glabrous, imbricated in 4 rows; flowers axillary, solitary, on very short pedicels; tube of calyx turbinate; calycine lobes glabrous, acute. ♄. G. Native of New Holland. Leptospérmum brevifòlium, Rudge in Lin. trans. 8. p. 299. t. 14. Bæ'ckea carnósula, Sieb. pl. exsic. nov. holl. no. 278.

Short-leaved Bæckea. Shrub 1 to 2 ft.

15 B. MICRA'NTHA (D. C. prod. 3. p. 230.) leaves obovate, triquetrous, glabrous, imbricated in 4 rows; flowers axillary, solitary, sessile. ♄. G. Native of New Holland. A much branched shrub.

Small-flowered Bæckea. Shrub 1 to 2 ft.

16 B. CRENULA'TA (D. C. l. c.) leaves obovate-cuneiform, crenulated upwards; flowers axillary, solitary, sessile; calycine lobes roundish, denticulated. ♄. G. Native of New Holland? Imbricària crenulàta, Smith in Lin. trans. 3. p. 259. Júngia imbricàta, Gærtn. fruct. 1. p. 175. t. 35. Móllia imbricàta, Gmel. syst. p. 420. Stereóxylum crenulàtum, Poir. Escallònia crenulàta, Rœm. et Schultes. Stamens 5.

Crenulated-leaved Bæckea. Shrub 1 to 2 ft.

17 B. OBOVA'TA (D. C. l. c.) leaves obovate, entire, glabrous, spreading; pedicels axillary, rather longer than the leaves, bearing 2-3 sessile flowers in an umbel at the top. ♄. G. Native of New Holland, at King George's Sound.

Obovate-leaved Bæckea. Shrub 1 to 2 ft.

18 B. DIOSMOÌDES (Sieb. pl. exsic. nov. holl. no. 277.) leaves ovate, acute, erect, rather concave, and somewhat imbricated; flowers axillary, solitary, sessile; lobes of calyx ovate, membranous, somewhat denticulated at the apex. ♄. G. Native of New Holland.

Diosma-like Bæckea. Shrub 1 to 2 ft.

19 B. SAXÍCOLA (Cunningh. mss.) ♄. G. Native of New Holland. This species is not described.

Rock Bæckea. Shrub 1 to 2 ft.

Cult. All the species of *Bæ'ckea* are delicate little shrubs. Their culture and propagation are the same as that recommended for *Fabricia*, see p. 827.

Tribe III.

MY'RTEÆ (plants agreeing with *My'rtus* in important characters). D. C. dict. class. vol. xi. and note, 1826. prod. 3. p. 230. Calyx 4-5-cleft. Petals 4-5. Stamens free. Fruit fleshy, many-celled.—Trees and shrubs, for the most part natives within the tropics, and a very few of New Holland.

The leaves are opposite and full of pellucid dots, or opaque, quite entire. The peduncles are axillary, sometimes 1-flowered, sometimes bearing trichotomous cymes, and sometimes branched, and approximating into a terminal panicle.

XXII. SONNERA'TIA (so named by the younger Linnæus in memory of M. Sonnerat, who travelled into New Guinea, the East Indies, and China, and communicated many new plants to the botanists of Europe; author of Voyage a la Nouvelle Guinée, Paris, 1776. 4to., Voyage aux Indes Orientales, et à la Chine, 1774-1781. Paris, 1782. 4to.) Lin. fil. suppl. p. 38. Juss. gen. 325. D. C. prod. 3. p. 231.—Aublètia, Gærtn. fruct. 1. p. 379. t. 78. but not of others.

LIN. SYST. *Icosándria, Monogýnia.* Calyx campanulate, 4-6-cleft, adhering to the ovarium at the base; lobes acute, valvate in æstivation. Petals 4-6, spreading, alternating with the lobes of the calyx, or wanting. Stamens numerous; filaments free; anthers roundish. Style filiform; stigma subcapitate. Base of berry adnate to the permanent calyx, but free at the apex, and appearing semi-superior, nearly globose, many-celled; rind membranous; cells 10-15, separated by thin dissepiments. Seeds numerous, nestling in fleshy pulp, curved, exalbuminous. Embryo curved, with a long radicle, and foliaceous, short, convolute, unequal cotyledons.—Small trees, with tetragonal branches. Leaves opposite, entire, oval, thickish, 1-nerved, nearly veinless, without any dots. Flowers terminal, nearly solitary, large.

1 S. A'CIDA (Lin. fil. suppl. p. 252.) branchlets tetragonal; leaves oval-oblong; calyx 6-cleft; petals 6; berry globose. ♄. G. Native of New Guinea and the Moluccas, in swamps. Lam. ill. t. 420. dict. 1. p. 429. Pagapàte, Sonn. voy. p. 16. tt. 10, 11. Aublètia caseolàris, Gærtn. fruct. 1. p. 379. t. 78. Rhizóphora caseolàris, Lin. spec. p. 635. Mángium caseolàre rùbrum, Rumph. amb. 3. t. 74. Blatti, Rheed. mal. 3. t. 10. Bagatpat, Ray, hist. 3. luz. p. 83. Petals red. Pulp of fruit acid.

Acid-fruited Sonneratia. Tree 40 ft.

2 S. A'LBA (Smith in Rees' cycl. vol. 33. no. 2.) branchlets terete; leaves oval-roundish; flowers 6-8-cleft, apetalous; berry obconical at the base, and depressed at the apex. ♄. S. Native of the Moluccas. Mángium caseolàre álbum, Rumph. amb. 3. t. 73.

White Sonneratia. Tree 50 ft.

3 S. APE'TALA (Buchan in Sym. emb. ava. 3. p. 313. t. 25. ex Smith in Rees' cycl. vol. 33. no. 3.) branches terete, pendulous; leaves ovate-lanceolate; flowers 4-cleft, apetalous. ♄. S. Native of Ava near Rangoon, on the wet inundated banks of the coast. Roth, nov. spec. p. 233.

Apetalous Sonneratia. Tree.

Cult. For culture and propagation see *Psídium*, p. 833.

XXIII. NE'LITRIS (from *νη, ne*, priv. and *ελυτρον, elytron*, a seed-vessel; in reference to the berry, which is without any partitions). Gærtn. fruct. 1. p. 134. t. 27. Lindl. coll. no. 16. in a note. D. C. prod. 3. p. 231.—Decaspérmum, Forst. gen. no. 37.—Psìdium species, Lin. fil.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx obovate; limb 4-5-toothed. Petals 4-5. Stamens numerous, free, inserted in a narrow ring at the base of the limb of the calyx. Style filiform; stigma capitate. Ovarium 4-10-celled; ovula fixed to the axis. Berry crowned by the calyx, few or many-seeded. Seeds covered by a bony testa. Embryo straightish, with a thick radicle, which is much longer than the cotyledons, which are ovate-lanceolate and minute.—Australian shrubs, with opposite, ovate or oblong, shining, dotless, 1-nerved, entire leaves; pedunculate flowers, and small fruit.

1 N. JAMBOSE'LLA (Gærtn. l. c.) leaves ovate, acute; peduncles axillary, 1-flowered, nearly the length of the leaves; ovarium 8-10-celled. ♄. G. Native of New Caledonia, and of the Society Islands. Decaspérmum fruticòsum, Forst. l. c. Psídium decaspérmum, Lin. fil. suppl. p. 252.

Jambosella Nelitris. Clt. 1810. Shrub 6 to 8 ft.

2 N. PANICULA'TA (Lindl. l. c.) leaves oblong, acuminated; flowers terminal and axillary, panicled; ovarium 4-celled. ♄. G. Native of the Moluccas. Eugènia polýgama, Roxb. hort. beng. p. 92. N. polýgama, Spreng. syst. 2. p. 488.

Panicled Nelitris. Tree.

3 N.? URVÍLLEI (D. C. prod. 3. p. 231.) panicles axillary and terminal, about the length of the leaves; bracteas linear, acute; tube of calyx hemispherical, pubescent, with ovate lobes; fruit 5-celled; leaves lanceolate, acuminated, opaque, stiff, glabrous on both surfaces; branchlets pubescent. ♄. S. Native of the Island of Praslin, one of the Sechelles. Leaves 2 inches long, and 8 lines broad. Flower-bud globose. Stamens and style about equal in length to the petals, which are oval-oblong. The fruit being unknown, the genus to which the plant belongs is therefore doubtful.

D'Urville's Nelitris. Tree.

4 N. HU'MILIS; dwarf; leaves elliptic-lanceolate, tapering to both ends, glabrous; panicles terminal; calycine segments triangular, acute; petals nearly orbicular. ♄. G. Native of New Holland. Stamens connected into a ring at the base, numerous, exserted. Stigma tapering. (v. s. in herb. Lamb.)

Dwarf Nelitris. Shrub 2 ft.

5 N.? PSIDIOI'DES; leaves elliptic, tapering to both ends, acuminated at the apex; peduncles racemose, axillary; pedicels opposite, and are, as well as the calyx, downy; branches angular; calycine segments equal in breadth, shorter than the petals. ♄. G. Native of New Holland. Stigma capitate. (v. s. in herb. Lamb.)

Guava-like Nilitris. Shrub 6 ft.

Cult. For culture and propagation see *Psídium*, p. 833.

XXIV. CAMPOMANE'SIA (dedicated to Rodriguez C. de Campomanes, a Spanish naturalist). Ruiz et Pav. fl. per. prod. p. 72. t. 13. syst. p. 128. Lindl. coll. no. 16. in a note. H. B. et Kunth, nov. gen. amer. 6. p. 150. D. C. prod. 3. p. 232.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx globose; limb 5-parted; lobes ovate. Petals 5. Stamens numerous, free, inserted in a narrow ring at the base of the limb of the calyx. Style filiform; stigma peltately capitate. Berry many-seeded, pulpy, globose, crowned by the calyx, 10-12-seeded (Ruiz et Pav.), 7-10-celled; cells containing about 9 seeds. Seeds 10-12, imbedded in pulp, disposed in one circular series, inserted in a large fleshy placenta, ex Kunth, somewhat reniform, ex Ruiz et Pav.; testa granular and resiniferous.—American trees. Leaves opposite, petiolate, conduplicate, entire, full of pellucid dots. Peduncles one or many-flowered, rising from the axils of the fallen leaves. Berry crowned by the calyx.

1 C. LINEATIFÒLIA (Ruiz et Pav. syst. 128. fl. per. ined. 4. t. 422.) leaves oval, acute; pedicels axillary, aggregate, bibracteolate. ♄. S. Native of the Andes of Peru, in very hot places. It is also cultivated in the gardens of Peru, under the name of *Palillo*, for the sake of its fruit, which are eaten by the inhabitants, and has much the taste of the Guava. The fruit is yellow and sweet-scented.

Lined-leaved Campomanesia. Tree.

2 C. CORNIFÒLIA (H. B. et Kunth, nov. gen. amer. 6. p. 150. t. 147.) leaves nearly elliptic, acute, clothed with fine pubescence beneath; lower peduncles aggregate or branched. ♄. S. Native of New Granada, near Ibague, where it is called *Guyavo de Anselmo*, and where the fruit is eaten by the inhabitants. Perhaps the same as the preceding species.

Dog-wood-leaved Campomanesia. Tree.

3 C.? TOMENTÒSA (H. B. et Kunth, l. c.) leaves elliptic-oblong, acutish, coriaceous, clothed with rufescent tomentum beneath. ♄. S. Native of New Granada, near Ibague. Flowers and fruit unknown.

Tomentose Campomanesia. Tree.

Cult. For culture and propagation see *Psídium*, p. 833.

XXV. PSI'DIUM (from ψίδιον, *psidion*, the Greek name of the pomegranate. It is derived from ψιω, *psio*, to make small, in reference to the number of seeds). Lin. gen. no. 615. Lam. ill. 416. Lindl. coll. no. 16.—Guaiàva, Tourn. inst. t. 443. Gærtn. fruct. 1. p. 185. t. 38.—Psídium and Buchárdia, Neck.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx ellipsoid (f. 121. *a.*) or obovate, usually contracted at the apex; limb ovate, undivided, but afterwards 1-5-cleft (f. 121. *d.*). Petals 5 (f. 121. *b.*). Stamens numerous, free, inserted in a broad circle almost through the whole undivided part of the limb. Style filiform (f. 121. *c.*); stigma capitate. Ovarium 5-20-celled (f. 121. *e.*) (ex Mart. in litt.); cells bipartite; from the septiform placenta being cleft at the margin, many of the cells become abortive at maturity. Ovula numerous, horizontal (f. 121. *e.*), fixed to the margin of the placenta. Berry many-seeded, corticate by the tube of the calyx, and crowned by its lobes. Seeds nestling in the pulp in the mature fruit, with a bony testa. Embryo form of a horse-shoe, with a hard crustaceous testa; radicle longer than the cotyledons, which are very small; cover of embryo separable at the radicle.—Trees or shrubs, natives of America within the tropics. Leaves opposite, feather-nerved, dotless. Peduncles axillary, 1-3-flowered, bibracteate. Flowers white. Fruit edible; cells usually not distinguishable at maturity. *Guava* is a corruption of the American name *Guayaba.*

* *Branchlets tetragonal.*

1 P. PU'MILUM (Vahl. symb. 2. p. 56.) branchlets tetragonal; leaves lanceolate, acute, glabrous above, tomentose and lined beneath; pedicels 1-flowered, shorter than the leaves; fruit globose. ♄. S. Native of the Moluccas, Ceylon, and Java. Blume, bijdr. fl. ned. ind. p. 1093.—Rumph. amb. 1. t. 49. P. angustifòlium, Lam. dict. 3. p. 16. Branches and under side of leaves white, ex Lam. P. cujavíllus, Burm. fl. ind. p. 114, but the peduncles are said to be 2-flowered, and the leaves ovate.

Var. β, Guadalupénse (D. C. prod. 3. p. 233.) leaves linear-lanceolate, velvety from rufous down beneath, as well as on the branchlets. ♄. S. Native of Guadaloupe. Perhaps the same as the Indian plant.

Dwarf Guava. Shrub 2 to 3 ft.

2 P. AROMA'TICUM (Aubl. guian. 1. p. 485. t. 191.) branchlets tetragonal; leaves oblong, acuminated, glabrous; peduncles 1-flowered; fruit globose, 4-celled. ♄. S. Native of the woods of Guiana and Cayenne. Buchárdia, Neck. gen. no. 728. Berry yellow, hardly the size of a cherry. The bruised leaves have the smell of balm.

Var. β, grandiflòrum (Aubl. guian. t. 190.) leaves ovate. ♄. S. Native along with the first, which it is very like, but smaller.

Aromatic Guava. Fl. July. Clt. 1779. Shrub 5 to 8 ft.

3 P. ACUTA'NGULUM (D. C. prod. 3. p. 233.) branchlets acutely tetragonal, almost 4-winged, glabrous; leaves ovate or elliptic-oblong, short, petiolate, rather attenuated at both ends, glabrous, full of pellucid and somewhat tubercular dots; pedicels solitary, 1-flowered; calycine lobes ovate, reflexed, longer than the tube, which is obovate before expansion. ♄. S. Native of Brazil, near Ega. Pedicels nearly an inch long. Leaves about 3 inches long.

Var. β, ácidum (Mart. herb.) leaves more obtuse at the base, hardly with any pellucid dots. ♄. S. Native of Brazil, at Nogueira, in the province of Rio Negro. Fruit globose, glabrous, pale yellow, size of a Borsdorffer apple. Lobes of calyx ovate, obtuse, erect, and usually connate, crowning the fruit; pulp acid, citron-coloured. Seeds orbicular, compressed, pale brown.

Acute-angled-branched Guava. Shrub.

4 P. STRIATE'LLUM (D. C. prod. 3. p. 233.) branchlets tetragonal, glabrous; leaves oblong, gradually acuminated, hardly obtuse at the base, on very short petioles, glabrous, and full of tubercular dots on both surfaces; pedicels solitary, 1-flowered, glabrous; ovarium obovate, striated lengthwise. ♄. S. Native of Brazil. Allied to *P. turbiniflòrum.* Leaves with pellucid dots when young. Perhaps a species of *Mýrtus.*

Striated-fruited Guava. Shrub 10 to 12 ft.

5 P. PUNCTULA'TUM (D. C. l. c.) branches somewhat tetragonal; leaves ovate, cuneated at the base, short-acuminated at the apex, glabrous, dotted beneath, and bearded in the axils of the veins; peduncles 1-flowered; ovarium broad, globose. ♄. S. Native of Brazil. Petioles half an inch long. Peduncles longer than the petioles. Young leaves villous and dotted. Lobes of calyx broad, very blunt, and spreading. Perhaps a *Mýrtus.*

Dotted Guava. Shrub 4 to 6 ft.

6 P. RIVULA'RE (Mart. herb. ex D. C. l. c.) branchlets somewhat tetragonal; leaves oval or ovate, short-acuminated, glabrous above, when young white beneath, clothed with rufous down at the nerves, but glabrous in the adult state; pedicels solitary, 1-flowered, opposite, at the base of the branchlets of the same year; fruit spherical. ♄. S. Native of Brazil, between Coari and Ega by rivulet sides. Lobes of calyx oval, obtuse. Fruit 10-celled.

Rivulet Guava. Shrub 6 to 10 ft.

7 P. MARIBE'NSE (Mart. herb. D. C. prod. 3. p. 233.) glabrous; upper part of branches tetragonal; leaves on short petioles, elliptic-oblong, cuneated at the base, bluntish at the apex; pedicels 1 flowered, a little longer than the petioles; fruit spherical. ♄. S. Native of Brazil, at Maribi, near the river Tapura. Leaves 2 inches long, and an inch broad. Petioles 2 lines long. Fruit 6 lines in diameter. Lobes of calyx short, at length obliterated or deciduous.

Maribi Guava. Shrub 6 to 10 ft.

8 P. MONTA'NUM (Swartz, fl. ind. occ. p. 879.) branches tetragonal; leaves oval-oblong, acuminated, quite glabrous; peduncles many-flowered; fruit roundish. ♄. S. Native of Jamaica, on the mountains. Wood very hard. Fruit small, acid, smelling like the flowers of the bitter-almond; hence it is called *Almandron.* Leaves broadly subcrenated according to the author, but almost entire according to the specimens examined. The wood is excellent, of a dark-colour and curled grain; it is easily worked, and takes a fine polish.

Mountain Guava. Clt. 1779. Tree 60 to 100 ft.

9 P. PYRÍFERUM (Lin. spec. 672.) branches tetragonal; leaves elliptic, acute, lined with rather prominent nerves, pubescent beneath; pedicels 1-flowered; fruit pear-shaped. ♄. S. Native of the Caribbee Islands and the continent of America, near Cumana, and now cultivated every where within the tropics, for the sake of its fruit. Lindl. bot. reg. 1079. Ruiz et Pav. fl. per. ined. 4. t. 418. Rumph. amb. 1: t. 47. Trew. ehr. t. 43. Guayàva pyrifórmis. Gærtn. fruct. 1. t. 38. P. vulgàre, Rich. act. soc. hist. par. p. 110. The common *Guava* is pear-shaped, and of a yellowish colour when ripe. Pulp sweet, aromatic, and pleasant. The fruit of the *guava* is eaten both by the natives and Europeans, either in its crude state or when made into jellies.

Pear-bearing or Common Guava. Fl. June, July. Clt. 1656. Tree 10 to 20 ft.

10 P. POMI'FERUM (Lin. spec. p. 672.) branches tetragonal;

leaves oval or oblong-lanceolate, pubescent beneath; peduncles 3-8, or many-flowered; fruit globose. ♄. S. Native of the West Indies, Mexico, and South America, from whence it has migrated to the East Indies, but is said to grow wild in Cochin-china, by Loureiro. Perhaps indigenous to both Asia and America, or probably two species are confused. Rumph. amb. 1. t. 48.—Mer. sur. t. 57. Hern, mex. p. 85. with a figure. Fruit yellow, somewhat astringent, with an agreeable odour. The root and young leaves are astringent, and are esteemed useful in strengthening the stomach. Peduncles downy, varying from one to many-flowered, whence it has been joined with *P. pyríferum* by Raddi, under the name of *P. Guaiàra*. Pulp of fruit red.

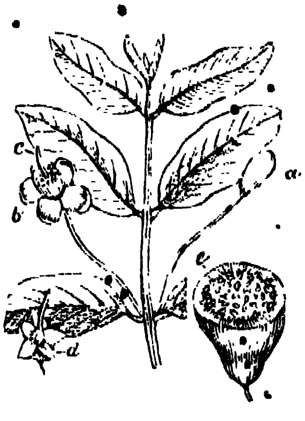


FIG. 121.

Var. β, sapidissima (Jacq. hort. schoenbr. 3. p. 62. t. 366.) peduncles 1-flowered.—Native country unknown. Berry dirty yellow, larger than a plum.

Apple-bearing or Common Red Guava. Fl. June, July. Clt. 1692. Shrub 6 to 15 ft.

11 P. HIA'NS (Mart. herb. D. C. prod. 3. p. 234.) branches tetragonal; leaves oval, obtuse at the base, and usually at the apex, puberulous on both surfaces, but hairy on the nerves beneath; peduncles solitary, 1, rarely 2-flowered, axillary, erect, lateral ones usually deflexed; flower-bud globose, gaping at the apex. ♄. S. Native of Brazil, at Vaodo, Parama, in Tabuleira, and Catingas. Branches, peduncles, and calyxes velvety from short rufous down. Ovarium obovate. Limb of calyx cup-shaped; lobes 5, roundish, at length reflexed.

Gaping Guava. Shrub 6 to 10 ft.

12 P. TURBINIFLÒRUM (Mart. in litt. ex D. C. 3. p. 234.) branches tetragonal, hairy; leaves ovate-oblong, gradually acuminated, obtuse at the base, on very short petioles, beset with tubercular dots on both surfaces, and hairy on the nerves beneath; pedicels 1-flowered, solitary, villous; calyx gaping, at length lobed; ovarium oblong, turbinate. ♄. S. Native of Brazil. Pedicels 9-10 lines long. Ovarium and calyx becoming glabrous at length. Branches opposite, at length terete.

Top-flowered Guava. Shrub 10 to 20 ft.

13 P. CINE'REUM (Mart herb. ex D. C. l. c.) branches tetragonal; leaves oblong, mucronate, on very short petioles, glabrous above, but clothed with adpressed canescent villi beneath; peduncles 1-3-flowered; fruit ovate, crowned by the lobes of the calyx, which are roundish-ovate and short. ♄. S. Native of Brazil, in the province of St. Paul. Perhaps a narrow-leaved variety of *P. incanéscens*.

Grey Guava. Shrub 4 to 6 ft.

14 P. INCANE'SCENS (Mart. herb. ex D. C. l. c.) branches tetragonal; leaves obovate, on short petioles, cuneated at the base, obtuse, and mucronate at the apex, glabrous above, but clothed with adpressed canescent villi beneath; peduncles 3-flowered; young fruit ovate, crowned by the lobes of the calyx, which are ovate and short. ♄. S. Native of Brazil, in fields near Taubate, in the province of St. Paul. A very distinct species. Branchlets rather downy. Leaves 2½ inches long, and 1½ broad. Fruit nearly like that of *Eugènia*, 4-5-seeded.

Hoary Guava. Shrub 4 to 6 ft.

15 P. GRANDIFÒLIUM (Mart. herb. ex D. C. l. c.) branches tetragonal, thick, clothed with white tomentum; leaves obovate, mucronate, on short petioles, cuneated at the base, glabrous above, but clothed with white tomentum beneath; peduncles 1-flowered; fruit globose, nearly naked. ♄. S. Native of Brazil, in fields at Ypanema, in the province of St. Paul. Like *P. incanéscens*, but the down is more woolly. Leaves 3 inches long. Stem 1-3 feet high. Root thick. Fruit about the size of a walnut. Perhaps the same as P. grandiflòrum, Ruiz et Pav. fl. per. ined. 4. t. 421. f. a.

Great-leaved Guava. Shrub 1 to 3 ft.

16 P. RU'FUM (Mart. herb. ex D. C. l. c.) branchlets tetragonal, densely clothed with rufous hairs, as well as the peduncles, bracteas, and calyxes; leaves elliptic or elliptic-oblong, on short petioles, villous on both surfaces when young, but in the adult state glabrous on the upper surface, and clothed with rufescent villi beneath; pedicels in the axils of the lower branchlets, but somewhat racemose; young fruit ovate-roundish, crowned by the lobes of the calyx, which are short and obtuse. ♄. S. Native of Brazil, in mountain fields in the province of Minas Geraes. Branchlets hairy, but the branches are terete and smooth. Leaves 4 inches long, and 1½ or 2 inches broad. Bracteoles linear.

Rufous Guava. Shrub 4 to 6 ft.

17 P. PUBE'SCENS (Mart. herb. ex D. C. l. c.) branches rather tetragonal; pedicels, bracteas, and calyxes hairy; leaves nearly sessile, oblong, acute, when young downy on both surfaces, hoary beneath; pedicels 1-flowered; bracteoles linear-subulate; lobes of calyx acute. ♄. S. Native of Brazil, in the province of Pernambuco, near the river Termo. Flowers large. Ovarium broadly obovate, not constricted at the apex. Habit nearly of *Cratæ̀gus eriocárpa*.

Pubescent Guava. Shrub 3 to 4 ft.

* * *Branchlets terete.*

18 P. GUINEE'NSE (Swartz, fl. ind. occ. 2. p. 881.) branches terete, pubescently villous; leaves petiolate, ovate, glabrous above, clothed with rusty tomentum beneath, as well as the petioles; peduncles 1-3-flowered; fruit roundish. ♄. S. Cultivated in the West Indies, but is said to have been introduced from Guinea. Berry fulvous, rather pubescent, red inside, about the size of a nutmeg, of an exquisite taste.

Guinea Guava. Shrub 8 to 12 ft.

19 P. POLYCA'RPON (Lamb. in Lin. trans. 11. p. 231. t. 17.) branches terete, hairy; leaves almost sessile, ovate-oblong, acute, pubescent above, wrinkled and scabrous beneath; peduncles 3-flowered; fruit globose. ♄. S. Native of the Island of Trinidad. Ker. bot. reg. 653. Branches reclinate. Fruit yellow inside, about the size of a plum, of a delicate taste. The middle flower on the peduncle is sessile, and the lateral ones pedicellate, as in the preceding and following species.

Many-fruited Guava. Fl. May. Clt. 1810. Shrub 3 to 6 ft.

20 P. ARA'CA (Raddi, mem. 1821. p. 5. t. 1.) branchlets terete, hairy; leaves petiolate, oval or oblong, obtuse, downy or hairy on both surfaces; peduncles axillary, 1-3-flowered; fruit ovoid. ♄. S. Native of Brazil, in fields about Rio Janeiro. P. minus, Mart. herb. Berry about the size of those of a sorbus, greenish-yellow on the outside, but whitish within. Very nearly allied to *P. Guineénse*, but the leaves are velvety above, not glabrous, and the nerves more elevated.

Araca Guava. Shrub 4 to 6 ft.

21 P. FLUVIA'TILE (Rich. ex herb. Thib.) branchlets terete, glabrous; leaves petiolate, oval, quite glabrous; lower ones obtuse at both ends, but the upper ones are acuminated at both ends; pedicels opposite, 1-flowered, almost 10-times the length of the petioles. ♄. S. Native of Cayenne, along the banks of rivers. P. Guianénse, Pers. ench. 2. p. 27. Peduncles an inch and a half long. Style longer than the stamens. Stigma hardly

capitate. Fruit unknown. Leaves full of pellucid dots. Perhaps a *Mýrtus.*

River-side Guava. Shrub 6 to 8 feet.

22 P. DENSI'COMUM (Mart. herb. ex D. C. l. c.) branches terete, rather compressed at the apex, glabrous; leaves petiolate, ovate-lanceolate, gradually acuminated, glabrous; pedicels 1-flowered, 3 or 4-times longer than the petioles; fruit globose. ♄. S. Native of Brazil, on the banks of the Solunois, and at Lake Ega. Tree glabrous, with a dense head. Allied to *P. fluviátile*, but differs in the pedicels being shorter.

Dense-headed Guava. Tree 20 feet.

23 P. LITTORA'LE (Raddi, mem. 1831. p. 6. t. 1. f. 2.) branchlets terete; leaves oval-oblong, thickish or coriaceous, attenuated at the base, bluntly acuminated at the apex, glabrous on both surfaces, shining above; pedicels 1-flowered, longer than the petioles; fruit exactly pear-shaped. ♄. S. Native of Brazil, on the sea-shore, where it is called by the inhabitants *Araca de Praya.* Fruit greenish-yellow, but white inside.

Shore Guava. Shrub 6 to 10 feet.

24 P. RIPA'RIUM (Mart. herb. ex D. C. l. c.) branches terete; pedicels and calyxes hairy; leaves almost sessile, linear-oblong, obtuse at the apex, rather cordate at the base, pubescent beneath, and nearly glabrous above; pedicels 3-flowered; fruit pear-shaped. ♄. S. Native of Brazil, on the banks of rivers. Nearly allied to *P. turbiniflòrum.* Leaves 3 inches long and an inch broad, with somewhat sinuated crenated margins. Lobes of calyx very blunt.

River-side Psidium. Tree 20 to 30 feet.

25 P. GUAVIRÒBA (D. C. prod. 3. p. 235.) glabrous; branches terete; leaves oval-lanceolate, acuminated, tapering to the base, petiolate; pedicels 1-flowered, length of petioles; fruit globose; calycine lobes short and blunt. ♄. S. Native of Brazil, in fields at Ypanema, in the province of St. [illegible], where it is called by the inhabitants *Guaviroba de Canorro* or *Guavirobo de Campo.* P. canìnum, Mart. herb. but not of Lour. Leaves 2 inches long, and 9-10 lines broad. Fruit the size of a large pea.

Guaviroba. Shrub 6 to 10 feet.

26 P.? DECUSSA'TUM (D. C. l. c.) branchlets terete, rather hairy; leaves oval, obtuse, membranous, opaque; pedicels axillary, 1-flowered, length of leaves; calyx at length bluntly 5-lobed, reflexed; style incurved. ♄. S. Native of Brazil, in fields, in the province of Minas Geraes. Mýrtus decussàta, Mart. herb. Leaves 6 lines long and 3 lines broad. Branches and branchlets opposite, slender. Stamens very numerous. Calyx glabrous.

Decussate-branched Guava. Shrub 2 to 3 feet.

27 P.? DESERTÒRUM (Mart. herb. ex D. C. prod. 3. p. 236.) branchlets terete, and are as well as the petioles and pedicels clothed with short velvety down; leaves ovate, acute, rather cordate at the base, with crenated margins, glabrous on both surfaces, full of pellucid dots; pedicels 1-flowered, slender; fruit ovate; lobes of calyx roundish. ♄. S. Native of Brazil, in the desert of Bahia. A small neat tree, with pale green leaves. Leaves 15-18 lines long, and 7-9 lines broad. Petioles 2-3 lines long. Pedicels 10-12 lines long. Flowers small.

Desert Guava. Tree 10 to 15 feet.

28 P.? TENUIFÒLIUM (Mart. herb. ex D. C. l. c.) branchlets terete, glabrous as well as the petioles and pedicels; pedicels 1-3 together, axillary, 1-flowered; leaves ovate, obtuse at the base, but acuminated at the apex, glabrous, but beset with crowded, very minute dots: fruit globose; lobes of calyx roundish. ♄. S. Native of Brazil, in the desert of Bahia. Fruit 5-celled; cells biovulate. Pedicels 5-6 lines long, slender, bractless at the apex. Leaves membranous. Very nearly allied to *P. desertòrum.*

Fine-leaved Guava. Tree 15 to 20 feet.

29 P. OLIGOSPE'RMUM (Mart. herb. ex D. C. l. c.) branches terete or compressed, slender, glabrous; leaves elliptic, acuminated, glabrous, full of pellucid dots; pedicels 1-flowered, rather compressed, thrice the length of the petioles; flower-bud oblong, acute; fruit obovate, subglobose, turbinate at the base, 1-3-seeded. ♄. S. Native of Brazil, in woods on the banks of rivers in the province of Bahia. Bark greyish. Leaves an inch long and 5-lines broad. Fruit nodding, yellow. Seeds imbedded in bitter, rather diaphanous pulp. P. oligospérmum, Link, enum. is perhaps different from this.

Few-seeded Guava. Shrub 8 to 10 feet.

30 P. LANUGINO'SUM (Ruiz, et Pav. fl. per. ined. 4. t. 421. f. b.) branches terete; leaves oblong, obtuse, crenated, woolly; peduncles 3-flowered, the middle flower sessile, and the lateral ones pedicellate, bearing 2 bracteas at the base of each; tube of calyx long, 4-cleft, with the lobes acute; stamens exserted. ♄. S. Native of Peru. Petals obovate. Fruit long, terete, 4-celled, crowned by the lobes of the calyx. Seeds reniform. Shrub woolly in every part.

Woolly Guava. Shrub 6 to 8 feet.

31 P.? MYRSINÌTES (D. C. prod. 3. p. 236.) branchlets terete, clothed with rufous hairs; pedicels axillary, solitary, 1-flowered, angular, hairy; bracteoles deciduous; ovarium turbinate, glabrous; lobes of calyx 5, very blunt; leaves oblong, almost sessile, obtuse at the base, acutish at the apex, villous on the margins, and middle nerve above, the rest glabrous. ♄. S. Native of Brazil, in deserts, in the provinces of the mines. Mýrtus myrsinìtes, Mart. herb. Pedicels 3-4 lines long. Throat of calyx broad, and staminiferous, as in *Psídium.* Leaves 12-15 lines long, and 3-4 broad. Perhaps a species of *Mýrtus.*

Myrtle-like Psidium. Tree 12 feet.

32 P. BROWNIA'NUM (Mart. herb. ex D. C. l. c.) branchlets hairy; pedicels solitary, axillary, 1-flowered, with lanceolate-linear bracteoles under the flowers; flower-bud ovate, acute, glabrous, at length splitting unequally into 5 roundish lobes; leaves ovate, almost sessile, bluntly attenuated at the apex, opaque, glabrous on both surfaces as well as the branches. ♄. S. Native of Brazil, in the desert of Bahia. A small, densely branched tree, with greyish bark. Leaves 2 inches long and 1 inch broad, with rather revolute margins. Petals roundish. Stamens usually changing into elliptic petals. Fruit unknown.

Brown's Guava. Tree 10 to 12 feet.

33 P. OBOVA'TUM (Mart. herb. ex D. C. l. c.) branchlets terete, velvety from short down; leaves obovate, coriaceous, quite glabrous in the adult state, but when young rather velvety; fruit nearly globose, glabrous. ♄. S. Native of Brazil, in fields, in the province of St. Paul. Very like the Brasilian *P. Cattleyànum*, but differs in the branches being beset with short villi.

Obovate-leaved Guava. Shrub 10 to 15 feet.

34 P. CATTLEIA'NUM (Sabine, in hort. trans. 4. p. 315. t. 11.) branchlets terete, glabrous; leaves obovate, coriaceous, quite glabrous; pedicels opposite, 1-flowered, hardly equal in length to the petioles. ♄. S. Native of China and of Brazil, or rather originally brought from China to Brazil. Lindl. coll. t. 16. Ker. bot. reg. 622. P. coriàceum, Mart. herb. P. Chinénse, Lodd. cab. The fruit of this *Guava* is rather large, nearly spherical, of a fine deep claret colour, growing in the axils of the leaves; the skin has much the consistence of that of a fig, but is thinner; the interior is a soft fleshy pulp, purplish red next the skin, but becoming paler towards the middle, and at the centre is quite white; it is juicy, and in consistence is much like a strawberry, to which it bears some resemblance in flavour.

Cattley's Guava. Fl. May, Ju. Clt. 1818. Tr. 10 to 20 ft.

35 P. CORDA'TUM (Sims, bot. mag. t. 1779.) branchlets terete, glabrous; leaves sessile, cordate-roundish, rather stem-clasping,

coriaceous, glabrous on both surfaces; pedicels aggregate or few-flowered, longer than the flowers. ♄. S. Native of Guadaloupe. P. amplexicaúle, Rich. in herb. Juss. Pers. ench. 2. p. 27.

Cordate-leaved Guava. Fl. May, July. Clt. 1811. Shrub 5 to 6 feet.

36 P. emargina'tum (Ruiz, et Pav. fl. per. ined. 4. t. 418.) peduncles axillary; leaves ovate, obtuse, coriaceous, somewhat cordate at the base, and emarginate at the apex, much shorter than the peduncles; fruit globose, crowned by the lobes of the calyx: calyx 4-cleft; petals 4. ♄. S. Native of Peru. Branches apparently terete.

Emarginate-leaved Guava. Shrub 8 to 10 feet.

37 P. macroste'mon (Ruiz et Pav. fl. per. ined. 4. t. 420. f. a.) branches dichotomously branched; leaves small, crowded, ovate, acute, downy; pedicels rising from the axils of the upper leaves, all 1-flowered, and forming a terminal raceme; stamens very long; stigma somewhat capitate; calyx 4-lobed; petals 4, obovate. ♄. S. Native of Peru. Branches apparently terete.

Long-stamened Guava. Shrub.

38 P. rutidoca'rpum (Ruiz et Pav. fl. per. ined. 4. t. 420. f. b.) branches terete; leaves oval, acuminated, wrinkled; pedicels axillary, solitary, 1-flowered; fruit oval, rugged, crowned by the lobes of the calyx; petals 5. ♄. S. Native of Peru.

Rugged-fruited Guava. Shrub.

† *Species not sufficiently known.*

39 P. du'bium (H. B. et Kunth, nov. gen. amer. 6. p. 152.) branchlets compressed; leaves on short petioles, lanceolate, terminating each in a long, narrow acumen, membranous, glabrous; peduncles racemose, short, few-flowered. ♄. S. Native of South America, among rocks on the banks of the Orinoco, near Atures. Calyx 4-cleft. Petals 4. Ovarium 2-celled; cells 2-seeded. Perhaps a species of *Mýrtus* or a *Eugènia.*

Doubtful Guava. Shrub 2 to 3 feet.

40 P. canìnum (Lour. coch. p. 310.) leaves on short petioles, ovate, acutish, tomentose on both surfaces; peduncles racemose, many-flowered, axillary, and terminal; fruit ovate. ♄. G. Native of China, about Canton. Loureiro calls this *P. caninum*, because dogs are delighted with it in the same manner as cats with valerian. The leaves are rather serrated. This species comes very near to *P. pùmilum.*

Dog's Guava. Shrub 2 to 3 feet.

41 P. nìgrum (Lour. l. c.) leaves ovate-lanceolate, glabrous on both surfaces, scattered; peduncles terminal, branched; fruit globose. ♄. G. Native of Cochin-china, in woods. Berry small, black. Leaves serrated.

Black-fruited Guava. Tree.

42 P. ru'brum (Lour. l. c.) leaves oblong, obtuse, glabrous, on short petioles; flowers axillary, sessile, crowded, 4-petalled; fruit oblong. ♄. G. Native of Cochin-china, in woods. Berry red, small, with an acrid sweet taste.

Red-fruited Guava. Tree.

43 P. I'ndicum (Raddi, mem. p. 6.) leaves rather fleshy, shining, rounded at the apex; berries roundish, sessile. ♄. S. Native of Brazil, where it is cultivated for its fruit, and has probably been imported from the East Indies.

Indian Guava. Tree 10 to 12 feet.

44 P. latifòlium (Link, enum. 2. p. 27.) leaves tapering into the petiole, which is short, and somewhat acuminated. ♄. S. Native of South America. Nothing more is known about this plant.

Broad-leaved Guava. Shrub 10 to 12 feet.

45 P. Willemetia'num (D. C. prod. 3. p. 337.) ♄. S. Native of the Mauritius, between Port St. Louis and Le Pouce. Willem. herb. maur. p. 28. Perhaps a species of *Jossínia.*

Willemet's Guava. Shrub.

Cult. The species of *Guàva* grow freely in a mixture of loam and peat. Cuttings will strike root if planted in sand, with a hand-glass over them. Some of the species fruit in the stoves of this country; but they are hardly worth the trouble and expense, to grow them for this purpose.

XXVI. JOSSI'NIA (meaning unknown to us). Comm. mss. D. C. prod. 3. p. 337.—Eugènia species, Lam. Mýrtus species, Spreng.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx turbinately globose; limb 4-parted, even to the base; lobes distinct in the bud. Petals 4. Stamens numerous, free, inserted in a broad disk, as in *Psidium.* Fruit fleshy, turbinately globose, crowned by the calycine lobes, many-seeded. Seeds not well known. Trees and shrubs, natives of the Mauritius, where they are commonly called *Bois de nèfle* by the colonists. Leaves stiff. Peduncles axillary, 1-flowered, bibracteolate, under the flowers. Fruit edible. This genus is not well known; it differs from *Eugènia* in the broad stamniferous disk; in the fruit being many-seeded, and in the seeds being like those of *Mýrtus:* it differs from *Psidium* in the lobes of the calyx being 4, not 5, and in the flower-bud; from *Mýrtus* and *Mýrcia* in the parts of the flower being 4, not 8.

1 J. mespiloìdes (D. C. prod. 3. p. 337.) leaves ovate-lanceolate, on long petioles, coriaceous, with revolute margins, glabrous and shining above, but velvety beneath, as well as on the branches and peduncles; pedicels 1-flowered, longer than the petioles. ♄. S. Native of the Island of Bourbon, where it is called *Bois de pèche marron, Bois de nèfle à grandes feuilles.* Eugènia mespiloìdes, Lam. dict. 3. p. 205. Mýrtus mespiloìdes, Spreng. syst. 2. p. 481. Petioles 8 lines long. Pedicels nearly an inch long. Fruit, according to the specimen in Jussieu's herbarium, ovate, fleshy, crowned by the calyx, velvety-canescent. Flowers large.

Medlar-like Jossinia. Tree 50 feet.

2 J. lu'cida (D. C. prod. 3. p. 337.) leaves obovate-orbicular, on short petioles, glabrous, coriaceous, pale beneath; flowers solitary, on short pedicels. ♄. S. Native of the Mauritius, where it is commonly called *Bois de cloux.* Eugènia lùcida, Lam. dict. 3. p. 205. Mýrtus Commersònii, Spreng. syst. 2. p. 479. Fruit obovate-globose, glabrous, crowned by the obtuse lobes of the calyx.

Shining Jossinia. Tree.

3 J. orbicula'ta (D. C. l. c.) leaves roundish, obtuse, coriaceous, glabrous, on short petioles, with reflexed margins; pedicels very short, 1-flowered, 5-6 together in a fascicle, and are as well as the calyxes rather velvety. ♄. S. Native of the Mauritius. Eugènia orbiculàta, Lam. dict. 3. p. 204. Mýrtus orbiculàta, Spreng. syst. 2. p. 480. There is a variety of this with solitary pedicels. Leaves 2 inches broad and hardly 2¼ inches long. Pedicels 3 lines long.

Orbicular-leaved Jossinia. Clt. 1823. Shrub 6 to 8 feet.

4 J. ellí'ptica (D. C. l. c.) leaves elliptic, attenuated at the base, bluntish at the apex, glabrous, rather coriaceous, on short petioles; flowers axillary, 2-4 in a fascicle, almost sessile; calyxes pubescent. ♄. S. Native of the Mauritius. Eugènia ellíptica, Lam. dict. 3. p. 206. but not of Smith. Flowers small. Lateral nerves of leaves hardly prominent, with the limb opaque, without any pellucid dots.

Elliptic-leaved Jossinia. Shrub 2 to 3 feet.

5 J. tinifo'lia (D. C. prod. 3. p. 238.) leaves oval, coriaceous, on short petioles, when young clothed with white velvety down as well as the branchlets, peduncles, and calyxes; pedicels solitary or twin, 3 or 4 times longer than the leaves. ♄. S. Native of the Mauritius, where it is called *Bois de nèfle.*

Eugènia tinifòlia, Lam. dict. 3. p. 204. Perhaps sufficiently distinct from *J. buxifòlia*. Pedicels 3-4 lines long.

Tinus-leaved Jossinia. Tree or shrub.

6 J. buxifòlia (D. C. l. c.) leaves ovate-oblong, bluntish, coriaceous, glabrous, on very short petioles, with reflexed margins, pale beneath; pedicels solitary, slender, shorter than the leaves, exactly axillary; calyxes clothed with silky velvety down. ♄. S. Native of the Island of Bourbon, on the mountains, where it is called *Bois de nèfle commun*. Eugènia buxifòlia, Lam. dict. 3. p. 204. Mýrtus Borbónica, Spreng. syst. 2. p. 481. Pedicels 7-8 lines long. Flowers small. Fruit unknown.

Box-leaved Jossinia. Shrub.

7 J. cotinifòlia (D. C. l. c.) leaves ovate or roundish, obtuse, rather coriaceous, with somewhat revolute margins, on very short petioles, full of pellucid dots, glabrous on both surfaces, pale beneath; pedicels 1-3 together, axillary, or supra-axillary, very slender, a little shorter than the leaves. ♄. S. Native of the Island of Bourbon, on the mountains. Eugènia cotinifòlia, Jacq. obs. 3. p. 3. t. 53. Mýrtus cotinifòlia, Spreng. syst. 2. p. 481. exclusive of the country. Leaves an inch long. Pedicels 8-10 lines long; in some specimens always solitary.

Cotinus-leaved Jossinia. Shrub.

8 J. cassinoìdes (D. C. l. c.) leaves ovate, acutish at both ends, coriaceous, glabrous, full of pellucid dots; pedicels 2-3-together, filiform, shorter than the leaves; lobes of calyx roundish. ♄. S. Native of Madagascar. Eugènia cassinoìdes, Lam. dict. 3. p. 205. Mýrtus cassinoìdes, Spreng. syst. 2. p. 481.

Cassine-like Jossinia. Tree.

Cult. All the species of *Jossinia* are worth cultivating, for the sake of their beautiful foliage, as well as for their flowers, which are rather large and white. Their culture and propagation are the same as that recommended for *Psidium*, p. 833.

XXVII. MYRTUS (from μυρον, *myron*, perfume; μυρτος of the Greeks; *Myrtus* of the Dutch; and almost the same in every European language). Lin. gen. 617. Gærtn. fruct. 1. p. 184. t. 38. D. C. prod. 3. p. 138.—Mýrtus species of Kunth. Mýrtus, Tourn. inst. t. 409.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx subglobose; limb 5-parted, rarely 4-parted. Petals 5, rarely 4. Stamens free. Berry 2-3-celled, nearly globose, crowned by the limb of the calyx. Seeds numerous in each cell even when mature, rarely solitary, bony, reniformly incurved. Embryo curved, with very short semicylindrical cotyledons, which are much shorter than the radicle.—Shrubs. Leaves opposite, full of pellucid dots. Pedicels axillary, 1-flowered.—In the most part of the species the flowers and seeds are unknown, it is therefore doubtful whether many of them belong to the genus. A great many of them probably belong to the genus *Mýrcia.*

Sect. I. Leucomy'rtus (λευκος, white, and μυρτος, *myrtos*, a myrtle; in reference to the white flowers of the species). D. C. prod. 3. p. 238. Flowers white. Seeds curved in the manner of a horse-shoe; when mature disposed irregularly in the cells.

* *Flowers 4-cleft, with few stamens.*

1 M. nummula'ria (Poir. dict. 4. p. 407. exclusive of the country) pedicels axillary, solitary, 1-flowered, shorter than the leaves, bibracteolate under the flowers; leaves roundish, shining, small, glabrous; stem creeping; calyx 4-cleft. ♄. G. Native of the Maclove or Falkland Islands, and at the Straits of Magellan. Gaud. ann. sc. nat. 5. t. 2. f. 5. Lucet-musque, Pernet. voy. 2. p. 58.

*Money-wort-*like Myrtle. Sh. creeping.

2 M. vaccinoìdes (H. B. et Kunth. nov. gen. amer. 6. p. 130.) pedicels axillary, solitary, 1-flowered, shorter than the leaves, bibracteolate at the apex; leaves small, elliptic-ovate, acute, coriaceous, veinless, glabrous; branchlets hairy; calyx 4-lobed; stamens 8. ♄. S. Native of Peru. Leaves 3-4 lines long. Petals ciliated. Berry subglobose, 2-3-celled. Seeds few, rather reniform. Embryo of *M. commùnis.* Allied to *M. nummulària.*

Whirtle-berry-like Myrtle. Sh. 1 ft.

3 M. myrsinoìdes (H. B. et Kunth, nov. gen. amer. 6. p. 132.) pedicels axillary, solitary, 1-flowered, bibracteolate at the apex; leaves small, obovate, somewhat emarginate, rather coriaceous, reticulated, shining, and are as well as the branches glabrous; flowers 4-cleft, octandrous. ♄. G. Native of Peru, in cold parts between Ayavaca and Guancabamba. A much-branched shrub. Leaves 4-5 lines long. Fruit unknown. Nearly allied to *M. vaccinoìdes.*

Myrsine-like Myrtle. Sh. 6 ft.

4 M. microphy'lla (Humb. et Bonpl. pl. equin. 1. p. 19. t. 4.) pedicels axillary, 1-flowered, shorter than the leaves, bearing 2 bracteoles under the flowers; leaves oval, acute, coriaceous, glabrous above, and clothed with adpressed silky down beneath; calyx 4-cleft, hairy. ♄. S. Native of the cold mountains of Saragura, near Loxa. Habit of *Phýlica* or *Erìca.* Petals white, ciliated. Margins of leaves revolute, 4 lines long. Berry red, globose, 2-3-celled. Ovula 2-4 in each cell. Embryo like that of *E. commùnis*, according to Kunth.

Small-leaved Myrtle. Sh. 3 ft.

* * *Flowers 5-cleft, polyandrous.*

5 M. commu'nis (Lin. spec. p. 673.) pedicels solitary, 1-flowered, about the length of the leaves, bearing 2 linear bracteoles under the flowers; calyx 5-cleft; leaves ovate or lanceolate, acute. ♄. F. Native of the south of Europe, on exposed rocks. Berry roundish, 2-3-celled. Seeds reniform. Embryo arched, with a long radicle, and small, equal cotyledons. Gærtn. fruct. 1. p. 184. t. 38. Lam. ill. t. 410. Duham. ed. nov. 1. p. 43. Corolla white. The common *myrtle* is well known as an elegant evergreen sweet-scented shrub, but unfortunately just too tender to abide our winters in the open air, without some protection. It was a great favourite among the ancients, and was sacred to Venus. *Myrtle* wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens. Both branches and berries were put into wine, and the latter were used in the cookery of the ancients. The *myrtle* was also one of their medicinal plants. All parts of it are astringent, but it is discarded from modern practice.

A. melanocárpa (D. C. prod. 3. p. 239.) fruit blackish. This variety of *myrtle* is frequent in the south of Europe, and in gardens, where there are varieties of it with double flowers and variegated leaves.

Var. α, Romàna (Mill. fig. t. 184. f. 1.) leaves ovate; pedicels longer. The *common broad-leaved* or *Roman myrtle.* It is sometimes called *flowering myrtle*, because it flowers more freely in England than any other variety.

Var. β, Tarentìna (Mill. dict.) leaves ovate; berries rounder. The *box-leaved myrtle.* Flowers small, and open late in the autumn. Leaves small.

Var. γ, Itálica (Mill. dict.) leaves ovate-lanceolate, acute; branches more erect. The *Italian* or *upright myrtle.*

Var. δ, Bæ'tica (Mill. dict.) leaves lanceolate, acuminated. The *orange-leaved myrtle.*—Blackw. t. 114.

Var. ε, Lusitánica (Lin. spec.) leaves lanceolate-ovate, acute. M. acùta, Mill. dict.—Clus. hist. 1. p. 66. f. 1. The *Portugal myrtle.* The *nutmeg myrtle* appears to be only a variety of this.

Var. β, Bélgica (Mill. dict.) leaves lanceolate, acuminated.

The *broad-leaved Dutch myrtle.* Leaves crowded, dark green. The *double-flowering myrtle* appears to be of this variety.

Var. θ, mucronàta (Lin. spec.) leaves linear-lanceolate, acuminated. M. mínima, Mill. *Rosemary* or *thyme-leaved myrtle.*

B. leucocárpa (D. C. prod. 3. p. 239.) fruit white. ♄. H. Native of Greece and the Balearic Islands. Smith, prod. fl. græc. p. 36. The fruit of this kind is rather large, edible, with a grateful taste and smell.

The above varieties are constant; but there are others in the gardens which are more variable. It will suffice to give the names of a few of these.

1 *Gold-striped broad-leaved myrtle.*

2 *Broad-leaved Jews' myrtle.* This variety has its leaves frequently in threes, on which account it is said to be in esteem among the Jews in their religious ceremonies.

3 *Gold-striped-leaved orange-myrtle.*

4 *Silver-striped Italian myrtle.*

5 *Striped box-leaved myrtle.*

6 *Silver-striped rosemary-leaved myrtle.*

7 *Silver-striped nutmeg myrtle.*

8 *Cock's-comb or bird's-nest myrtle.*

9 *Spotted-leaved myrtle.*

Common Myrtle. Fl. July, Aug. Clt. 1597. Sh. 3 to 10 ft.

6 M. MYRICOIDES (H. B. et Kunth, nov. gen. amer. 6. p. 131. t. 539.) peduncles axillary, 1-flowered, hardly shorter than the leaves, pubescent, furnished with 2 bracteoles at the apex; leaves oblong, coriaceous, veinless, glabrous above, puberulous beneath as well as on the branchlets; calyx 5-cleft. ♄. S. Native of Peru. Petals glabrous. Berry nearly globose, 3-4-celled. Seeds numerous, nearly reniform. Embryo as in *M. communis.*

Myrica-leaved Myrtle. Sh. 4 to 6 ft.

7 M. SALUTA'RIS (H. B. et Kunth, l. c. p. 132.) pedicels axillary, solitary, 1-flowered, shorter than the leaves, puberulous; leaves ovate-oblong, obtuse, rather membranous, reticulated, glabrous, shining; branchlets rather hairy; calyx quinquefid. ♄. S. Native near Carichana, on the banks of the Orinoco, where it is called *Guayava-Arayan.* Leaves 2 inches long, and an inch broad. Petals ciliated, length of stamens. Berry nearly globose, 2-celled, about the size of a sloe. Seeds bony, solitary, or numerous in the cells. A decoction of the root of this species is considered good against hæmorrhages.

Salutary Myrtle. Sh. 4 to 6 ft.

8 M. CALOPHY'LLA (H. B. et Kunth, l. c. p. 133.) pedicels axillary, 1-flowered, solitary, or twin, shorter than the leaves, bibracteolate at the apex; leaves elliptic-oblong, acute, running into the petiole at the base, coriaceous, veinless, shining, and are as well as the branchlets glabrous; calyx 5-cleft. ♄. S. Native on the banks of the Orinoco, near Maypures. Leaves 2 inches long. Pedicels 10-14 lines long, when bearing the fruit. Flowers as large as those of *M. commùnis.* Berry nearly globose, 2-celled, about the size of a sloe. Embryo probably like that of *M. commùnis.*

Beautiful-leaved Myrtle. Sh. 6 to 8 ft.

9 M. U'GNI (Molin. chil. ed. gall. p. 133.) pedicels axillary, 1-flowered, a little recurved, rather longer than the leaves, bearing each 2 linear bracteoles under the flower; leaves ovate, acute, glabrous; calyx 5-cleft, with the lobes reflexed. ♄. G. Native of Chili, where it is called *U'gni,* and by the Spaniards *Murtilla.* Feuill. obs. 3. p. 44. t. 31. Lam. dict. 4. p. 412. Petals almost like those of *M. commùnis.* Fruit red, musky, nearly globose, 8-seeded, compressed. The natives of Chili express the juice from the fruit and mix it with water, to which it gives a beautiful red colour. It forms a very refreshing drink, and has something of the odour of rosemary.

Ugni Myrtle. Sh. 2 to 3 ft.

10 M.? ARA'YAN (H. B. et Kunth, l. c. p. 133.) pedicels axillary, solitary, 1-flowered, a little shorter than the leaves, bibracteolate under the flower; leaves ovate-oblong, acute, membranous, reticulated, glabrous, shining; branchlets hairy; calyx 5-cleft. ♄. S. Native of Peru, at Gonzanama, at the elevation of 3000 feet, where it is called, along with some other species, *Arayan.* Leaves 20-22 lines long. Flowers size of those of *M. commùnis.* Berry globose, red, 2-celled; cells 1-seeded.

Arayan Myrtle. Sh. 6 to 8 ft.

11 M. MULTIFLÒRA (Juss. herb. Jaume, in Duham. ed. nov. 1. p. 208.) pedicels solitary, axillary, elongated, and in terminal racemes; flowers 5-cleft; leaves ovate-orbicular, mucronate, opaque, coriaceous, hairy on the petioles, margins, and nerves on both surfaces, as well as the branchlets and peduncles. ♄. S. Native of Chili and Peru. Leaves 8-9 lines long and 6-7 broad, green above, and white beneath. Pedicels 6 inches long, glabrous at the apex, as well as the calyxes, but hairy at the base. Fruit and seeds unknown. Perhaps the same as *M. Lùma,* Molin. chil. 173. but *M. Lùma* of Spreng. syst. appears to be different. The bark is astringent, and possesses the same qualities as that of *M. ùgni.*

Many-flowered Myrtle. Shrub.

12 M.? GOLTHEA'NA (Mart. herb. ex D. C. prod. 3. p. 240.) pedicels 1-flowered, 3 times shorter than the leaves, bearing 2 acute bracteoles at the apex: lower ones axillary and solitary; upper ones in umbellate fascicles; leaves oval, acuminated, rather coriaceous, quite glabrous, shining; tube of calyx globose, with 5 oblong-oval lobes. ♄. S. Native of Demerara, and of Brazil at Rio Janeiro. Leaves 4 inches long, 15-16 lines broad, opaque, dotted beneath. Peduncles 9 lines long. Flowers large. Petals 7-9 lines long. Staminiferous disk broad, as in *Psidium.* Ovarium globose, 2-3-celled. Stamens very numerous, shorter than the petals. Fruit globose, yellowish, 5-celled. Seeds many, oblong.

Goethe's Myrtle. Shrub.

13 M.? E'LEGANS (D. C. prod. 3. p. 240.) glabrous; pedicels axillary, 1-flowered, solitary, about equal in length to the leaves; bracteas small under the flowers; lobes of calyx 4, broad, acutish; tube obovate; leaves lanceolate, attenuated at both ends, acute, stiff, opaque; branches tetragonal. ♄. S. Native of Brazil, in the province of Minas Geraes. Psídium élegans, Mart. herb. Habit almost of *M. commùnis* var. *Romàna.* In habit it comes near *Eugènia Pìa;* but neither the flower-bud nor fruit has been seen, and therefore the genus is very doubtful.

Elegant Myrtle. Shrub.

14 M.? FASCICULA'RIS (D. C. l. c.) pedicels 1-flowered, 4-7-together, axillary, a little shorter than the leaves, bearing 2 linear bracteoles under the flowers; leaves oval-oblong, acute at both ends, full of pellucid dots, clothed with velvety pubescence when young, as well as the calyxes; calyx 5-lobed; lobes very obtuse. ♄. S. Native of Cayenne. Flowers and leaves rising in fascicles from the axils of the old leaves, as in *Pỳrus.* Pedicels 6 lines long. Fruit and seeds unknown. Limb of calyx 5-cleft, not 5-parted.

Fascicled-flowered Myrtle. Shrub.

15 M.? BRACHYSTE'MON (D. C. l. c.) pedicels 1-flowered, axillary, 3-5-together, 3 times shorter than the leaves, bearing 2 ovate bracteoles under the flowers; leaves ovate, glabrous, bluntly somewhat acuminated; calyx 5-cleft; branchlets rather downy. ♄. S. Native of St. Domingo and Porto Rico, in hedges. Eugènia Patrìsii, Spreng. in herb. Balb. but not of Vahl. Leaves an inch long, and 6 lines broad. Pedicels 3-5 lines long. Flowers small. Stamens 20, shorter than the petals. Fruit and seeds unknown.

Short-stamened Myrtle. Shrub.

SECT. II. RHODOMY'RTUS (from ῥοδον, *rhodon,* a rose, and *μυρ-*

roc, *myrtos*, a myrtle, a red myrtle; in reference to the flowers being red). D. C. prod. 3. p. 240. Flowers rose-coloured. Seeds flat, compressed, disposed in two series in each cell. According to Salisbury, this section is sufficient to form a distinct genus.

16 M. TOMENTÒSA (Ait. hort. kew. 2. p. 159) peduncles 1-3-flowered, bearing 2 ovate bracteoles under each flower, shorter than the leaves, and are, as well as the branches and calyxes, velvety; leaves ovate, velvety above in the young state, clothed with hoary tomentum beneath, 3-nerved, with the lateral nerves almost marginal; calyx 5-cleft. ♄. G. Native of China, Cochinchina, and among the Nellygerry Mountains in the East Indies, and in the Island of Junkseilon, ex Salisb. Curt. bot. mag. t. 250. Lois. herb. amat. t. 267. M. canéscens, Lour. coch. p. 311.—Pluk. alm. t. 372. f. 1. Petals rose-coloured, longer than the stamens and style, velvety on the outside. Fruit ovate, 3-celled. Seeds compressed, 2 series in each cell. Embryo as in *M. commùnis* according to Kunth. There is a smoother variety of this species which goes under the name of *M. affinis* in the gardens.

Tomentose Myrtle. Fl. June, July. Clt. 1776. Sh. 2 to 6 ft.

17 M.? SPECTA'BILIS (Blum. bijdr. p. 1083.) peduncles crowded, axillary, 1-flowered, shorter than the leaves; calyx silky, 4-cleft; leaves ovate-oblong, 3-nerved, bluntly acuminated, acutish at the base, coriaceous, glabrous, greyish silvery beneath. ♄. S. Native of Java, in the province of Bantam. Fruit unknown.

Showy Myrtle. Shrub.

† *In the following species the seeds, fruit, and number of the parts of the flower being unknown, it is therefore doubtful whether any of them belong to the genus. Many of them on future examination may prove to belong to the genus Mýrcia, especially those natives of South America.*

* *Pedicels axillary, 1-flowered.*

18 M.? LINIFÒLIA (Spreng. syst. 2. p. 479.) pedicels axillary, 1-flowered, usually solitary, shorter than the leaves; leaves petiolate, linear, obtuse, nerveless, glabrous, flat beneath. ♄. S. Native of the West Indies. The rest unknown. Perhaps the same as *Eugènia leptospermoìdes.*

Flax-leaved Myrtle. Shrub.

19 M.? TENUIFÒLIA (Smith in Lin. trans. 3. p. 280.) pedicels axillary, solitary, 1-flowered, shorter than the leaves; leaves linear, mucronate, with revolute margins, pubescent beneath; calyxes glabrous; petals pubescent. ♄. G. Native of New Holland. Leaves an inch long, and one line broad. Flowers white, one-half smaller than those of *M. commùnis.* Fruit and seeds unknown.

Fine-leaved Myrtle. Clt. 1824. Shrub 3 to 6 ft.

20 M. GRA'MMICA (Spreng. syst. 2. p. 480.) pedicels 1-flowered, usually solitary, capillary, shorter than the leaves; leaves oblong, attenuated at both ends, obtuse, full of parallel veins, and are, as well as the branches, glabrous. ♄. S. Native of Brazil.

Written-leaved Myrtle. Shrub.

21 M.? LU'RIDA (Spreng. l. c.) pedicels 1-flowered, usually solitary, stiff, shorter than the leaves, stipulate at the base; leaves sessile, lanceolate, cuspidate, quite glabrous on both surfaces, reticulately veined. ♄. S. Native of Monte Video.

Lurid Myrtle. Shrub.

22 M.? OVA'LIS (Spreng. syst. 2. p. 479.) pedicels 1-flowered, usually solitary, exceeding the leaves; leaves oval, veiny, glabrous; branches covered with fuscous villi. ♄. S. Native of Brazil.

Oval-leaved Myrtle. Shrub.

23 M.? HE'YNII (Spreng. l. c. p. 248.) pedicels axillary, 1-flowered, usually solitary, length of the petioles, bracteate at the base, and bibracteolate at the apex; leaves elliptic, obtuse, coriaceous, full of pellucid dots, clothed with rusty tomentum when young, as well as the branchlets and pedicels. ♄. S. Native of the East Indies. Mýrtus latifòlia, Roth, nov. spec. p. 232. but not of Aublet. Leaves 3 inches long, and 2 inches broad. Petioles 2 lines long. Fruit, seeds, and number of the lobes of calyx unknown.

Var. β, confèrta (D. C. prod. 3. p. 241.) pedicels 3-5-together; flowers a little smaller than those of the species. Roth, l. c.

Heyne's Myrtle. Shrub.

24 M.? ERYTHROXYLOÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 149.) flowers 3-6-together, axillary, and terminal, 4-5-petalled; leaves elliptic, emarginate, reticulated, coriaceous, glabrous, shining; branchlets rather hairy. ♄. S. Native of South America, near Cumana. Flowers, fruit, and seeds unknown.

Erythroxylum-like Myrtle. Shrub.

** *Peduncles axillary, 2-3 or many-flowered.*

25 M. LU'CIDA (Lin. spec. p. 674.) peduncles usually 3 flowered; flowers 5-petalled, nearly sessile, disposed into a tapering lanceolate spike. ♄. S. Native of Surinam.

Shining Myrtle. Shrub or tree.

26 M.? SELLO'I (Spreng. syst. 2. p. 482.) peduncles capillary, 3-flowered, shorter than the leaves; flowers 5-cleft; leaves oblong, attenuated at both ends, bluntish, opaque, pale and veiny beneath. ♄. S. Native of Brazil.

Sello's Myrtle. Shrub.

27 M. VESTÌTA (Spreng. syst. add., p. 193.) leaves lanceolate, acute, veiny, clothed with woolly tomentum, as well as the branchlets; peduncles very short, nearly opposite; flowers 4-cleft. ♄. S. Native of Brazil, at Rio Grande.

Clothed Myrtle. Shrub.

28 M. MEGAPOTA'MICA (Spreng. l. c.) leaves lanceolate-spatulate, obscurely veined, clothed with yellowish silky down beneath; peduncles aggregate, shorter than the leaves; flowers quadrifid. ♄. S. Native of Brazil, at Rio Grande.

Rio Grande Myrtle. Shrub.

29 M. TRIFLÒRA (Spreng. l. c. but not of Jacq.) peduncles straight, bracteate, 3-flowered, about equal in length to the leaves; flowers crowded, 5-cleft; leaves ovate-lanceolate, acute, glabrous, shining above, and reticulated with veins beneath. ♄. S. Native of Monte Video.

Three-flowered Myrtle. Shrub.

30 M. RUSCIFÒLIA (Willd. spec. 2. p. 970.) peduncles axillary, short, crowded, many-flowered, pubescent; leaves roundish-elliptic, quite glabrous, and full of pitted dots above. ♄. S. Native of the East Indies. Leaves almost the size of those of *Rùscus aculeàtus*, but a little larger and more blunt; when young ornamented with rufescent pili. Flowers and fruit unknown.

Butcher's-broom-leaved Myrtle. Shrub.

*** *Peduncles many-flowered, corymbose, or in branched panicles.*

31 M.? FÍRMA (Spreng. syst. 2. p. 487.) panicles axillary, opposite, trichotomous, tomentose, rather shorter than the leaves; leaves ovate-elliptic, coriaceous, large, rufescent, glabrous, veiny. ♄. S. Native of Brazil. The rest unknown.

Firm Myrtle. Shrub.

32 M.? A'NCEPS (Spreng. neue. entd. 2. p. 170. syst. 2. p. 487.) panicles axillary, erect, about equal in length to the leaves; leaves lanceolate, nearly sessile, coriaceous, shining, full of parallel veins, discoloured beneath; branches 2-edged, quite smooth. ♄. S. Native of Brazil.

Two-edged-branched Myrtle. Shrub.

33 M.? DIOICA (Lin. spec. 675.) peduncles axillary and terminal, trichotomously panicled, length of the leaves; leaves oblong; flowers dioecious. ♄. S. Native of South America. M. dioica, Spreng. syst. 2. p. 486. is probably different from the plant of Lin.

Dioecious Myrtle. Shrub.

34 M. FU'LVA (Spreng. syst. 2. p. 487.) panicle terminal; flowers crowded; leaves oblong-lanceolate, glabrous, as well as the branches. ♄. S. Native of Japan. Berry 2-3-celled; cells 1-seeded. Branches and buds alternate. Leaves solitary, twin or tern. Said to be allied to *Photinia*, and most probably belongs to the one-styled Rosaceous plants.

Fulvous Myrtle. Shrub.

35 M.? UMBRACTÍCOLA (H. B. et Kunth, nov. gen. amer. 7. p. 258.) racemes axillary, bipartite; branchlets glabrous; leaves on short petioles, lanceolate-oblong, very much acuminated, acutish at the base, coriaceous, shining, with revolute margins, puberulous on both surfaces. ♄. S. Native in shady places on the banks of the Orinoco, near Maypures. Calyx globose. Ovarium 2-celled; cells biovulate. The number of petals and the fabric of the seeds are unknown.

Shaded Myrtle. Shrub.

36 M.? MA'XIMA (Molin. chil. p. 173.) peduncles many-flowered; leaves alternate, nearly oval; trunk large. ♄. G. Native of Chili.

Large Myrtle. Shrub 6 to 10 ft.

37 M.? LÆ'VIS (Thunb. fl. jap. 198.) peduncles terminal, umbellate; calyx 5-toothed; leaves ovate, acuminated, acutely serrated, veiny, attenuated at both ends, coriaceous, shining above, reticulated with veins beneath, and clothed with fulvous villi, as well as the panicles and branches. ♄. S. Native of Brazil. The rest unknown.

Smooth Myrtle. Shrub.

38 M. PSIDIOI'DES (Desv. in Hamilt. prod. fl. ind. occ. p. 44.) peduncles axillary and terminal, crowded, and are, as well as the calyxes, pubescent; leaves somewhat ovate-lanceolate, acuminated, full of parallel nerves, pubescent beneath. ♄. S. Native of the West Indies. Perhaps a species of *Mýrcia*.

Guava-like Myrtle. Shrub.

39 M. UMBELLA'TA (Desv. l. c. p. 45.) flowers axillary and terminal, in umbellate fascicles; calyx campanulate, 5-toothed; stem dichotomous, divaricate; branches rather cinereous; leaves ovate, acuminated, glabrous, veiny, nearly sessile. ♄. S. Native of Guiana. Perhaps a species of *Mýrcia*.

Umbellate-flowered Myrtle. Shrub.

40 M. CAULIFLÒRA (Mart.) trunk and branches excorticated, and bearing the flowers; leaves lanceolate, long-acuminated, acute at the base, quite glabrous; flowers crowded; berry globose, of a violaceous purple colour. ♄. S. Native of Brazil.

Stem-flowering Myrtle. Shrub.

N. B. M. Chinénsis, Lour. 8. p. 313. is a species of *Symplòca* according to Desv. in herb. mus. par. not probably distinct from Symplòca Sínica, Ker. bot. reg. t. 710.

Cult. All the species of *myrtle* grow well in a mixture of sandy loam and peat; and cuttings not too ripe strike root readily either in sand or mould.

XXVIII. MY'RCIA (a surname of Venus). D. C. dict. class. hist. nat. vol. xi. and diss. (1826.) D. C. prod. 3. p. 242.—Mýrtus species of Lin. and others.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx globose, rarely ovate (f. 122. *a.*); limb 5-parted. Petals 5 (f. 122. *b.*). Stamens numerous, free. Ovarium 2-3-celled; cells many-ovulate. Berry 1-2-celled, when mature 1-3-seeded. Seeds rather globose, with a smooth testa. Cotyledons foliaceous, corrugately contortuplicate.--Little trees or shrubs, natives of the West Indies and South America. Leaves opposite, quite entire, full of pellucid dots or opaque, furnished with nerves like those of *Mýrtus.* Peduncles axillary and almost terminal, panicled, many-flowered. Flowers white. The species are disposed geographically, in consequence of not being sufficiently known, and therefore there are not more obvious characters as yet known for distributing them into sections.

§ 1. *Sphærocárpæ* (from σφαιρα, *sphaira*, a sphere, and καρπος, *karpos*, a fruit; in reference to the fruit of all the species being spherical). *D. C. prod. 3. p. 243. Fruit or tube of calyx spherical.*

* *Species natives of the West Indies.*

1 M. PUNCTA'TA (D. C. prod. 3. p. 243.) peduncles axillary, opposite, about equal in length to the leaves, 3-flowered; flowers 5-cleft, middle flower on each peduncle sessile, lateral ones pedicellate; bracteoles setaceous; leaves oblong, bluntish, dotted on both surfaces, tender, silky, glabrous in the adult state. ♄. S. Native of the Island of Santa Cruz, not in the East Indies, as it is incautiously written by Persoon. Mýrtus punctàta, Spreng. syst. 2. p. 482. Eugènia punctàta, Vahl. symb. 3. p. 64. Calyx 5-lobed. Petals 4, ex Vahl. but in all probability this is wrong, as it is impossible that the calyx can be 5-lobed, and the petals only 4 in number.

Dotted-leaved Myrcia. Shrub 3 to 6 ft.

2 M.? BALBISIA'NA (D. C. prod. 3. p. 243.) peduncles axillary, longer than the leaves, cymosely-corymbose, bifid, and are, as well as the compressed branches, full of dots; flowers 5-cleft, sessile in the forks of the corymb, the others pedicellate; bracteoles linear; leaves oval, obtuse, glabrous, full of pellucid dots. ♄. S. Native of Guadaloupe. Peduncles sometimes 2, concrete, teretish, ending in 4 bifid 5-flowered branchlets. Calyx dotted, with a silky tube, and a 5-lobed obtuse glabrous limb. Seeds unknown.

Balbis's Myrcia. Shrub 4 to 6 ft.

3 M. DIVARICA'TA (D. C. l. c.) racemes axillary, panicled; pedicels opposite, divaricate; flowers 5-cleft; leaves oval-lanceolate, attenuated at both ends, hardly veined, full of pellucid dots, and are, as well as the branches, glabrous. ♄. S. Native of St. Domingo and Martinique.—Plum. ed. Burm. t. 208. f. 1. Eugènia divaricàta, Lam. dict. 3. p. 203. Mýrtus laurifòlia, Hort. par. Mýrtus divaricàta, Ham. prod. fl. ind. occ. p. 45. Berry ovoid, dark blue, 1-seeded. Allied to *E. virgultòsa*, but distinct.

Divaricate Myrcia. Shrub 4 to 6 ft.

4 M. SORÒRIA (D. C. l. c.) peduncles axillary, shorter than the leaves, downy, having the flowers crowded in racemes at their tops; tube of calyx short, villous, with roundish pubescent lobes; leaves ovate-lanceolate, long and bluntly acuminated, full of pellucid dots, and reticulately veined: adult leaves glabrous on both surfaces; petioles and branches terete and downy. ♄. S. Native of the Island of Trinidad. Sieb. fl. trin. no. 111. Very like *M. Haynеàna*, but differs in the flowers being more crowded, in the leaves being much more distinct, full of pellucid dots, and the branches are terete not gradually compressed. Fruit unknown.

Sister Myrcia. Shrub 5 to 10 ft.

5 M. DEFLE'XA (D. C. prod. 3. p. 244.) peduncles length of leaves, twin in the upper axils of the leaves, and therefore 4 subumbellate and terminal, panicled, many-flowered; flowers 5-cleft; pedicels twin, and are, as well as the branches, villous; leaves elliptic, acuminated, full of pellucid dots, rather shining above, somewhat coriaceous, girded by a marginal nervule. ♄ S. Native of St. Domingo. Eugènia deflèxa, Poir. suppl. 3

p. 124. Lobes of calyx roundish, full of pellucid dots. Style and all the parts of the inflorescence velvety. Leaves rather villous when young, adult ones glabrous, except on the nerves on the under surface, 2 inches long, and 9 lines broad, deflexed. Young fruit ovate. Cotyledons corrugated. Panicles twin in the axils of the upper leaves.

Deflexed Myrcia. Shrub 2 to 3 ft.

6 M.? THOMASIA'NA (D. C. l. c.) peduncles axillary and terminal, opposite, racemose, usually 6-flowered; pedicels opposite, 1-flowered, furnished with one bractea at the base of each; flowers 5-cleft; leaves elliptic, acuminated, opaque, shining above, and full of impressed dots on both surfaces, as well as the branches. ♄. S. Native of the Island of St. Thomas, ex herb. Deless. Peduncles, bracteas, and calyxes puberulous when examined by a lens. Stamens length of petals. Fruit and seeds unknown.

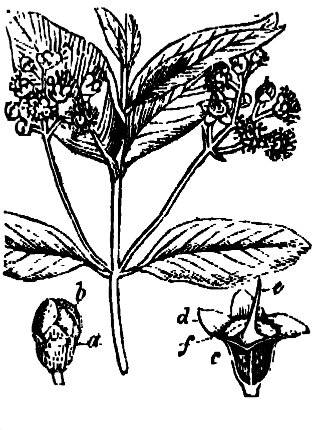
St. Thomas Myrcia. Shrub 6 to 10 feet.

7 M. CORIA'CEA (D. C. prod. 3. p. 243.) peduncles terminal, panicled, glabrous, longer than the leaves; branchlets distant, opposite, bearing 1-3 flowers at the apex; flowers 5-cleft, nearly naked; leaves obovate or elliptic-roundish, obtuse, coriaceous, opaque, with somewhat revolute margins, shining on both surfaces, full of impressed dots above, and are, as well as the branches, glabrous. ♄. S. Native of the Caribbee Islands. —Plum. ed. Burm. t. 208. f. 2. Pluck. alm. 155. f. 3. Mýrtus coriàcea, Vahl, symb. 2. p. 59. Mýrtus cotinifòlia, Poir. dict. 4. p. 410. Mýrtus àcris β, Swartz, prod. and Mýrtus coriàcea, Swartz, fl. ind. p. 912.? but the flowers are said to be 4-cleft. Bracteoles hardly any under the flowers. Berry globose, size of black pepper. Seeds 1-2, nearly globose. Cotyledons foliaceous, corrugately complicated.

Coriaceous-leaved Myrcia. Clt. 1759. Shrub 4 to 6 ft.

8 M. A'CRIS (D. C. l. c.) peduncles axillary and terminal, trichotomous, corymbose, compressed, longer than the leaves; flowers 5-cleft; leaves elliptic, obtuse, convex, coriaceous, quite glabrous, reticulated above from elevated veins, full of very fine pellucid dots. ♄. S. Native of the West Indies, in mountain woods and pastures. Hook. bot. mag. 3153. Mýrtus àcris, Swartz, fl. ind. occ. 2. p. 909. Mýrtus caryophyllàta, Jacq. Caryophýllus racemòsus, Mill. dict. Mýrtus àcris, Coll. hort. ripul. p. 19. but not of Sieb.—Pluk. alm. t. 155. f. 3. Berry oblong, according to Swartz. Allied to *Eugènia Piménta*, but differs in the flowers being always 5-cleft. In Jamaica this tree is commonly called *wild cinnamon* or *wild clove* tree. It is a handsome tree, of a pyramidal form. The timber is very hard, red, and weighty, capable of being polished, and used for mill cogs. The leaves have a very sweet aromatic smell, and on account of their agreeable astringency often used in sauce. The flowers are small and white, with a slightly reddish tinge. The berries are round, and are as large as peas, and have an aromatic smell and taste, which renders them agreeable for culinary purposes. The tree grows in Antigua, Jamaica, and Barbadoes, and fills the woods with the fragrant smell of its leaves, resembling that of cinnamon.

FIG. 122.



Sharp-tasted Myrcia, Wild cinnamon or Wild clove. Fl. May, July. Clt. 1759. Tree 20 to 40 ft.

9 M. PIMENTOÌDES (D. C. l. c.) peduncles axillary and terminal, trichotomously panicled; flowers 5-cleft, those in the forks sessile, the rest pedicellate; leaves ovate, coriaceous, opaque, shining; branchlets acutely tetragonal, and are, as well as the pedicels, glabrous. ♄. S. Native of the West India Islands, and now cultivated in the East Indies. Mýrtus piménta latifòlia, Roxb. hort. beng. p. 37. Mýrtus citrifòlia, Poir. dict. 4. p. 410. Div. ab. Eugènia citrifòlia of the same author. As variable a plant as *Eugènia Piménta*, the leaves lanceolate and acuminated, ex Poir., but oval and obtuse in the specimens, some collected in Guadaloupe, and others in the botanic garden at Calcutta, but it differs from *Eugènia Piménta* in the branches being acutely tetragonal. The leaves, berries, and flower-buds have a hot taste, and a fragrant smell, like those of *M. àcris*, and are used for culinary purposes.

Pimento-like Myrcia. Fl. May. Clt. ? Tree.

10 M. LEPTO'CLADA (D. C., prod. 3. p. 244.) peduncles axillary and subterminal, loosely panicled, glabrous, length of the leaves; pedicels 1-flowered, short; flowers 5-cleft; leaves elliptic-oblong, acuminated, full of pellucid dots, and are glabrous, as well as the branches. ♄. S. Native of St. Domingo. Very like *M. multiflòra*. Leaves 3 inches long, and an inch broad. Flowers small. Lobes of calyx 4, 2 obtuse, and 2 acutish. Berry globose, 1-seeded. Seeds shining. Cotyledons foliaceous, corrugately plicate.

Slender-branched Myrcia. Shrub 5 to 6 ft.

11 M. SPLE'NDENS (D. C. l. c.) peduncles axillary and terminal, panicled, and are as well as the branches villous; buds very villous; leaves ovate-elliptic, acuminated, full of large pellucid dots, glabrous, shining above, areolate with prominent and anastomosing veins; flowers small, 5-cleft. ♄. S. Native of St. Domingo and Guadaloupe, among shrubs on the mountains. Mýrtus spléndens, Swartz, fl. ind. occ. 2. p. 907. Eugènia periplocifòlia, Jacq. coll. 2. p. 108. t. 4. Eugènia microcárpos, Lam. dict. 3. p. 201. Eugènia laxiflòra, Poir. suppl. 3. p. 123.? Leaves an inch and a half long. Berry globose, scarlet. Seeds 2, hemispherical. Cotyledons corrugated. There are varieties of this plant with the panicles either longer or shorter than the leaves, and the flowers either 4 or 5-cleft.

Var. β, Mìni (D. C. l. c.) peduncles shorter than the leaves; flowers 4-cleft. ♄. S. Native of Cayenne. Eugènia Mìni, Aubl. guian. 1. p. 498. t. 197. Perhaps a variety of *M. multiflòra*, but according to the figure it comes nearer to *M. spléndens*. Perhaps two species are confused under the name. Perhaps Eugènia pàtens of Poir. suppl. 3. p. 124. is referrible to this plant.

Splendent Myrcia. Clt. 1803. Tree 12 to 20 feet.

12 M. MULTIFLÒRA (D. C. l. c.) peduncles axillary and terminal, paniculate, longer than the leaves, and are, as well as the branches, glabrous; leaves oval, bluntly acuminated, membranous, full of pellucid dots, with the veins rather prominent on both surfaces, and confluent near the margin. ♄. S. Native of Cayenne. Eugènia multiflòra, Rich. in act. soc. hist. nat. par. 1792. p. 110. Lam. dict. 3. p. 302. Mýrtus multiflòra, Spreng. syst. 2. p. 485. but not of Jaume. Allied to *M. spléndens*, but differs in the flowers being small, glabrous, and 5-cleft. Fruit globose. Seeds 1-2, large, with a hard testa. Cotyledons foliaceous, corrugated.

Many-flowered Myrcia. Shrub.

13 M. FA'LLAX (D. C. l. c.) panicles subterminal; rachis compressed; immature fruit ovate, but when mature globose; leaves glabrous, shining, elliptic, ending in a linear, obtuse, abrupt acumen, having the lateral veins hardly prominent and confluent at the margins. ♄. S. Native of French Guiana. Eugènia fállax, Rich. act. soc. hist. nat. par. 1792. p. 100. Leaves full of pellucid dots. Pedicels pubescent. Lobes of calyx rounded at the base, smoothish, permanent, but the tube is white and downy. Seed 1. Style hooked, according to Leblond.

Fallacious Myrcia. Shrub 5 to 6 ft.

14 M. SYLVA'TICA (D.C. l. c.) racemes panicled, axillary and terminal, solitary; flowers 5-cleft, pubescent, 1-3 on the branches, middle one sessile; leaves elliptic-ovate, long-acuminated, somewhat ciliated, full of impressed dots above, downy when young, as well as the branches. ♄. S. Native of Guiana, in woods. Mýrtus sylvática, Meyer, esseq. p. 191. Styles said to be 3. Fruit and seeds unknown.

Wood Myrcia. Shrub 4 to 6 ft.

15 M. PLATY'CLADA (D. C. l. c.) peduncles axillary and subterminal, panicled, longer than the leaves, and are, as well as the branches, compressed, and consequently 2-edged; flowers 5-cleft; leaves obovate, obtuse, somewhat coriaceous, opaque, glabrous, rather cuneated at the base. ♄. S. Native of French Guiana. Leaves 2 and 2½ inches long, and 12-15 lines broad. Petioles 3 lines long. Young branches clothed with adpressed down, as well as the petioles, nerves, and peduncles. Fruit and seeds unknown.

Broad-branched Myrcia. Shrub.

16 M. DIVE'RGENS (D. C. prod. 3. p. 245.) panicle terminal, many-flowered, having its branches divaricating; calyx 5-cleft; leaves oval, acuminated, opaque, and are, as well as the branches, glabrous. ♄. S. Native of Cayenne. Leaves 3 inches long, and an inch and a half broad. Flowers small. Fruit and seeds unknown.

Diverging Myrcia. Shrub.

17 M. GUIANE'NSIS (D. C. l. c.) peduncles axillary, 1-3-flowered, slender, shorter than the leaves; flowers 5-cleft, bibracteolate at the base; leaves oval, bluntish, on short petioles, glabrous, full of pellucid dots. ♄. S. Native of Guiana, on the Serpent Mountains. Eugènia Guianénsis, Aubl. guian. 1. p. 506. t. 201. Mýrtus Guianénsis, Ham. prod. fl. ind. occ. no. 45. Berry roundish, red, 1-seeded, about the size of a red currant. Seeds unknown.

Guiana Myrcia. Shrub 3 to 4 ft.

18 M. BRACTEOLA'RIS (D. C. l. c.) peduncles axillary, opposite, rather villous, in fascicled racemes; flowers crowded, bracteolate, 5-cleft; leaves ovate-elliptic, long-acuminated, shining above, and are, as well as the branches, glabrous. ♄. S. Native of Cayenne. Mýrtus bracteolàris, Poir. dict. 4. p. 411. Mýrtus Stoùpyi, Spreng. syst. 2. p. 484. Cotyledons large, foliaceous, plicately wrinkled, ex Kunth, not. in mem. soc. hist. nat. par. 1824. p. 325.

Bracteolate-flowered Myrcia. Shrub 4 to 6 ft.

19 M. CA'RNEA (D. C. l. c.) racemes panicled, axillary and terminal, rather tomentose, twice shorter than the leaves; flowers 1-3 on the tops of the branches of the panicle, middle one sessile; calyx 5-cleft, tomentose; leaves oblong-lanceolate, acuminated. ♄. S. Native of Guiana, near Essequibo. Mýrtus cárnea, Meyer, esseq. p. 191. Said to be allied to *Eugènia virgultòsa*. Petals pubescent, and the anthers flesh-coloured. Fruit and seeds unknown. Perhaps the same as *M. Coumèta* according to Sprengel.

Flesh-coloured-anthered Myrcia. Shrub 4 to 6 ft.

20 M. COUME'TA (D. C. l. c.) peduncles axillary and subterminal, racemosely panicled; branchlets 3-flowered; flowers 5-cleft, all pedicellate; leaves broad, ovate, acuminated, glabrous, on short petioles, full of pellucid dots. ♄. S. Native of Guiana, in woods at the river Sinemari. Eugènia Coumèta, Aubl. guian. 1. p. 497. t. 195. Mýrtus Coumèta, Spreng. syst. append. 2. p. 488. Berry roundish, white, crowned by the teeth of the calyx, which are acute, 1-celled, 1-seeded. Seed thick, roundish. Cotyledons unknown. *Coumeta* is the Guiana name of the shrub.

Coumeta Myrcia. Shrub 4 to 6 ft.

21 M.? TOMENTÒSA (D. C. l. c.) peduncles axillary, longer than the leaves, racemosely panicled; branches, calyxes, and leaves clothed with villous tomentum; flowers 5-cleft; leaves ovate, nearly sessile, full of pellucid dots. ♄. S. Native of Guiana, on the banks of the river Sinemari. Eugènia tomentòsa, Aubl. guian. 1. p. 504. t. 200. Mýrtus Aublètii, Spreng. syst. 2. p. 486. Stamens longer than the petals. Fruit and seeds unknown.

Tomentose Myrcia. Shrub 3 to 4 ft.

22 M. FERRUGÍNEA (D. C. l. c.) peduncles terminal, paniculately corymbose, bracteolate, clothed with rusty velvety down; leaves oval-elliptic, acute at the base, and acuminated at the apex, glabrous above, but clothed with rusty velvety down beneath, but they at length become glabrous on both surfaces; calyx 5-cleft. ♄. S. Native of French Guiana. Eugènia ferrugínea, Poir. suppl. 3. p. 124. Mýrtus ferrugínea, Spreng. exclusive of the synonymes. Leaves nearly like those of *Eugènia chrysophýlla* or *E. chrysophylloìdes*, but it differs in the inflorescence. Fruit globose, glabrous, 2-3-seeded. Seeds large, angular, roundish. Cotyledons thickish, corrugated.

Rusty Myrcia. Shrub 4 to 6 ft.

23 M. CRASSINE'RVIA (D. C. l. c.) peduncles axillary, solitary, or twin, panicled, shorter than the leaves: flowers bluntly 5-lobed; leaves oval, abruptly acuminated, feather-nerved, and girded by a marginal nerve, coriaceous, opaque, shining above, clothed with rufous velvety down beneath, as well as the panicles and branchlets. ♄. S. Native of French Guiana. M. latifòlia, Forsyth in herb. L'Her. Lateral nerves of leaves thick and prominent beneath. Fruit nearly globose, crowned, at length glabrous, 1-seeded. Seed roundish. Cotyledons foliaceous, corrugately plicate.

Thick-nerved-leaved Myrcia. Shrub.

24 M. BRACTEA'TA (D. C. l. c.) peduncles axillary, 3-flowered, bearing opposite, leafy bracteas in the middle and at the base of the flowers, shorter than the leaves; leaves ovate-lanceolate, tapering into an elongated acumen, with rather revolute, ciliated margins, having the middle nerve hairy on both surfaces; branches hispid; calyxes villous. ♄. S. Native of Cayenne and Brazil. Eugènia bracteàta, Rich. act. soc. hist. nat. par. 1792. p. 110. Mýrtus bracteàta, Mart. herb. Leaves 2 inches long, and 9-10 lines broad, shining. Tube of calyx ovate. Style inflexed. Bracteas coloured, according to Richard. Flowers 5-cleft, rarely 4-cleft. The fruit is that of *Mýrcia*, according to the specimen.

Bracteate Myrcia. Shrub.

* * *Species natives of Brazil.*

† *Fruit nearly globose, 1-3-celled.*

a. *Leaves on long or short petioles, never cordate at the base.*

25 M. HAYNEA'NA (D. C. prod. 3. p. 246.) peduncles axillary, shorter than the leaves, racemose or subpanicled, hairy; tube of calyx with a short, villous tube, and 5 roundish pubescent lobes; leaves oval-oblong, acuminated, full of pellucid dots, reticulately veined, glabrous in the adult state, except on the nerves beneath as well as the branches, which are rather hairy; buds silky. ♄. S. Native of Brazil, at Mato-Virga. Mýrtus Hayneàna, Mart. herb. Leaves 3 inches long and an inch broad. Petioles 1-2 lines long. There are some black bristles at the axils of the leaves, which are almost stipular. Branchlets compressed. Fruit unknown. The shrub agrees with *M. soròria* on the one hand, and with *M. bracteàta* on the other.

Hayne's Myrcia. Shrub.

26 M. MYAPÒRINA (D. C. l. c.) peduncles axillary, opposite, racemose, 5-9-flowered, almost bractless, about equal in length to the leaves; fruit globose, crowned by the lobes of the calyx, which are bluntish; leaves oblong, obtuse, or nearly obovate, dotted on both surfaces, nearly nerveless and almost glabrous, even

when young, as well as the branchlets. ♄. S. Native of Brazil. Mýrtus punctàta, Mart. mss. but not of Spreng. A shrub, about 5 or 6 feet high, with erectly spreading branches. Fruit at first scarlet, but at length dark purple. Leaves 15 lines long. Seeds 2-3, smooth.

Myaporum-like Myrcia. Sh. 4 to 6 ft.

27 M. SALICIFÒLIA (D. C. l. c.) peduncles axillary, few-flowered, racemose, rather shorter than the leaves, glabrous; fruit globose, crowned by the lobes of the calyx, which are 5 and obtuse; leaves lanceolate-linear, attenuated at both ends, full of pellucid dots, glabrous in the adult state, but pubescent when young, as well as the branches. ♄. S. Native of Brazil, at Rio Tapura. Mýrtus salicifòlia, Mart. herb. Leaves 2 inches long and 4 lines broad. Fruit the size of a pea. Seeds not seen. Flowers unknown.

Willow-leaved Myrcia. Sh. 4 to 6 ft.

28 M. DAPHNOÌDES (D. C. l. c.) peduncles axillary, longer than the leaves, panicled, clothed with rufous hairs; lobes of calyx 5, roundish, ciliated in the young state; leaves oblong, obtuse, cuneated at the base, opaque, stiff, crowded, rather villous on both surfaces when young, but in the adult state glabrous above and puberulous beneath; branchlets clothed with rufous down. ♄. S. Native of Brazil, near Camabuao. Branches short, spreading, very leafy, when young sometimes compressed. Leaves an inch and a half long, but hardly half an inch broad, full of impressed dots on the upper surface when old. Racemes nearly 2 inches long. Fruit unknown.

Daphne-like Myrcia. Sh. 6 to 10 ft.

29 M. NIGRE'SCENS (D. C. l. c.) peduncles axillary, nearly terminal, panicled, divaricately branched, longer than the leaves; branches and flowers quite glabrous; leaves oval-oblong, attenuated at the base, obtuse at the apex, opaque, stiff, almost nerveless, except the middle nerve, quite glabrous on both surfaces. ♄. S. Native of Brazil, at the river Amazon. Mýrtus nigréscens, Mart. herb. Leaves 2 inches long, and 8-12 lines broad, of an obscure green colour. Petioles 2-3 lines long, wrinkled, having the epidermis separating, as if it were transversely. Branches white. Lobes of calyx 5, roundish, deciduous, rather irregular. Fruit unknown.

Blackish Myrcia. Sh. 4 to 8 ft.

30 M. BANISTERIÆFÓLIA (D. C. l. c.) peduncles axillary, opposite, twice trifid, a little shorter than the leaves; leaves elliptic, bluntish, membranous, opaque, glabrous above, but villous beneath from adpressed rufescent down, as well as the branchlets, peduncles, and flowers. ♄. S. Native of Brazil, in fields near Yta in the province of St. Paul. Mýrtus banisteriæfòlia, Mart. herb. Leaves an inch and a half long, and 9 lines broad, of an obscure green. Flowers small, 5-cleft. Fruit unknown.

Banisteria-leaved Myrcia. Sh. 4 to 6 ft.

31 M. PALU'STRIS (D. C. l. c.) peduncles axillary, panicled, longer than the leaves; flowers crowded at the tops of the branchlets, and are as well as the bracteas downy; leaves oval, cuneated at the base, obtuse, opaque, glabrous above, paler beneath and dotted, puberulous on the nerves. ♄. S. Native of Brazil, in marshes in the province of St. Paul. Mýrtus palústris, Mart. herb. Leaves an inch and a half long and an inch broad. Petioles 2 lines long. Panicle 2 inches long, pubescent. Lobes of calyx 5, obtuse. Habit almost of *M. banisteriæfòlia.*

Marsh Myrcia. Sh. 4 to 6 ft.

32 M. HEBEPE'TALA (D. C. l. c.) peduncles axillary, nearly terminal, racemosely panicled, and are as well as the calyxes and branches hairy; calyx bluntly 5-lobed; leaves oblong, somewhat acuminated, with a few pellucid dots, clothed with adpressed, silky down in the young state, but glabrous above and rather hairy beneath in the adult state. ♄. S. Native of Brazil. Mýrtus pseudo-caryophýllus, Gomez? ex herb. Mart. Leaves 3 inches long and an inch broad. Petiole 3 lines long. Flower-bud globose. Petals pubescent on the outside. Fruit unknown.

Hairy-petalled Myrcia. Sh. 4 to 8 ft.

33 M. ERIOCA'LYX (D. C. prod. 3. p. 247.) peduncles axillary, racemosely panicled, longer than the leaves, and are as well as the panicles clothed with velvety villi; calyx 5-cleft, very villous; leaves elliptic, oblong, with revolute margins, rather coriaceous, opaque, glabrous above, but velvety beneath. ♄. S. Native of Brazil, in woods in the district of the diamonds. Leaves an inch long and 5-6 lines broad, nerveless above, nerved beneath: with 2 small, nearly abortive ones, produced from the axils of the racemes. Bracteas foliaceous, deciduous.

Woolly-calyxed Myrcia. Sh. 4 to 6 ft.

34 M. PUBE'SCENS (D. C. l. c.) peduncles axillary, panicled, rather shorter than the leaves, or longer; bracteas, calyxes, and young leaves clothed with adpressed, somewhat rufescent down; leaves oval, obtuse, full of pellucid dots while young: but opaque and glabrous on the upper surface, and clothed with rufescent down on the under surface in the adult state; lobes of calyx 5, obtuse. ♄. S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Leaves 30 lines long, and 12 lines broad. Panicle 1½ to 3 inches long. Fruit unknown.

Pubescent Myrcia. Sh. 4 to 6 ft.

35 M.? MACRO'CHLAMYS (D. C. l. c.) peduncles axillary, and nearly terminal, few-flowered; branchlets and bracteas clothed with velvety tomentum; tube of calyx turbinate, shorter than the lobes, which are oblong; bracteoles 2, inserted at the base of the calyx; leaves oval, obtuse, reticulately veined, when young rather villous, full of pellucid dots, but glabrous, stiff, and opaque in the adult state. ♄. S. Native of Brazil, in the desert of Bahia. Shrub 10 feet. Leaves pale, 18 lines long and 9 broad. Petioles 2-3 lines long. Peduncles 9-10 lines long. Flower-bud globose. Staminiferous torus broad. Fruit unknown.

Long-cloaked Myrcia. Sh. 10 ft.

36 M. RU'FIPES (D. C. l. c.) panicles axillary, longer than the leaves, and terminal, many-flowered, clothed with velvety, rufous down as well as the branchlets; calyx with a glabrous subglobose tube, and 5 ovate lobes, which are clothed with rufescent down; leaves oval, obtuse, full of pellucid dots when young, clothed with rufous villi on the nerve, but in the adult state glabrous on both surfaces. ♄. S. Native of Brazil, in the provinces of the mines. Mýrtus rùfipes, Mart. herb. Leaves 2 inches long, and an inch broad. Petioles 2 lines long. Bracteas and bracteoles almost wanting. Bark usually separating from the epidermis, which is rufous.

Rufous-petioled Myrcia. Sh. 4 to 6 ft.

37 M. CAMPE'STRIS (D. C. l. c.) peduncles panicled, many-flowered, axillary, and terminal, longer than the leaves; calyx and branchlets densely clothed with rufous down; bracteoles setaceous; leaves oval-oblong, with rather revolute margins, opaque, glabrous above, puberulous on the nerve beneath. ♄. S. Native of Brazil, in fields, in the provinces of the mines. Mýrtus campéstris, Mart. herb. Very like *M. rùfipes*, but differs in the leaves being narrower and in the bracteas being elongated. The leaves are sometimes disposed 3 in a whorl. Fruit unknown.

Field Myrcia. Sh. 4 to 6 ft.

38 M. SCHRANKIA'NA (D. C. l. c) peduncles axillary, twice or thrice longer than the leaves, rather pubescent, panicled, and rather corymbose at the apex; calyx with a glabrous tube, and 5 somewhat ciliated lobes; leaves oval, nearly sessile, full of pellucid dots when young, with the margin and nerve villous: but opaque and glabrous in the adult state; branches clothed

with rufous villi. ♄. S. Native of Brazil, in the province of Minas Geraes, in the desert called the Certao. Mýrtus Schrankiàna, Mart. herb. Leaves 10-12 lines long, and 4-5 broad. A shrub 3-4 feet high, with dense branches. Peduncles 2 inches long. Lobes of calyx obtuse. Fruit unknown.

Schrank's Myrcia. Sh. 3 to 4 ft.

39 M. exsu'cca (D. C. l. c.) peduncles axillary and terminal, panicled, longer than the leaves; bracteas and calyxes ciliated while young; leaves elliptic or obovate, obtuse, membranous, full of pellucid dots, glabrous except on the nerves, margins, and petioles, which are rather puberulous; branchlets puberulous. ♄. S. Native of Brazil, in fields. Mýrtus Duárti and M. exsúcca, Mart. herb. Leaves pale, an inch and a half long, 8-10 lines broad. Fruit unknown.

Dry Myrcia. Sh. 4 to 6 ft.

40 M.? leucophlæ'a (D. C. l. c.) leaves oval, acute, with a few pellucid dots, glabrous; peduncles axillary, and nearly terminal, racemosely panicled, shorter than the leaves, and are as well as the buds clothed with rufous velvety down; flower-buds obovate, small, glabrous; lobes of calyx 5, very short. ♄. S. Native of Brazil, in the province of Bahia, in woods. Mýrtus leucophlæ'a, Mart. herb. Branches white, separating from the epidermis. Leaves 3 inches long, and half an inch broad. Petioles 2-3 lines long. Racemes 15 lines long. Fruit small.

White-juiced Myrcia. Sh. 4 to 6 ft.

41 M. Linkia'na (D. C. prod. 3. p. 248.) peduncles axillary, nearly terminal, panicled, shorter than the leaves, and are as well as the branches clothed with soft velvety villi; calyx with a villous tube, and 5 roundish, smoothish lobes; leaves oblong, acuminated, full of pellucid dots, membranous, narrowed at the base, with the margins revolute, glabrous above, but clothed with soft velvety down beneath. ♄. S. Native of Brazil, in woods in the province of Rio Janeiro, near Retiro. Mýrtus Linkiàna, Mart. herb. Leaves 3-4 inches long and 10-17 lines broad. Flowers small. Bracteas small, deciduous.

Link's Myrcia. Sh. 4 to 6 ft.

42 M. exi'mia (D. C. l. c.) panicles axillary, a little shorter than the leaves, many-flowered, densely clothed with velvety short tomentum, as well as the calyxes, branchlets, and young leaves; lobes of calyx 5, obtuse; leaves oval-oblong, acuminated, stiff, opaque, reticulately veined, in the adult glabrous above, and velvety beneath; branchlets somewhat compressed. ♄. S. Native of Brazil, in the province of Minas Geraes, in the desert. Leaves pale, 4 inches long, and 1½ and 2 inches broad, on short velvety petioles. A beautiful tree, about 30 feet high.

Choice Myrcia. Tr. 30 ft.

43 M. cordiæfòlia (D. C. l. c.) peduncles axillary and nearly terminal, panicled, shorter than the leaves, hairy; calyx clothed with silky villi, with 5 very blunt lobes; leaves ovate, obtuse, opaque, stiff, glabrous above, and a little blistered, velvety beneath: with the nerves reticulated, very prominent, and areolate. ♄. S. Native of Brazil, in the province of St. Paul. Mýrtus cordiæfòlia, Mart. herb. Leaves bluntish at the base, 9 inches long and 4-5 inches broad. Petioles 7 lines long. Flower-bud globose, downy. Bark of the branches rufous. Fruit unknown.

Var. β, minor; leaves acutish, one half smaller than those of the species.

Heart-leaved Myrcia. Shrub.

44 M. vesti'ta (D. C. l. c.) panicle terminal, branched, many-flowered; branches, bracteas, and calyxes, densely clothed with tomentum; calycine lobes 5, obtuse; leaves elliptic, acutish, almost sessile, opaque above, and rather villous, but densely clothed with hoary tomentum beneath, opposite or alternate. ♄. S. Native of Brazil, in the provinces of the mines, in elevated fields. Mýrtus vestìta, Mart. herb. Petals oval-orbicular. Leaves 2 inches long and an inch broad. Fruit unknown.

Var. β, obtusifòlia (D. C. l. c.) leaves broader and blunter; panicle rather rufescent. ♄. S. Native of Brazil.

Clothed Myrcia. Sh. 5 to 10 ft.

45 M. specta'bilis (D. C. l. c.) peduncles axillary and nearly terminal, paniculately corymbose, compressed, a little shorter than the leaves, and are as well as the bracteas and calyxes clothed with somewhat silky velvety down; leaves oval-oblong, acuminated, full of pellucid dots, rather villous from deciduous down on the upper surface, and rather hairy on the nerves and nervules beneath. ♄. S. Native of Brazil, in woods in the province of Rio Janeiro. Mýrtus spectábilis, Mart. herb. Leaves 7 inches long and 2 inches broad, on very short petioles, with the nerves reticulately veined. Flowers in fascicles, on the ultimate branchlets of the panicle. Petals, when in the bud, as well as the calyx, clothed with silky down on the outside. Fruit unknown.

Shewy Myrcia. Sh. 4 to 6 ft.

46 M. macrophy'lla (D. C. l. c.) peduncles axillary, and nearly terminal, one half shorter than the leaves, panicled; pedicels distant, hardly pubescent; fruit obovate-globose, smoothish, crowned by the calycine lobes, which are roundish and connivent; leaves elliptic-oblong, acute, or shortly acuminated, full of pellucid dots, rather membranous, glabrous above and reticulately veined, rather pubescent on the nerves and veins beneath. ♄. S. Native of Brazil, at Coari. Leaves 9 inches long, and 2½ inches broad, standing on short pubescent petioles. Leaf-buds downy. Branches terete, glabrous.

Long-leaved Myrcia. Sh. 4 to 6 feet.

47 M. magnoliæfòlia (D. C. l. c.) peduncles axillary and nearly terminal, panicled, one half shorter than the leaves, compressed, downy; flowers crowded on the ultimate branches; tube of calyx clothed with white villi, but the calycine lobes are orbicular and smoothish; leaves oval-oblong, acutish, stiff, opaque, shining above, clothed with velvety pubescence on the under surface, as well as the branchlets: with the nerves parallel, and the veins reticulated between them. ♄. S. Native of Brazil, at the Rio Negro. Leaves somewhat downy beneath, 5-6 inches long, 1½ to 2 inches broad, standing on petioles, which are 1-2 lines long. Flower-bud nearly globose. Fruit unknown.

Var. β; leaves short-acuminated; fruit globose, glabrous.

Magnolia-leaved Myrcia. Sh. 5 to 10 ft.

48 M. macroca'rpa (D. C. prod. 3. p. 249.) panicle compound, terminal, glabrous, longer than the leaves; fruit globose, depressed, crowned by the short, obtuse lobes of the calyx; leaves elliptic, acutish, coriaceous, opaque, shining above, and quite glabrous on both surfaces, as well as the branches. ♄. S. Native of Brazil, on Mount Formosa, in the province of Rio Janeiro. Allied to *M. Neesiàna*. Branches white. Leaves 4 inches long and 1½ broad. Fruit 6 lines broad, and 4 lines long, glabrous, 2-seeded. Seeds with a smooth testa. Cotyledons corrugated.

Long-fruited Myrcia. Shrub.

49 M. Neesia'na (D. C. l. c.) peduncles axillary, racemose, few-flowered, pubescent, about half the length of the leaves; fruit ovate-globose, scabrous, crowned by the lobes of the calyx, which are ovate and obtuse; leaves oval-oblong, terminating in a short, blunt acumen each, opaque, glabrous on both surfaces; branchlets hairy. ♄. S. Native of Brazil, in woods at the river Amazon. Mýrtus Neesiàna, Mart. herb. Leaves 4-5 inches long, and 1½ broad, standing on petioles, which are 3 lines long. Calyx pubescent when in flower. Fruit size of a large pea, but obovate. Seeds 1-2.

Nees's Myrcia. Tr. 20 to 30 ft.

50 M. Maragna'na (D. C. l. c.) peduncles disposed in a

terminal panicle, and are, as well as the branches and calyxes, glabrous; limb of calyx 5-parted, short, deciduous; fruit globose, 2-3-seeded; leaves oval, bluntly acuminated, attenuated at the base, coriaceous, opaque, quite glabrous, smooth above. ♄. S. Native of Brazil, in the province of Maragnon. Mýrtus Maragnàna, Mart. herb. Leaves 24-28 lines long, and 8-9 lines broad, standing on petioles 1-2 lines long. Panicle hardly longer than the leaves.

Maragnon Myrcia. Shrub.

51 M. SEPIA'RIA (D. C. l. c.) panicles axillary and terminal, many-flowered; peduncles compressed, rather pubescent, longer than the leaves; calycine lobes obtuse; leaves oval-oblong, bluntly acuminated, stiff, with a few scattered, pellucid dots, shining above, and glabrous on both surfaces, as well as the branchlets. ♄. S. Native of Brazil, in the province of Bahia. Mýrtus sepiària, Mart. herb. Leaves 24-28 lines long, and 8-9 lines broad, standing on petioles 1-2 lines long. Lower peduncles 2 inches long, all near together, so as to form a terminal panicle. Bracteas small, obtuse, pubescent as well as the calyxes, when young.

Hedge Myrcia. Shrub.

52 M. LITTORA'LIS (D. C. l. c.) panicles axillary and terminal, many-flowered, longer than the leaves, clothed with adpressed pubescence; calycine tube clothed with white down; calycine lobes very short, hardly distinct, obtuse, at length spreading; leaves oval, obtuse, opaque, stiffish, nearly veinless, except the middle nerve, glabrous on both surfaces in the adult state, but rather downy when young, as well as the branchlets. ♄. S. Native of Brazil, in the province of Bahia, among bushes. Mýrtus littoràlis, Mart. herb. Leaves nearly 2 inches long, and an inch broad. Petioles hardly a line long. Branches compressed, but in the adult state terete and white.

Shore Myrcia. Shrub.

53 M. PUBIFLÒRA (D. C. l. c.) peduncles axillary and nearly terminal, compressed, longer than the leaves, disposed in a branched panicle at the apex, downy as well as the flowers; leaves elliptic, somewhat oblong, obtuse, coriaceous, opaque, glabrous on both surfaces in the adult state, but when young downy beneath; branches pubescently villous. ♄. S. Native of Brazil, on the mountains in the provinces of the mines, at Serro Frio. Branches naked, in consequence of the epidermis being deciduous. Leaves 2½ inches long and an inch broad. Bracteas fucescent, concave, deciduous. Flower-bud hairy, nearly globose. Calyx 5-cleft in the young state. Fruit unknown.

Downy-flowered Myrcia. Shrub.

54 M. HIRTIFLÒRA (D. C. l. c.) peduncles axillary or terminal, opposite, and disposed in a terminal panicle; bracteas and calyxes very hairy; calycine lobes short, acute; petals glabrous; leaves elliptic-oblong, bluntly and shortly acuminated at the apex, membranous, full of pellucid dots, glabrous on both surfaces as well as the branches. ♄. S. Native of Brazil, in the province of Bahia, on the high mountain called Serra das Lages. Leaves about 3 inches long and 15-18 lines broad. Petioles 2 lines long. Fruit unknown.

Hairy-flowered Myrcia. Shrub.

55 M. CASSINOÌDES (D. C. l. c.) peduncles axillary and nearly terminal, racemose, clothed with velvety tomentum, longer than the leaves; fruit globose, muricated, pubescent, crowned by the lobes of the calyx, which are rather villous, very obtuse and conniving; leaves elliptic or oblong, obtuse, stiff, opaque, crowded, clothed with velvety villi on both surfaces when young, as well as the branchlets, but glabrous on the upper surface in the adult state. ♄. S. Native of Brazil, in the provinces of the mines. Leaves glabrous, rather rufescent when young, from 1-2 inches long, and 9-10 lines broad. Fruit the size of a pea. Seeds 2-3. Cotyledons corrugated.

Cassine-like Myrcia. Tr. 10 to 15 ft.

56 M. VENULÒSA (D. C. prod. 3. p. 250.) peduncles axillary or terminal, panicled, velvety, longer than the leaves; fruit globose, glabrous, rather muricated; calycine lobes broad, obtuse, short; leaves oblong, bluntish, somewhat cuneated at the base, opaque, reticulately veined on both surfaces, glabrous, and shining above, but clothed with dense, short, velvety tomentum beneath, as well as on the branchlets. ♄. S. Native of Brazil, in the province of St. Paul. Mýrtus venulòsa, Mart. herb. Leaves an inch and a half long and 5-6 lines broad. Peduncles 2 inches long. Fruit the size of a pea, within the bearded limb of the calyx. Seeds 2. Cotyledons corrugated.

Var. β, Capoeirénsis (D. C. l. c.) leaves elliptic-oblong, less reticulated than in the species, and the fruit is less muricated. ♄. S. Native of Brazil, in Capoeira. Perhaps a proper species.

Veiny-leaved Myrcia. Shrub.

57 M. ELÆODE'NDRA (D. C. l. c.) peduncles axillary, and nearly terminal, racemosely panicled, pubescent when young, about equal in length to the leaves; calycine lóbes 5, very blunt, smoothish; leaves oblong-lanceolate, obtuse, full of pellucid dots, rather stiffish, glabrous on both surfaces; petioles and branches densely clothed with soft rufescent down. ♄. S. Native of Brazil. A tree 15-20 feet high, with loose, spreading branches. Leaves pale, rather glaucous, 2 inches long, and 9-10 lines broad. Flowers distant on the racemes. Lower branches of peduncle 3-flowered, upper ones 1-flowered. Fruit unknown.

Elæodendron-like Myrcia. Tr. 15 to 20 ft.

58 M. TÓRTA (D. C. l. c.) peduncles axillary, racemose, 7-9-flowered, length of leaves, nearly bractless; fruit globose, crowned by the lobes of the calyx, which are short and roundish; leaves oblong, obtuse, full of pellucid dots, somewhat attenuated at the base, and glabrous on both surfaces, as well as the branchlets. ♄. S. Native of Brazil, on Serra Branca. Mýrtus tórta, Mart. herb. Leaves 2 inches long, and 9 lines broad, standing on petioles 1-2 lines long. Racemes an inch and a half long. Fruit glabrous, dark purple, shining. A tree 10-12 feet high, with twisted branches. Bark thick, greyish, chinky.

Twisted Myrcia. Tr. 10 to 12 ft.

59 M. SUBALPE'STRIS (D. C. l. c.) peduncles axillary and nearly terminal, racemosely panicled, longer than the leaves, glabrous; fruit globose, crowned by the lobes of the calyx, which are short, obtuse, and connivent; leaves elliptic-oblong, obtuse at both ends, opaque, stiffish, glabrous above, but velvety from short tomentum beneath. ♄. S. Native of Brazil, in the provinces of the mines. Mýrtus subalpéstris, Mart. herb. Shrub 3 feet. Branches erect, terete. Fruit black, glabrous. Seeds 2, with a smooth testa. Cotyledons corrugated. Fruit unknown.

Alp Myrcia. Shrub 3 feet.

60 M. MYRTILLIFÒLIA (D. C. l. c.) peduncles axillary, longer than the leaves, paniculately corymbose, few-flowered, and are as well as the calyxes glabrous; bracteoles nearly wanting; branchlets rather pubescent; leaves oval, coriaceous, pale, glabrous, full of pellucid dots when young, reticulately veined beneath, smoothish in the adult state, opaque, and therefore dotless. ♄. S. Native of Brazil, in the province of Bahia. Mýrtus myrtillifòlia, Mart. herb. Very like *M. ramulòsa*, but differs in the leaves being more coriaceous, pale; in the racemes being more crowded and corymbose, with hardly any bracteoles.

Myrtle-leaved Myrcia. Tr. 20 to 30 ft.

61 M.? RAMULÒSA (D. C. l. c.) racemes axillary, 3-5-flowered, about the length of the leaves; bracteoles setaceous, under the pedicels, and shorter than them; calycine lobes short; leaves oval, full of pellucid dots, membranous, reticulately veined, glabrous, but rather villous on the nerve beneath, and on the margins and petioles; branches compressed, clothed with velvety

hairs beneath. ♄. S. Native of Brazil. Mýrtus virgultòsa, Mart. herb. but not of Swartz. Flowers small, glabrous. Fruit unknown. Leaves 5-6 lines long, 4-5 lines broad.

Var. β, multiflòra (D. C. l. c.) racemes panicled, 12-20-flowered, longer than the leaves. Perhaps distinct from var. *α*.

Branched Myrcia. Sh. 4 to 6 ft.

62 M. AMAZÓNICA (D. C. l. c.) peduncles shorter than the leaves, rather hairy, racemosely panicled; fruit nearly spherical, glabrous, crowned by the lobes of the calyx, which are short and obtuse; leaves elliptic-oblong, bluntly acuminated, opaque, stiffish, reticulately veined, glabrous on both surfaces; branchlets pubescent. ♄. S. Native of Brazil, on the banks of the river Amazon. Mýrtus Amazónica, Mart. herb. Leaves nearly 3 inches long and 1 broad; petioles 2 lines long. Fruit 1-seeded, and globose; 2-seeded and somewhat didymous; or 3-seeded and bluntly 3-sided. Seeds with a smooth testa. Cotyledons corrugated. Flowers unknown.

Amazon Myrcia. Sh. 4 to 6 ft.

63 M. FENESTRA′TA (D. C. prod. 3. p. 251.) peduncles axillary, rather panicled, one half shorter than the leaves, rather hairy; fruit ovate-globose, smoothish, crowned by the lobes of the calyx, which are small and bluntish; leaves nearly sessile, ovate, obtuse at the base and somewhat cordate, acuminated at the apex, full of pellucid dots; lateral nerves at equal distances, and blistered between the veins: middle nerve hispid beneath; branchlets 2-edged, rather hairy. ♄. S. Native of Brazil, on the banks of rivers, at Ega. Mýrtus fenestràta, Mart. Leaves 3 inches long and 1½ inch broad. Seeds 2. Cotyledons corrugated. Fruit unknown.

Windowed Myrcia. Sh. 4 to 6 ft.

64 M. PERTU′SA (D. C. l. c.) peduncles axillary, twice shorter than the leaves, panicled, somewhat compressed; calyxes pubescent, obtusely 5-lobed; leaves oblong, long-acuminated, somewhat attenuated at the base, full of pellucid dots, glabrous on both surfaces; branchlets terete, hardly pubescent. ♄. S. Native of Brazil. Allied to *M. fenestràta*, but the branches are not 2-edged, and the leaves are one half narrower, nearly all glabrous, or bearing small pili on the nerves beneath. Flowers nearly of *M. pseùdo-mini*. Fruit unknown.

Pertuse-leaved Myrcia. Sh. 4 to 6 ft.

65 M. LEUCODE′NDRON (D. C. prod. 3. p. 251.) peduncles axillary, and nearly terminal, panicled, clothed with minute, adpressed pubescence, equal in length to the leaves; calycine lobes glabrous, roundish, rather irregular; leaves oval-oblong, somewhat acuminated, membranous, full of pellucid dots, rather puberulous when young as well as the branchlets, but glabrous in the adult state. ♄. S. Native of Brazil. A tree 30 feet high, with the bark of the branches white. Leaves 2½ inches long, 9-10 lines broad. Petioles 1-2 lines long. Flowers almost of *M. nigréscens*. Fruit unknown.

White-tree Myrcia. Tr. 30 ft.

66 M. SPHÆROCA′RPA (D. C. l. c.) peduncles axillary, cymosely panicled, a little longer than the leaves; fruit globose, crowned by the lobes of the calyx, which are short and obtuse; leaves elliptic, cuneated at the base, bluntly acuminated at the apex, full of pellucid dots, quite glabrous on both surfaces, as well as the branches and panicles. ♄. S. Native of Brazil. Habit of *Eugènia Candolleàna*, but differs in the peduncles being longer, in the fruit being globose, and in the flowers being 5-cleft. Leaves nearly 2 inches long and 8-9 lines broad; petioles 2 lines long. Fruit one half smaller than a pea.

Round-fruited Myrcia. Sh. 4 to 6 ft.

67 M. OBLONGA′TA (D. C. l. c.) peduncles axillary, longer than the leaves, panicled at the apex, smoothish; lobes of calyx small, roundish; fruit globose; leaves oblong, obtuse, coriaceous, with a few pellucid dots, and are as well as the branchlets quite glabrous; lateral nerves almost wanting. ♄. S. Native of Brazil, in woods, in the province of St. Paul. Mýrtus oblongàta, Mart. herb. Very nearly allied to *M. sphærocárpa*, and *M. élegans*. Flowers unknown. Leaves nearly 2 inches long and 6 lines broad. Floral leaves hardly an inch long. Seeds with a smooth testa. Cotyledons contortuplicate.

Oblong Myrcia. Tree.

68 M. E′LEGANS (D. C. l. c.) panicles axillary and terminal, loose, twice the length of the leaves, and are as well as the flowers glabrous; bracteas linear-oblong; bracteoles almost wanting; fruit globose, crowned by the lobes of the calyx, which are short and obtuse; leaves oval, obtuse, opaque, stiff, and are as well as the branches glabrous, beset with impressed dots on the upper surface, when young pilose. ♄. S. Native of Brazil, in the province of Para. Mýrtus élegans, Mart. herb. Leaves 2 inches long, 10-14 lines broad. Petioles 2 inches long. Flowers small. Fruit size of a pea. Seeds 2. Cotyledons corrugated. Allied to *M. Amazónicum.*

Elegant Myrcia. Shrub.

69 M. CAMARÆA′NA (D. C. l. c.) peduncles axillary and nearly terminal, hardly longer than the leaves, panicled, and are as well as the flowers glabrous; fruit spherical, dotted; calycine lobes deciduous after flowering; leaves oval, bluntly and shortly acuminated, full of pellucid dots, hardly veiny, glabrous on both surfaces as well as the branchlets. ♄. S. Native of Brazil, in the province of Bahia, near Enginhoda Ponte. Mýrtus Camaræàna, Mart. herb. Leaves 2 inches long and 1 broad. Fruit about the size of a pea, marked with a circular areola. Seeds 2, with a friable smooth testa. Cotyledons contortuplicate.

Camara's Myrcia. Tr. 10 to 15 ft.

70 M. SPIXIA′NA (D. C. l. c.) peduncles axillary, loosely panicled, longer than the leaves; bracteas and bracteoles almost wanting; leaves elliptic-obovate, rather cuneated at the base, obtuse at the apex, reticulately veined, with a few pellucid dots, rather membranous, quite glabrous on both surfaces, as well as the branches, panicles, and flowers. ♄. S. Native of Brazil, at the river Amazon. Leaves 2 inches long and an inch broad. Petioles hardly 2 lines long. Panicle 3-4 inches long. Flowers small. Lobes of calyx obtuse. Style exserted. Fruit unknown.

Spix's Myrcia. Shrub.

71 M. COSTA′TA (D. C. prod. 3. p. 252.) panicles axillary and terminal, many-flowered, length of the leaves, hardly pubescent; tube of calyx clothed with white pubescence; lobes of calyx bluntish, smoothish; leaves ovate, acuminated, full of pellucid dots, membranous, glabrous on both surfaces, feather-nerved and reticulately veined. ♄. S. Native of Brazil, near Bahia. Mýrtus costàta, Mart. herb. Allied to *M. pseùdo-mìni.* Leaves 2 inches long and an inch broad. Petioles 2-3 lines long. Flowers small. Bracteas oblong, deciduous, acute, under the pedicels. Fruit unknown.

Ribbed-leaved Myrcia. Tr. 10 to 12 ft.

72 M. POLYA′NTHA (D. C. l. c.) peduncles panicled, axillary and terminal, crowded, equal in length to the leaves, glabrous, as well as the calyxes and branchlets; leaves ovate, bluntly acuminated, coriaceous, full of pellucid dots, quite glabrous on both surfaces, smooth on the upper surface, and full of impressed dots. ♄. S. Native of Brazil, in the deserts in the province of Bahia. Mýrtus polyántha, Mart. herb. Leaves 15-18 lines long, and 8-9 broad. Flowers small. Allied to *M. ambígua* and *M. pseudo-mìni*, but quite glabrous. Fruit unknown.

Many-flowered Myrcia. Shrub.

73 M. AMBÍGUA (D. C. l. c.) peduncles panicled, axillary and terminal, longer than the leaves, and are, as well as the calyxes and branchlets, pubescent; leaves oval, acuminated, with a few pellucid dots, having the veins hardly prominent, smoothish above, and full of impressed dots, glabrous on both surfaces. ♄. S.

Native of Brazil, in the provinces of the mines. Eugènia Mìni var. ? Mart. herb. Intermediate between *M. pseùdo mini* and *M. multiflòra.* Inflorescence of *M. multiflòra*, but rather downy. Fruit unknown.

Var. β, pauciflòra (D. C. l. c.) leaves rather narrower; panicles shorter, few-flowered. ♄. S. Native of Brazil. Perhaps the same as *Eugènia Mìni ?* Mart. herb.

Ambiguous Myrcia. Shrub.

74 M. PSEU'DO-MINI (D. C. l. c.) peduncles axillary, opposite, panicled, longer than the leaves or shorter; calyx and buds villous; leaves elliptic-oblong, gradually acuminated, shining above, hardly reticulated, full of pellucid dots when examined by a lens; flowers small, 5-cleft. ♄. S. Native of Brazil, at Rio Janeiro. Eugènia Mìni, Mart. herb. Very like the plant figured by Aublet, but differs in the flowers being 5-cleft. Leaves hardly reticulated above, at length nearly smooth; lower ones small, roundish, shorter than the peduncles; upper ones large, rather longer than the peduncles. Petioles 2 lines long. Fruit ovate-globose, blackish, 2-seeded, crowned by the lobes of the calyx, which are very blunt, and somewhat conniving. Seeds smooth. Cotyledons contortuplicate.

False-mini Myrcia. Shrub.

75 M. CORYMBÒSA (D. C. l. c.) panicles terminal, oppositely branched, subcorymbose; bracteas and bracteoles almost wanting; leaves oval, bluntly acuminated, opaque, quite glabrous, as well as the branches, panicles, and flowers. ♄. S. Native of Brazil, at Rio Tapura. Leaves 3 inches long, and 15-18 lines broad. Petioles hardly 2 lines long. Flowers small, quinquefid. Fruit unknown.

Corymbose-flowered Myrcia. Shrub.

76 M. LAURIFÒLIA (D. C. l. c.) panicles axillary and nearly terminal, shorter than the leaves or longer, glabrous, as well as the flowers; bracteas linear-oblong; calycine lobes roundish; leaves oval, obtuse, stiff, opaque, nearly veinless except the middle nerve, and are, as well as the branches, glabrous. ♄. S. Native of Brazil, in the province of Para. M. laurifòlia, Mart. herb. Leaves pale, 2 inches long, nearly one inch broad. Petioles 2 lines long. Flowers small. Fruit unknown.

Laurel-leaved Myrcia. Shrub.

77 M. PA'LLENS (D. C. l. c.) peduncles panicled, axillary and nearly terminal, a little longer than the leaves, and are, as well as the calyxes and branchlets, glabrous; leaves exactly oval, obtuse at both ends, glabrous, glaucous, full of pellucid dots, as well as being dotted with brown beneath. ♄. S. Native of Brazil, in the provinces of the Mines. Mýrtus tórta, Mart. herb. Leaves 9-10 lines long, and 5-6 lines broad, finely veined. Bracteoles small, setaceous; lobes of calyx obtuse. Shrub twisted, 10 feet high. Fruit unknown.

Pale Myrcia. Shrub 10 ft.

78 M. DECÓRTICANS (D. C. l. c.) peduncles axillary and nearly terminal, rather longer than the leaves, panicled, rather hairy; lobes of calyx orbicular, white, and are, as well as the tube, glabrous; leaves ovate-elliptic, short-acuminated, full of pellucid dots when young, opaque stiffish and glabrous in the adult state; branchlets puberulous, separating from the epidermis. ♄. S. Native of Brazil. Mýrtus decorticàta, Mart. herb. Leaves hardly acute, 3 inches long, and 1½ inch broad, with somewhat revolute margins. Petioles 1-2 lines long, at length transversely subrimose. Petals 5, orbicular. Seeds 2, according to Martius.

Decorticated Myrcia. Tree 10 ft.

79 M. LASÍOPUS (D. C. prod. 3. p. 253.) peduncles axillary and terminal, crowded into a panicle, many-flowered, longer than the leaves, and are, as well as the bracteas, hairy; calyxes glandular, bluntly 5-lobed; leaves ovate, obtuse at both ends, coriaceous, opaque, glabrous, as well as the branches. ♄. S. Native in fields in the provinces of the Mines. Eugènia lasíopus, Mart. herb. Allied to *M. pubéscens* on the one hand, and to *M. decorticàta* on the other. Leaves an inch and a half long. Petioles a line long. Flowers small, crowded. Fruit unknown. There are varieties of this species with very blunt, and acutish leaves, which are obtuse at the base, but hardly cordate.

Hairy-peduncled Myrcia. Shrub 8 to 10 ft.

80 M. DURIU'SCULA (Mart. herb. ex D. C. prod. 3. p. 253.) peduncles panicled, axillary and nearly terminal, rather shorter than the leaves, and are, as well as the bracteas, hispid; calyxes glandular, glabrous, bluntly 5-lobed; leaves broad, ovate, obtuse at both ends, coriaceous, opaque, and are, as well as the branches, glabrous. ♄. S. Native of Brazil, in the province of Bahia. Perhaps merely a variety of *M. lasiopus*, but the panicles are shorter and less hairy.

Hardish Myrcia. Shrub 8 to 10 ft.

81 M. PRUNIFÒLIA (D. C. l. c.) peduncles supra-axillary, equal in length to the leaves or longer, panicled, and are, as well as the branchlets, clothed with soft hairs; calyx with a villous globose tube, and ovate ciliated spreadingly reflexed lobes; leaves oval or ovate or obovate, full of pellucid dots, membranous, glabrous on the upper surface in the adult state. ♄. S. Native of Brazil, in the province of Minas Geraes. Mýrtus prunifòlia, Mart. herb. A very variable species, or many are confused under this name.

Var. α, angústior (D. C. l. c.) leaves oval, attenuated at both ends; panicle villous, with its branches compressed and divaricating.

Var. β, obovàta (D. C. l. c.) leaves broadly obovate; panicle pubescent, sparingly branched, equal in length to the leaves; fruit globose, irregularly hollowed out into empty cells, but this is probably occasioned by insects.

Var. γ, ovàta (D. C. l. c.) leaves broadly ovate, rather opaque; panicle hardly pubescent, longer than the leaves; fruit didymous, globose. Seeds 2, with a brittle testa. Cotyledons contortuplicate.

Plum-leaved Myrcia. Shrub.

82 M.? CURATELLÆFÒLIA (D. C. l. c.) panicle corymbose, nearly terminal; peduncles compressed, clothed with canescent velvety down; fruit globose, velvety, crowned by the calycine lobes, which are short, broad, and spreading; leaves obovate, obtuse, somewhat cuneated at the base, membranous, opaque, smoothish above, and clothed with canescent velvety down beneath. ♄. S. Native of Brazil, in fields at Taubate, in the province of St. Paul. Mýrtus curatellæfòlia, Mart. herb. Fruit divided into many empty cells inside.

Curatella-leaved Myrcia. Shrub 4 to 6 ft.

83 M.? PILÒSA (D. C. l. c.) peduncles axillary, twice the length of the leaves, racemose or somewhat panicled, and are, as well as the branches and calyxes, hairy; calyx with a globose tube, and ovate, acute, ciliated, spreadingly reflexed lobes; leaves oblong or somewhat ovate, rather opaque, clothed with villi when in a young state, but glabrous on the upper surface in the adult state, and velvety beneath, but at length smoothish. ♄. S. Native of Brazil. Mýrtus pilòsa, Mart. herb. Fruit globose, crowned by the spreading calyx, divided inwardly into 15-20 compartments, some of them empty, and some of them filled with seeds. Seed with a hard testa. This species is very doubtful; it is probably a *Mýrtus* or a *Mýrcia*, or a new genus, or the fruit is probably deformed by insects.

Pilose Myrcia. Shrub 4 to 6 ft.

84 M. SERI'CEA; erect, much branched; leaves oblong, acuminated, glabrous above, and clothed with white silky down beneath, on short petioles; racemes panicled, axillary; peduncles and branches tomentose. ♄. S. Native of Maranham, in Brazil.

Silky Myrcia. Shrub 6 to 8 ft.

85 M. læ'vis; branched; leaves oblong, acuminated, glabrous on both surfaces; racemes panicled, terminal, and axillary. ♄. S. Native of Maranham, in Brazil.

Smooth Myrcia. Shrub 6 to 8 ft.

86 M. ferrugínea; branched; leaves oblong, acuminated, coriaceous, canescent above, rusty beneath; racemes panicled, axillary, and terminal. ♄. S. Native of Maranham, in Brazil.

Rusty Myrcia. Shrub 6 to 8 ft.

87 M. pube'scens; branched; leaves oblong, acuminated, pubescent above, and silky beneath; racemes panicled, axillary and terminal, pubescent. ♄. S. Native of Maranham, in Brazil.

Pubescent Myrcia. Shrub 4 to 6 ft.

88 M. angu'sta; leaves narrow, ovate-lanceolate, glabrous on both surfaces; racemes panicled, axillary and terminal. ♄. S. Native of Maranham, in Brazil.

Narrow-leaved Myrcia. Shrub 4 to 6 ft.

b. *Leaves sessile, cordate at the base.*

89 M. subcorda'ta (D. C. l. c.) peduncles compressed, axillary, nearly terminal, panicled, disposed in a kind of corymb, glabrous, as well as the calyxes; leaves sessile, bluntly cordate, broadly ovate, obtuse, coriaceous, opaque, glabrous on both surfaces in the adult state, but when young covered with deciduous down beneath. ♄. S. Native of Brazil, in the provinces of the Mines. Calycine lobes broad, obtuse, short. Fruit globose, crowned by the circular calyx. Seeds shining, very aromatic. Cotyledons contortuplicate. Leaves 12-15 lines long, and 10-12 lines broad. Flowers unknown.

Subcordate-leaved Myrcia. Shrub 3 to 4 ft.

90 M. varia'bilis (D. C. prod. 3. p. 254.) peduncles axillary and nearly terminal, longer than the leaves, panicled, and are, as well as the branches, glabrous and somewhat compressed; leaves sessile, half stem-clasping, cordate, coriaceous, dotless, glabrous, reticulately veined, with the veins elevated on the upper surface. ♄. S. Native of Brazil, in the provinces of the Mines. Mýrtus variábilis, Mart. herb. Calycine lobes broad, obtuse, glabrous. Allied to *M. dealbàta*, and having its leaves and branchlets clouded with white as in that species; and is perhaps merely a variety of it with different formed leaves.

Var. α, ovatifòlia (Mart. herb.) leaves ovate-lanceolate, bluntly acuminated. ♄. S. Leaves an inch and a half long, and 8-9 lines broad.

Var. β, intermèdia (Mart. herb.) leaves ovate, bluntish. ♄. S. Leaves an inch long, and 6-7 lines broad.

Var. γ, nummulària (D. C. l. c.) leaves nearly orbicular, somewhat emarginate at the apex. ♄. S. Leaves nearly an inch broad, and about the same in length.

Variable Myrcia. Shrub.

91 M. dealba'ta (D. C. l. c.) peduncles axillary and terminal, panicled, longer than the leaves, and are, as well as the bracteas, glabrous, but sprinkled with white powder; leaves sessile, cordate, half stem-clasping, coriaceous, stiff, reticulately veined, glabrous, pale. ♄. S. Native of Brazil, in the province of Minas Geraes. Mýrtus dealbàta, Mart. herb. Leaves an inch long, and 5 lines broad, dotless. Calycine lobes broad, when young rather ciliated when examined by a lens, but at length glabrous, acutish. Petals roundish, glandular. Inflorescence nearly as in *M. exsúcca*. Fruit unknown.

Whitened Myrcia. Shrub.

92 M. racemulòsa (D. C. l. c.) peduncles axillary, racemose, twice the length of the leaves, 3-7-flowered, glabrous; branchlets hairy; leaves sessile, cordate, obtuse, coriaceous, quite glabrous, reticulately veined, dotted, rather opaque. ♄. S. Native of Brazil, in the provinces of the Mines. Mýrtus racemulòsa, Mart. herb. Leaves 3-4 lines long, and 3 lines broad, margined by a nerve. Flowers small, glabrous. Calycine lobes short, broad, blunt, glandular. A very distinct species, with the habit of *Bæ'ckea*. Inflorescence nearly as in *M. ramulòsa*. Fruit unknown.

Racemulose-flowered Myrcia. Shrub 2 to 3 ft.

93 M. scutulífera (D. C. l. c.) peduncles axillary and nearly terminal, panicled, glabrous, many-flowered, 4 times the length of the leaves; leaves sessile, cordate-ovate, reticulately veined, coriaceous, opaque, glabrous; branchlets rather hairy. ♄. S. Native of Brazil, in fields in the provinces of the Mines. Mýrtus scutulífera, Mart. herb. Very like *M. racemulòsa*, but the flowers are more numerous but similar, the leaves are also similar, but longer, and the branchlets less hairy. It is probably only a variety of it.

Saucer bearing Myrcia. Shrub.

94 M. albo-tomentòsa (D. C. l. c.) peduncles axillary and terminal, panicled, longer than the leaves, and are, as well as branches and bracteas, hairy; calyxes very hairy; leaves sessile, cordate, ovate, bluntish, coriaceous, opaque, glabrous above, densely clothed with velvety tomentum beneath. ♄. S. Native of Brazil, at the river St. Francisco, in the provinces of the Mines. Mýrtus albo-tomentòsa, Mart. herb. Leaves 8-10 lines long, and 7-9 lines broad, when young villous beneath. Calycine lobes blunt. Fruit unknown.

White-tomentose Myrcia. Shrub.

95 M. lasia'ntha (D. C. l. c.) peduncles axillary and nearly terminal, collected into a panicle, intermixed with leaves, and are, as well as the branchlets and calyxes, very hairy; leaves sessile, half stem-clasping, cordate, ovate, acutish, coriaceous, opaque, villous beneath, smooth and glabrous above. ♄. S. Native of Brazil, [illegible] the provinces of the Mines. Mýrtus lasiántha, Mart. herb. Leaves 5-6 lines long, and 4-5 broad, crowded, somewhat reticulately veined, and villous on the upper surface. Panicle clothed with soft hairs, many-flowered. Calycine lobes broad, bluntish. Fruit unknown.

Woolly-flowered Myrcia. Shrub.

§ 2. *Oocárpæ* (from ωον, *oon*, an egg, and καρπος, *karpos*, a fruit; in reference to the shape of the fruit). D. C. prod. 3. p. 254. *Fruit ovate or oblong.*

96 M. Be'rberis (D. C. l. c.) peduncles panicled, axillary or terminal, shorter than the leaves; fruit oblong, rather elliptic, crowned by the short obtuse calycine lobes; leaves elliptic, terminated in a long abrupt acumen each, coriaceous, when young full of pellucid dots, but in the adult state opaque, and shining above, quite glabrous on both surfaces, as well as the branchlets and panicles. ♄. S. Native of Brazil, at the river Tapura; and of French Guiana. Mýrtus Bérberis, Mart. herb. Leaves 4 inches long, and hardly an inch and a half broad. Petioles 2-3 lines long. Panicle 2-3 inches long. Bracteoles small, deciduous. Fruit 3 lines long, 1-seeded. Cotyledons corrugated.

Berberry-like Myrcia. Shrub.

97 M. Formosia'na (D. C. prod. 3. p. 255.) peduncles panicled, rather shorter than the leaves, axillary or nearly terminal; fruit ovate, crowned by the lobes of the calyx, which are short and obtuse; leaves elliptic-oblong, gradually acuminated, coriaceous, opaque above, shining a little on both surfaces, and quite glabrous, as well as the panicles and branchlets, which are compressed. ♄. S. Native of Brazil, in the province of St. Paul, in woods on the mountains. Very nearly allied to *M. Bérberis*, but differs in the leaves being gradually, not abruptly acuminated, and in the fruit being more ovate. Seed one. Cotyledons corrugated.

Formosa Myrcia. Shrub.

98 M. ROSTRA'TA (D. C. l. c.) peduncles axillary, racemose, shorter than the leaves, 5-7-flowered; pedicels distant, opposite; calyx bluntly 5-lobed, clothed with adpressed down; fruit obovate; leaves lanceolate, much acuminated, full of pellucid dots, shining above and glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of Brazil, in the province of St. Paul. My'rtus rostràta, Mart. herb. Leaves stiffish, 3 inches long, and 7-8 lines broad. Peduncles an inch long. Fruit 4 lines long, crowned by the calyx. Seeds unknown.

Beaked Myrcia. Tree 10 to 12 ft.

99 M. ERÍOPUS (D. C. l. c.) peduncles panicled, axillary, a little longer than the leaves, and are, as well as the branches, hispid; tube of calyx oblong, hispid; leaves oval-oblong, acuminated, when young full of pellucid dots, clothed with long silky velvety down, opaque in the adult state, and smoothish. ♄. S. Native of Brazil, in the province of Rio Janeiro, in woods. My'rtus eríopus, Mart. herb. Leaves 1½ inch long, and 6 lines broad. Petioles 2 lines long. Calycine lobes short, obtuse.

Woolly-peduncled Myrcia. Shrub 8 to 10 ft.

*** *Species natives of Columbia.*

100 M. UMBELLULÍFERA (D. C. prod. 3. p. 255.) peduncles 3-6-flowered, solitary or twin, or 2-4 seated on a short common peduncle; flowers rather umbellate, with the middle one usually sessile; calyxes 5-cleft; leaves elliptic, obtuse at both ends, somewhat emarginate at the apex, coriaceous, reticulated, glabrous, rather silvery beneath; branchlets finely tomentose. ♄. S. Native of Cumana, in cultivated places. My'rtus umbellulífera, H. B. et Kunth, nov. gen. amer. 6. p. 135. Flowers about the size of those of *Cratæ'gus oxyacántha*. Stamens about 140 in number. Ovarium 2-3-celled; cells 4-6-ovulate. Fruit and seeds unknown.

Umbel-bearing Myrcia. Shrub.

101 M.? CLUSIÆFÒLIA (D. C. l. c.) panicles axillary, depauperated, equal in length to the leaves; calyx 5-cleft; leaves elliptic, rounded at the apex, and sometimes emarginate, running down into the petioles, coriaceous, reticulated and shining, and are, as well as the branches, glabrous. ♄. S. Native of South America. My'rtus clusiæfòlia, H. B. et Kunth, nov. gen. amer. 6. p. 138. Leaves about 2 inches long, and about 17-21 lines broad. Petioles 3-4 lines long. Fruit globose, about the size of a pea, few-seeded. Seeds unknown. Said to be like *M. Piménta* and *M. coriàcea.*

Clusia-leaved Myrcia. Shrub.

102 M.? POLYA'NTHA (D. C. l. c.) panicles axillary and terminal, branched; branchlets 1-3-flowered, compressed, clothed with fine silky down; leaves oblong, acuminated, acute at the base, obsoletely reticulated, coriaceous, glabrous above and shining, puberulous beneath, as well as on the branchlets. ♄. S. Native of South America, on the banks of the rivers Atabapo and Orinoco. My'rtus polyántha, H. B. et Kunth, nov. gen. amer. 6. p. 140. t. 545. Ovarium 2-celled; cells 2-ovulate. Fruit and seeds unknown.

Many-flowered Myrcia. Shrub.

103 M.? COMPLICA'TA (D. C. l. c.) panicles axillary and terminal, branched; branchlets 1-3-flowered, compressed, clothed with fine silky down; leaves oblong, acuminated, rounded at the base, complicated, coriaceous, glabrous, shining, and are, as well as the branches, puberulous. ♄. S. Native of New Granada, at San Felipe. My'rtus complicàta, H. B. et Kunth, nov. gen. amer. 6. p. 141. Ovarium 2-celled; cells 2-ovulate as in *M. polyántha.* Said to be allied to *M. defléxa* of Poir.

Complicated-leaved Myrcia. Shrub 8 to 10 ft.

104 M. COCCOLOBÆFÒLIA (D. C. l. c.) panicles axillary, depauperated, compressed, glabrous, about equal in length to the leaves; calyx 4-5-cleft; leaves roundish-ovate, obtuse, rounded at the base, coriaceous, reticulated, shining, and are, as well as the branches, glabrous. ♄. S. Native of New Granada, near Ibague. My'rtus coccolobæfòlia, H. B. et Kunth, nov. gen. amer. 6. p. 139. Flowers unknown. Berry nearly globose, glabrous, red, 3-celled, acid; cells few-seeded. Embryo like that of *M. bracteolàris.*

Coccoloba-leaved Myrcia. Shrub 5 ft.

105 M. BILLARDIA'NA (D. C. l. c.) pedúncles axillary, panicled, glabrous, about equal in length to the leaves; flowers 5-lobed; leaves oblong, acuminated, acute at the base, on very short petioles, membranous, reticulated, glabrous. ♄. S. Native of New Andalusia, on Mount Cocollar. My'rtus Billardiàna, H. B. et Kunth, nov. gen. amer. 6. p. 139. t. 544. Flowers unknown. Berry nearly globose, 1-2-seeded. Cotyledons foliaceous, corrugated. Radicle long, descending. Calyx 4-lobed from the figure, but from the description 5-lobed.

La Billardier's Myrcia. Shrub 10 to 12 ft.

106 M.? MÓLLIS (D. C. prod. 3. p. 256.) panicles axillary and terminal, branched, clothed with fuscescent tomentum; calyx 5-cleft; leaves oblong, acuminated, rounded at the base, coriaceous, reticulated, glabrous above and shining, but clothed with pubescent tomentum beneath, and on the branches. ♄. S. Native of New Granada, near Pasto. My'rtus móllis, H. B. et Kunth, nov. gen. amer. 6. p. 141. Flowers hardly known. Fruit and seeds unknown. Said to be allied to *Eugènia defléxa.*

Soft Myrcia. Shrub 8 to 12 ft.

107 M. ACUMINA'TA (D. C. l. c.) panicles axillary, solitary and terminal, tern, branched, exceeding the leaves; calyx 4-5-cleft; leaves ovate-oblong, long-acuminated, obtuse at the base, reticulated, coriaceous, shining, pubescent on the nerve, but when young silky. ♄. S. Native of New Granada, between Mariquita and St. Anna. My'rtus acuminàta, H. B. et Kunth, nov. gen. amer. 6. p. 141. Ovarium turbinate, 2-celled; cells 2-seeded. Embryo like that of *M. bracteolàris.*

Acuminated-leaved Myrcia. Shrub 8 to 10 ft.

108 M.? HUMBOLDTIA'NA (D. C. l. c.) panicles axillary, solitary, somewhat branched, divaricate, clothed with rusty tomentum, shorter than the leaves; calyxes 5-parted; leaves ovate-oblong, terminating in a narrow acumen, acute at the base, coriaceous, reticulated, shining, puberulous beneath; branches tomentose. ♄. S. Native on the banks of the Orinoco. My'rtus defléxa, H. B. et Kunth, nov. gen. amer. 6. p. 142. Leaves 6-7 inches long, and 2 inches broad. Ovarium 2-celled; cells 2-seeded. In the immature seeds the cotyledons are foliaceous, complicated, and perhaps afterwards corrugated.

Humboldt's Myrcia. Shrub 8 to 10 ft.

109 M. XYLOPIOÌDES (D. C. l. c) peduncles axillary, cymosely panicled, shorter than the leaves; leaves lanceolate, terminating in a narrow acumen each, obtuse at the base, on short petioles, membranous, reticulated, downy beneath, as well as on the branches. ♄. S. Native of New Granada, near the town of Buga, in the province of Popayan. My'rtus xylopioìdes, H. B. et Kunth, nov. gen. amer. 7. p. 257. t. 657. Calyx 5-lobed. Fruit elliptic, 1-seeded. Cotyledons fleshy, corrugated.

Xylopia-like Myrcia. Shrub 8 to 10 ft.

110 M.? LONGIFÒLIA (D. C. l. c.) glabrous; leaves on very short petioles, large, oblong, acuminately cuspidate, somewhat cordate, coriaceous, very shining; calyx 5-toothed; drupe pear-shaped, 1-seeded. ♄. S. Native in woods on the banks of the Orinoco. My'rtus longifòlia, H. B. et Kunth, nov. gen. amer. 7. p. 258. Drupe 2-celled; cells 1-seeded. Structure of the flowers and seeds unknown.

Long-leaved Myrcia. Shrub 8 to 10 ft.

**** *Uncertain species.*

111 M. MELASTOMOÌDES (D. C. l. c.) peduncles axillary, panicled, shorter than the leaves; leaves ovate, acutish, strongly 3-nerved, sessile, very opaque and glabrous. ♄. S. Native of Tobago. Flowers 5-cleft. Margin of calyx permanent, usually 5-toothed. Fruit nearly globose, 1-seeded. Seeds large, shining. Cotyledons foliaceous, corrugated.

Melastoma-like Myrcia. Shrub 5 to 10 ft.

112 M.? TRIA'NTHA (D. C. l. c.) peduncles axillary, 3-5-flowered, shorter than the leaves; flowers 5-cleft, middle one sessile, lateral ones pedicellate; bracteas linear at the base of the calyx; leaves ovate-lanceolate, acute, full of pellucid dots; branchlets tetragonal, rather pubescent. ♄. S. Native country unknown. Leaves nearly of *M. commùnis var. Romàna*. Lobes of calyx acute. Fruit and seeds unknown.

Three-flowered Myrcia. Tree 10 to 15 ft.

113 M.? VERNICÒSA (D. C. l. c.) peduncles axillary, 3-5-flowered, a little longer than the leaves; calyx bluntly and repandly 5-toothed; leaves oval, obtuse at both ends, nearly sessile, shining on both surfaces, and as if they were varnished above; branches and peduncles glabrous. ♄. S. Native of South America. Leaves 20 lines long, and 12-14 broad, when young furnished with pellucid dots, but opaque in the adult state. Pedicels opposite, distant. Fruit and seeds unknown.

Varnished-leaved Myrcia. Shrub 6 to 12 ft.

Cult. All the species of *Mýrcia* are very like the common *myrtle* when in flower; they grow best in a mixture of loam, peat, and sand; and young cuttings will root readily if planted in a pot of sand, with a hand-glass over them.

XXIX. CALYPTRA'NTHES

(from καλυπτρα, *calyptra*, a veil, and ανθος, *anthos*, a flower; in allusion to the operculum of the flower). Swartz, prod. fl. ind. occ. p. 917. t. 15. St. Hil. pl. usual. bras. t. 14. D. C. prod. 3. p. 256.--Chytracùlia and Suzy'gium, P. Browne, jam. 239. and 240.—Chytràlia, Adans. jam. p. 80.—Calyptránthes, Juss. dict. 6. p. 274. but not of Pet. Th. nor Blume.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx obovate; limb entire before flowering, but circumcised at the base at the time of flowering, constituting a lateral deciduous operculum. Petals wanting, or 2 or 3 small. Stamens numerous; filaments capillary; anthers small, round, 2-celled. Style one. Stigma simple. Ovarium 2-3-celled; cells 2-seeded in the central angle. Berry 1-celled from abortion, 1-4-seeded.—Small trees, natives of the West Indies and Brazil. Leaves feather-veined. Peduncles axillary, many-flowered. Mature seeds not well known, but they are probably similar to those of *Mýrcia*.

1 C. OBSCU'RA (D. C. prod. 3. p. 257.) leaves oval, acuminated, stiff, shining above, full of pellucid dots beneath, quite glabrous, as well as the branches, on short petioles; flowers 2-5 together, axillary, on short pedicels. ♄. S. Native of Brazil. Psídium obscùrum, Mart. herb. Calyx with an obovate tube, having the limb irregularly ruptured after flowering. Allied to *C. rígidum.*

Obscure Calyptranthes. Shrub.

2 C. RÍGIDA (Swartz, prod. p. 80. fl. ind. occ. p. 923.) arborescent; leaves ovate, acute, convex, stiff, glabrous; peduncles axillary, simple, usually 3-flowered, glabrous. ♄. S. Native of Jamaica, on the higher mountains. Flowers small, white, nearly sessile on the tops of the peduncles. Berry minute, roundish, 1-seeded.

Stiff Calyptranthes. Tree 12 to 15 ft.

3 C. CHYTRACU'LIA (Swartz, prod. p. 79. fl. ind. occ. p. 921.) arboreous; leaves ovate, attenuated at the apex, stiffish, glabrous; peduncles axillary and terminal, trichotomous, panicled, and are, as well as the flowers, clothed with rufous velvety down. ♄. S. Native of Jamaica, St. Thomas, and Guadaloupe, on the mountains. Chytracùlia arbòrea, P. Browne, jam. 239. t. 37. f. 2. My'rtus chytracùlia, Lin. amœn. 5. p. 398. Flowers small, glomerate, white. Berry dry, 1-seeded. Eugènia pállens, Poir. suppl. 3. p. 122. The specific name is derived from χυτρα, a vessel, in reference to the operculum of the flower.

Chytraculia Calyptranthes. Fl. March, May. Clt. 1778. Tree.

4 C. SYZY'GIUM (Swartz, prod. p. 79. fl. ind. occ. p. 919.) arborescent; leaves ovate, obtuse, stiff; peduncles axillary, trichotomous, many-flowered, glabrous. ♄. S. Native of Jamaica, in arid calcareous places by the sea side. Suzy'gium fruticòsum, Lin. amœn. 5. p. 398. Flowers on short pedicels. Berry roundish, black, 3-4-seeded. The specific name is derived from συζυγος, coupled, in reference to the manner in which the leaves are united in pairs.

Coupled Calyptranthes. Fl. May, July. Clt. 1779. Shrub 10 to 12 feet.

5 C. MARTIUSIA'NA (D. C. l. c.) leaves oval, attenuated at the base, bluntish at the apex, rather opaque, having the lateral nerves confluent at their tops, reticulated, glabrous on both surfaces, as well as on the branches; peduncles compressed, trifid at the apex, with the ramifications bearing 3 sessile approximate, bibracteate flowers at the apex. ♄. S. Native of Brazil, in woods on the road to Felisbert. Leaves 4 inches long, and 2 inches broad. Peduncles diverging, 1½ inch long. Lateral pedicels 4 lines long, and the middle one 6 lines long. Bracteoles glabrous, deciduous. Calyx villous. Flower-bud ovate, acute, separating transversely into a conical operculum. Stamens numerous. Fruit unknown.

Martius's Calyptranthes. Tree.

6 C.? ERIÓPODA (D. C. l. c.) leaves ovate, hardly petiolate, obtuse, coriaceous, opaque, glabrous; peduncles axillary, or nearly terminal, solitary or twin, a little branched, somewhat racemosely spicate, shorter than the leaves, hairy from rufous villi; calyx villous; fruit globose, crowned by the neck of the calyx. ♄. S. Native of Brazil. My'rcia eríopus, Mart. herb. Fruit like that of *Mýrcia*, but the calyx agrees with *Calyptránthes.* Leaves 15-18 lines long, and 10-12 lines broad.

Woolly-footed Calyptranthes. Tree.

7 C. PULCHE'LLA (D. C. l. c.) leaves obovate, cuneated at the base, obtuse at the apex, coriaceous, dotted beneath, when young full of pellucid dots, glabrous on both surfaces, and on the branches; peduncles axillary, angular, a little shorter than the leaves, bearing 5-9 flowers. ♄. S. Native of Brazil, in the provinces of the Mines. Flowers 3, approximate on the tops of the peduncles. Flower-bud obovate, furnished with small rufous pili at the base. Leaves 15-16 lines long, and 7-9 lines broad.

Pretty Calyptranthes. Tree.

8 C. DE'NSA (D. C. l. c.) leaves oval, acutish at the base, stiff, opaque, and are, as well as the branchlets, glabrous; peduncles axillary and terminal, corymbosely panicled, and are, as well as the branchlets, angular; fruit globose, crowned by the short truncate tube of the calyx. ♄. S. Native of Brazil, in the provinces of the Mines. Leaves nearly like those of *C. Chytracùlia*, an inch long, and 6 lines broad. Fruit 2-seeded. Embryo pseudo-monocotyledonous. Flower-bud not seen.

Dense-flowered Calyptranthes. Tree.

9 C. CONCÍNNA (D. C. prod. 3. p. 258.) leaves elliptic-oblong, cuneated at the base, bluntish at the apex, full of pellucid dots, white from villi beneath, as well as on the branches, opaque in the adult state, and glabrous on both surfaces; peduncles axillary, opposite, bearing 3-5 flowers at the apex, in a kind of umbel. ♄. S. Native of Brazil. Leaves 2 inches long, 10 lines broad, nearly like those of *Mýrcia oblongàta.* Peduncles

15 lines long. Flowers larger than any other of the species. Fruit unknown.

Neat Calyptranthes. Tree.

10 C. NIGRICANS (D. C. l. c.) shrubby; leaves obovate, obtuse, stiff, opaque, and are, as well as the branches, glabrous; peduncles axillary or terminal, equal in length to the leaves, somewhat panicled. ♄. S. Native of Brazil. Leaves hardly petiolate, 2-3 inches long, and 15-18 lines broad. Flowers small. Flower-bud obovate, mucronate, blackish, as well as the whole plant.

Blackish Calyptranthes. Tree.

11 C.? LORANTHIFÒLIA (D. C. l. c.) leaves elliptic, obtuse, rather coriaceous, opaque, clothed with adpressed pubescence, as well as the branchlets, but glabrous above; peduncles twin, opposite, panicled, rising from the base of the branchlets, and are, as well as the flowers, clothed with adpressed rufous down. ♄. S. Native of Brazil, in fields in the province of St. Paul. Leaves 2 inches long, and 15 lines broad. Petioles 2-3 lines long. Racemes 2 inches long. Flowers tern, and as if they were operculated, from the bracteoles cohering at the apex.

Loranthus-leaved Calyptranthes. Tree.

12 C. CUSPIDA'TA (Mart. herb. ex D. C. prod. 3. p. 258.) leaves oval, narrowly acuminated, opaque, rather membranous, glabrous on both surfaces, as well as on the branches; peduncles axillary and terminal, loosely panicled, compressed, and are, as well as the calyxes, velvety from adpressed short rufous down. ♄. S. Native of Brazil, in the province of Rio Negro, in woods. Leaves 6 inches long, and 2 inches broad. Panicle shorter than the leaves, usually much branched from the base. Flower-bud obovate, dotted. Fruit unknown.

Cuspidate Calyptranthes. Tree.

13 C. LU'CIDA (Mart. herb. ex D. C. l. c.) leaves elliptic-oblong, acuminated at both ends, petiolate, full of pellucid dots, glabrous on both surfaces, as well as on the branches, shining above; peduncles axillary, twin, panicled, a little shorter than the leaves, and are, as well as the calyxes, glabrous. ♄. S. Native of Brazil, in the province of Bahia. A tree 20 feet high, with white bark. Branchlets angular. Leaves about 2 inches long, and 9 lines broad.

Shining Calyptranthes. Tree 20 ft.

14 C. AROMA'TICA (St. Hil. pl. usul. bras. t. 14.) shrubby; leaves connate, oblong-elliptic, quite glabrous; peduncles axillary or terminal, twin, elongated, panicled. ♄. S. Native of Brazil, in woods about Rio Janeiro. Petals 2-3, small, greenish. The flower-buds are whitish and aromatic, and are used in Brazil as a succedaneum for cloves. An oil might be obtained from them equal to oil of cloves.

Aromatic Calyptranthes. Shrub.

15 C. PANICULA'TA (Ruiz et Pav. fl. per. syst. p. 131. prod. p. 74. t. 13.) leaves lanceolate-oblong, bluntly acuminated; racemes panicled, terminal. ♄. S. Native of Peru, in groves. Flowers very fragrant. Operculum conical. Berry 2-4-celled. A species not sufficiently known. Ruiz et Pav. fl. per. 4. t. 424.

Panicled Calyptranthes. Shrub 10 to 12 ft.

16 C.? LATERIFLÒRA (D. C. prod. 3. p. 258.) spikes simple, rising from the old trunk or branches, villous; bracteas ovate, acute, concave, lower ones sessile; flowers sessile in the axils of the bracteas; leaves oblong, acuminated, opaque, quite glabrous on both surfaces. ♄. S. Native of Brazil, in the provinces of the Mines. Spikes 3-4 inches long, pedunculate, 11-15-flowered; flowers opposite, axillary, bibracteate. Flower-bud nearly globose, very villous, at length ruptured at the apex, not 4-5-lobed as in *Mýrtus* and *Eugènia*, and not truly calyptrate as in *Calyptránthes*. Perhaps a new genus, but the expanded flowers, as well as the fruit, are unknown.

Side-flowering Calyptranthes. Tree 20 to 30 ft.

17 C.? BULLA'TA (D. C. l. c.) branches minutely pubescent; leaves broad-lanceolate, obtuse, more or less blistered. ♄. S. Native of Honduras. My'rtus bullàta, Salisb. prod. 354. This species is hardly known.

Blistered Calyptranthes. Shrub 12 to 14 ft.

Cult. See *Mýrcia* for culture and propagation, p. 847.

XXX. SYZY'GIUM (the name is derived from συζυγος, *syzygos*, coupled; in allusion to the manner in which the branches and leaves are united by pairs). Gærtn. fruct. 1. p. 166. t. 33. but not of Browne. D. C. prod. 3. p. 259.—Opa, Lour. fl. coch. 309.—Calyptránthes spec. Willd.—Eugènia spec. Lam. Roxb. —Calyptránthus, Blume, bijdr. p. 1089.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx obovate; limb nearly entire or repandly lobed. Petals 4-5, roundish, joined into a calyptra, and as if they were forming a convex membranous circumcised operculum. Stamens numerous, free. Style one; stigma simple. Ovarium 2-celled; cells few-ovulate. Berry 1-celled, 1 or few-seeded. Seeds globose. Cotyledons large, thick, half hemispherical. Radicle small, inserted beneath the middle of the cotyledons, and concealed by them.—Trees or shrubs, natives of the Old World within the tropics. Leaves opposite, glabrous. Peduncles axillary and terminal, cymosely corymbose. This genus differs from *Calyptránthes* in the operculum being formed from the petals, not from the calyx; from *Caryophýllus* in the tube of the calyx being obovate or turbinate, not cylindrical, and with the lobes hardly distinct; and from *Eugènia* in the cotyledons being less closely conferruminated, and in the petals cohering into a calyptra.

§ 1. *Fruit globose or subglobose.*

1 S. GUINEE'NSE (D. C. prod. 3. p. 259.) leaves oblong-elliptic, acuminated at both ends, shining above and reticulated beneath; cymes trichotomous, corymbose, terminal; calyx 5-toothed. ♄. S. Native of Guinea and Senegal. Calyptránthes Guineénsis, Willd. spec. 2. p. 974. This species is intermediate between *Jambòsa* and *Syzy'gium.* Fruit unknown.

Guinea Syzygium. Tree.

2 S. LATIFÒLIUM (D. C. l. c.) leaves broadly ovate, obtuse at both ends, somewhat emarginate at the apex, coriaceous, reticulated, on very short petioles; flowers nearly sessile, in lateral fascicles. ♄. S. Native of the Mauritius. Calyptránthes, Sieb. fl. maur. 2. no. 98. in this the leaves are 9 inches long and 5 broad.

Broad-leaved Syzygium. Tree.

3 S. OBOVA'TUM (D. C. l. c.) leaves obovate or oval, obtuse, coriaceous, on short petioles, feather-nerved, and somewhat reticulated; cymes numerous, on long peduncles, disposed in a terminal panicle; calyxes repand. ♄. S. Native of the Mauritius. Eugènia obovàta, Poir. suppl. 3. p. 124. My'rtus obovàta, Spreng. syst. 2. p. 436. Calyptránthes Pollícina, Willem. maur. p. 29. Calyptránthes, Sieb. fl. maur. no. 99. Leaves 5 inches long, and 3 inches broad. Berry globose, larger than a pea. Seeds 2, hemispherical. Cotyledons fleshy, conferruminated.

Obovate-leaved Syzygium. Tree.

4 S. PANICULA'TUM (D. C. l. c.) leaves oval, acuminated, feather-nerved, silky; cymes numerous, rather crowded, disposed in a terminal panicle; calyx repand. ♄. S. Native of the Island of Bourbon, where it is called *Bois à écorce blanche.* S. paniculàtum, Gærtn. fruct. 1. p. 166. t. 33.? Jambolifera péndula, Lin. ex Steud. Eugènia paniculàta, Lam. dict. 3. p. 199. Branches with white bark. Petioles 5 lines long. Leaves 2 inches long, and an inch broad.

Panicled Syzygium. Tree.

5 S. CYMÒSUM (D. C. l. c.) leaves ovate-lanceolate, acuminated, hardly feather-nerved, coriaceous; cymes axillary and

terminal, panicled; calyx rather repand. ♄. S. Native of the Mauritius and Bourbon. Eugènia rhodomèlea, Comm. Eugen. cymòsa, Lam. dict. 3. p. 199. My'rtus cymòsa, Spreng. Eug. nigréscens, Poir. suppl. 3. p. 123.? Branches brownish red. Leaves like those of the preceding species, but the flowers are larger.

Cymose-flowered Syzygium. Tree.

6 S. GLOMERA'TUM (D. C. prod. 3. p. 259.) leaves ovate, obtuse, coriaceous, on very short petioles, reticulately veined, one-nerved; cymes nearly terminal, crowded with flowers, corymbose; calyx hardly repand. ♄. S. Native of the Mauritius, where it is called *Bois de pomme.* Eugènia glomeràta, Lam. dict. 3. p. 199. My'rtus glomeràta, Spreng. no. 69. My'rtus coriàcea, Sieb. fl. maur. 2. no. 102. and probably the My'rtus àcris, Sieb. l. c. no. 101. exclusive of the synonyme of Swartz. Eugènia contrácta, Poir. suppl. 3. p. 125.

Glomerated Syzygium. Tree.

7 S. JAMBOLA'NUM (D. C. l. c.) leaves oval or obovate, feather-nerved, coriaceous; cymes panicled, loose, lateral and terminal; calyxes quite entire. ♄. S. Native of the East Indies. Jambolàna, Rumph. amb. 1. t. 42. Jambolifera pedunculàta, Houtt. pfl. syst. 1. p. 462. t. 7. f. 1. Eugènia Jambolàna, Lam. dict. 3. p. 198. Calyptránthes Jambolàna, Willd. spec. 2. p. 975. and in Ust. neu ann. 2. p. 23. Blum. bijdr. 1091. Petioles 5-6 lines long. Fruit black, esculent. It is commonly called *Java-plum.*

Var. α; leaves acuminated. Eugènia Jambolàna, Roxb.

Var. β; leaves elliptic, tapering to both ends. Eugènia Jambolàna, Roxb. and Rumph.

Var. γ; leaves obovate, very obtuse. Perhaps Eugènia obtusifòlia, Roxb. hort. beng. p. 37.

Jambolan Syzygium. Clt. 1796. Tree.

8 S. INOPHY'LLA (D. C. prod. 3. p. 260.) leaves ovate-elliptic, acuminated at both ends, coriaceous, shining, reticulately veined; cymes axillary and terminal, corymbose; pedicels 3-flowered; flowers sessile; calyx quite entire. ♄. S. Native of the East Indies. Eugènia inophy'lla, Roxb. hort. beng. no. 37.

Veiny-leaved Syzygium. Tree.

9 S. CARYOPHYLLIFÒLIUM (D. C. l. c.) leaves ovate-elliptic, acuminated at both ends, coriaceous, feather-nerved; peduncles lateral, in dense cymose panicles; calyx rather repand, with a transparent border. ♄. S. Native of the East Indies.—Pluk. alm. t. 274. f. 2.—Rheed. mal. 5. t. 29. Rumph. amb. 1. t. 41. My'rtus Cumìni, Lin. spec. 674. Eugènia caryophyllifòlia, Lam. dict. 3. p. 198. Eugen. corticòsa, Lour. coch. p. 309. Calyptránthes caryophyllifòlia, Blum. l. c. Petioles almost an inch long. Stamens short.

Clove-leaved Syzygium. Clt. 1822. Tree.

10 S. NERVÒSUM (D. C. l. c.) leaves oval-elliptic, attenuated at the base, acuminated at the apex, rather coriaceous, feather-nerved, lateral nerves rather prominent; peduncles lateral and terminal, cymosely panicled, loose; calyx quite entire. ♄. S. Native of the Moluccas. Eug. operculàta, Roxb. hort. beng. p. 37.

Nerved-leaved Syzygium. Tree.

11 S. VENÒSUM (D. C. l. c.) leaves elliptic, cuneated at the base, acuminated at the apex, rather coriaceous; lateral veins nearly regular, forming a marginal vein in front of the margin; panicles axillary and terminal, shorter than the leaves; calyx nearly entire. ♄. S. Native of Nipaul. Petioles 8-9 lines long. Leaves 4 inches long and 1½ broad.

Veiny-leaved Syzygium. Tree.

12 S. AREOLA'TUM (D. C. l. c.) leaves elliptic, cuneated at the base, acuminated at the apex, rather coriaceous, reticulately veined; areolæ regular at the margin, and as if they were constituting a double line; peduncles panicled, axillary and terminal, 3 or 4 times shorter than the leaves; calyx quite entire. ♄. G. Native of Nipaul. Flower-bud globose, somewhat depressed. Operculum corolline. Cupula truncate.

Areolate-veined Syzygium. Tree.

13 S. FRUTICÒSUM (D. C. l. c.) shrubby; leaves elliptic-ovate, acuminated, rather coriaceous, feather-veined; peduncles lateral, opposite or aggregate, loosely and corymbosely panicled. ♄. S. Native of Chittagong, in the East Indies. Flowers small. Operculum almost as in the first section, wholly dehiscent, but corolline, obtuse, and marcescent. Eugènia fruticòsa, Roxb. hort. beng. p. 37.

Shrubby Syzygium. Shrub 5 to 10 feet.

14 S. CARYOPHYLLÆ'UM (Gærtn. fruct. 1. p. 166. t. 33.?) leaves obovate, bluntish or emarginate, rather coriaceous, dotless; peduncles cymosely corymbose, trichotomous, terminal. ♄. S. Native of Ceylon. My'rtus caryophyllàta, Lin. spec. 675. Swartz, obs. 202. Calyptránthes caryophyllàta, Pers. ench. no. 4. Flowers small. Calyx obovate, repandly toothed. Operculum corolline.

Clove-like Syzygium. Tree.

15 S. ZEYLA'NICUM (D. C. l. c.) arboreous; leaves ovate, acuminated, coriaceous, shining above, and full of impressed dots beneath; peduncles nearly terminal, cymosely panicled. ♄. S. Native of Ceylon. My'rtus, Herm. zeyl. 435. with a good figure. My'rtus Zeylánica, Lin. spec. p. 675. Andr. bot. 619. Berry (ex Herm.) white and 1-seeded. Flowers small. Calyx with an oblong tube, and an evidently 5-lobed limb. Operculum corolline.

Ceylon Syzygium. Fl. June, July. Clt. 1798. Tree.

16 S. SPICA'TUM (D. C. l. c.) leaves ovate, acuminated, coriaceous, shining above, full of impressed dots; peduncles short, umbelliferous, crowded into a spicate ovate raceme; style exserted. ♄. S. Native of the East Indies. Eugenia spicàta, Lam. dict. 3. p. 201. Calyx turbinate, pruinosely glaucous, 5-cleft. Perhaps sufficiently distinct from *S. Zeylánicum.*

Spicate-flowered Syzygium. Tree.

17 S. ODORA'TUM (D. C. l. c.) leaves ovate-lanceolate, attenuated at the base, acute at the apex, rather coriaceous, dotless; peduncles terminal, cymosely corymbose; berry globose, crowned by the limb of the calyx, which is very entire. ♄. G. Native of Cochin-china, among bushes, and of China. O'pa odoràta, Lour. coch. p. 309. S. lùcidum, Gærtn. fruct. 1. p. 167. t. 33.?

Sweet-scented Syzygium. Shrub 4 to 6 feet.

18 S. RACEMÒSUM (D. C. prod. 3. p. 261.) leaves oblong-lanceolate, acuminated, full of parallel veins; peduncles umbellulate, racemose, axillary or terminal; fruit globose. ♄. S. Native of Java, on the mountains. Calyptránthus racemòsa, Blum. bijdr. p. 1089.

Racemose-flowered Syzygium. Tree.

19 S. LAXIFLÒRUM (D. C. l. c.) leaves oblong-lanceolate, acuminated at both ends, full of transverse parallel veins; panicles terminal or axillary, divaricate; pedicels subumbellate. ♄. S. Native of Java, in mountain woods. Calyptránthus laxiflòra, Blum. bijdr. p. 1090. Perhaps the same as *S. Zeylánicum.*

Loose-flowered Syzygium. Tree.

20 S. CORYMBÒSUM (D. C. l. c.) leaves oblong-lanceolate, acuminated at both ends, veined; corymb terminal, divaricate; pedicels subumbellate; young branches 4-sided; fruit nearly globose. ♄. S. Native of Java, on the mountains. Calyptránthus corymbòsa, Blum. bijdr. p. 1091.

Corymbose Syzygium. Tree.

§ 2. *Fruit oblong.*

21 S. PYRIFÒLIUM (D. C. l. c.) leaves elliptic-lanceolate, bluntly acuminated, full of parallel veins; corymbs trichotomous, terminal; pedicels usually 3-flowered; fruit oblong.

♄. S. Native of Java, on Mount Salak. Caly'ptranthus pyrifolia, Blum. l. c. Like S. caryophyllifòlium, but evidently distinct, in the corymbs being constantly terminal, and in the flowers being much larger.

Pear-leaved Syzygium. Tree 20 feet.

22 S. ROSTRA'TUM (D. C. l. c.) leaves broadly lanceolate, each with a long blunt acumen, shining, full of fine parallel veins; racemes axillary or terminal, solitary or crowded; pedicels 3-flowered; calyx obsoletely 4-toothed; fruit oblong. ♄. S. Native of Java, on high mountains. Calyptránthus rostràta, Blum. bijdr. p. 1092.

Beaked Syzygium. Tree.

23 S.? ACUMINATÍSSIMUM (D. C. l. c.) panicles terminal, corymbose; pedicels usually 3-flowered; calyx almost quite entire; petals 5-6, small; leaves lanceolate, very much acuminated, finely veined, coriaceous; fruit oblong. ♄. S. Native of Java, on the mountains. My'rtus acuminatíssima, Blume, l. c. p. 1088.

Acuminated Syzygium. Tree.

24 S.? MAGNOLIÆFÒLIUM (D. C. prod. 3. p. 261.) panicles terminal and axillary; flowers usually tern; calyx nearly entire; leaves elliptic-oblong, obtuse at the apex, narrow at the base, coriaceous, veined; fruit oblong. ♄. S. Native of Java, in the mountain woods in the province of Burangrang. My'rtus magnoliæfòlia, Blum. bijdr. p. 1088.

Magnolia-leaved Syzygium. Tree 20 feet.

† *Species not sufficiently known.*

25 S. METROSIDE'ROS (D. C. l. c.) leaves ovate, scattered, serrated; peduncles nearly terminal, somewhat racemose; petals pilose inside. ♄. G. Native of Cochin-china, in woods. O'pa Metrosidèros, Lour. coch. p. 309. exclusive of the synonyme of Rumph. Style bipartite. Berry 1-seeded, dry, crowned by the calyx. Perhaps belonging to a different genus.

Iron-wood Syzygium. Tree.

26 S. BELLU'TTA (D. C. l. c.) arboreous; leaves ovate, acute, shining; peduncles somewhat spicate, axillary and terminal; fruit globose. ♄. S. Native of Malabar. Bellutta-Kannelli, Rheed. mal. 5. t. 20. Pet. Th. dict. sci. nat. 4. p. 29.?

Bellutta-Kannelli Syzygium. Tree 20 feet.

27 S. MA'KUL (Gærtn. fruct. 1. p. 166. t. 33.) ♄. S. Native of Ceylon. Fruit unknown.

Makul Syzygium. Tree.

28 S. MYRTIFÒLIUM (D. C. l. c.) Eugènia myrtifòlia, Roxb. hort. beng. p. 37.

Myrtle-leaved Syzygium. Tree 20 feet.

29 S. HYPERICIFÒLIUM (D. C. prod. 3. p. 261.) My'rtus hypericifòlia, Salisb. prod. p. 354.

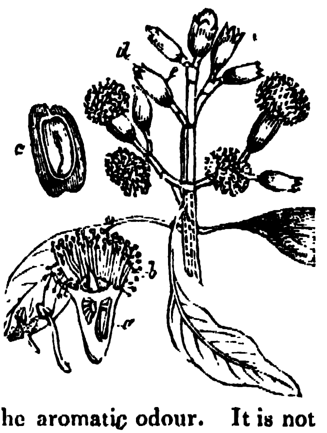
St. John's-wort-leaved Syzygium. Tree.

Cult. For culture and propagation see *Mýrcia*, p. 847.

XXXI. CARYOPHY'LLUS (The Arabs, who have been acquainted from all antiquity with the clove, called it Qarumfel, which the Greeks altered to *Caryophyllon.*) Tourn. inst. t. 432. Lin. gen. 669. Gærtn. fruct. 1. p. 169. t. 33. Blum. in litt. D. C. prod. 3. p. 261. My'rtus species, Kunth.—Eugènia species, Willd.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx cylindrical (f. 123. *c.*); limb 4-parted (f. 123. *d.*). Petals 4, cohering together into a calyptra as in *Syzy'gium.* Stamens free (f. 123. *b.*), disposed in 4 bundles, inserted in a 4-angled fleshy concavity near the teeth of the calyx. Ovarium 2-celled (f. 123. *a.*); cells 20-ovulate. Mature berry 1-2-celled, 1-2-seeded. Seeds cylindrical or semi-ovate. Cotyledons thick, fleshy, concave on the outside, sinuated in various ways on the inside. Radicle rising from the centre of the cotyledons, straight, and hidden by them.—Trees. Leaves opposite, coriaceous, dotted. Cymes terminal or subcorymbose in the forks of the branches.

FIG 123.



1 C. AROMA'TICUS (Lin. spec. p. 735.) leaves ovate-oblong, acuminated at both ends; cymes many-flowered. ♄. S. Native of the Moluccas. Hook, bot. mag. 2749. and 2750.—Rumph. amb. 2. tt. 1, 2, 3. Blackw. t. 338. Eugènia caryophyllàta, Thunb. diss. p. 1. My'rtus caryophy'llus, Spreng. The dried flower-buds of this tree are the cloves of the shops, the clou de Giroffe of the French. Calyx dark purple. Petals pale purple.

Every part of the plant is covered with minute dots or glands, which contain the oil, that gives the aromatic odour. It is not easy to determine when the *clove* was first known to Europeans. J. Bauhin tells us, that the inhabitants of the Moluccas were hardly acquainted with its value, till some Chinese vessels visited their country, and transported many plants into China, and that they were thus the means of distributing them into other districts of India, into Persia and Arabia. Sir James Smith (in Rees' cycl.) suspects that it was brought into Greece from Arabia, and that the first distinct mention of it is made by Paulus Ægineta, a Greek physician of the seventh century, when it was used in food and in medicine; and the same author supposes it was the Carunfel of Serapion, and the Charumfel bellum of Avicenna, two Arabian physicians. The Moluccas being discovered by the Portuguese in 1511, and from that time, or very soon after, it may be imagined, that *cloves* came into common use in Europe. The *clove* is now cultivated in almost every part of Asia, where the soil and climate are suitable; and several of the West India Islands now possess this precious vegetable, as St. Vincent, Trinidad, Martinique, St. Kitts, and other French Islands. The French have introduced it into Bourbon and the Mauritius, through the medium of M. Poivre, their then Intendent of those islands, who sent two vessels in 1769 to the kings of Gueby and Patony, to procure the *clove* and other valuable spices, which now succeed better in those islands than in Amboyna. Plants were sent from the Mauritius to Cayenne about the year 1779, and in 1792 the plantation there contained 2500 trees, which bore cloves equal to those of the East Indies, and fetched a higher price in France than those from the Moluccas.

The cloves of commerce are the unexpanded flowers, the corolla forming a ball or sphere on the top, between the teeth of the calyx; thus with the narrow base of the germ tapering downwards, giving the appearance of a nail; hence the Dutch call it *naghel;* the Spaniards *clavo;* the Italians *chiodo;* and the French *clou,* from which the English *clove* is derived.

The uses of cloves are sufficiently known, particularly in domestic economy, as a seasoning in various dishes, and to give flavour to wines and spirits. In medicine they are esteemed tonic and exhilarating, powerfully stimulating on the muscular fibres, but dangerous to bilious persons. These properties, and their acrid and burning taste, depend on the essential oil. Cloves yield, by distillation with water, about one-seventh of their weight of volatile oil. When the alcoholic extract is freed from the volatile oil by distillation with water, the oil that arises proves mild, and the resin that remains insipid. Its pungency, therefore, seems to depend upon a combination of these principles. The Dutch oil of cloves is extremely hot, fiery, and of a reddish brown colour, but is greatly adulterated both with fixed oils and resin of cloves; for the genuine oil, when recently distilled, is comparatively mild and colourless. It is heavier than water, and rises in distillation with some difficulty. It is hot and caustic, and therefore employed in the cure of toothache. It is also employed by perfumers.

The cloves are gathered by hand, or beaten with reeds, so as to fall upon cloths which are placed under the trees to receive them, and dried by fire, or, what is better, in the sun. The fully-formed berries are preserved in sugar, and eaten after dinner, to promote digestion. *Clove* trees being difficult to transplant, the seeds are usually sown where the trees are intended to remain, for if the roots are once injured it is seldom they recover.

Aromatic or Common Clove. Clt. 1796. Tree 20 to 40 ft.

2 C. ELLÍPTICUS (Labill. sert. caled. p. 64. t. 63.) leaves ovate or elliptic, obtuse; cymes 3-flowered. ♄. G. Native of New Caledonia.

Elliptic-leaved Clove. Shrub 3 to 4 feet.

3 C. ANTISE'PTICUS (Blum. in litt. ex D. C. prod. 3. p. 262.) leaves oblong-lanceolate, bluntly acuminated, full of fine pellucid veins; corymbs axillary and terminal; pedicels umbellate; calyx tubular, bluntly 5-toothed. ♄. S. Native of Java, in the province of Buiten-Zorg, at Mount Pantjor. Calyptránthus aromática, Blum. bijdr. p. 1092.

Antiseptic Clove. Tree.

4 C. FASTIGIA'TUS (Blum. in litt. ex D. C. prod. 3. p. 262.) leaves cuneate-oblong, bluntish, full of fine, transverse, parallel veins; corymbs terminal, fastigiate; pedicels 3-flowered. ♄. S. Native of Java, in woods, in the western parts. Calyptránthus fastigiàta, Blum. bijdr. p. 1090. This plant appears to be allied to *Caryophýllus*, in the calyx or ovarium being cylindrical, and in the limb of the calyx being bluntly and evidently 4-lobed.

Fastigiate Clove. Tree 30 to 40 feet.

5 C. FLORIBU'NDUS (Blum. in litt. ex D. C. l. c.) leaves oval-oblong, bluntish, attenuated at the base, almost veinless, shining; corymbs terminal, trichotomous, divaricate; pedicels 3-flowered. ♄. S. Native of Java, in woods on Mount Salak. Calyptránthus floribúnda, Blum. l. c. p. 1091. This is distinguished from the first species in the leaves being broader, stiffer, and in the corymbs being divaricate and dense-flowered.

Bundle-flowered Clove. Tree 30 to 40 feet.

Cult. All the species of clove require a strong dry heat to flourish well, except *C. ellípticus*, which is a green-house plant. A mixture of loam and peat is the best soil for them. Ripened cuttings of them will root if planted in a pot of sand, with a hand-glass over them, in a moist heat. All the species are difficult to preserve through the winter in our stoves.

XXXII. ACME'NA (one of the names of Venus). D. C. dict. class. vol. xi. not. 1826. prod. 3. p. 262.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx turbinate; limb truncate, somewhat involute in the young state. Petals 5, small, distant, some of them sometimes abortive. Stamens numerous, free. Style terete, short. Berry globose or oval, 1-seeded. Seed roundish, thick. Cotyledons conferruminated.—Shrubs. Leaves opposite, glabrous, quite entire. Cymes 3-flowered, disposed in a terminal panicled thyrse. Flowers white.

1 A. FLORIBU'NDA (D. C. prod. 3. p. 262.) leaves full of pellucid dots, oval-lanceolate, acuminated at both ends. ♄. G. Native of New Holland. Metrosidèros floribúnda, Smith, in Lin. trans. 3. p. 267. Vent. malm. t. 75. Myrtàcea, Sieb. nov. holl. no. 598. Ovarium 3-celled. Stamens hardly twice the length of the petals.

Var. β, elliptica (D. C. l. c.) leaves elliptic, acuminated. ♄. G. Native of New Holland. Eugènia ellíptica, Smith, l. c. p. 281. Sims, bot. mag. 1872. Eugènia Smíthii, Poir. Mýrtus Smíthii, Spreng. syst. no. 121. Berry globose, white. Calyx not toothed on the margin. Petals unknown.

Bundle-flowered Acmena. Fl. May, Sept. Clt. 1790. Sh. 4 to 6 ft.

2 A. KINGII; leaves elliptic, coriaceous, acuminated, glabrous, tapering to the base; panicle terminal, with trichotomous peduncles, and 3-flowered pedicels. ♄. G. Native of New Holland. Calyx truncate. (v. s. in herb. Lamb.)

King's Acmena. Fl. May, Sept. Clt. 1793. Shrub 4 to 8 ft.

3 A.? PARVIFLÒRA (D. C. l. c.) leaves opaque, oval-lanceolate, acuminated. ♄. S. Native of the Moluccas. Flowers 3-times smaller than those of *A. floribúnda*, but similar. Fruit unknown. Perhaps a species of *Syzýgium*.

Small-flowered Acmena. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Tristània*, p. 813.

XXXIII. EUGE'NIA (in honour of Prince Eugene of Savoy, who was a protector and encourager of botany, and possessed a botanic garden). Mich. nov. gen. t. 108. Lin. gen. no. 616. exclusive of some species. D. C. prod. 3. p. 262.—Gréggia, Gærtn. fruct. 1. p. 168. t. 33.—Mýrtus species, Swartz, Kunth. Olýnthia, Lindl. coll. no. 19. in a note.

LIN. SYST. *Icosándria, Monogynia.* Tube of calyx roundish; limb 4-parted, even to the ovarium. Petals 4. Stamens numerous, free. Ovarium 2-3-celled; cells many-ovulate. Berry nearly globose, crowned by the calyx, when mature 1-celled, but rarely 2-celled. Seeds 1-2, large, roundish. Embryo pseudo-monocotyledonous. Cotyledons very thick, and conferruminated. Radicle very short, hardly distinguishable.—Trees or shrubs, for the most part natives of the West Indies and South America. Leaves and inflorescence sometimes that of *Mýrtus* and sometimes that of *Mýrcia*.

* *Peduncles axillary, 1-flowered.*

1 E. MICHE'LII (Lam. dict. 3. p. 203.) pedicels axillary, 1-flowered, usually solitary, shorter than the leaves; leaves ovate-lanceolate, glabrous; calyx 4-cleft; limb reflexed; berry torose. ♄. S. Native of Brazil and about Demerara, also cultivated in Martinico, under the name of *Cerisier de Cayenne*. Jacq. obs. 3. p. 3. Eugènia, Mich. nov. gen. t. 108. Till. pis. t. 44. Mýrtus Brasiliàna, Lin. spec. p. 674. Plínia rùbra, Lin. fil. suppl. p. 253. Curt. bot. mag. t. 473. Fruit edible, torulose, adhering to the calyx. Cotyledons conferruminated, ex Kunth. Perhaps the *Plinia*, Plum. gen. t. 11. which is the *Plínia pinnàta* of Lin. 735.

Micheli's Eugenia. Shrub 12 to 14 feet.

2 E. LIGU'STRINA (Willd. spec. 2. p. 962.) pedicels 1-flowered, usually solitary, elongated, rising from the axils of the leaves or bracteas, bractless under the flowers; leaves lanceolate, obtuse, rather concave, shining above, glabrous on both surfaces, as well as on the flowers. ♄. S. Native of the West Indies, Mýrtus cerásina, Vahl. symb. 2. p. 57. Mýrtus ligústrina, Swartz, fl. ind. occ. p. 835. Fruit black, 2-seeded, crowned by the calyx. Embryo with conferruminated cotyledons.

Privet-like Eugenia. Fl. Aug. Clt. 1798. Shrub 2 to 4 ft.

3 E. SUBTERMINA'LIS (D. C. prod. 3. p. 263.) pedicels 1-flowered, solitary, rising from the axils of the upper leaves, opposite, slender, 3-times shorter than the leaves; bracteoles small, acute, 2 under each flower; fruit globose; calycine lobes bluntish; leaves oblong, acuminated at both ends, opaque, nerveless, and are as well as the branchlets glabrous. ♄. S. Native of Brazil, at the river Ilheos. Leaves 2 inches long and 5 lines broad. Petioles 2 lines long. Pedicels 7-8 lines long.

Subterminal Eugenia. Shrub 4 to 6 feet.

4 E. PÌA (D. C. l. c.) pedicels 1-flowered, solitary, elongated, rising from the axils of the bracteas and leaves; leaves lanceolate, bluntish, shining above, glabrous on both surfaces, as well as on the flowers; branchlets hairy. ♄. S. Native of Brazil, in the province of Minas Geraes, at Serra de Piedado. Mýrtus Pìa, Mart. ined. Very like *E. ligústrina*, but the branches are

tomentose or hairy, and the fruit 4-seeded. Cotyledons conferruminated. Habit of *Mýrtus*.

Pia Eugenia. Shrub 4 to 6 feet.

5 E. SESSILIFÒLIA (D. C. l. c.) pedicels axillary, solitary, 1-flowered, opposite, slender, bractless at the apex, 3-times shorter than the leaves; fruit globose, crowned by the calycine lobes, which are oblong and acutish; leaves sessile, attenuated at both ends, oblong, full of pellucid dots, and are as well as the branches glabrous. ♄. S. Native of Brazil, in the province of Bahia. Mýrtus sessilifòlia, Mart. herb. Lobes of calyx 3 lines long. Pedicels 7-9 inches long. Leaves 3 inches long and 1 inch broad. Seeds thick, pseudo-monocotyledonous.

Sessile-leaved Eugenia. Tree.

6 E. SPARSIFLÒRA (D. C. l. c.) pedicels 1-flowered, solitary, one half shorter than the leaves, opposite, bractless at the apex, rising from the lower part of the branchlets, in the axils of the scales or leaves; fruit globose; leaves oval, acuminated, obtuse at the base, glabrous on both surfaces as well as the branches. ♄. S. Native of Brazil, near Almada, in the province of Bahia. Mýrtus sparsiflòra, Mart. herb. Pedicels slender, 9 inches long. Calycine lobes 4, oval. Leaves 3-4 inches long, and 15 lines broad. Petioles 4 lines long. Seeds unknown.

Scattered-flowered Eugenia. Tree 20 feet.

7 E. LA'XA (D. C. l. c.) pedicels axillary, solitary, 1-flowered, very slender, shorter than the leaves; leaves oval, attenuated at the base, glabrous, acuminated at the apex; branchlets and young leaves clothed with rufous pubescence, but at length becoming glabrous; lobes of calyx 4, 2 larger and suborbicular; young fruit obovate. ♄. S. Native of Brazil, about Bahia, in the deserts. Mýrtus láxa, Mart. herb. Pedicels 12-20 lines long, straight, rising from the axils of the upper leaves. Bracteas none, or very small. Leaves 3 inches long and 1 inch broad, full of pellucid dots. Immature fruit 1-seeded. Allied to *E. Patrisii*, but the fruit is obovate, not globose.

Loose Eugenia. Tree 10 to 20 feet.

8 E. INOCA'RPA (D. C. prod. 3. p. 264.) pedicels axillary, 1-flowered, shorter than the leaves; calycine lobes 4, ovate; fruit globose, fibrous inside, 2-seeded; leaves ovate, attenuated at the base, acuminated at the apex, glabrous; branchlets clothed with rufous down, furnished with stipula-formed scales. ♄. S. Native of Brazil, at Rio Negro. Mýrtus inocárpus, Mart. herb. Leaves 3 inches long and 1½ inch broad. Petioles short. Fruit full of tubercular dots, about the size of a plum, with fibry, acid-sweet flesh. Pedicels few, 7 lines long. Seeds 2, convex on one side and flat on the other.

Nerved-fruited Eugenia. Tree 20 feet.

9 E. INVOLUCRA'TA (D. C. l. c.) pedicels axillary, 1-flowered, solitary, with large, foliaceous, deciduous bracteas under the flower; floral leaves smaller than the rest; calycine lobes 4, ovate-oblong, reflexed; leaves elliptic, petiolate, attenuated at both ends, when young rather villous and full of pellucid dots, but glabrous and opaque in the adult state; branches compressed. ♄. S. Native of Brazil. A small tree, with erect, spreading branches. Pedicels 5 lines long. Bracteoles 5 lines long. Sterile leaves 2 inches long. Petioles 4-5 lines long. Floral leaves smaller than the others.

Involucrated-flowered Eugenia. Shrub 6 to 8 feet.

10 E.? BRACTEA'TA (Ræusch. nom. ex D. C. prod. 3. p. 264.) pedicels axillary, solitary, 1-flowered, bibracteate under the flowers, villous; leaves elliptic, obtuse, glabrous, when young clothed with adpressed silky down; calyxes ciliated. ♄. S. Native of the East Indies. Mýrtus bracteà'a, Willd. spec. 2. p. 969. Fruit and seeds unknown.

Bracteate-flowered Eugenia. Clt. 1820. Shrub.

11 E. BALSA'MICA (Jacq. fragm. t. 45. f. 2.) pedicels lateral, solitary, 1-flowered, slender, rather villous, bearing 2 oval bracteoles under each flower; leaves ovate, bluntly acuminated, pale and dotted, glabrous; calyx rather villous. ♄. S. Native of Jamaica. My'rtus balsámica, Spreng. syst. 2 p. 481. Petals ciliated, one half shorter than the stamens. Bracteas usually at the origin of the petioles. Fruit and seeds unknown.

Balsam Eugenia. Clt. 1816. Tree 10 to 20 feet.

12 E. POHLIA'NA (D. C. prod. 3. p. 264.) pedicels axillary, solitary, rather longer than the leaves, some 1-flowered, and others 3-flowered; middle flower sessile. in the bifurcation, 2 lateral ones pedicellate; bracteoles subulate; calycine lobes 4, roundish, clothed with silky down on the outside, at length reflexed; leaves ovate, glaucous, dotted beneath, opaque, glabrous; petioles and branches clothed with rufous velvety down. ♄. S. Native of Brazil, in deserts, in the provinces of the mines. My'rtus Pohliàna, Mart. herb. Allied to *E. Sellowiàna* and *E. càna*, but in consequence of the pedicels being 1 or 3-flowered, it is an intermediate plant between the first and fourth sections. Leaves 9-10 lines long and 5 lines broad. Peduncles 10-11 lines long. Flowers about the size of those of *Mýrtus commùnis*. Fruit unknown.

Pohl's Eugenia. Tree 20 feet.

13 E. SELLOWIA'NA (D. C. l. c.) pedicels axillary, solitary, 1-flowered, bearing 2 subulate bracteoles; calyxes and branchlets clothed with velvety hoary down; leaves ovate-oblong, acuminated, full of pellucid dots, velvety above in the young, but in the adult state glabrous above, pubescent and reticulately nerved beneath. ♄. S. Native of Brazil, in the provinces of the mines, in the deserts. My'rtus Sellowiàna, Mart. herb. A crooked tree, about 10 feet high. Leaves 2 inches long and 7-8 lines broad, spreading, not reflexed. Pedicels 4-10 lines long, rising from the axils of the upper leaves. Allied to *E. càna*.

Sello's Eugenia. Shrub 10 feet.

14 E. CA'NA (D. C. l. c.) pedicels axillary, solitary, 1-flowered, opposite, somewhat divaricate, bearing 2, subulate, rather alternate bracteas above the middle; calyx clothed with hoary velvety down; leaves ovate-oblong, acuminated, deflexed, opaque, when young pubescent above, but at length glabrous, and clothed with hoary velvety down beneath. ♄. S. Native of Brazil, in the provinces of the mines. My'rtus càna, Mart. herb. Species allied to *E. Sellowiàna*, but very distinct. Calycine lobes ovate, obtuse, reflexed. Pedicels 6-7 lines long. Leaves an inch long; floral ones smaller.

Hoary Eugenia. Tree 10 to 15 feet.

15 E.? RÒSEA (D. C. l. c.) pedicels axillary, 1-flowered, shorter than the leaves, bearing 2 oblong bracteas under the flowers; branches, calyxes, and bracteas clothed with hairy tomentum; leaves oblong, attenuated at both ends, with revolute margins, smaller ones villous on both surfaces, adult ones glabrous above, but clothed with velvety tomentum beneath; lobes of calyx large, broadly ovate, obtuse. ♄. S. Native of Brazil, among rocks. Psídium ròseum, Mart. herb. A bush, with numerous procumbent branches. Flowers rose-coloured, 4-cleft, with a broad, staminiferous disk, as in *Psídium*. Leaves 2 inches long, and 4-7 lines broad. Pedicels 7 inches long. Fruit unknown.

Rose-coloured-flowered Eugenia. Shrub procumbent.

16 E. KUNTHIA'NA (D. C. l. c.) pedicels axillary, 1-flowered, 3 times shorter than the leaves, bibracteolate at the apex; ovarium ovate, small; calycine lobes 8, obtuse, constricted after flowering; leaves oblanceolate, coriaceous, rather glaucous, glabrous, hardly with any pellucid dots; branchlets downy above. ♄. S. Native of Brazil. My'rtus Kunthiàna, Mart. herb. Seed 1, elliptic-globose, pseudo-monocotyledonous. Pedicels 5-6 lines long.

Var. α; fruit red.

Var. β; fruit yellow.

Var. γ; leaves smaller; pedicels shorter, 2 lines long. ♄. S. Native of Brazil, in the province of Minas Geraes.

Kunth's Eugenia. Tree 10 to 15 feet.

17 E.? FŒ'TIDA (Pers. ench. 2. p. 29.) pedicels axillary, solitary, 1-flowered, bibracteolate under the flowers, hardly longer than the petioles; leaves ovate-lanceolate, bluntly acuminated, membranous; calyx 4-lobed. ♄. S. Native of Cayenne. My'rtus fœ'tida, Spreng. syst. 3. p. 481. Fruit globose, size of a pepper. Seeds unknown.

Var. α, *maleòlens* (Pers. ench. l. c.) pedicels solitary; leaves blunter, rather coriaceous. ♄. S. Native of the West Indies. E. fœ'tida, Vahl. herb.

Stinking Eugenia. Tree 10 feet.

18 E. ANGUSTIFÒLIA (Lam. dict. 3. p. 203.) pedicels axillary, solitary, or twin, 1-flowered, naked, 3-times shorter than the leaves; leaves linear, acute, with revolute edges, and are as well as the branches glabrous. ♄. S. Native of St. Domingo. Plum. ed Burm. t. 207. f. 2. My'rtus angustifòlia, Spreng. syst. 2. p. 479. not of Lin. M. rosmarinifòlia, Spreng. l. c. Stamens hardly longer than the petals. Fruit globose, red, few-seeded. Seeds compressed.

Narrow-leaved Eugenia. Tree 10 to 12 feet.

19 E.? ROSMARINIFÒLIA (Poir. suppl. 3. p. 129.) pedicels axillary, 1-flowered, usually solitary, shorter than the leaves; leaves small, linear, mucronate, with revolute edges, glabrous, above but villous on the under surface, as well as on the branches; calyx 4-cleft, obtuse. ♄ S. Native of the Caribbee Islands. My'rtus rosmarinifòlia, Pers. ench. 2. p. 30. Fruit and seeds unknown. Perhaps sufficiently distinct from *E. angustifòlia.*

Rosemary-leaved Eugenia. Shrub.

20 E. ALPIGE'NA (D. C. l. c.) pedicels axillary, solitary, 1-flowered, 6-times shorter than the leaves, bibracteolate at the apex; flowers and branches covered with canescent down; calycine lobes 4, ovate; leaves on short petioles, elliptic-oblong, hoary beneath, clothed with adpressed pubescence above, opaque, nerveless, except the middle nerve. ♄. S. Native of Brazil, on the mountains, in the provinces of the mines. My'rtus alpigèna, Mart. herb. Allied to *E. alpìna.* Branches crowded. Flowers small. Leaves an inch long and 4 lines broad, pubescent above while young, but at length nearly glabrous, full of impressed dots.

Alp-growing Eugenia. Tree 10 feet.

21 E. OBSCU'RA (D. C. l. c.) pedicels 1-2, axillary, very short, 1-flowered; bracteoles subulate, adnate to the tube of the calyx; leaves almost sessile, glabrous, ovate-lanceolate, bluntly acuminated; calyxes and petals pilose on the outside; branchlets hairy. ♄. S. Native of Maranham. My'rtus obscùra, Lindl. bot. reg. t. 1044. Petals acuminated. Bracteas inserted immediately under the lobes of the calyx, in which it differs from all the other species.

Obscure Eugenia. Clt.? Shrub 4 to 6 feet.

22 E. MYRTIFÒLIA (D. C. prod. 3. p. 265.) pedicels axillary, 1-flowered, one half shorter than the leaves, almost bractless at the apex; ovarium globose; calycine lobes 4, broad, obtuse, constricted after flowering; leaves oval, cuneated at the base, bluntish at the apex, pale beneath, hardly with any pellucid dots, and are as well as the branches glabrous. ♄. S. Native of Brazil, in the provinces of the mines. My'rtus tenélla, var. Mart. herb. Allied to *E. rígidum.* Young fruit many-celled. Seeds unknown. Leaves 8 lines long and 4 broad, almost sessile, shining above; lateral veins confluent at the apex.

Myrtle-leaved Eugenia. Shrub 2 feet.

23 E. ALPÌNA (Willd. spec. 2. p. 961.) pedicels axillary, solitary, 1-flowered, shorter than the leaves, thickish; leaves ovate, coriaceous, veinless, glabrous; branches usually in fours, erect, rusty. ♄. S. Native of Jamaica, on the tops of the Blue Mountains. My'rtus rígida, Swartz, in herb. Lher. My'rtus alpìna, Swartz, fl. ind. occ. p. 883. Berry dry, ovate, when mature 1-seeded. Seed oblong.

Alpine Eugenia. Shrub 4 to 6 feet.

24 E. WILLDENÒWII (D. C. l. c.) pedicels 1-flowered, filiform, solitary, or twin, axillary and lateral, bearing 2 subulate very short bracteas under the flowers; leaves oblong, acuminated, coriaceous, dotless, shining. ♄. S. Native of Ceylon. Said to be allied to *E. Michèlii* and *E. Patrísii.* Eugènia Zeylanica, Willd. spec. 2. p. 963. but not of Roxb. My'rtus Willdenòwii, Spreng. syst. 2. p. 480. exclusive of the var. from Porto Rico.

Willdenow's Eugenia. Shrub.

25 E. OBTU'SA (D. C. prod. 3. p. 266.) pedicels axillary, solitary, 1-flowered, a little shorter than the leaves; the bracteas under the flowers and the calycine lobes are oval-oblong and foliaceous; leaves oval, obtuse at both ends, glabrous, full of impressed dots on the upper surface, when young rufous beneath, but at length pale; branches and petioles clothed with rufous villi. ♄. S. Native of Peru. My'rtus obtùsa, Juss. herb. Leaves 5-6 lines long and 3 lines broad. Fruit nearly globose, 1-seeded. The bracteoles are larger than those in the allied species. Habit of *E. alpìna*, but the pedicels are longer, and the bracteoles are much larger and permanent.

Blunt-leaved Eugenia. Shrub.

26 E. PORTORICE'NSIS (D. C. l. c.) pedicels 1-flowered, slender, shorter than the leaves, axillary or lateral, bearing 2 ovate, puberulous bracteoles under the flowers; leaves ovate-elliptic, acuminated, membranous, dotless, and are as well as the branches glabrous; petals sub-ciliated. ♄. S. Native of Porto-Rico, on the edges of woods. Eugènia latifòlia, Spreng. in herb. Balb. Pedicels half an inch long, axillary, solitary, numerous, rising from the base of the branches in an irregular way. Bracteoles small, scale-formed at the origin of the petioles. Leaves nearly 3 inches long. Flowers small, glabrous. Ovarium globose. Fruit and seeds unknown.

Var. β, *brévipes* (D. C. l. c.) pedicels hardly 3-times longer than the petioles; leaves smaller, rather coriaceous. ♄. S. Native of Porto Rico. My'rtus Willdenòwii, var. Porto-Ricénsis, Spreng. ex herb. Balb. but exclusive of the synonymes. Fruit and seeds unknown.

Porto-Rico Eugenia. Tree.

27 E. PRODU'CTA (D. C. l. c.) pedicels 1-flowered, axillary, and lateral, solitary, or rather aggregate, naked, much shorter than the leaves; leaves coriaceous, quite glabrous, shining above, oval, drawn out into a long, linear, blunt acumen each; calyx 4-cleft. ♄. S. Native of Cayenne. Leaves oval, 3-4 inches long, and 2 inches broad, terminating in an acumen, which is an inch long and a line and a half broad. Berry globose, 1-seeded. Seed thick. Cotyledons fleshy, conferruminated.

Drawn-out-leaved Eugenia. Shrub.

28 E. CRASSIFÒLIA (D. C. prod. 3. p. 266.) pedicels axillary, 1-2-flowered, very short, thickish; fruit globose, crowned by the lobes of the calyx, which are deciduous; leaves oblong, coriaceous, acuminated at both ends, glabrous above, but covered with hairy down beneath; petioles as well as the branchlets rather velvety. ♄. S. Native of Brazil, in woods, in the province of St. Paul. My'rtus crassifòlia, Mart. herb. Seed 1, thick, rather horny, pseudo-monocotyledonous. Leaves 1½ inch long and ½ an inch broad. Petioles longer than the pedicels.

Thick-leaved Eugenia. Shrub.

29 E. FELISBE'RTI (D. C. l. c.) pedicels solitary, very short, 1-flowered, opposite, rising from the axils of the small bractea-formed leaves; bracteoles large, under the flowers; calyx villous, 4-cleft; leaves oblong, acuminated at both ends, full of pellucid dots, when young rather villous on both surfaces; nerves,

petioles, and branches clothed with adpressed villi. ♄. S. Native of Brazil, in woods on the road to Felisbert. My'rtus Felisbérti, Mart. herb. Leaves membranous, pale green, 4 inches long and an inch and a half broad. Petals roundish, hardly longer than the calyx. Stamens innumerable. Fruit unknown.

Felisbert Eugenia. Shrub.

30 E. PARVIFÒLIA (D. C. l. c.) pedicels axillary, 1-flowered, a little shorter than the leaves; bracteoles small; leaves oblong-linear, obtuse, acute, marked by the nerve above, which is impressed, dotted beneath, the rest veinless and glabrous. ♄. S. Native of Peru. My'rtus parvifòlia, Juss. herb. Flowers small. Very like the following species, but the leaves are a little larger, and not exactly linear, acute at the apex.

Small-leaved Eugenia. Shrub 2 to 3 feet.

31 E.? LEPTOSPERMOÌDES (D. C. l. c.) pedicels axillary 1-flowered, a little shorter than the leaves; bracteoles small; leaves oblong-linear, obtuse, nearly nerveless, dotted, glabrous. ♄. S. Native of Chili and Peru. Leaves 4-5 lines long, and a line broad. Flowers small. Fruit and seeds unknown. It agrees with the figure of Feuill. obs. 3. t. 31. and is not unlike *Myrtus U'gni.* My'rtus parvifòlia, Juss. herb.

Leptospermum-like Eugenia. Shrub 2 to 3 feet.

32 E. PATRÍSII (Vahl. ecl. amer. 2. p. 35.) pedicels 1-flowered, slender, axillary, solitary, and nearly terminal, in fours, naked under the flowers, bractless at the base; leaves elliptic, glabrous, acuminated at both ends. ♄. S. Native of French Guiana. My'rtus Patrísii, Spreng. syst. 2. p. 480. Pedicels an inch and a half long. Bracteas acute, short. Fruit globose, not torose. Staminiferous disk broad, nearly as in *Psidium.* Seeds very few. Cotyledons conferruminated? in the immature state. Allied to *Mýrtus ligústrina.*

Patris's Eugenia. Tree.

33 E. NEMORA'LIS (D. C. prod. 3. p. 267.) glabrous; pedicels axillary, 1-flowered, solitary, opposite, erect, equal in length to the petioles; bracteoles hardly any under the flowers; fruit elliptic; calycine lobes 4, broad, obtuse; leaves elliptic, abruptly and obsoletely apiculated, coriaceous, opaque. ♄. S. Native of Brazil. My'rtus nemoràlis, Mart. herb. Allied to *E. clinocárpa*, but differs in the fruit being erect and twice the size. Leaves 2 inches long and an inch broad.

Grove Eugenia. Shrub.

34 E. CLINOCA'RPA (D. C. l. c.) glabrous; pedicels axillary, 1-flowered, twice the length of the petioles, when in flower erect, and when in fruit deflexed; bracteoles small, under the flowers; fruit elliptic; lobes of calyx short, very blunt; leaves oval, rather oblong, attenuated at the base, obsoletely acuminated at the apex, rather coriaceous, full of pellucid dots. ♄. S. Native of Brazil, at the river Peruaguacu, in the province of Bahia, in woods. My'rtus clinocárpa, Mart. herb. Leaves 15-18 lines long and 6-8 lines broad. Young branches somewhat tetragonal. Fruit 1-seeded. Cotyledons conferruminated.

Bed-fruited Eugenia. Shrub.

35 E. BRASILIE'NSIS (Lam. dict. 3. p. 203.) pedicels 1-flowered, slender, rising from the axils of the scaly leaves, along the branches from velvety scaly buds; bracteoles none; calycine lobes reflexed; leaves oval or obovate-oblong, bluntish, coriaceous, quite glabrous. ♄. S. Native of Brazil. My'rtus Dombéyi, Spreng. syst. 2. p. 485.—E. bracteolàris, Lam. mss. in herb. Juss. Leaves shining above, 3 inches long, 1½ broad. Pedicels about equal in length to the floral leaves. Stamens hardly longer than the petals.

Brasilian Eugenia. Shrub.

36 E. REINWARDTIA'NA (D. C. l. c.) pedicels interpetiolar, 1-flowered, shorter than the leaves; leaves on short petioles, elliptic-oblong, bluntish, coriaceous, remote, smoothish. ♄. S. Native of the Moluccas. My'rtus Reinwardtiàna, Blum. bijdr. p. 1082. Calyx 4-cleft. Fruit roundish, and with the seeds nearly as in *Eugènia.*

Reinwardt's Eugenia. Shrub.

37 E. MARANHAOE'NSIS; branched; leaves oblong, coriaceous, acuminated, glabrous on both surfaces; pedicels axillary, 1-flowered. ♄. S. Native of Maranham, in Brazil.

Maranham Eugenia. Shrub 4 to 8 feet.

38 E. MYRTOÌDES; branched; leaves ovate, quite entire, acute, coriaceous, almost sessile; pedicels axillary, 1-flowered. ♄. S. Native of the western coast of Africa, on the Gold coast, particularly at Accra.

Myrtle-like Eugenia. Shrub 4 to 8 feet.

* * *Pedicels axillary, 1-flowered, twin, tern, or numerous.*

39 E.? PUNICÆFÒLIA (D. C. l. c.) pedicels axillary, 1-flowered, twin, much shorter than the leaves, bibracteolate under the flowers; leaves oblong, obtuse, acute at the base, rather coriaceous, shining, and are as well as the branches glabrous; calyx 4-cleft. ♄. S. Native near Cumana, on Mount Impossible. My'rtus punicæfòlia, H. B. et Kunth, nov. gen. amer. 6. p. 149. Leaves 2 inches long. Flowers the size of those of *Cratæ'gus oxyacántha.* Ovarium 2-celled. Berry nearly globose, red, 1-2-seeded. Said to be allied to *My'rtus ligústrina.*

Pomegranate-leaved Eugenia. Shrub 10 to 12 feet.

40 E. VISMIOÌDES (D.C. l. c.) pedicels 1-3, axillary, 1-flowered, much shorter than the leaves, bibracteolate, under the flowers; leaves oval, cuneated at the base, on very short petioles, bluntly attenuated at the apex, glabrous on both surfaces as well as on the branches, with a very few pellucid dots. ♄. S. Native of the Moluccas. Pedicels 4 lines long. Flower-bud globose. Lobes of calyx very blunt, roundish. Leaves 3 inches long and 1½ broad.

Vismia-like Eugenia. Shrub 6 to 8 feet.

41 E. SA'NCTA (D. C. l. c.) pedicels 1-3 together, axillary, 1-flowered, 4 times shorter than the leaves, bibracteolate under the flowers; leaves oval, almost sessile, bluntish at both ends, stiff, full of minute pellucid dots, glabrous on both surfaces; branches rather pubescent. ♄. S. Native of Brazil, in the province of Bahia, among bushes at the bottoms of the mountains. My'rtus sáncta, Mart. herb. Leaves pale green, 15 lines long, and 8-9 lines broad. Pedicels 3-4 lines broad, and are as well as the calyxes glabrous. Calycine lobes very blunt. Style hooked at the apex. Fruit unknown.

Holy Eugenia. Shrub 2 to 3 feet.

42 E. COARE'NSIS (D. C. l. c.) pedicels 1-3 together, 1-flowered, bibracteolate, under the flowers, 3 times shorter than the leaves; calycine lobes 4, obtuse; leaves oval, nearly sessile, bluntly somewhat acuminated, stiff, opaque, and are as well as the branches glabrous; lateral veins almost wanting. ♄. S. Native of Brazil, at Rio Negro. My'rtus Coarénsis, Mart. herb. Leaves an inch long and 6 lines broad. Pedicels 2-3 lines long. Flowers small. Fruit unknown.

Coari Eugenia. Shrub.

43 E. KOCHIA'NA (D. C. prod. 3. p. 268.) pedicels 1-3 together, 1-flowered, 3-times shorter than the leaves, bibracteolate at the apex; calycine tube obovate, with the lobes ovate; leaves oval-oblong, sessile, stiff, opaque, obtuse at both ends, almost veinless, and are as well as the obsoletely tetragonal branchlets, glabrous. ♄. S. Native of Brazil. My'rtus Kochiàna, Mart. herb. Leaves an inch long and 4 lines broad, erect. Nearly like those of *Phyllirǽa mèdia.* Pedicels 4 lines long. Flowers small.

Koch's Eugenia. Tree 20 to 30 feet.

44 E. STIGMATÒSA (D. C. l. c.) pedicels 1-3 together, axillary, 1-flowered, 3-times the length of the petioles, acutely bibracteolate, under the flowers; leaves oval, cuneated at the base, bluntly acuminated at the apex, glabrous, full of large pellucid

dots, which are rarely blackish beneath. ♄. S. Native of Brazil, in the desert of Bahia. My'rtus stigmatòsa, Mart. herb. Very nearly allied to *E. dipoda*. Pedicels 6 lines long. Leaves paler beneath, 2 inches long and an inch broad. Flowers small. Lobes of calyx roundish, reflexed; tube nearly globose. Fruit unknown.

Stigmatose Eugenia. Tree.

45 E. DÍPODA (D. C. prod. 3. p. 268.) pedicels 1-flowered, axillary, twin, shorter than the leaves, bibracteolate under the flowers; leaves elliptic-oblong, attenuated at both ends, with an obtuse acumen, and are as well as the branches glabrous. ♄. S. Native of French Guiana. Leaves 1½ inch long, and about the same in breadth, full of very minute pellucid dots. Pedicels 5 lines long. Berry ovate, 1-seeded. Cotyledons thick, conferruminated. Calycine lobes very blunt.

Var. β, brachypoda (D. C. l. c.) pedicels 3 lines long.

Two-pedicelled Eugenia. Shrub.

46 E. PRÓCERA (Poir. suppl. 2. p. 129.) pedicels 1-flowered, axillary, 2-4 together, shorter than the leaves, bibracteolate under the flowers; leaves ovate, bluntly acuminated, and are as well as the branchlets glabrous. ♄. S. Native of St. Domingo, in woods also of Martinique and Santa-Cruz. My'rtus prócera, Swartz, fl. ind. occ. p. 887. Branches twiggy. Leaves an inch and a half long. Petioles 3 lines long. Berry nearly globose, about the size of a pepper, 1-seeded. Cotyledons conferruminated. Fruit eatable.

Tall Eugenia. Tree 20 to 30 feet.

47 E. PSEU'DO-PSÍDIUM (Jacq. amer. 15. t. 93.) pedicels 1-flowered, shorter than the leaves, bibracteate under the flowers, lower ones axillary, solitary, upper ones nearly terminal, in fascicles; leaves ovate, acute, and are as well as the branches glabrous; fruit smooth, globose. ♄. S. Native of Martinico, in mountain woods, where it is called *Gouyavier bâtard*. My'rtus pseùdo-psídium, Spreng. syst. 2. p. 480. exclusive of the synonymes. Berry red, 1-seeded. Seed thick. Cotyledons conferruminated. Fruit eatable, and held in considerable esteem in the West Indies.

False-guava Eugenia. Tree 20 feet.

48 E. PSIDIOÌDES (D. C. prod. 3. p. 268.) pedicels thickish, axillary, 1-flowered, much shorter than the leaves, 4-8 in a fascicle, minutely bibracteolate under the flowers; leaves oval, shortly acuminated, coriaceous, with revolute margins, and are as well as the branchlets glabrous. ♄. S. Native of Cayenne. Very like *E. pseùdo-psidium*, but the leaves are more oval, and distinctly mucronately acuminated, coriaceous, with revolute edges; the pedicels are shorter, and hardly half an inch long. Fruit globose. Seed 1, large. Bracteoles small.

Guava-like Eugenia. Tree.

49 E. NÌGRA (D. C. l. c.) pedicels 3-4 together, axillary, 1-flowered, thickish, length of petioles; fruit globose; leaves oval, short-acuminated, coriaceous, opaque, shining above, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of Brazil, in the province of Para near Ega. My'rtus nìgra, Mart. herb. Branches terete. Leaves 5 inches long and 2 broad. Pedicels, when in fruit, hardly 3 lines long. Flowers unknown. Fruit half an inch in diameter. Calycine lobes deciduous, and therefore the fruit is marked with a somewhat tetragonal areola at the apex. Seeds 2, large.

Black Eugenia. Tree.

50 E. CITRIFÒLIA (Poir. suppl. 3. p. 129.) peduncles axillary, very short, branched; pedicels in fascicles, shorter than the petioles, bracteolate under the flowers; leaves elliptic-oblong, acuminated, coriaceous, shining, and are as well as the branches quite glabrous. ♄. S. Native of Cayenne. My'rtus Cayennénsis, Spreng. syst. 2. p. 480. Fruit small, according to Poiret, globose, and 1-seeded. Leaves 3-5 inches long.

Citron-leaved Eugenia. Shrub.

51 E. DYSENTE'RICA (D. C. prod. 3. p. 268.) pedicels axillary, solitary, 1-flowered, slender, shorter than the leaves, rather crowded on the short branches, bractless at the apex; calycine lobes ciliated, bearded at the apex; leaves ovate, obtuse, quite glabrous, on short petioles, rising with the flowers. ♄. S. Native of Brazil, in fields about Goyaz, where it is called *Cogaiteira*. My'rtus dysentérica, Mart. herb. trav. vol. 2. A twisted tree, leafless at the time of flowering. Branches glabrous, bearing 5-6 scales. Berry globose, depressed, furrowed, citron-coloured. Scales of buds ciliated.

Dysenteric Eugenia. Tree 10 to 20 feet.

52 E. MARTIUSIA'NA (D. C. prod. 3. p. 269.) pedicels 5-9 together, axillary, 1-flowered, about the length of the petioles; bracteoles 2, obtuse, connate under the flowers; fruit globose, 3-seeded; calycine lobes 4, small, obtuse; leaves oval, bluntish at both ends, coriaceous, opaque, and are as well as the branchlets glabrous. ♄. S. Native of Brazil, in woods in the province of Bahia. My'rtus Lindleyàna, Mart. herb. but not of Kunth. Leaves about 3 inches long, and about 2 broad. Petioles 3 lines long. Fruit the size of a pea. Seeds compressed, somewhat reniform. Cotyledons conferruminated.

Martius's Eugenia. Tree.

53 E. LONGIFÒLIA (D. C. l. c.) pedicels 3-5 together, 1-flowered, a little shorter than the petioles, bibracteolate at the apex; calyx with an obovate, somewhat turbinate tube, and 4 obtuse lobes; leaves elliptic-oblong, acuminated at both ends, and are as well as the branches glabrous; lateral nerves running into a vein, which is distant from the margin. ♄. S. Native of Brazil, in swampy shady places of woods, in the province of Bahia. My'rtus longifòlia, Mart. herb. A loose tree, with expanded branches. Leaves 9 inches long and 2½ inches broad. Petioles 4 lines long. Pedicels 3 lines long. Flowers small. Fruit unknown.

Long-leaved Eugenia. Tree.

54 E. LATIFÒLIA (Aubl. guian. 1. p. 502. t. 199.) pedicels axillary, usually tern, 1-flowered, length of the petioles, bibracteolate under the flowers; leaves broad-ovate, acute, reticulately veined, and are as well as the branches glabrous; fruit ovate. ♄. S. Native of French Guiana, on the edges of fields. My'rtus latifòlia, Spreng. syst. 2. p. 481. Leaves 10-11 inches long and 5-6 inches broad. Flowers white, sometimes 5-cleft, according to Aublet. Berry olive-formed, violaceous, 1-seeded. Seed thick.

Broad-leaved Eugenia. Clt. 1793. Shrub 6 to 7 feet.

55 E. UNDULA'TA (Aubl. l. c. p. 508. t. 202.) pedicels axillary, usually 3-together, 1-flowered, rather shorter than the petioles, bibracteolate under the flowers; leaves ovate-oblong, acuminated, with undulated margins, and are, as well as the branchlets, glabrous; fruit ovate. ♄. S. Native of Guiana, on the banks of the river Sinenari. My'rtus undulàta, Spreng. syst. 2. p. 482. Leaves 6-7 inches long, full of pellucid dots. Peduncles very short, branched. The flowers are said to be 5-cleft by Aublet, but in the figure they are drawn 4-cleft. Berry red, 1-seeded.

Waved-leaved Eugenia. Shrub 3 to 4 feet.

56 E.? ANASTOMÒSANS (D. C. l. c.) pedicels 1-flowered, axillary and lateral, 2-3-together, 3 times longer than the petioles, bibracteolate under the flowers; leaves oval, acute, membranous, glabrous; lateral nerves running into a vein, which is distant from the margin; calycine lobes very obtuse, 2 smaller than the rest. ♄. S. Native of French Guiana. Ovarium subglobose-ovate, 2-celled, few-seeded. Style filiform, long. Leaves 4-5 inches long, and 2 inches broad. Pedicels 6-7 lines long. Fruit and seeds unknown.

Anastomosing-veined Eugenia. [illegible] 15 feet.

57 E. MICROPÒRA (D. C. l. c.) pedicels axillary, 3-9 to-

gether, 1-flowered, length of the petioles, umbellate, refracted after flowering; fruit globose, depressed; calycine lobes 4, ovate; leaves oval, acuminated, petiolate, and are, as well as the branches, glabrous; lateral nerves running into a vein which is distant from the margin. ♄. S. Native of Brazil, at the river Amazon. My'rtus umbellàta, Mart. herb. but not of Spreng. Leaves 5 inches long and 2 broad, full of minute pellucid dots. Petioles 5 lines long. Pedicels 4 lines long. Seeds 1 to 3. Fruit orange-coloured.

Small-pored-leaved Eugenia. Tree.

58 E. PAUCIFLÒRA (D. C. l. c.) pedicels 1-3-together, axillary, 1-flowered, slender, three times the length of the petioles, acutely bibracteolate under the flowers; calycine lobes 4, roundish; leaves oval-oblong, acuminated at the apex, attenuated at the base, petiolate, full of minute pellucid dots, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of Brazil, in woods in the province of Minas Geraes. My'rtus species, Mart. herb. Flowers few, small. Torus nearly as in *Psidium.* Pedicels 6-7 lines long, very slender. Leaves 5 inches long and 15-18 lines broad.

Few-flowered Eugenia. Tree 10 feet.

59 E. HILARIA'NA (D. C. l. c.) pedicels axillary, 2-5-together, 1-flowered, longer than the petioles, bluntly bibracteolate under the flowers; fruit globose, crowned by the calycine lobes, which are 4, obtuse, and conniving; leaves linear-oblong, obtuse, attenuated at the base, stiff, opaque, on very short petioles, and are as well as the branches glabrous, with revolute edges. ♄. S. Native of Brazil, in the provinces of the Mines. Leaves 2 to 3 inches long, and half an inch broad. Petioles one line long. Pedicels 4 lines long. Fruit smaller than a pea.

St. Hilare's Eugenia. Shrub 4 to 5 feet.

60 E. FRUTICULÒSA (D. C. prod. 3. p. 27[illegible].) pedicels axillary, 1-flowered, longer than the petioles, lower ones solitary, upper ones 2-3 together, minutely bibracteolate under the flower; fruit ovate; calycine lobes obtuse; leaves oblong, cuneated at the base, obtuse at the apex, stiff, opaque, glabrous in the adult state, as well as on the branchlets, but when young clothed with adpressed down beneath. ♄. S. Native of Brazil, in the province of St. Paul. My'rtus fruticulòsa, Mart. herb. A small shrub, having the branches knotted at the base. Leaves nearly 2 inches long, and 4-5 lines broad. Pedicels 4 lines long. Fruit yellow. Seed one, large.

Shrubby Eugenia. Shrub 1 to 2 feet.

61 E. RUSCIFÒLIA (Poir. suppl. 3. p. 123.) pedicels axillary, solitary or the upper ones are aggregate, glabrous, longer than the petioles; leaves ovate, obtuse, coriaceous, glabrous, dotted beneath. ♄. S. Native of South America. My'rtus daphnoìdes, Spreng. syst. 2. p. 480. Fruit and seeds unknown. Perhaps the peduncles are one or many-flowered.

Butcher's-broom-leaved Eugenia. Shrub.

62 E.? OLEÆFÒLIA (D. C. prod. 3. p. 270.) pedicels 1-flowered, axillary, 4 in a fascicle, twice the length of the petioles, bibracteolate under the flowers; leaves oblong, obtuse, cuneated at the base, coriaceous, shining, and are, as well as the branches, glabrous; calyx 4-cleft. ♄. S. Native of South America, in the province of Jaen de Bracamoros, at the river Marannon. My'rtus oleæfòlia, H. B. et Kunth, nov. gen. amer. 6. p. 147. Pedicels 3 lines long. Berry 3-celled; cells 8-ovulate. Seeds unknown. Allied to *Eugènia buxifòlia.*

Olive-leaved Eugenia. Shrub 4 to 6 feet.

63 E. PISTACIÆFÒLIA (D. C. l. c.) pedicels 3-together, axillary, 1-flowered, twice the length of the petioles, minutely bracteate at the base, and bibracteate at the apex; tube of calyx globose; leaves ovate-lanceolate, obtuse at the base, bluntish at the apex, rather coriaceous, and are, as well as the branches, glabrous. ♄. S. Native of Brazil, in the provinces of Bahia. My'rtus pistaciæfòlia, Mart. herb. Leaves with a few pellucid dots, like those of the *Pistàchia.* Pedicels 3-4 lines long, rising from very short scaly branches. Flowers small. Fruit unknown.

Pistachia-leaved Eugenia. Tree 10 to 12 feet.

64 E. STICTOPE'TALA (Mart. herb. ex D. C. prod. 3. p. 270.) glabrous; pedicels 5-7, aggregate, 1-flowered, rising from the axils of the old leaves, sometimes upon a very short peduncle; bracteas 2, ovate, adpressed to the ovarium; lobes of calyx 4, ovate, nearly orbicular, full of glandular dots; leaves nearly sessile, ovate or oval, obtuse at both ends, coriaceous, opaque, reticulately nerved on both surfaces. ♄. S. Native of Brazil, in the interior provinces. Pedicels 5-6 lines long. Leaves 3 inches long and 1½ broad.

Dotted-petalled Eugenia. Shrub 4 to 6 feet.

65 E.? ERYTHROCA'RPA (D. C. prod. 3. p. 270.) pedicels 1-flowered, axillary, usually 5-together, racemosely umbellate, one half shorter than the leaves, furnished with one bractea at the base, 2 bracteoles under the flowers; leaves elliptic, obtuse, acute at the base, coriaceous, shining, and are, as well as the branches, glabrous; calyxes 4-cleft. ♄. S. Native of New Granada, near Honda. My'rtus erythrocárpa, H. B. et Kunth, nov. gen. amer. 6. p. 148. Leaves 12-14 lines long. Ovarium globose, 2-celled; cells 10-11-ovulate. Berry red. Seeds unknown.

Red-fruited Eugenia. Tree 6 to 8 feet.

66 E.? MAXIMILIA'NA (D. C. l. c.) pedicels axillary, 2-6-together, aggregate, bibracteolate under the flowers; leaves elliptic, attenuated, coriaceous, dotted, shining, quite glabrous. ♄. S. Native of Brazil, about Barada Vereda. My'rtus micrántha, Nees et Mart. in nov. act. bonn. 12. p. 51. but not Kunth. Bracteoles ciliated. Ovarium 2-celled, many-ovulate. Fruit and seeds unknown. Said to be allied to *Mýrcia bracteàta* and *M. lùcida.*

Maximilian's Eugenia. Shrub 3 to 4 feet.

67 E.? LAMBERTIA'NA (D. C. l. c.) pedicels 1-flowered, 5-6-together, axillary, much shorter than the leaves, minutely bibracteate under the flowers; leaves oval, acutish at both ends, with a very few dots, reticulately veined beneath, rather coriaceous, and are, as well as the branches, quite glabrous; calycine lobes ovate, obtuse. ♄. S. Native of the West Indies, in St. Vincent's. Petioles 3 lines long, hardly shorter than the pedicels. Leaves 4 inches long and 2 inches broad. Fruit ovate-globose, 1-seeded.

Lambert's Eugenia. Shrub.

68 E. PLURIFLÒRA (D. C. l. c.) glabrous; pedicels 1-flowered, hardly longer than the petioles, 5-7 from the axils of the old leaves, each bearing 2 ovate bracteas at the apex, which are adpressed to the ovarium; calycine lobes 4 ovate; leaves oval, coriaceous, obtuse, opaque, shining above, tubercularly dotted beneath. ♄. S. Native of Brazil, in the provinces of the Mines. Branches terete, robust. Leaves 1½ inch long. Petioles 2 lines long. Flowers small. Fruit unknown.

Many-flowered Eugènia. Shrub.

69 E. BAHIE'NSIS (D. C. prod. 3. p. 271.) pedicels 2-7-together, or rising from a short rachis, 1-flowered, a little longer than the leaves, minutely bibracteolate at the apex; leaves elliptic, somewhat acuminated, opaque, and are, as well as the branchlets, glabrous; lateral veins hardly prominent; calycine lobes 4, roundish. ♄. S. Native of Brazil, in the province of Bahia, in dense woods. My'rtus Lambertiàna, Mart. herb. Very nearly allied to *E. Lambertiàna,* but the leaves are a little narrower, more brown, never reticulated. Flowers double the size. Fruit unknown.

Bahia Eugenia. Tree 10 to 12 feet.

70 E.? PARKERIA'NA (D. C. prod. 3. p. 271.) pedicels 1-flow-

ered, 5-7-together, shorter than the leaves, rising from the axils of the bracteas, which are oblong, bearing 2 linear bracteoles under the flowers; leaves elliptic-acuminated, glabrous; calyx 4-cleft; bracteas and bracteoles ciliated. ♄. S. Native about Demerara and of the Island of Trinidad. Sieb. pl. trin. no. 245. Allied to *E. Patrísii* and *E. inæquifòlia*, but differs in the pedicels being in fascicles, 6-7 lines long. Leaves 2 inches long, full of pellucid dots. Fruit and seeds unknown.

Parker's Eugenia. Shrub.

71 E.? CORONA'TA (Vahl. ined. in herb. Puerari ex D. C. l. c.) pedicels 1-flowered, aggregate in the axils of the upper leaves, and much shorter than them, bearing 2 ovate bracteas under the flowers; leaves oval, bluntish at both ends, coriaceous, and are, as well as the branches, quite glabrous; calycine lobes 4, roundish. ♄. S. Native of Guinea. Leaves 1½ inch long, and 8-10 lines broad. Pedicels 3-4 lines long. Flowers smaller than those of *My'rtus commùnis*. Ovarium globose. Fruit and seeds unknown.

Crowned-fruited Eugenia. Shrub.

72 E.? ADENOCA'LYX (D.C. prod. 3. p. 271.) pedicels 3-5-together, 1 flowered, in fascicles, shorter than the petioles, glabrous; leaves broad, ovate, acuminated, coriaceous, full of pellucid dots; branches and flowers quite glabrous; calyx 4-cleft, obtuse, full of glandular dots; bracteoles 2 at the base of the calyx, very blunt, and somewhat connate. ♄. S. Native of Cayenne. Leaves, 4 inches long, 2½ broad; lower ones on the branches obtuse. Pedicels hardly 1½ line long. Fruit and seeds unknown.

Gland-calyxed Eugenia. Shrub.

73 E. BIMARGINA'TA (D. C. l. c.) pedicels 5-7-together, axillary, 1-flowered, much shorter than the leaves, bibracteolate under the flowers; calyx with an obovate tube, and bluntish short lobes; leaves ovate or ovate-oblong, sessile, somewhat cordate at the base, obtuse at the apex, coriaceous, stiff, opaque; marginal nerve double, outer one contiguous to the margin. ♄. S. Native of Brazil. My'rtus antidysentérica, Mart. herb. Leaves of the lower branches 15 lines long, and 11-12 lines broad; upper ones 20 lines long and 9 lines broad, with the margins of all reflexed. Pedicels 2 lines long.

Double-margined-leaved Eugenia. Shrub 4 to 8 feet.

74 E. VE'TULA (D. C. prod. 3. p. 271.) pedicels 1-3-together, 1-flowered, a little shorter than the leaves, glabrous, bibracteolate at the apex; calyx with a roundish tube and suborbicular lobes; leaves sessile, ovate, cordate at the base, obtuse at the apex, coriaceous, opaque, glabrous above, clothed with hoary velvety down beneath, as well as on the branchlets, but at length becoming naked. ♄. S. Native of Brazil, in the provinces of the Mines. My'rtus vétula, Mart. herb. Leaves 10-12 lines long and 1-9 broad. Pedicels 5-6 lines long. Calyx glabrous. Stamens shorter than the petals.

Old Eugenia. Shrub 4 to 6 feet.

75 E. MARÍTIMA (D. C. l. c.) pedicels 2-3-together, 1-flowered, hardly longer than the petioles, bibracteolate at the apex, rising from a very short rachis, in something like racemes; calyx with an obovate tube, and ovate-roundish lobes; leaves oval, bluntish, glabrous, opaque; lateral veins hardly evident at the apex. ♄. S. Native of Brazil, by the sea-side at Ilheos. My'rtus marítima, Mart. herb. Leaves 1½ inch long, and 9-10 lines broad. Pedicels 2-3 lines long. Flowers small.

Sea-side Eugenia. Shrub.

76 E. ROXBU'RGHII (D. C. l. c.) pedicels 1-flowered, axillary and lateral, aggregate or subracemose, much shorter than the leaves, bibracteolate under the flowers; leaves oval, bluntish, coriaceous, dotless, glabrous; calyxes and pedicels clothed with rusty pubescence. ♄. S. Native of the East Indies, in Silhet. Eugènia Zeylánica, Roxb. hort. beng. p. 92. but not of Willd. Fruit globose, 1-seeded, glabrous, about the size of a grain of pepper. Leaves 15 lines long, and 7-8 lines broad.

Roxburgh's Eugenia. Tree.

77 E. MÍNIMA (Blum. cat. hort. buit. p. 75.) pedicels crowded, axillary, 1-flowered, shorter than the leaves; calyx crenulated; leaves on short petioles, elliptic-lanceolate, glabrous, full of fine parallel stripes. ♄. S. Native of Java, in woods. My'rtus variegàta, Blum. bijdr. p. 1082. Fruit small, obovate, 1-seeded. Seeds of *Eugènia*. Calyx somewhat attenuated at the base.

Small Eugenia. Shrub 4 to 6 feet.

78 E. TENE'LLA (D. C. prod. 3. p. 272.) pedicels 1-3, very short, axillary, 1-flowered, minutely bibracteolate under the flowers; lobes of calyx 4, obtuse; leaves oval, obtuse, somewhat cuneated at the base, membranous, full of pellucid dots, veinless, except the middle nerve, glabrous; petioles and branchlets puberulous. ♄. S. Native of Brazil, on high mountains in the provinces of the Mines. My'rtus tenélla, Mart. herb. Habit almost of *E. alpina* and *E. obtùsa*, but truly different. Stamens and style exserted. Fruit unknown. Leaves 6-7 lines long, and 3 lines broad. Flowers small. Perhaps referrible to section iii.

Weak Eugenia? Shrub 2 to 3 feet.

79 E.? FLAVE'SCENS (D. C. prod. 3. p. 272.) pedicels 3-5-together, axillary, 1-flowered, bibracteolate at the apex; lobes of calyx 4, ovate, acutish; leaves ovate, acuminated at the base, and attenuated at the apex, obtuse, membranous, full of pellucid dots, glabrous on both surfaces, as well as on the petioles, pedicels, and calyxes. ♄. S. Native of Brazil, in the desert of Bahia. My'rtus flàva, Mart. herb. Calyxes yellowish. Petals 4, orbicular, white, ex Mart. Staminiferous disk 4-sided in the middle of the flower. Style longer than the filaments. Fruit unknown.

Yellowish Eugenia. Shrub 4 to 6 feet.

*** *Flowers axillary, almost sessile, or on short peduncles, and disposed in glomerate fascicles in the axils of the leaves.*

80 E.? L'HERITIERIA'NA (D. C. prod. 3. p. 272.) flowers axillary, sessile, crowded; leaves elliptic-acuminated, and are, as well as the branches, quite glabrous; lateral nerves confluent near the margins. ♄. S. Native of Tobago. My'rtus dumòsa, L'Her. herb. but not of Vahl. Very nearly allied to *E. coffeæfòlia*. Leaves less opaque, full of pellucid dots when examined by a lens.

L'Heritier's Eugenia. Shrub 5 to 6 feet.

81 E. COFFEÆFÒLIA (D. C. l. c.) flowers axillary, sessile, crowded; leaves elliptic, attenuated at the base, acuminated at the apex, and are, as well as the branches, quite glabrous; lateral nerves of leaves confluent at the apex, a considerable distance from the margin of the leaf. ♄. S. Native of Cayenne. Fruit globose, glabrous, size of a small pea. Seed one, roundish. Embryo homogeneous. Leaves obscure, almost without dots, 4-6 inches long, and from 1-2 inches broad.

Coffee-leaved Eugenia. Shrub 6 to 8 feet.

82 E. AFFÌNIS (D. C. l. c.) peduncles axillary, branched, 3-flowered, very short, bibracteolate at the base; leaves ovate-oblong, acuminated, and are, as well as the branches, quite glabrous; fruit oval. ♄. S. Native of St. Domingo and Porto Rico, at the edges of woods. Allied to *E. undulàta*, but differs in the leaves being one-half smaller and flat. Berry olive-formed, 1-seeded. Cotyledons conferruminated.

Allied Eugenia. Shrub 6 to 8 feet.

83 E. CALOPHYLLOÌDES (D. C. l. c.) flowers axillary and lateral, crowded, nearly sessile, 4-cleft; leaves oval, acute, shining above, glabrous in the adult state; nerves on the under surface, petioles, branchlets, pedicels, and calycine tube, clothed with rusty velvety down. ♄. S. Native of Sierra Leone.

Calophylloides lùcida, Smeathn. mss. Lobes of calyx ovate, obtuse, smoothish. Leaves 5-6 inches long, and 2 or 2½ broad, on very short petioles, dotless; lateral nerves confluent towards the margins. Ovarium globose. Fruit and seeds unknown.

Calophyllum-like Eugenia. Shrub 10 feet.

84 E. CHRYSOPHY'LLUM (Poir. suppl. 3. p. 129.) flowers axillary, almost sessile, aggregate, 4-cleft; leaves ovate, acute, glabrous and shining above, but clothed with adpressed silky golden down beneath, which becomes nearly deciduous; fruit ovate, rather velvety. ♄. S. Native of Cayenne, not in the Mauritius. My'rtus chrysophy'llum, Spreng. syst. 2. p. 482. exclusive of the synonymes. Flowers clothed with rusty down, sessile. Pedicels 2 lines long after flowering, rather branched at the base. Mature fruit size of an olive, 1-seeded. Cotyledons conferruminated, furnished with bladdery glands inside.

Golden-leaved Eugenia. Tree.

85 E.? CORDA'TA (D. C. l. c.) flowers almost sessile, axillary and lateral, rather crowded; leaves sessile, ovate, very blunt, rather cordate, shining, and are, as well as the branches, quite glabrous; calyxes 4-5-cleft. ♄. S. Native of the West India Islands. My'rtus cordàta, Swartz, fl. ind. occ. p. 893. Vahl. symb. 2. p. 55. Branches compressed above. Ovarium roundish. Stigma deflexed. Fruit and seeds unknown.

Cordate-leaved Eugenia. Shrub 2 to 3 feet.

86 E. LATERIFLÒRA (Willd. spec. 2. p. 749.) flowers almost sessile, lateral, crowded or scattered; leaves obovate-roundish, very blunt, attenuated at the base, with revolute margins, coriaceous, pale beneath, reticulated from elevated veins on both surfaces, and are, as well as the branches, quite glabrous. ♄. S. Native of the Island of Santa Cruz. E. sessiliflòra, Vahl. symb. 3. p. 64. Calyx and petals dotted. Fruit and seeds unknown.

Side-flowered Eugenia. Tree.

87 E. SESSILIFLÒRA (D. C. prod. 3. p. 273.) flowers almost sessile, lateral, crowded or scattered; leaves oblong or oval, bluntish, with somewhat revolute margins, rather membranaceous, hardly veined, and are, as well as the branches, quite glabrous. ♄. S. Native of St. Domingo. My'rtus sessiliflòra, Spreng. syst. 2. p. 479. E. sessiliflòra, Vahl. symb. 3. p. 64.? E. laterifòlia, Pers.? Fruit one-half smaller than those of *E. lateriflòra*, but not sufficiently known.

Sessile-flowered Eugenia. Shrub.

88 E. LINEA'TA (D. C. prod. 3. p. 273.) flowers axillary, almost sessile, crowded; leaves ovate, acuminated, stiff, lined with elevated nerves, hoary beneath, but villous on the nerves; calyxes 4-cleft, clothed with rusty down. ♄. S. Native of St. Domingo, in mountain fields. My'rtus lineàta Swartz, fl. ind. occ. p. 891. but not of Blume. Berry sapid scarlet, size of a cherry. Seeds 2 or more, angular. Leaves full of pellucid dots, but they are said to be scentless.

Lined-leaved Eugenia. Shrub 6 to 10 feet.

89 E.? TUBERCULA'TA (D.C. l. c.) flowers crowded in the axils of the leaves, and on the tops of the branches, sessile, bibracteolate at the base, 4-cleft; leaves elliptic-oblong, coriaceous, with revolute edges, clothed with glandular tubercles above, and glabrous, but with silky down beneath, as well as on the calyxes; branchlets hairy. ♄. S. Native of Cuba, near Regla. My'rtus tuberculàta, H. B. et Kunth, nov. gen. amer. 6. p. 148. Ovarium 2-celled; cells 8-10-ovulate. Fruit and seeds unknown. Said to be allied to *E. lineàta*.

Tubercular-leaved Eugenia. Shrub.

90 E. CAULIFLÒRA (D. C. l. c.) flowers crowded, rising from the excoriated trunk and branches, from where the axils of the old leaves had been; pedicels very short, 1-flowered; leaves lanceolate, petiolate, attenuated at the base, long-acuminated at the apex, with a very few pellucid dots, and are, as well as the branches, glabrous. ♄. S. Native of Brazil. My'rtus cauliflòra, Mart. reise, p. 285. isis. 1824. p. 589. but not of Blume. Berry edible, globose, of a purplish violet-colour, 1-seeded. Cotyledons conferruminated. Leaves 3 inches long and 9-10 lines broad. Petioles 2 lines long.

Stem-flowered Eugenia. Tree 10 to 20 feet.

91 E. UMBELLA'TA (D. C. l. c.) pedicels numerous, short, 1-flowered, umbellate, bibracteolate at the apex, rising from the axils of the old branches; leaves sessile, cordate at the base, ovate, acutish, coriaceous, opaque, and are, as well as the branchlets, glabrous, with the marginal nerve thick. ♄. S. Native of Brazil, in woods at Vao do Paranan. My'rtus lateriflòra, Mart. herb. but not of others. Umbels lateral, 7-8-flowered. Pedicels 2-3 lines long. Calycine lobes 4, roundish. Leaves 2-4 inches long and 1-2 broad. Lateral nerves of leaves confluent in front of the margins.

Umbellate-flowered Eugenia. Shrub 6 to 8 feet.

92 E. DELICA'TULA (D. C. l. c.) flowers 2-3-together, axillary, nearly sessile; leaves oblong, attenuated at both ends, stiffish, opaque, dotted beneath, glabrous on both surfaces, with a marginal nerve; petioles very short, and are, as well as the young branches, clothed with down. ♄. S. Native of Brazil, in the province of St. Paul. My'rtus delicàtula, Mart. herb. A tree about 20 feet high, much divided. Leaves 15 lines long and 3 lines broad. Flowers small, like those of *E. rígida*.

Delicate Eugenia. Tree 20 feet.

93 E. RÍGIDA (D. C. l. c.) flowers axillary, 1-3-together, nearly sessile, aggregate, bracteolate; fruit globose, somewhat depressed; calycine lobes 4, short, obtuse, somewhat connivent after flowering; leaves ovate, obtuse, stiffish, opaque, nerveless except the middle nerve, glabrous; petioles and branchlets pubescent. ♄. S. Native of Brazil, in the provinces of the Mines. My'rtus rígida, Mart. herb. Leaves 9-10 lines long and 4-5 broad. Pedicels very short, pubescent. Bracteoles obtuse. A much branched small tree. Flowers small. Fruit size of a pea, 2-seeded. Cotyledons conferruminated.

Stiff Eugenia. Tree 15 feet.

94 E. GUAPU'RIUM (D. C. l. c.) flowers in fascicles, splitting the bark of the naked branches in rising; leaves elliptic, petiolate, acuminated, membranous, full of pellucid dots, glabrous above, and beset with a few hairs beneath; petioles and branches villous. ♄. S. Native of Peru. Guapùrium, Juss. gen. p. 324. Guapùrium Peruviànum, Poir. dict. sc. nat. 20. p. 11. Lobes of calyx 4. Petals 4. Fruit umbilicate, 2-3-seeded. Seeds large, almost like those of *Eugènia*. *Guapuru* is the Peruvian name of the tree.

Guapuru Eugenia. Shrub or tree.

95 E.? CERASIFÓRMIS (D. C. prod. 3. p. 274.) corymbs axillary or terminal, simple; branchlets 3-flowered; calyx 4-cleft; ovarium hemispherical; leaves broad-lanceolate, bluntly acuminated, coriaceous, glabrous, with recurved margins, full of fine transverse parallel veins. ♄. S. Native of Java, on the mountains at fountains of rivers. Allied to *E. lineàta*, but the rib of the leaf is for the most part purplish, and the marginal vein is simple. My'rtus cerasifórmis, Blum. bijdr. p. 1088. Fruit globose. Seeds thick, angular, about 3 in number. Cotyledons conferruminated. Flowers not seen.

Cherry-formed-fruited Eugenia. Shrub.

96 E.? TRIFLÒRA (Ham. prod. fl. ind. occ. p. 44.) peduncles axillary, usually tern, 3-flowered; flowers bractless, sessile; leaves alternate, petiolate, oblong, attenuated at the base, shining, greyish green beneath. ♄. S. Native of Carthagena, in woods. Myrtus triflòra, Jacq. stirp. am. p. 153. t. 193. f. 59. but not of Spreng. Petals 4, obovate. Fruit unknown. Leaves aromatic when bruised. This species differs from all in the leaves being alternate, but perhaps this is the case only at the tops of the branches.

Three-flowered Eugenia. Shrub or tree.

97 E. BRACHY′PODA (D. C. l. c.) peduncles a little branched, axillary, shorter than the petioles, minutely bibracteate under the flowers; leaves elliptic, attenuated at the base, acuminated at the apex, shining above, pale beneath, glabrous on both surfaces; calyxes glabrous; branchlets and pedicels clothed with rufous velvety down. ♄. S. Native of Cayenne. Leaves 2 or 3 inches long and an inch broad, full of pellucid dots. Pedicels 3 lines long. Fruit while young globose and 1-seeded.

Short-pedicelled Eugenia. Shrub or tree.

98 E. DÍSTICHA (D. C. l. c.) peduncles axillary, branched, 3-5-flowered, very short; leaves distich, ovate-lanceolate, acute, glabrous; lateral nerves confluent within the margin; calyx 4-lobed; stigma hooked. ♄. S. Native of Jamaica, on the mountains. My′rtus dísticha, Swartz, fl. ind. occ. p. 894. Sims, bot. mag. t. 867. Lindl. coll. t. 19. good. My′rtus horizontàlis, Vent. malm. t. 60. In Swartz's plant the leaves are said to be very coriaceous, and with the lateral veins hardly manifest, but it is probably the same. Fruit ovate, red. Seeds 2-4, thick. Cotyledons conferruminated.

Distich-leaved Eugenia. Clt.? Shrub 5 to 6 feet.

99 E. GLABRA′TA (D. C. l. c.) peduncles axillary, many-flowered, very short; leaves elliptic, acuminated, convex, coriaceous; branches and flowers quite glabrous. ♄. S. Native of St. Domingo, in bushy places, on the mountains. My′rtus glabràta, Swartz, fl. ind. occ. p. 903. but not of Blume. Peduncles and petioles 2 lines long. Leaves an inch and a half or 2 inches long, and an inch broad. Berry oblong, black. Seeds 1-2, oblong.

Smooth Eugenia. Shrub 4 to 6 feet.

100 E. CAMPE′STRIS (D.C. l. c.) flowers axillary, crowded, nearly sessile; leaves oval-oblong, acuminated at both ends, opaque, rather villous above when young, but at length becoming glabrous, rather hairy beneath and pale; branchlets compressed, rather hairy; branches white, glabrous. ♄. S. Native of Brazil, in fields, in the province of Minas Geraes. My′rtus campéstris, Mart. herb. Pedicels hardly any. Bracteoles 2, and are, as well as the calyxes, hairy. Lobes of calyx oblong, bluntish. Petals roundish, emarginate. Style exserted. Leaves 2 inches long and 9 lines broad. Petioles 2 lines long. Fruit unknown.

Field Eugenia. Tree 20 feet.

101 E. AXILLA′RIS (Poir. suppl. 3. p. 126.) peduncles axillary, many-flowered, very short, at length rather longer than the petioles; pedicels minutely bibracteolate under the flowers; leaves oval, bluntish, acuminated, flat, shining; branches and flowers glabrous. ♄. S. Native of Jamaica, on the mountains. My′rtus axillàris, Swartz, fl. ind. occ. p. 901. but not of Poir. Leaves 2-8 inches long, on very short petioles. Flowers minute, white. Stamens very short. Berry ovate, 1-seeded. Allied to *E. montícola* and *E. glabràta*.

Axillary-flowered Eugenia. Fl. Sep. Clt. 1793. Sh. 4 to 6 ft.

102 E.? POIRE′TII (D. C. l. c.) peduncles axillary, many-flowered, very short, rather longer than the petioles; pedicels minutely bibracteolate under the flowers; leaves oval-oblong, attenuated at the base, obtuse at the apex, full of pellucid dots, shining above, and pale beneath, glabrous on both surfaces, as well as on the branches and flowers. ♄. S. Native of St. Domingo. Leaves an inch long. Flowers minute. Berry globose, 1-seeded, size of a grain of pepper. My′rtus axillàris, Poir. dict. 4. p. 412. but not of Swartz. M. Poirèti, Spreng. syst. 2. p. 483. Eug. axillàris, Spreng. in herb. Balb.

Poiret's Eugenia. Shrub 4 to 6 feet.

103 E. FLORIBU′NDA (West. st. cr. p. 216. ex Willd. spec. 2. p. 960.) peduncles crowded, axillary, many-flowered, length of the petioles, bracteate at the base; leaves oblong, acuminated, with revolute margins, finely veined, full of pellucid dots. ♄. S. Native of the Island of Santa Cruz. Peduncles sometimes solitary. Flowers 4-cleft. Leaves nearly lanceolate, gradually attenuated.

Bundle-flowered Eugenia. Shrub 4 to 6 feet.

104 E. BUXIFÒLIA (Willd. spec. 2. p. 960.) peduncles axillary, branched, many-flowered, very short; pedicels bibracteolate under the flowers; leaves obovate-oblong, obtuse, attenuated at the base, opaque, dotted beneath, with somewhat revolute edges, and are, as well as the branches and flowers, glabrous. ♄. S. Native of St. Domingo, in sterile places. My′rtus buxifòlia, Swartz, fl. ind. occ. 2. p. 899. E. myrtoìdes, Poir. suppl. 3. p 125. Style curved. Fruit roundish, 1-seeded. Embryo of *E. dísticha*. Leaves 1 or 1½ inch long, of an obscure brown-colour.

Box-leaved Eugenia. Fl. May, Ju. Clt. 1818. Sh. 4 to 6 ft.

105 E.? MONTÍCOLA (D. C. prod. 3. p. 275.) racemes many-flowered, very short, axillary, solitary; leaves ovate or oval, obtuse, flat, opaque, and are, as well as the branches, glabrous; calyx 4-5-lobed. ♄. S. Native of Jamaica, on the high mountains. My′rtus montícola, Swartz, fl. ind. occ. 2. p. 898. Racemules few-flowered. Flowers 4-cleft. Leaves ovate-oblong. The fruit is unknown, but the plant is so nearly allied to *Eugènia buxifòlia* as hardly to be distinguished from it.

Mountain-born Eugenia. Shrub 4 to 6 feet.

106 E.? GUADALUPE′NSIS (D. C. l. c.) racemes axillary, sessile, many-flowered, crowded into glomerated whorls; pedicels bibracteolate under the flowers; leaves ovate, coriaceous, opaque, obtuse or emarginate at the apex, and are, as well as the branches, glabrous; calyx 4-lobed. ♄. S. Native of Guadaloupe. Eug. buxifòlia, Spreng. in herb. Balb. Eug. Baruénsis var. Guadalupénsis, Spreng. syst. 2. p. 483. Leaves 2 inches long, 12-15 lines broad. Petioles 3 lines long, rather longer than the racemes. Fruit and seeds unknown.

Guadaloupe Eugenia. Shrub 6 to 8 feet.

107 E. BARUE′NSIS (Jacq. coll. 3. p. 183. icon. rar. t. 486.) racemes axillary, hardly equal in length to the petioles, and are, as well as the calyxes, pubescent; pedicels bibracteolate under the flowers; leaves ovate or oblong-lanceolate, bluntly acuminated at the apex, membranous, full of pellucid dots. ♄. S. Native of the Island of Baru, and of St. Domingo. My′rtus Baruénsis, Spreng. syst. 2. p. 483. Leaves 3 inches long and an inch broad. Petioles 4-5 lines long. Stamens a little longer than the petioles. Fruit globose, glabrous, 1-seeded.

Var. β, latifòlia (D. C. l. c.) racemules and calyxes glabrous; leaves ovate-lanceolate. ♄. S. Native of St. Domingo. Eug. latifòlia, Spreng. in herb. Balb. but not of Aubl. Perhaps a proper species.

Baru Eugenia. Clt.? Shrub 4 to 6 feet.

108 E.? CASEAROÌDES (D.C. l. c.) racemes axillary and nearly terminal, twin, short, in conglomerate whorls; pedicels bibracteolate at the base of the calyxes; leaves oblong, acuminated, acute at the base, membranous, glabrous, puberulous on the nerve beneath, as well as the branchlets and peduncles. ♄. S. Native of Cumana, on Mount Cocollar. My′rtus casearoìdes, H. B. et Kunth, nov. gen. amer. 6. p. 145. t. 546. Leaves an inch and a half long, full of pellucid dots. Ovarium 2-celled; cells 6-8-ovulate. Fruit and seeds unknown. There is a plant very nearly allied to this, which was collected in St. Domingo under the name of *Mýrtus prócera*, Browne, but not of Swartz.

Casearia-like Eugenia. Shrub 4 to 6 feet.

109 E.? MALPIGHIOÌDES (D. C. l. c.) racemes axillary and nearly terminal, twin, very short, 4-8-flowered; pedicels bibracteolate under the flowers; leaves ovate, acuminated, coriaceous, glabrous, shining; branches hairy. ♄. S. Native of South America, in the province of Jaen de Bracamoros, at the river

Amazon. My'rtus malpighioìdes, H. B. et Kunth, nov. gen. amer. 6. p. 146. Allied to *E. axillàris* and *E. cascaroìdes*. Fruit and seeds unknown.

Malpighia-like Eugenia. Shrub 6 to 8 feet.

110 E. Guayaquile'nsis (D. C. l. c.) racemes axillary, short, about equal in length to the petioles, in conglomerate whorls; leaves oblong, acuminated, narrowed at the base, rather coriaceous, covered with adpressed hairs on both surfaces; branches hairy. ♄. S. Native of Quito, near Guayaquil. My'rtus Guayaquilénsis, H. B. et Kunth, nov. gen. amer. 6. p. 147. Leaves 3-4 inches long, and an inch and a half broad. Fruit glabrous, 1-seeded, hardly the size of a sloe. Seeds unknown.

Guayaquil Eugenia. Shrub 3 to 4 feet.

111 E. Sinemarie'nsis (Aubl. guian. 1. p. 501. t. 198.) peduncles axillary, very short, branched, 3-6-flowered; pedicels bibracteolate under the flowers; leaves ovate-oblong, acuminated, full of pellucid dots, and are, as well as the branchlets, glabrous. ♄. S. Native of Guiana, on the banks of the river Sinemari. My'rtus Sinemariénsis, Spreng. Leaves rather membranous, 5-6 inches long, and from 1 to 2 broad. Fruit globose, 1-seeded. Cotyledons conferruminated. Seeds somewhat globose. Flowers sometimes 5-cleft, and the seeds are sometimes 2-3.

Sinemari Eugenia. Fl. May, July. Clt. 1823. Sh. 2 to 3 ft.

112 E. chrysophylloìdes (D. C. prod. 3. p. 276.) racemules axillary, very short, branched, and are, as well as the calyxes, clothed with rufous silky down; pedicels longer than the rachis; leaves elliptic, acuminated, coriaceous, glabrous above, but clothed with rufous silky deciduous down beneath, when young rather velvety; style flexuous, elongated. ♄. S. Native of Cayenne. Allied to *Eug. chrysophýllum*, but the flowers are evidently pedicellate, and disposed in short racemes. Lobes of calyx reflexed. Bracteoles none under the flowers. Fruit and seeds unknown.

Chrysophyllum-like Eugenia. Shrub.

113 E. bracteòsa (D. C. l. c.) pedicels 1 or 3 together, axillary, 1-flowered, and are, as well as the calyxes, bracteas, branches, and young leaves, clothed with tomentum; bracteoles about equal in length to the calyx; leaves oblong, dotless, coriaceous, glabrous above, and at length naked beneath, obtuse, callously mucronate; branches compressedly terete. ♄. S. Native of Brazil, in the provinces of the Mines. Pedicels 2 lines long. Leaves 2-3 inches long and 6-7 lines broad, opaque. Fruit unknown. This species has the habit of *E. alpigèna*.

Bracteate Eugenia. Tree.

114 E.? Xalape'nsis (D. C. l. c.) peduncles axillary, short, 2-6-flowered; leaves ovate, acuminated, acute at the base, rather membranous, shining, and are, as well as the branches, glabrous. ♄. S. Native of Mexico, near Xalapa. My'rtus Xalapénsis, H. B. et Kunth, nov. gen. amer. 6. p. 145.

Xalapa Eugenia. Shrub 6 feet.

115 E.? dumòsa (D. C. l. c.) peduncles axillary, very short, 4-flowered, bracteate at the base of the pedicels and under the flowers; leaves petiolate, broad-lanceolate, acuminated, membranous, clothed with silky villi. ♄. S. Native of South America. My'rtus dumòsa, Vahl. symb. 2. p. 57.

Bushy Eugenia. Fl. June, July. Clt. 1793. Sh. 3 to 4 ft.

* * * * *Peduncles axillary, bifid or dichotomous; the flowers in the forks sessile, the rest pedicellate.*

116 E.? biflòra (D. C. prod. 3. p. 276.) peduncles axillary, solitary, bifid, 2-flowered, bibracteolate at the bifurcation; leaves lanceolate, acute, glabrous on both surfaces. ♄. S. Native of Jamaica. Brown, jam. p. 248. t. 25. f. 3. Caryophy'llus fruticòsus, Mill. My'rtus biflòra, Lin. amœn. 5. p. 398. Fruit 3-celled, 3-seeded.

Two-flowered Eugenia. Fl. Apr. May. Clt. 1739. Sh. 6 to 10 ft.

117 E.? Sprenge'lii (D. C. l. c.) peduncles axillary, aggregate, 2-flowered, shorter than the leaves, bibracteolate under the flowers; leaves linear, obtuse, veinless, coriaceous; calyx 4-cleft. ♄. S. Native of Brazil. E. angustifòlia, Spreng. nov. prov. 18. but not Lam. Petals oblong. Fruit and seeds unknown.

Sprengel's Eugenia. Shrub.

118 E ? compre'ssa (D. C. l. c.) peduncles axillary, shorter than the leaves, 3-flowered; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves oblong, obtuse, running into the petiole at the base, rather coriaceous, reticulated, and are, as well as the compressed branches, glabrous. ♄. S. Native of Peru, near Caxamarca. My'rtus compréssa, H. B. et Kunth, nov. gen. amer. 6. p. 135. Ovarium 2-celled; cells 14-15-ovulate. Fruit and seeds unknown.

Compressed-branched Eugenia. Shrub.

119 E.? apicula'ta (D. C. l. c.) peduncles axillary, a little longer than the leaves, bifid, 3-flowered, middle flower sessile, lateral ones pedicellate; pedicels minutely bibracteolate under the flowers; leaves ovate, mucronately apiculated, glabrous above, puberulous beneath, and on the pedicels; branchlets hairy; calyx somewhat attenuated at the base. ♄. G. Native of Chili. Lobes of calyx very obtuse, somewhat ciliated. Leaves an inch long, and an inch and a half broad. Fruit and seeds unknown. Allied to *E. díscolor*.

Apiculated-leaved Eugenia. Shrub.

120 E. Dombeya'na (D. C. prod. 3. p. 276.) peduncles 1-3-together, axillary, 1-3-flowered, shorter than the leaves; flowers 4-cleft; tube of calyx rather turbinate; limb spreading, reflexed; leaves oblong, acute at both ends, opaque, glabrous, above, canescent beneath, and are as well as the branchlets villous. ♄. S. Native of Peru. My'rtus lanceolàta, Juss. herb. Jaum. in Duham. ed. nov. 1. p. 208. but not *E. lanceolàta*, Lam. Allied to *E. díscolor*, but the leaves are much narrower, 10-12 lines long and 3 lines broad. Pedicels 5 lines long, sometimes 1-flowered at the apex, sometimes 3-flowered; pedicels, especially 2, rising from the axils of the bracteas, 4 lines long, 1-flowered. Torus square. Fruit unknown.

Dombey's Eugenia. Shrub or tree.

121 E.? A'cka (D. C. prod. 3. p. 277.) peduncles axillary and nearly terminal, 1-3-flowered, very short, crowded; bracteoles 2, ovate, depressed; tube of calyx pubescent; lobes 4, ovate, ample, and are as well as the petioles full of pellucid dots; style very long, compressed; fruit ovate, many-seeded, crowned; leaves oval, obtuse, or acutish, opaque, glabrous above, but velvety from deciduous tomentum beneath, especially when young. ♄. S. Native of Peru. My'rtus A'cka, Juss. herb. Branches terete, short. Leaves crowded, copper-coloured above, rusty, beneath, 15-16 lines long, 6-7 lines broad. Lobes of calyx obtuse, somewhat bifid in the adult state. Stamens elongated. Style twisted when young, at length long and compressed.

Acka Eugenia. Shrub.

122 E.? díscolor (D. C. l. c.) peduncles axillary, shorter than the leaves, usually 3-flowered; flowers quadrifid, middle one sessile, lateral ones pedicellate; bracteoles under the calyx, linear-subulate; leaves opposite and tern, elliptic-oblong, acute, running into the petiole at the base, rather coriaceous, reticulated, discoloured, shining above, and are as well as the branchlets glabrous; branches triangular. ♄. S. Native on the Andes, near San Felipe. My'rtus díscolor, H. B. et Kunth, nov. gen. amer. 6. p. 134. and M. bícolor, t. 540. Ovarium 2-celled. Cells 6-13-ovulate. Fruit and seeds unknown.

Discoloured-leaved Eugenia. Shrub.

123 E. foliòsa (D. C. l. c.) peduncles axillary, 3-flowered, glabrous, about equal in length to the leaves; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves approximate,

roundish-elliptic, rounded at the base, coriaceous, glabrous, shining; branches angular. ♄. S. Native of South America. My'rtus foliòsa, H. B. et Kunth, nov. gen. amer. 6. p. 134. Ovarium 2-celled; cells 7-8-ovulate. Style curved. Leaves 9-11 lines long and 7-9 lines broad. Fruit and seeds unknown.

Leafy Eugenia. Shrub.

124 E. SUBAMPLEXICAU'LIS (D. C. l. c.) peduncles axillary, shorter than the leaves, 3-flowered; flowers 4-cleft, the one on the bifurcation sessile, and the others pedicellate; lobes of calyx ovate, concrete above the ovarium, but at length reflexed along with the petals; leaves ovate-oblong, cordate at the base, sessile, acuminated at the apex, opaque, glabrous on both surfaces, as well as on the branches. ♄. S. Native of Brazil, in woods on Mount Formosa on the confines of the provinces of Rio Janeiro and St. Paul. My'rtus subamplexicaúlis, Mart. herb. Leaves 3 inches long and an inch broad. Peduncles an inch long. The lateral flowers on pedicels 4 lines long. Petals obovate-oblong.

Somewhat-stem-clasping-leaved Eugenia. Shrub.

125 E. CRENULA'TA (Willd. spec. 2. p. 961.) peduncles axillary, solitary, usually 3-flowered, hardly longer than the very short petioles; leaves oval or roundish, bluntly subcrenated at the apex, and are as well as the branches glabrous. ♄. S. Native of St. Domingo, in mountain thickets. My'rtus crenulàta, Swartz, fl. ind. occ. 2. p. 889. Leaves 6-7 lines long and 4 lines broad. Flowers minute. Petals white, oblong. Stamens very minute. Berry roundish, red, 1-seeded. Seeds roundish.

Crenulated-leaved Eugenia. Shrub 8 to 12 feet.

126 E. BRACHYBÒTRYA (D. C. l. c.) peduncles axillary, few-flowered, a little longer than the petioles, trifid; leaves ovate, acuminated, obtuse at the base, almost sessile, shining, opaque; branches and flowers glabrous. ♄. S. Native of Cayenne. Fruit globose, glabrous. Seeds few, thick, and rather angular. Leaves 2 inches long and 12-15 lines broad. Racemes 4-5 lines long.

Short-racemed Eugenia. Shrub 5 to 6 feet.

127 E. SIEBERIA'NA (D. C. l. c.) racemules axillary, few-flowered; fruit ovate-oblong; lobes of calyx 4, short, broad, very obtuse, conniving, crowned; leaves oval, shortly and bluntly apiculated, membranous, full of pellucid dots, white beneath from hardly visible down. ♄. S. Native of the Island of Trinidad. Sieb. fl. trin. no. 222. Leaves 3 inches long and 18-21 lines broad. Petioles 3-4 lines long. Peduncles rather velvety, hardly longer than the petioles. Fruit 7-8 lines long. Seeds oblong.

Sieber's Eugenia. Shrub 5 to 6 feet.

128 E. MACROSPE'RMA (D. C. l. c.) peduncles axillary, few-flowered, length of the petioles, shortly trifid at the apex; leaves oval, attenuated at the base, on longish petioles, acuminated at the apex, glabrous above, rather velvety beneath from rufous deciduous down, as well as the branchlets and pedicels; calycine lobes very obtuse. ♄. S. Native of Brazil, in the desert of Bahia. Fruit ovate, crowned by the calyx, glabrous, 1-seeded. Seeds similar to those of a *Phaseolus*, 7 lines long and 5 lines broad. Cotyledons conferruminated. Petioles 5 lines long. Leaves 5 inches long, hardly 2-lobed.

Long-seeded Eugenia. Shrub 5 to 6 feet.

129 E. MYROBALA'NA (D. C. l. c.) racemes few-flowered, axillary, short; fruit oblong, bluntly attenuated at both ends, crowned by the lobes of the calyx, which are very blunt and somewhat incurved, 1-seeded; seeds oblong; leaves oval, acuminated at the apex, opaque, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of Brazil, at Rio Negro. My'rtus myrobálanus, Mart. herb. Leaves 9 inches long, and $3\frac{1}{2}$ broad. Petioles 6 lines long. Fruit an inch long and half an inch broad.

Myrobalan Eugenia. Tree 20 feet.

130 E. SALICIFÒLIA (D. C. prod. 3. p. 278.) peduncles axillary, shorter than the leaves, twice bifid, 7-flowered, 3 of them sessile in the forks, and 4 of them pedicellate; limb of calyx deciduous; leaves lanceolate, rather membranous, narrowly acuminated, reticulated, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of New Granada. My'rtus salicifòlia, H. B. et Kunth, nov. gen. amer. 6. p. 136. t. 541. M. dumòsa, Spreng. syst. 2. p. 483. exclusive of the synonyme. Ovarium 2-3-celled; cells 11-18-ovulate. Fruit and seeds unknown

Willow-leaved Eugenia. Shrub 6 to 10 feet.

131 E.? LIMBA'TA (D. C. prod. 3. p. 278.) peduncles axillary, shorter than the leaves, bifid, or twice bifid; some of the flowers sessile in the forks, and the others pedicellate; bracteoles linear; leaves oblong, acutish, running into the petiole at the base, coriaceous, reticulated, emarginate, shining, glabrous; branches puberulous. ♄. S. Native of Peru, near Ayavaca. My'rtus limbàta, H. B. et Kunth, l. c. Lobes of calyx ciliately fringed. Stamens beyond 200. Ovarium 2-celled; cells 16-ovulate. Flowers and seeds unknown.

Limbate Eugenia. Shrub.

132 E. FIMBRIA'TA (D. C. l. c.) peduncles axillary, exceeding the leaves, 3-flowered or bifid, with 1 flower in the fork, and the branchlets 3-flowered; bracteas lanceolate, rather foliaceous; leaves roundish-elliptic, obtuse at both ends, coriaceous, reticulated, and are as well as the branchlets pubescent; petals fringed with villi. ♄. S. Native of Peru, near Ayavaca. My'rtus fimbriàta, H. B. et Kunth, nov. gen. amer. p. 137. t. 542. Ovarium 2-celled; cells 15-ovulate. Fruit and seeds unknown.

Fringed-petalled Eugenia. Tree.

133 E.? LINDLEYA'NA (D. C. l. c.) peduncles axillary and nearly terminal, dichotomous, shorter than the leaves, rather corymbose; flowers sessile in the forks, and the others pedicellate; leaves nearly elliptic, obtuse, acutish at the base, coriaceous, margined, obsoletely veined, glabrous, pubescent when young, as well as the branches and corymbs. ♄. S. Native of South America, near San Felipe. My'rtus Lindleyàna, H. B. et Kunth, l. c. p. 138. t. 543. but not of Mart. herb. Ovarium 2-3-celled; cells 12-13-ovulate. Fruit and seeds unknown.

Lindley's Eugenia. Shrub 10 to 12 feet.

134 E.? RHOPALOÌDES (D. C. l. c.) peduncles axillary, about equal in length to the leaves, usually 6-flowered and dichotomous at the apex; flowers sessile in the forks, the rest pedicellate; leaves obovate, rounded at the apex, cuneated at the base, reticulated, coriaceous, shining, and are as well as the branches glabrous. ♄. S. Native of Peru, at Ayavaca. My'rtus rhopaloìdes, H. B. et Kunth, l. c. p. 137. Ovarium 2-celled; cells 20 ovulate. Fruit and seeds unknown.

Rhopala-like Eugenia. Tree.

135 E. EXSU'CCA (D. C. l. c.) peduncles axillary or nearly terminal, length of leaves, bifid or dichotomous, cymose; flowers in threes, middle one sessile; tube of calyx obovate, clothed with rufous silky down; lobes 4, roundish, reflexed; leaves obovate, obtuse, opaque, pale, glabrous above, but rather velvety beneath when young; petioles and branches clothed with rufous down. ♄. S. Native of Peru. My'rtus exsúcca, Domb. mss. but not of Mart. Peduncles sometimes rising by threes from the axils. Bracteoles linear, acute, under the flowers. Leaves 15 lines long and 7-8 broad. Fruit unknown.

Dry Eugenia. Tree 20 feet.

136 E.? DICHÒTOMA (D. C. prod. 3. p. 278.) peduncles axillary, opposite, or nearly terminal, longer than the leaves, bifid or twice bifid; flowers sessile in the forks, the rest pedicellate; leaves elliptic-lanceolate, attenuated at both ends, 1-nerved, full of pellucid dots, glabrous in the adult state, pubescent on both

surfaces when young, as well as the branchlets and calyxes. ♄. S. Native of St. Domingo. Perhaps the same as *Mýrtus dichótoma* of Vahl. mss. Poir. suppl. 4. p. 53. but Poiret says his plant has 5-cleft flowers, but they are 4-cleft in the plant we have in view. Lobes of calyx blunt. Bracteoles oblong, rather foliaceous. Pedicels twice or thrice the length of the flowers in the forks. Petioles pubescent, 2 lines long. Fruit globose, size of a pea, 2-3-celled.

Dichotomous Eugenia. Shrub 6 to 8 feet.

137 E. CHE'KEN (Hook, in Beech. bot. p. 56.) peduncles axillary, usually 1-flowered, solitary, longer than the leaves, furnished with 2 minute, deciduous, linear bracteas under the flowers; leaves glabrous, very dense, oval, acute at both ends, on very short petioles, obsoletely and parallelly nerved, full of pellucid dots; calycine segments very blunt. ♄. G. Native of Chili, about Valparaiso. My'rtus folio subrotundo vulgo. Cheken, Feuill. obs. 3. p. 45. t. 32. Fruit round, black. Seeds 2, rather cordate. A decoction of the leaves of this plant is said to cure diseases of the eyes. The bark is so astringent as to render a decoction of it of great use in cases of dysentery.

Cheken Eugenia. Shrub 4 to 6 feet.

138 E.? TRINE'RVIA (D. C. prod. 3. p. 279.) peduncles trifid, or twice trifid, 3-7-flowered, shorter than the flowers; bracteoles oblong, under the flowers, and are as well as the branchlets and calyxes rather hairy; leaves oval-oblong, acuminated at both ends, glabrous above in the adult state, 3-nerved, and clothed with tomentose pubescence beneath; lateral nerves almost marginal. ♄. G. Native of New Holland. My'rtus trinérvia, Smith, in Lin. trans. 3. p. 80. but not of Lour. Ovarium 2-3-celled, but only 1-celled in the adult state. Fruit globose, size of a pea. Ovula 7-8. Seeds unknown. The leaves are 3-nerved, and the plant therefore allied to *Mýrtus tomentòsa*. It is the only species from New Holland, and on that account may probably be a new genus.

Three-nerved-leaved Eugenia. Clt. 1824. Shrub 4 to 6 feet.

* * * * * * *Peduncles in racemose cymes or panicles, axillary, or the upper ones are terminal.*

139 E. XYLOPIFÒLIA (D. C. prod. 3. p. 279.) peduncles axillary, shorter than the leaves, racemose; pedicels few, elongated, bracteate at the base; leaves oblong, attenuated at the base, acuminated at the apex, coriaceous, opaque, shining above, and are as well as the branches glabrous. ♄. S. Native of French Guiana. Leaves 2 inches long and 8 lines broad. Pedicels 4 lines long. Calycine lobes 4, blunt, bent in after flowering. Fruit, globose, glabrous, crowned, 1-seeded. Seeds thick, conforming to the fruit. Cotyledons conferruminated, full of resinous vesicles.

Xylopia-leaved Eugenia. Shrub 6 to 8 feet.

140 E. CUSPIDIFÒLIA (D. C. l. c.) peduncles axillary, very short, racemose, and are as well as the calyxes clothed with rufous down; pedicels 7-9, in umbellate fascicles; leaves elliptic-oblong, cuspidate, coriaceous, hardly with any pellucid dots, glabrous on both surfaces, dotless, and paler beneath. ♄. S. Native of Brazil, on the banks of the river Negro. My'rtus cuspidifòlia, Mart. herb. A tree 30 to 40 feet. Flowers at first sight appearing as in section second, in secund fascicles. Petioles hardly more than 2 lines long. Calycine lobes 4, reflexed, oval, obtuse. Allied to *E. xylopifòlia*. Leaves 3 inches long and 1 inch broad.

Cuspidate-leaved Eugenia. Tree 30 to 40 feet.

141 E. SPHÆROSPE'RMA (D. C. l. c.) racemes axillary, 5-7-flowered, much shorter than the leaves; pedicels slender; fruit spherical, 1-seeded; seed globose; leaves oblong, attenuated both at the base and apex, acuminated, full of pellucid dots, shining above, pale beneath and dotted, quite glabrous on both surfaces, as well as the branchlets and flowers. ♄. S. Native of Brazil, at the Rio Negro. My'rtus cuspidifòlia, Mart. herb. Leaves 3 inches long and half an inch broad. Fruit size of a grain of pepper. Lobes of calyx 4, obtuse, short. Allied to *E. cuspidifòlia* and *E. xylopifòlia*.

Round-seeded Eugenia. Shrub or tree.

142 E. MODE'STA (D. C. l. c.) racemes few-flowered, axillary, 3-times shorter than the leaves; bracteas ovate, obtuse, permanent, under the flowers; fruit spherical; lobes of calyx ovate, somewhat introflexed; leaves oblong, attenuated at both ends, narrowed and usually emarginate at the apex, with a few pellucid dots, quite glabrous on both surfaces, as well as the branches. ♄. S. Native of Brazil, at the river Ilheos. My'rtus modésta, Mart. herb. Leaves 2 inches long and 5 lines broad. Racemes 5-7-flowered, 5 lines long. Pedicels opposite, bracteolate at the base. Fruit the size of a grain of pepper, and is as well as the whole plant glabrous.

Modest Eugenia. Shrub or tree.

143 E.? VA'HLII (D. C. l. c.) racemes axillary, opposite, solitary, or twin, compressed, rather villous, shorter than the leaves; leaves ovate, acute, 3-nerved, glabrous. ♄. S. Native of Cayenne. E. trinérvia, Vahl. ecl. 2. p. 36. but not of Smith. My'rtus Vàhlii, Spreng. syst. 2. p. 486. Leaves 2 inches long. Branchlets compressed, rather villous. Lobes of calyx 4, obtuse. Petals oblong. Ovarium villous. Fruit and seeds unknown.

Vahl's Eugenia. Shrub.

144 E. RUFE'SCENS (D. C. l. c.) peduncles axillary, oppositely racemose, or in fascicles, and are as well as the calyxes clothed with rufous down; leaves oblong, attenuated at the base, bluntish at the apex, opaque, but at length glabrous. ♄. S. Native of Brazil, in fields in the province of St. Paul. Perhaps *Mýrtus rufèscens*, Spreng. syst. 2. p. 487. Tube of calyx ovate; lobes 4, erect, oblong. Seeds 2-3, compressed in the immature fruit. Leaves 2 or 2½ inches long, and 9-10 lines broad. Racemes one half shorter than the leaves. Pedicels 4 lines long, sometimes in racemes and sometimes in fascicles in the axils of the leaves.

Rufescent Eugenia. Shrub 6 to 8 feet.

145 E. CONFU'SA (D. C. l. c.) peduncles axillary, disposed in simple racemes, length of the petioles; pedicels 1-flowered, twice or thrice the length of the petioles; leaves elliptic, rather attenuated at the base, long-acuminated at the apex, shining above, with revolute margins, full of pellucid dots, and are as well as the branches and flowers glabrous. ♄. S. Native of Guadaloupe. E. floribúnda, Spreng. in herb. Balb. An intermediate plant, between the second and fifth sections. Pedicels very short, rising from the rachis, bearing 1 bractea at the base of each, and 2 acute bracteoles at the apex, under the flowers.

Confused Eugenia. Shrub or tree.

146 E. INUNDÀ'TA (D. C. prod. 3. p. 280.) peduncles axillary, shorter than the leaves, 3-7-flowered, racemose; pedicels elongated, and are as well as the calyxes clothed with white down; bracteoles obtuse, under the flowers; leaves oval or obovate, obtuse, membranous, opaque, glabrous on both surfaces, as well as branchlets. ♄. S. Native of Brazil, in inundated places at Rio Negro. My'rtus inundàta, Mart. herb. Leaves 15-18 lines long and 5-6 broad. Petioles a line long. Lower surface of leaves rather dotted. Petals oval-oblong. Bracteas small, obtuse, under the pedicels. Calycine lobes obtuse. Fruit unknown.

Inundated Eugenia. Shrub or tree.

147 E. LA'NCEA (Poir. suppl. 3. p. 123.) racemes axillary, puberulous, nearly simple, shorter than the leaves; pedicels rather distant, bibracteolate under the flowers; leaves oval-ob-

long, acuminated at both ends, rather opaque, and are as well as the branches glabrous, shining above, veinless, and marked with elevated dots. ♄. S. Native of the Island of St. Thomas. Perhaps a var. of *E. virgultòsa*. Stem whiter.

Lance-leaved Eugenia. Shrub 6 to 10 feet.

148 E. TRINITAˋTIS (D. C. l. c.) peduncles axillary, solitary, opposite, longer than the leaves, disposed in simple racemes; pedicels opposite, 1-flowered, furnished each with 1 bractea at the base and 2 at the apex; flowers 4-lobed; leaves elliptic, acuminated, coriaceous, with a few pellucid dots, shining above, and pale beneath, quite glabrous on both surfaces, as well as the branches and peduncles. ♄. S. Native of the Island of Trinidad. My′rtus dioica, Sieb. pl. exs. trin. no. 94. Leaves an inch and a half long, and half an inch broad. Peduncles slender, 2-3 inches long. Lobes of calyx obtuse. Fruit globose, 1-seeded, a little smaller than a pea. Seed roundish. Cotyledons conferruminated.

Trinidad Eugenia. Shrub or tree.

149 E. POLYSTAˋCHYA (Rich. in act. soc. hist. nat. par. 1792. p. 110.) peduncles axillary, solitary, or in fascicles, length of leaves, oppositely racemose, compressed, clothed with rufous velvety down; calyx downy, bluntly 4-lobed; leaves ovate-lanceolate, acuminated, opaque, coriaceous, glabrous; branchlets compressed, smoothish. ♄. S. Native of French Guiana. E. rugòsa, Ruiz et Pav. in herb. Deless. The fruit of the Guiana plant is unknown, but that of Pavon is furrowed from numerous irregular crests, as in *E. uniflòra*. Seeds pseudo-cotyledonous.

Many-spiked Eugenia. Shrub or tree.

150 E. EMARGINAˋTA (D. C. l. c.) racemes axillary, solitary, 8-10-flowered, when in fruit they are about equal in length to the leaves; calyx 4-parted: leaves obovate-oblong, emarginate, cuneated at the base, coriaceous, puberulous beneath, shining above, and are as well as the branches glabrous. ♄. S. Native on the banks of the Orinoco. My′rtus emarginàta, H. B. et Kunth, nov. gen. amer. 6. p. 142. Flowers unknown. Berry nearly globose, pubescent, 1-seeded. Seed smooth. Cotyledons contortuplicate?

Emarginate-leaved Eugenia. Shrub or tree.

151 E. LUDIBU′NDA (Bert. ined. ex D. C. l. c.) peduncles axillary, solitary, opposite, or in fascicles, panicled, shorter than the leaves; branches and flowers pubescent or villous; leaves ovate, acuminated, membranous, full of pellucid dots, glabrous in the adult state; calyx 4-cleft. ♄. S. Native of St. Domingo. My′rtus montícola, Vahl. herb. ex Puer. Fruit globose, 1-seeded. Seed shining, pseudo-monocotyledonous.

Sporting Eugenia. Shrub or tree.

152 E. GRE′GII (D. C. l. c.) peduncles axillary, many-flowered; pedicels opposite, 1-flowered; flowers 4-cleft; leaves elliptic or ovate, acute, or obtuse, clothed with hoary tomentum beneath. ♄. S. Native of the Island of Dominica. My′rtus Grégii, Swartz, fl. ind. occ. p. 896. Grégia aromática, Gærtn. fruct. 1. p. 168. t. 33. Berry obovate-globose, coriaceous, when young 2-celled, many-seeded, but in the adult state 1-celled, 1-seeded. Seed large. Cotyledons fleshy, conferruminated.

Greg's Eugenia. Clt. 1776. Tree 30 to 40 feet.

153 E. FRAˋGRANS (Willd. spec. 2. p. 964.) peduncles axillary, trichotomous, and simple, compressed, twice the length of the leaves; flowers 4-cleft; leaves ovate, rather convex, and somewhat coriaceous, dotted, and are as well as the branchlets glabrous; stem arboreous. ♄. H. Native of the south of Jamaica, and on the high mountains of Martinique and Guiana. My′rtus fràgrans, Swartz, fl. ind. occ. p. 914. Sims, bot. mag. 1242. Vahl. symb. 2. p. 59. Eug. paniculàta, Jacq. coll. 2. p. 108. t. 5. f. 1. E. montàna, Aubl. guian. 1. p. 495. t. 195. Berry roundish, 1-seeded.

Fragrant Eugenia. Fl. April, May. Clt. 1790. Tree 20 ft.

154 E. VIRGULTÒSA (D. C. l. c.) racemes axillary and terminal, puberulous, somewhat compressed, shorter than the leaves; pedicels rather remote, decussate, bibracteolate at the base; leaves oval-oblong, acuminated at both ends, rather opaque, and are as well as the branches glabrous, shining above, and marked with impressed dots and veins. ♄. S. Native of the high mountains of Jamaica, Santa Cruz, &c. My′rtus virgultòsa, Swartz, fl. ind. occ. 2. p. 905. exclusive of the synonyme of Plumier. Vahl. symb. 2. p. 58. Berry roundish, rather dry. Seeds 2-3, angular.

Twiggy Eugenia. Fl. July, Aug. Clt. 1787. Tr. 12 to 15 ft.

155 E. BIFAˋRIA (Wall. pl. asiat. rar. 2. p. 47. t. 161.) arboreous, quite smooth; leaves oblong, acuminated, approximate, on short petioles, spreading in a bifarious manner, shining, blistered above, and transversely nerved beneath, with the anastomosing vessels very conspicuous, and forming 2 marginal veins, which are remote from the margin; corymbs axillary, solitary, branched; ovarium clavate, on a slender pedicel; petals orbicular, unguiculate; berry oval, crowned by the permanent lobes of the calyx, which are incurved. ♄. S. Native of the mountains on the confines of Silhet.

Bifarious-leaved Eugenia. Tree 30 feet.

156 E. PARVIFLÒRA (Lam. dict. 3. p. 200. exclusive of the synonyme of Rheede) peduncles axillary, a little shorter than the leaves, panicled, pubescent; bracteas oval, foliaceous, under the branchlets of the panicle; bracteoles linear, under the flowers; leaves elliptic-oblong, acuminated, opaque, rather dotted, glabrous above, pubescent beneath as well as on the branchlets. ♄. S. Native of Java. My′rtus parviflòra, Spreng. syst. 2. p. 485. Calyx clothed with white down; lobes 4, obtuse. Flowers small. Embryo like that of *Mýrtus commúnis*, ex Kunth.

Small-flowered Eugenia. Shrub or tree.

157 E. EGE′NSIS (D. C. prod. 3. p. 281.) peduncles axillary, length of the petioles, bearing 8-10 slender, 1-flowered pedicels, which are twice the length of the petioles, disposed in the manner of a raceme; bracteas small, under the flowers and at the origin of the pedicels; leaves elliptic-oblong, long-acuminated, full of pellucid dots, reticulated, glabrous on both surfaces as well as the branchlets, which are compressed. ♄. S. Native of Brazil, in the province of Rio Negro, near Ega. My′rtus Egénsis, Mart. herb. Leaves 4 inches long, and an inch broad. Pedicels 7 lines long. Peduncles or rachis 3-4 lines long. Fruit larger than a pea, globose, 1-seeded. Seeds globose. Immature embryo pseudo-monocotyledonous.

Ega Eugenia. Tree.

158 E. ACUTI′LOBA (D. C. l. c.) racemes axillary, simple, 7-flowered, shorter than the leaves, and are as well as the branches rather hairy; lobes of calyx and bracteas rather acute; leaves oval-oblong, attenuated at the base, acuminated at the apex, full of pellucid dots, rather villous on the upper surface when young, but glabrous in the adult state, dotless, paler beneath, and pubescently villous. ♄. S. Native of Jamaica. Intermediate between *E. virgultòsa* and *E. parviflòra*. Fruit unknown.

Acute-lobed Eugenia. Shrub 6 to 10 feet.

159 E. RACEMÒSA (D. C. prod. 3. p. 281.) racemes axillary, simple, 7-8-flowered, clothed with villous tomentum, much shorter than the leaves; bracteas and bracteoles small, acute: calycine lobes 4, roundish; leaves oval-lanceolate, long-acuminated, with a few pellucid dots, clothed with adpressed villi when young, but glabrous in the adult state, shining above. ♄. S. Native of Brazil, in woods. My′rtus racemòsa, Mart. herb. Leaves 3 inches long, and 12-15 lines broad. Racemes 9-10 lines long. Petals obovate. Style acute, longer than the stamens. Fruit unknown.

Racemose-flowered Eugenia. Shrub or tree.

160 E. CANDOLLEA'NA (D. C. l. c.) peduncles axillary, opposite, and terminal, tern, racemose, 7-9-flowered, shorter than the leaves; bracteoles bluntish; leaves oval-oblong, rather cuneated at the base, bluntly acuminated at the apex, full of pellucid dots, quite glabrous on both surfaces as well as on the branches. ♄. S. Native of Brazil, in woods near Rio Janeiro. My'rtus Candolleàna, Mart. herb. Leaves 2 inches long and 9-10 lines broad. Peduncles 9-10 lines long. Fruit ovate, crowned by the lobes of the calyx, which are ovate, obtuse, 4 in number, and glabrous as well as the whole inflorescence.

De Candolle's Eugenia. Shrub or tree.

161 E. COLLI'NA (D. C. l. c.) peduncles extra-axillary, racemosely panicled, shorter than the leaves, or equal in length to them; lobes of calyx 4, ovate, obtuse, spreadingly reflexed; staminiferous disk broad; leaves elliptic, bluntish, stiff, opaque, and are as well as the branchlets glabrous. ♄. S. Native of Brazil, on hills. My'rtus collìna, Mart. herb. Peduncles rising a little above the leaves, opposite, and forming a cross angle with the leaves. Calyxes downy, expanded like that of *Psidium*, but 4-lobed, and with the lobes distinct in the bud. Leaves 2 and 2½ inches long and 1 inch broad. Peduncles an inch and a half long. Fruit unknown.

Hill Eugenia. Shrub or tree.

162 E. CAPPARIDIFÒLIA (D. C. l. c.) peduncles axillary, racemose, 3-times shorter than the leaves, 7-8-flowered; bracteas and bracteoles ovate; fruit ovate, globose, glabrous at length, but when young clothed with short velvety down, as well as the lobes of the calyx, which are 4 and ovate; leaves oval oblong, bluntish, coriaceous, stiff, opaque, and are as well as the branches glabrous. ♄. S. Native of Brazil, on Serro Frio, in the provinces of the Mines. My'rtus capparidifòlia, Mart. herb. Leaves 2½ inches long, and 9-10 lines broad. Racemes 8-10 lines long. Fruit larger than a pea, 1-seeded. Cotyledons conferruminated.

Capparis-leaved Eugenia. Shrub or tree.

163 E. FÍRMA (D. C. prod. 3. p. 282.) peduncles axillary, racemose, simple, shorter than the leaves; bracteas and bracteoles small, broad, hardly acute; fruit globose, 2-seeded, crowned by the 4 ovate, erect lobes of the calyx; leaves oval, bluntish, stiff, opaque, glabrous on both surfaces as well as the branchlets and racemes. ♄. S. Native of Brazil. My'rtus fírma, Mart. herb. Leaves 3-4 inches long and from 1-2 broad, on short petioles. Racemes 2 inches long. Fruit size of a cherry, of an orange colour.

Firm Eugenia. Shrub 6 to 10 feet.

164 E. INÆQUÍLOBA (D. C. l. c.) peduncles axillary, disposed in a many-flowered, terminal panicle; calyx 4-lobed, the 2 larger lobes membranous, roundish and ciliated; leaves elliptic, somewhat attenuated at both ends, rather coriaceous, opaque, and are as well as the branches glabrous. ♄. S. Native of Cayenne. Leaves 2½ inches long and an inch broad, shining above. Flowers small. Fruit globose. Seeds roundish. Cotyledons conferruminated.

Unequal-lobed-calyxed Eugenia. Shrub 6 to 8 feet.

165 E. MARÍTIMA (D. C. l. c.) racemes axillary, 1-2, terminal, tern, sessile, short, 8-10-flowered, hardly exceeding the petioles; branches and calyxes glabrous; calyx coriaceous, 4-lobed. ♄. S. Native of Mexico, near Acapulco. My'rtus marítima, H. B. et Kunth, nov. gen. amer. 6. p. 146. Leaves 2½ inches long, and 12-16 lines broad. Petals ciliated. Ovarium 2-celled; cells many-ovulate. Berry pea-shaped, 1-seeded. Perhaps distinct from *E. buxifòlia.*

Sea-side Eugenia. Shrub 6 to 10 feet.

166 E. MICRA'NTHA (D. C. l. c.) racemes 1-2, axillary, or 2-3, terminal, usually 10-flowered, shorter than the leaves, and are as well as the branchlets and calyxes rather hairy; leaves rather ovate-oblong, acuminated, cuneated, and acute at the base, revolute all round, rather coriaceous, glabrous, and rather shining. ♄. S. Native of New Granada, near Honda, and perhaps of Peru. My'rtus micrántha, H. B. et Kunth, l. c. p. 144. but not of Nees nor Mart. Ovarium 2-celled; cells many-ovulate. Fruit red, 1-seeded.

Small-flowered Eugenia. Shrub 6 to 10 feet.

167 E. A'LBIDA (Humb. et Bonpl. pl. equin. 2. p. 107. t. 113.) racemes axillary, solitary, shorter than the leaves, or terminal, in threes, 8-10-flowered, and are as well as the branchlets clothed with silky silvery down; calyx acutely 4-lobed; leaves oblong-lanceolate, acuminated, narrowed at the base, coriaceous, glabrous above and shining, but covered with silky silvery down beneath. ♄. S. Native of New Granada, on mountains near Fusagasuga. Ovarium 2-celled; cells many-ovulate. Seed subglobose. Cotyledons fleshy, conferruminated.

Whitish Eugenia. Tree 12 to 18 feet.

168 E. PUBE'SCENS (D. C. l. c.) racemes axillary, twin, and terminal in fours, 8-10-flowered, about equal in length to the leaves, pubescent; calyx bluntly 4-lobed; leaves oblong, obtuse, acute at the base, coriaceous, glabrous above and shining, clothed with silky pubescence beneath; branchlets puberulous. ♄. S. Native on the banks of the Orinoco, near Maypures. My'rtus pubéscens, H. B. et Kunth, l. c. p. 143. but not of Mart. Leaves 27-30 lines long and 12-14 lines broad. Flowers about the size of those of the hawthorn. Petals ciliated. Stamens about 170 in number. Ovarium 2-celled; cells many-ovulate. Fruit and seeds unknown.

Pubescent Eugenia. Shrub or tree.

169 E. PSEU'DO-CARYOPHY'LLUS (D. C. l. c.) peduncles axillary, alternate, twice trifid at the apex, shorter than the leaves; and are, as well as the calyxes, branchlets, and buds, clothed with hoary pubescence; leaves oblong, acuminated at both ends, stiff, opaque, glabrous above and shining, clothed with canescent silky down beneath. ♄. S. Native of Brazil, in the province of St. Paul. My'rtus oleáster, Mart. herb. My'rtus pseùdo-caryophy'llus, Gomez. mem. act. lisb. 3. p. 93. t. 6. ex St. Hil. Leaves 3 inches long and 9-10 lines broad. Petioles 2 lines long. Fruit ovate, crowned by the lobes of the calyx, obtuse, somewhat inflexed. Peduncles 1½ inch long.

Var. β, ocoteoìdes (D. C. l. c.) peduncles axillary, and almost terminal, trichotomous, corymbose; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves elliptic-oblong, acuminated, feather-nerved, glabrous above, and rather canescent from short silky adpressed down beneath; young branches puberulous. ♄. S. Native of Brazil. Fruit and seeds unknown.

Bastard-clove Eugenia. Tree 15 to 20 feet.

170 E. FULVE'SCENS (Mart. herb. ex D. C. prod. 3. p. 283.) peduncles axillary, and nearly terminal, panicled, and trichotomous; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves elliptic, acuminated at both ends, feather-nerved, glabrous above, rather velvety beneath from short rufescent down, as well as branchlets and peduncles; branches compressed. ♄. S. Native of Brazil, in fields in the provinces of the Mines. Very like *E. pseùdo-caryophy'llus var. Ocoteoìdes*, but the leaves are shorter, and not silky beneath.

Fulvescent Eugenia. Shrub or tree.

171 E. PA'TENS (Poir. suppl. 3. p. 124.) racemes axillary, rather spreading, many-flowered, ultimate ones panicled; lobes of calyx 4, orbicular, 2 of which are smaller than the other 2; leaves lanceolate, acuminated, spreading, coriaceous, full of pellucid dots, and are, as well as the branches, glabrous. ♄. S. Native of Cayenne. Racemes a little shorter than the leaves. Bracteoles 2, ovate, obtuse under the calyx. Stamens a little longer than the petals. Fruit unknown.

Spreading Eugenia. Shrub or tree.

172 E. MIKANIA'NA (D. C. prod. 3. p. 283.) peduncles axillary, opposite, and nearly terminal, divaricately branched, longer than the leaves, and are, as well as the calyxes and branches, clothed with rufous tomentum; leaves ovate-oblong, acuminated, full of pellucid dots when young, villous and rather tomentose above, but in the adult state opaque, glabrous above, and almost naked beneath. ♄. S. Native of Brazil, in the province of St. Paul. My'rtus Mikaniàna, Mart. herb. Fruit ovate, crowned by the 4 lobes of the calyx, which are blunt and conniving. Leaves 2 inches long and 9 lines broad, on petioles a line long. Allied to *E. rufèscens*, but the inflorescence is different.

Mikan's Eugenia. Tree 20 feet.

173 E. ACETÒSANS (Poir. suppl. 3. p. 125.) racemes axillary and terminal, pedunculate, longer than the leaves; pedicels opposite; flowers 4-cleft; leaves obovate, obtuse, coriaceous, dotted beneath, and are, as well as the branches, glabrous. ♄. S. Native of Guiana. Leaves with an acid taste according to Richard. My'rtus acetòsans, Spreng. syst. 2. p. 488. Fruit and seeds unknown.

Acid-leaved Eugenia. Tree.

174 E. ÆRUGÌNEA (D. C. l. c.) peduncles axillary and terminal, many-flowered, racemosely panicled, shorter than the leaves; calyxes and panicles covered with rufous velvety down; pedicels opposite, 1-3-flowered; calyx 4-cleft; leaves oval-oblong, acute at both ends, opaque, membranous, glabrous in the adult state. ♄. S. Native of South America. My'rtus ærugìnea, Forsyth in herb. Lher. Petioles 5 lines long. Leaves 3 inches long and 12-15 lines broad. Racemes an inch and a half long. The two broadest lobes of the calyx are blunter. Fruit and seeds unknown.

Rusty Eugenia. Shrub or tree.

175 E. MURICA'TA (D. C. l. c.) peduncles axillary and terminal, racemose, shorter than the leaves; bracteas small, acute under the flowers; fruit obovate, rough from blunt tubercles, crowned by the 4 lobes of the calyx, which are obtuse and spreading; leaves elliptic-oblong, acuminated, opaque, rather coriaceous, glabrous above, but clothed with paler rufous down beneath, pubescent while young, but glabrous in the adult state. ♄. S. Native of Brazil. My'rtus muricàta, Mart. herb. Leaves 6 inches long and 2 inches broad. Petioles 2-3 lines long. Racemes 3 inches long when in flower, but when bearing the fruit they are from 4-6 inches long. Allied to *E. ripària*. Seeds unknown.

Muricated-fruited Eugenia. Tree 20 feet.

176 E. RIPA'RIA (D. C. l. c.) peduncles axillary and terminal, shorter than the leaves, racemosely panicled; bracteas under the flowers, broad at the base, and acute at the apex; calyxes, peduncles, and branchlets, covered with rufescent down; leaves elliptic-oblong, terminated by a long acute acumen, coriaceous, opaque, nerveless, clothed with rufescent down beneath. ♄. S. Native of Brazil, on the banks of the river Amazon. My'rtus ripària, Mart. herb. Leaves 8 inches long and 2 inches broad, standing on petioles 2 lines long. Panicle 2-3 inches long. Calycine lobes 4, spreading, roundish. Staminiferous disk broad, as in *Psídium*. Fruit unknown.

River-side Eugenia. Tree 20 feet.

177 E. HIRSU'TA (Ruiz et Pav. fl. per. 4. t. 417. a.) peduncles leafy, few-flowered; pedicels 1-flowered, having 2 leafy bracteas in the middle, and each flower is surrounded by 5 bracteas in the form of an involucrum; leaves ovate, acuminated, with revolute margins, on very short petioles; fruit oblong, small, crowned by the 5-lobed limb of the calyx, ex icon. ♄. S. Native of Peru. Hairy in every part. Style subulate.

Hairy Eugenia. Shrub 6 to 8 feet.

178 E. FLÓRIDA (D. C. l. c.) peduncles axillary or terminal, panicled, many-flowered, longer than the leaves; bracteoles acute, 2 under each flower, and a solitary one at the base of each pedicel; petals obovate, spreadingly reflexed; leaves elliptic-oblong, acuminated, membranous, opaque, nearly veinless above, and are, as well as the branchlets, glabrous. ♄. S. Native of Brazil, on the banks of the river Amazon. My'rtus flórida, Mart. herb. Flowers as large as those of *Mýrtus commùnis*. Style exserted. Calycine lobes 4, obtuse. Fruit unknown.

Florid Eugenia. Tree 20 to 30 feet.

179 E. LÆVIGA'TA (D. C. prod. 3. p. 283.) peduncles axillary and terminal, much branched, covered with rufous down, as well as the flowers and buds; leaves oval-oblong, attenuated at the base, bluntly acuminated at the apex, opaque, smooth above, pale and dotted beneath, glabrous on both surfaces, as well as on the branches. ♄. S. Native of Brazil, in the desert of Rio St. Francisco. My'rtus lævigàta, Mart. herb. Leaves 2 inches long and 8-9 lines broad, standing on petioles 3 lines long. Flower-bud globose. Fruit unknown.

Smooth Eugenia. Shrub or tree.

180 E. PA'TULA (D. C. prod. 3. p. 284.) peduncles axillary or terminal, racemose, simple, 5-7-flowered, shorter than the leaves; pedicels spreading, distant; bracteas and bracteoles small, acute; lobes of calyx obtuse; leaves linear-oblong, acuminated, with a few pellucid dots; branchlets and racemes quite glabrous. ♄. S. Native of Brazil, at the river Amazon. My'rtus pâtula, Mart. herb. Leaves 3-4 inches long and 5-10 lines broad. Petioles 2 lines long. Tube of calyx globose. Flowers small.

Spreading Eugenia. Tree 20 to 30 feet.

181 E. RUTIDOCA'RPA (Ruiz et Pav. fl. per. 4. t. 416.) peduncles racemose, aggregate in the axils of the leaves, and terminal, panicled, numerous, about the length of the leaves; leaves ovate-oblong, acuminated; fruit globose, rough. ♄. S. Native of Peru.

Rough-fruited Eugenia. Tree.

182 E.? PA'LLENS (D. C. l. c.) peduncles terminal, twin, racemose; pedicels opposite, for the most part one-flowered, furnished each with one bractea at the base, and 2 bracteoles at the apex; calyxes 4-cleft, clothed with cinereous villi; leaves broad-lanceolate, attenuated, dotted above, and are, as well as the branchlets, glabrous. ♄. S. Native of South America. My'rtus pállens, Vahl. symb. 2. p. 57. Spreng. syst. 2. p. 485. exclusive of the synonyme of Poir., which is referrible to *Calyptránthes chytracùlia*. Branches rather compressed above. Petals very minutely ciliated, length of the stamens. Fruit and seeds unknown.

Pale Eugenia. Tree.

183 E. NERVÒSA (Lour. coch.) peduncles 1-flowered, terminal, crowded; calyx 4-lobed; lobes obtuse, concave; leaves lanceolate, glabrous. ♄. G. Native of Cochin-china, in woods. My'rtus Loureiri, Spreng. syst. 2. p. 489. Petals small, roundish. Stamens above 100 in number, 3 times longer than the petals. Style subulate, acute, longer than the stamens. Berry globose, nerved, glabrous, reddish brown.

Nerved-leaved Eugenia. Tree 30 to 40 feet.

184 E. CORYMBÒSA (Lam. dict. 4. p. 199.) peduncles terminal, corymbose, with opposite branchlets; calyx with 4 short teeth; leaves ovate, obtuse, opaque, shining above, veined beneath, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of the East Indies. Njara, Rheed. mal. 5. p. 53. t. 27. Berry globose, blackish, 1-seeded, ex Rheed.

Corymbose-flowered Eugenia. Tree.

185 E. ANDROSÆMOÌDES (D. C. l. c.) racemes terminal and axillary, somewhat corymbose, few-flowered, shorter than the leaves; leaves oval, obtuse, stiff, coriaceous, opaque, nearly sessile, glabrous; branches tetragonal. ♄. S. Native of the East

Indies. My'rtus androsæmoides, Vahl. symb. 2. p. 58. perhaps exclusive of the synonyme. Fruit globose, size of a pepper. Seeds 2, hemispherical, fleshy inside, pseudo-monocotyledonous. M. androsæmoides of many herbaria.

Androsæmum-like Eugenia. Shrub.

186 E.? PE'NDULA (D. C. l. c.) racemes terminal, elongated, pendulous; branches short, usually 3-flowered; calyxes semiquadrifid; leaves on short petioles, oblong-lanceolate, attenuated at both ends, glabrous. ♄. S. Native of Java, in woods in the province of Bantam. My'rtus péndula, Blum. bijdr. p. 1085. Said to be allied to *E. lanceolàta*.

Pendulous-racemed Eugenia. Shrub.

187 E. SPICIFLÒRA (Nees et Mart. nov. act. bonn. 12. p. 52.) peduncles compressed, rising from the stem; flowers spicate, opposite, tribracteolate; leaves oblong-lanceolate, acuminated, ciliated, hairy on the stem and petioles. ♄. S. Native of Brazil, at the river Ilheos. Leaves a hand long. Petioles covered with yellow bristles. Tube of calyx funnel-shaped. Fruit and seeds unknown. Said to be allied to *E. Brasiliénsis*.

Spicate-flowered Eugenia. Shrub 10 to 18 feet.

188 E.? LANCEOLA'TA (Lam. dict. 3. p. 200.) peduncles nearly terminal, racemose, few-flowered; calyx turbinate, 4-lobed; leaves lanceolate, nearly sessile, full of pellucid dots, glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of the East Indies. My'rtus Sonneràtii, Spreng. syst. 2. p. 485. Petals concave. Stamens, fruit, and seeds unknown.

Lanceolate-leaved Eugenia. Shrub 6 to 12 feet.

189 E. TE'MU (Hook. in Beech. voy. pt. bot. p. 56.) panicles axillary, for the most part solitary, somewhat corymbose, few-flowered, almost the length of the leaves; leaves elliptic or obovate, very blunt, coriaceous, pale beneath, when young rather velvety, as well as the branchlets, on short petioles. ♄. G. Native of Chili, about Valparaiso. *Temu* of Chili. Perhaps the same as My'rtus Lùma of Molini.

Temu Eugenia. Shrub 5 to 6 feet.

190 E.? DUMETÒRUM (D. C. l. c.) racemes long, nearly terminal; leaves ovate, acuminated, 3-nerved, glabrous on both surfaces, as well as the fruit. ♄. G. Native of Cochin-china, among bushes. My'rtus trinérvis, Lour. coch. p. 312. My'rtus dumetòrum, Poir. suppl. 4. p. 52. Nélitris trinérvia, Spreng. syst. 2. p. 488. Berry brown, 1-celled. Seeds few, angular, ex Lour.

Bush Eugenia. Shrub 6 to 10 feet.

191 E. AXILLA'RIS; racemes axillary, exceeding the pendulous petioles, covered with adpressed pubescence; peduncles bibracteolate at the apex, puberulous; leaves lanceolate, bluntly acuminated, glabrous, dotless; tops of branches and petioles beset with small down, the rest of the plant glabrous. ♄. S. Native of Mexico, in woods near Jalapa. My'rtus axillàris, Moc. et Sesse. Flowers small.

Axillary-flowered Eugenia. Shrub.

192 E. VERRUCULÒSA (D. C. l. c.) panicle terminal, elongated; bracteas and bracteoles, as well as the lobes of the calyx, broad, short, and obtuse; fruit large, spherical, covered with dotted warts, crowned by the spreading lobes of the calyx; leaves elliptic, attenuated at the base, acuminated at the apex, stiff, opaque, shining above, almost veinless, quite glabrous on both surfaces, as well as on the branchlets. ♄. S. Native of Brazil, at the river Tapura. My'rtus verruculòsa, Mart. herb. Leaves 3-4 inches long and 15 lines broad. Petioles 2 lines long. Fruit 7 lines in diameter. Seed one, pseudo-monocotyledonous.

Warted-fruited Eugenia. Shrub or tree.

193 E. TABA'SCO; cymes nearly sessile, lateral; leaves elliptic-lanceolate, acute at the base, and obtuse at the apex, full of pellucid dots; berry globose; limb of calyx bluntly 4-lobed, having the lobes conniving; fruit 1-celled and 1-seeded from abortion; embryo spirally convolute; branches tetragonally winged. ♄. S. Native of Mexico, in hot regions. My'rtus Tabásco, Moc. et Sesse, ex Cham. et Schlecht. Linnæa. 5. p. 559. My'rtus Piménta and Pimenta de Tabasco of the Mexicans. The seeds are used as a condiment.

Tabasco Pimenta. Tree.

194 E. MICROCA'RPA (Cham. et Schlecht. in Linnæa. 5. p. 560.) glabrous; branches dichotomous; leaves on short petioles, acute at the base, and drawn out into a blunt acumen at the apex, shining above, and paler beneath, full of pellucid dots; berries glomerate at the tops of the branches, on short bibracteolate peduncles, crowned by 4 very blunt segments; flesh spongy, thick; cotyledons conferruminated; seed one. ♄. S. Native of Mexico, in woods near Jalapa. Flowers not seen.

Small-fruited Eugenia. Tree.

195 E. MARGINA'TA (Pers. ench. 2. p. 17.) peduncles axillary and almost terminal, trifid, trichotomous; tube of calyx globose, with 4 very blunt lobes; leaves oval, acutish, besprinkled with a very few pellucid and red glands, shining above, beset with impressed dots beneath, but with elevated ones above, glabrous on both surfaces in the adult state; branches terete, clothed with rusty villi at the tops. ♄. S. Native of St. Domingo. Perhaps the same as My'rtus marginàta, Spreng. syst. 2. p. 438.

Marginated-leaved Eugenia. Shrub or tree.

196 E. PIME'NTA (D. C. prod. 3. p. 85.) peduncles axillary and terminal, trichotomously panicled; flowers 4-cleft, those in the forks almost sessile, the rest panicled; leaves oblong or oval, full of pellucid dots, rather opaque, glabrous; branches terete; branchlets compressed, pubescent when young, as well as the pedicels. ♄. S. Native of the Caribbee Islands, Jamaica, &c., and now cultivated in the East Indies. The upper leaves are rarely somewhat alternate, the rest opposite. Bracteoles 2 under each flower, falling off very late. Berry globose, 1-seeded. Embryo roundish. Cotyledons conferruminated, not distinct. Bayberry tree, Hugh. barb. p. 145. t. 10. good. ex Sims, bot. mag. 1236. My'rtus Piménta, Lin. spec. 676. Swartz, obs. p. 202. Soon after the *pimenta* trees have blossomed the berries become fit for gathering, without being suffered to ripen, as when ripe they are moist and glutinous, and therefore difficult to cure, and when dried become black and tasteless. The berries are dried by spreading them on a terrace exposed to the sun for about 7 days, during which time they gradually lose their green colour, and become of a reddish brown. The smell of them resembles a mixture of cinnamon, cloves, and nutmegs; their taste approaches to that of a mixture of the whole three; whence the tree has received the name of all-spice. Newmann ascertained that its flavour resides entirely in a volatile oil heavier than water, and its pungency is a resin or a substance soluble in alcohol, and insoluble in water. Pimenta is a warm aromatic stimulant, and is much used as a condiment in dressing food. As a medicine it may be advantageously substituted for the more costly spices. An oil is obtained by distillation, which is said to be nearly equal to oil of cloves, and is sometimes substituted for it.

Var. α, longifòlia (D.C. l. c.) leaves oblong-lanceolate, bluntly acuminated.—Pluk. t. 155. f. 4.

Var. β, ovalifòlia (D. C. l. c.) leaves oval, shorter, obtuse.—Sloane, hist. jam. 2. t. 191. f. 1. Perhaps referrible to My'rcia pimentoides, and probably the My'rtus aromática of Poir. dict. 4. p. 410. and is therefore perhaps a species of My'rcia.

Pimenta, or Jamaica All-spice, or Jamaica Pepper. Fl. May, July. Clt. 1728. Tree 20 to 30 feet.

197 E. CHRYSOBALANOÌDES (D. C. l. c.) peduncles terminal, exceeding the leaves; pedicels opposite, 1-flowered; bracteas and bracteoles ovate, concave, dotted; flowers 4-cleft; leaves

broad, oval, obtuse or acuminated, full of pellucid dots, and are as well as the branches glabrous. ♄. S. Native of Guadaloupe. Branches terete. Petioles 5 lines long. Leaves 2-3 inches long and 1 or 2 inches broad. Pedicels rather downy. Calyx large, dotted. Fruit and seeds unknown.

Cocoa-plum-like Eugenia. Shrub 6 to 10 feet.

198 E.? NÍTENS (D. C. l. c.) peduncles terminal, somewhat trichotomous at the apex; leaves elliptic-lanceolate, acute at the base, and bluntish at the apex, shining above, and full of pellucid dots beneath, and are glabrous as well as the branchlets. ♄. S. Native of the Mauritius. My'rtus nítens, Poir. suppl. 4. p. 51. Fruit 3-4-celled. Flowers 4-cleft, ex herb. mus. par. Seeds unknown.

Shining Eugenia. Shrub or tree.

199 E.? BERTERIA'NA (Spreng. syst. 2. p. 487.) panicle terminal; flowers crowded, 4-cleft; leaves oblong-lanceolate, acuminated, shining above, and quite glabrous beneath. ♄. S. Native of South America, at the river Magdalena. My'rtus Berteriàna, Spreng. syst. 2. p. 487. The rest unknown.

Bertero's Eugenia. Shrub or tree.

200 E. PYRIFÒLIA (Desv. in Ham. prod. fl. ind. occ. p. 44.) panicle brachiate, terminal, many-flowered; rachis pubescent; leaves on short petioles, ovate, acuminated, nerved. ♄. S. Native of Guiana. The rest unknown.

Pear-leaved Eugenia. Shrub or tree.

† *Species of Eugènia not sufficiently known.*

201 E. ACUMINA'TA (Link, enum. 2. p. 28.) ♄. S. Native country, flowers, and fruit unknown. Leaves acuminated.

Acuminated-leaved Eugenia. Shrub or tree.

202 E.? UMBELLA'TA (Spreng. neu. entd. 2. p. 169.) pedicels 1 flowered, umbellate; leaves oblong, obtuse, opaque. ♄. S. Native of Brazil. The rest unknown. A very doubtful species.

Umbellate-flowered Eugenia. Shrub or tree.

203 E. RAMIFLÒRA (Desv. in Ham. prod. fl. ind. occ. p. 43.) pedicels short, clothed with rufous tomentum; calyx clothed with hoary tomentum; branches divaricate, glabrous; leaves on short petioles, oblong-elliptic, acuminated, shining above, and rather tomentose beneath. ♄. S. Native of Guiana. Flowers 4-cleft. The rest unknown.

Branch-flowered Eugenia. Tree 15 to 20 feet.

204 E. TRUNCIFLÒRA; glabrous; leaves nearly sessile, oblong, acuminated, acute, obtuse at the base, rather coriaceous, full of pellucid dots: flowers rising in fascicles from the trunk, 4-cleft, icosandrous; ovarium 2-celled; cells about 15-ovulate; ovula fixed to the middle of the dissepiment. ♄. S. Native of Mexico, in shady woods between Mesachica and Papantla. Leaves 5-7 inches long and 2 or 2½ broad. Petioles thick, a line long. Peduncles 3-9 lines long, furnished with 2 scale-formed bracteas under each flower. Flower-bud globose, size of a pea. Flowers white, more than half an inch in diameter when expanded. My'rtus? truncifiòra, Cham. et Schlecht. in Linnæa. 5. p. 561.

Bitten-flowered Eugenia. Shrub.

N. B. There are numerous names of species in Roxburgh's Hortus Bengalensis, but all without descriptions.

Eugènia villòsa, Poir. suppl. 3. p. 124. or My'rtus villòsa, Spreng. syst. 2. p. 487. is obviously the Monímia rotundifòlia, Pet. Th. or Ambòra tomentòsa, Bory; a plant belonging to *Urtíceæ*.

Eugènia violàcea, Lam. dict. 3. p. 200. is evidently a Rubiaceous plant, and perhaps an *Exòra* mixed with the leaves of a species of *Syzygium* in M. Jussieu's herbarium.

Cult. For culture and propagation see *Jambòsa*, p. 869.

XXXIV. JAMBO'SA (altered from *Schambu*, the Malay name of one of the species). Rumph. amb. 1. p. 121.—D. C. prod. 3. p. 286.—Jámbos, Adans. fam. 2. p. 88.—Eugènia species, Swartz, Kunth.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx turbinate (f. 124. *a.*), attenuated at the base, having the throat drawn out beyond the ovarium, dilated and obovate; limb 4-cleft; lobes roundish. Petals 4, inserted in the throat of the calyx, broad, concave, obtuse. Stamens very numerous (f. 124. *b.*), longer than the petals, free, straight. Style filiform; stigma simple, acutish. Ovarium many-celled, many-ovulate. Fruit 1-2-seeded, fleshy from the large baccate calyx, umbilicate at the apex. Seed angular. Cotyledons fleshy, thick, with conferruminated margins. Radicle almost cylindrical, hidden between the cotyledons.—Indian trees, with opposite leaves, standing on short petioles, and full of pellucid dots. Cymes lateral and terminal, few-flowered, simple, much shorter than the leaves; pedicels lateral, opposite, and one terminal. Flowers large, bractless, articulated on the tops of the pedicels. Fruit large, eatable. The greater part of the species being cultivated for the sake of their fruit are therefore difficult to extricate from confusion.

1 J. VULGA'RIS (D. C. prod. 3. p. 286.) racemes cymose, terminal; leaves narrow-lanceolate, attenuated at the base, acuminated at the apex. ♄. S. Native of the East Indies, and now cultivated in all the regions within the tropics. Malácca-Schambu, Rheed. mal. 1. t. 17. Eugènia Jámbos, Lin. spec. p. 672. Sims, bot. mag. 1696. E. Jámboo, Roxb. hort. beng. p. 38.—Delaun. herb. amat. t. 77. Thouin, ann. mus. 1. p. 35. My'rtus Jámbos, H. B. et Kunth, nov. gen. amer. 6. p. 138. Leaves 6-7 inches long and 1 to 1½ inch broad. Fruit ovate-globose. Flowers white. The *Jamsorade* or *Rose-apple* is a branching tree, about 20 feet high. The fruit is pear-shaped, about the size of a medlar, white, red, or rose-coloured, and ripening from September to December. There are several varieties differing in the size and colour of the fruit. It is not so much esteemed as the Malay-apple: it is however nevertheless excellent, resembling in appearance and flavour a Brussels apricot. To grow the fruit in this country, it requires a hot and moist atmosphere.

Common Jamsorade or Rose-apple. Fl. Feb. July. Clt. 1768. Tree 20 to 30 feet.

2 J. SAMARANGÉNSIS (D. C. l. c.) racemes loose, terminal or axillary, shorter than the leaves; branches usually 3-flowered; leaves elliptic-oblong, bluntish, rounded at the base, or nearly cordate, glabrous. ♄. S. Native of Java. My'rtus Samarangénsis, Blum. bijdr. p. 1084. Flowers rose-coloured or whitish. Leaves acutish, greyish green beneath. Perhaps sufficiently distinct from the following.

Samarang Rose-apple. Tree 20 to 25 feet.

3 J. VENÒSA (D. C. l. c.) racemes simple, terminal, or sub-corymbose, few-flowered; leaves elliptic, coriaceous, opaque, glabrous on both surfaces, and reticulately veined; branches angular. ♄. S. Native of Madagascar and of the Mauritius. Eugènia venòsa, Lam. dict. 3. p. 200. My'rtus venòsa, Spreng. syst. 2. p. 485. Leaves on short petioles, 4 inches long and 2 or 2½ broad. Fruit said to be 1-seeded.

Veiny-leaved Rose-apple. Tree 20 feet.

4 J. MACROPHY'LLA (D. C. l. c.) cymes lateral, fascicled; leaves ovate-lanceolate, obtuse at the base, acuminated at the apex. ♄. S. Native of the East Indies. Eugènia macrophy'lla, Lam. dict. 3. p. 139. Eugènia álba, Roxb. hort. beng. p. 39. Leaves 1 foot and more long, and 5 inches broad. Peduncles 5-flowered, 3 inches long. Flowers white? Perhaps J. sylvéstris álba, Rumph. amb. 1. p. 127. t. 39.

Long-leaved Rose-apple. Clt. 1820. Tree 20 to 30 feet.

5 J. PURPURA'SCENS (D. C. l. c.) cymes lateral, in fascicles;

leaves elliptic, hardly acute at the base and apex. ♄. S. Native of the Island of Trinidad, (Sieb. trin. no. 148.) where it is probably cultivated. Flowers purple. Eugènia Malaccénsis, Smith, exot. bot. t. 61. Andr. bot. rep. 458. but not of Lin. Eugènia purpùrea, Roxb. hort. beng. p. 37. Eugen. pseudo-Malaccénsis, Hort. par.

Purplish-flowered Rose-apple. Fl. May, Aug. Clt. 1768. Tree 20 to 30 feet.

6 J. MALACCE'NSIS (D. C. l. c.) cymes lateral, short; leaves ovate-lanceolate, attenuated at both ends. ♄. S. Native of the East Indies. Nati-Schambu, Rheed. mal. 1. t. 18. Eugènia Malaccénsis, Lin. spec. p. 672. Lam. dict. 3. p. 196. Cor. ann. mus. 9. p. 292. f. 2. My'rtus Malaccénsis, Spreng. syst. 2. p. 484. Leaves a foot long, shining. Fruit pear-shaped. Jambòsa nigra 1. t. 38. f. 1. Flowers white. This tree resembles the jamsorade, but has broader leaves. The fruit is ovate, an inch and a half in diameter, fleshy, and sweet-scented like the rose, agreeable to the taste, smell, and sight, and esteemed wholesome. It is common in most of the islands in the South Sea.

Malay Apple. Fl. May, Aug. Clt. 1768. Tree 20 to 30 ft.

7 J. AMPLEXICAU'LIS (D. C. prod. 3. p. 287.) racemes few-flowered, terminal; lower flowers axillary, solitary; leaves membranous, oblong-lanceolate, obtuse, glabrous, undulated, rather cordate at the base. ♄. S. Native of Sumatra. Eugènia amplexicaùlis, Roxb. hort. beng. p. 37. Lindl. bot. reg. t. 1033. Fruit very fine purple, size of a small apple. Calyx fleshy, bluntly 4-cleft.

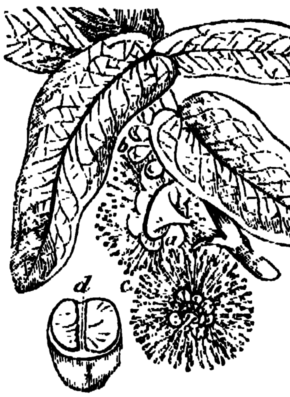
Stem-clasping-leaved Rose-apple. Fl. May, July. Clt. 1823. Tree 20 to 30 feet.

8 J. AUSTRA'LIS (D. C. l. c.) axillary peduncles 3-flowered, solitary, terminal ones rather panicled; leaves elliptic-lanceolate, acute. ♄. G. Native of New Holland. Eugènia myrtifòlia, Sims, bot. mag. t. 2230. Ker. bot. reg. 627. Lodd. bot. cab. 525. Eugènia austràlis, Wendl. ex Link, enum. hort. berl. 2. p. 28. Coll. hort. rip. append. 1. p. 123. t. 8. My'rtus austràlis, Spreng. syst. 2. p. 482. Flowers white.

Southern Rose-apple. Fl. April, July. Clt. 1800. Tree 20 ft.

9 J. FORMÒSA; leaves elliptic-oblong, rather acuminated, sessile, cordate, stem-clasping; racemes axillary, rising after the leaves have fallen, sessile, short: pedicels clavate-elongated; flowers smooth; stamens very long; berry globose, pendulous. ♄. S. Native of the East Indies, at Moalmyne, and at the bottoms of the rocks on the banks of the Athan, in Martaban. Eugènia formòsa, Wall. pl. rar. asiat. 2. p. 6. t. 108. Calyx and petals reddish; filaments white. (f. 124.)

FIG. 124.



Beautiful Rose-apple. Tree 30 feet.

10 J. LAURIFÒLIA (D. C. l. c.) cymes axillary, opposite, 3-5-flowered; lower pedicels opposite, elongated; flowers 3, terminal, sessile on the tops of the peduncles; leaves elliptic, bluntish at both ends. ♄. S. Native of the East Indies. Eugènia laurifòlia, Roxb. hort. beng. p. 92. Eugen. Javánica, Lam. dict. 3. p. 200. exclusive of the synonymes of Rumph. My'rtus Javánica, Spreng. syst. 2. p. 484. but not of Blume. Flowers white.

Laurel-leaved Rose-apple. Clt. 1823. Tree 20 to 30 feet.

11 J. HYPERICIFÓLIA (D. C. l. c.) pedicels terminal, solitary, 1-flowered, shorter than the leaves; leaves sessile, oblong-lanceolate, acuminated, rather cordate at the base, glabrous. ♄. S. Native of Java, on Mount Salak. My'rtus hypericifòlia, Blum. bijdr. p. 1082. Calyx 4-cleft, rather attenuated at the base.

St. John's-wort-leaved Rose-apple. Shrub.

12 J.? OWARIE'NSIS (D. C. l. c.) cymes panicled, terminal; branchlets opposite, 3-flowered at the apex; calyxes turbinate, shortly and bluntly 4-lobed; leaves oval, acuminated, coriaceous, glabrous, rusty beneath. ♄. S. Native of the west coast of Africa, in the kingdom of Waree. Eugènia Owariénsis, Beauv. fl. d'ow. 2. t. 70. The veins of the leaves are parallel in the figure and rather prominent. Leaves 3 inches long and 1½ broad. Stamens very numerous, exserted. Branches furnished with supra-axillary, opposite tubercles. Fruit unknown, but in the form of the calyx this plant agrees with *Jambòsa*.

Waree Rose-apple. Tree 20 feet.

13 J.? OBTUSÍSSIMA (D. C. prod. 3. p. 287.) panicles corymbose, terminal, or lateral; branches 3-flowered; calyx 4-cleft, attenuated at the base; leaves almost sessile, oblong, obtuse, somewhat cordate at the base, coriaceous, glabrous. ♄. S. Native of Java. My'rtus obtusíssima, Blum. bijdr. p. 1085. Compare it with *Eugènia androsæmoìdes*, ex Blume.

Very obtuse-leaved Rose-apple. Tree 20 to 30 feet.

14 J. DENSIFLÒRA (D. C. l. c.) corymbs terminal, coarctate; pedicels 3-flowered; calyx 4-cleft, very much attenuated at the base; leaves oblong-lanceolate, coriaceous, glabrous, acuminated at both ends. ♄. S. Native by the sea-side, in the island of Nusa-Kambanga, in the East Indies, where it is called by the inhabitants *Jambon*. Eugènia densiflòra, Blum. bijdr. p. 1087.

Dense-flowered Rose-apple. Tree 20 feet.

15 J. GLABRA'TA (D. C. l. c.) peduncles filiform, 1-3-flowered, glabrous, shorter than the leaves; ovarium clavate; calyx 4-cleft; leaves oblong-lanceolate, bluntly acuminated, finely veined, quite glabrous; calyx attenuated at the base. ♄. S. Native of Java, on the mountains. My'rtus glabràta, Blum. bijdr. p. 1088. but not of Swartz.

Smooth Rose-apple. Tree.

16 J. LINEA'TA (D. C. l. c.) corymbs terminal or axillary, compound; calyx 4-cleft; ovarium elongated; leaves broad-lanceolate, bluntly acuminated, glabrous, with fine parallel veins, shining. ♄. S. Native of Java, in mountain woods, where it is called *Kikangar*. My'rtus lineàta, Blum. bijdr. p. 1087. but not of Swartz.

Lined-leaved Rose-apple. Tree 20 feet.

17 J. A'LBA; racemes terminal and axillary; the terminal ones forming a panicle; peduncles 3-5-flowered; leaves very broad, elliptic, cordate at the base, strongly veined; petioles very short. ♄. S. Native of the East Indies. Calycine lobes broad, short, and rounded. Eugènia álba, Roxb. hort. beng. p. 37.

White Rose-apple. Tree.

18 J.? CAULIFLÒRA (D. C. l. c.) panicles lateral; flowers in nearly sessile glomerules; calyx 4-cleft, attenuated at the base; leaves sessile, oblong, bluntly acuminated, rather cordate at the base, coriaceous, glabrous, and shining. ♄. S. Native of Java, at the foot of Mount Burangrang, where it is called *Kupa*. My'rtus caulifiòra, Blum. bijdr. p. 1086. but not of Mart.

Stem-flowered Rose-apple. Tree 20 to 30 feet.

19 J. A'QUEA (Rumph. amb. 1. p. 126. t. 30. f. 2.) panicles axillary and terminal; leaves elliptic-acuminated, auricled at the base, on very short petioles; stigma simple. ♄. S. Native of the Moluccas. Eugènia àquea, Roxb. hort. beng. p. 37. Fruit torose, depressed.

Watery Rose-apple. Clt. 1820. Tree 20 to 30 feet.

20 J.? DOME'STICA (Rumph. amb. 1. p. 121. t. 37.) racemes lateral, short; leaves ovate, acute; fruit obovate. ♄. S. Native of the Moluccas.

Domestic Rose-apple. Tree.

21 J. **Hardwíckia**; leaves sessile, cordate at the base, elliptic, obtuse; corymbs terminal; peduncles usually 3-flowered; flowers sessile on the peduncles; calycine segments roundish; stamens exserted. ♄. S. Native of the Mauritius. Perhaps a species of *Jossínia* (v. s. in herb. Lamb.).

Hardwick's Rose-apple. Tree.

22 J. rotundifòlia; corymbs terminal; leaves roundish, coriaceous, with revolute margins, reticulately veined, glabrous. ♄. S. Native of the Isle of France. Perhaps a species of *Jossínia* (v. s. in herb. Lamb.).

Round-leaved Rose-apple. Tree.

The *Eugènia oblàta*, *E. lanceæfòlia*, and *E. lanceolària* of Roxb. hort. beng. p. 37. are probably referrible to this genus, but they have not yet been described.

Cult. A genus of fine trees, with large foliage, beautiful flowers, and eatable fruit. They thrive well in a mixture of sand, loam, and peat; and flower freely when the plants are of good size. Ripened cuttings strike root readily in sand, under a hand-glass.

Tribe IV.

BARRINGTONIEÆ (plants agreeing with the genus *Barringtònia* in important characters). D. C. dict. class. vol. 11. not. 1826. prod. 3. p. 288. A genus of *Lecythídeæ*, Rich. et Poit. Lobes of calyx 4-6. Petals 4-6. Stamens innumerable, equal, disposed in many series; filaments monadelphous a short way at the base. Fruit baccate or dry, valveless, many-celled. Cotyledons large and fleshy.—Trees. Leaves dotless, alternate, or nearly opposite, or in crowded whorls, quite entire or serrated. Flowers in racemes or panicles.

XXXV. BARRINGTO'NIA (dedicated to the Honourable Daines Barrington, F.R.S. A.S. &c. an active Fellow of the Society of Antiquaries, and author of several papers in their Transactions). Forst. gen. no. 38. D. C. prod. 3. p. 288. Butónica, Lam. dict. 1. p. 515. Juss. gen. p. 326.—Commersònia, Sonn. voy. guin. t. 8, 9. Huttum, Adans. fam. 2. p. 88. —Mitrària, Gmel. syst. p. 799. but not of Cav.

Lin. syst. *Monadélphia, Polyándria.* Tube of calyx ovate; limb 2, rarely 3-parted; lobes oval, obtuse, concave, permanent. Petals 4, large, coriaceous. Stamens numerous, in many series; filaments filiform, long, free, but joined together into a short ring at the base; anthers roundish. Style filiform, length of stamens; stigma simple. Urceolus rising from the top of the ovarium, and sheathing the base of the style. Ovarium 4-celled; cells 2-ovulate. Berry large, ventricose at the base, pyramidal and tetragonal upwards, crowned by the limb of the calyx, 1-celled when mature; cell obversely pear-shaped, fibrous, almost putamineous. Seed ovate-globose, pendulous, attenuated upwards. Embryo exalbuminous (Blume), elliptic-globose, having its radicle superior, and confused with the cotyledons, which are conferruminated, and the embryo is therefore pseudo-monocotyledonous.—Large trees. Leaves crowded, opposite, or in whorls, dotless, obovate. Flowers large, disposed in a terminal thyrse; pedicels furnished with 1 bractea each.

1 B. speciòsa (Lin. fil. suppl. p. 312.) flowers disposed in an erect thyrse; leaves shining, cuneate-oblong, obtuse, quite entire; fruit acutely tetragonal, pyramidal. ♄. S. Native of the south of China, Java, Sumatra, the Moluccas, and of the islands in the Pacific Ocean, at the mouths of rivers by the sea-side. Blum. bijdr. p. 1096. Gaud. in Freyc. voy. part. bot. p. 483. Butónica, Rumph. amb. 3. p. 114. B. Butónica, Forst. gen. t. 38. Mammèa Americàna, Lin. spec. p. 737. Commersònia, Sonn. voy. guin. 1. p. 14. t. 8. and t. 9. Mitrària Commersònia, Gmel. l. c. Butónica speciòsa, Lam. dict. 1. p. 521. Flowers purple and white, large and handsome. The drupe is reddish brown; the seeds of which, mixed with bait, inebriates fish in the same manner as *Cócculus Indicus.*

Shewy Barringtonia. Clt. 1785. Tree 30 to 40 feet.

2 B. racemòsa (Blum. in litt. ex D. C. prod. 3. p. 288.) racemes pendulous, very long; leaves cuneate-oblong, acuminated, serrulated; fruit bluntly tetragonal, pyramidal. ♄. S. Native of Malabar, Moluccas, and Marianne Island. in humid woods. Gaud. in Freyc. voy. part. bot. p. 483. t. 107. Samstravadi, Rheed. mal. 4. t. 6. Eugènia racemòsa, Lin. spec. p. 673. Lam. dict. 3. p. 197.

Racemose-flowered Barringtonia. Clt. 1822. Tree 30 to 40 ft.

Cult. Most splendid trees, with large, shewy foliage and flowers, but difficult to cultivate. They require to be kept moist and warm, and the house in which they are grown should never be allowed to fall below 60° of Fahrenheit. A mixture of sand, loam, and peat is a good soil for them. Cuttings, taken off at a joint when the wood is ripe, planted in sand, with a hand-glass over them, root readily. The cuttings should not be stripped of any of their leaves.

XXXVI. STRAVA'DIUM (*Tsjeria Samstravadi* is the Malabar name of one of the species). Juss. gen. p. 326. D. C. prod. 3. p. 289.– Stravàdia, Pers. ench. 2. p. 30. Meteòrus, Lour. coch - Maníchea, Sonn. voy. guin. p. 139. tt. 92, 93. ex Juss.

Lin. syst. *Monadélphia, Polyándria.* All as in *Barringtònia*, but differs in the limb of the calyx being 4-parted. Ovarium semi-bilocular; cells biovulate. Fruit oblong, tetragonal. Perhaps only a section of *Barringtònia*, according to Gærtn. and Blume.

1 S. a'lbum (D. C. prod. 3. p. 289.) leaves cuneate-oblong, acuminated, obsoletely serrulated; racemes very long, pendulous; drupe ovate. ♄. S. Native of the Moluccas, in woods on the sea-shore. Rumph. amb. 3. p. 116. Stravàdia álba, Pers. Flowers white. Perhaps sufficiently distinct from *Barringtònia racemòsa.*

White-flowered Stravadium. Tree 20 to 30 feet.

2 S. ru'brum (D. C. l. c.) leaves cuneate-oblong, acuminated, obsoletely serrulated; racemes very long, pendulous; drupe acutely 4-angled. ♄. S. Native of the Moluccas and Malabar, in bogs and watery places.—Rumph. amb. 3. t. 115.- -Rheed. mal. 4. t. 7. Eugènia acutángula, Lin. spec. p. 673. Barringtònia acutángula, Gærtn. fruct. p. 97. t. 111. Stravàdia rùbra, Pers. Flowers red.

Red-flowered Stravadium. Clt. 1822. Tree 20 to 30 feet.

3 S. coccíneum (D. C. l. c.) leaves ovate-oblong, subserrated; racemes very long, pendulous; drupe bluntly octagonal. ♄. S. Native of Cochin-china, in woods. Meteòrus coccíneus, Lour. coch. p. 410. Flowers scarlet. Fruit brown. Petals concrete, with the tube of the stamens.

Scarlet-flowered Stravadium. Tree 30 to 40 feet.

4 S. spica'tum (Blum. in litt. ex D. C. prod. 3. p. 289.) leaves cuneate-oblong, acute, serrated; spikes filiform, pendulous. ♄. S. Native of Java, in the province of Bantam, in the lower woods. Barringtònia spicàta, Blum. bijdr. p. 1097. Calyx 4-cleft. The rest unknown.

Spike-flowered Stravadium. Tree.

5 S. exce'lsum (Blum. in litt. D. C. prod. 3. p. 289.) leaves oblong, attenuated at both ends, finely serrulated; racemes compound, terminal; drupe oblong, tetragonal. ♄. S. Native of the Island of Nusa-Kambanga, in woods on the sea-shore. Barringtònia excélsa, Blum. bijdr. p. 1097. Tree 80 feet high. Calyx 4-cleft. The rest unknown.

Tall Stravadium. Tree 80 feet.

Cult. For culture and propagation see *Barringtònia.*

XXXVII. GUSTA'VIA (dedicated to Gustavus III. king of

Sweden, and patron of Linnæus, and who presented a large collection of Indian plants to him). Lin. amœn. 8. (1775.) p. 266. Lin. fil. suppl. 51. Poit. mem. mus. 13. p. 156. D. C. prod. 3. p. 289.—Pirigàra, Aubl. guian. (1775.) 1. p. 487. H. B. et Kunth, nov. gen. amer. 7. p. 261.—Spallanzània, Neck. elem. (1790.) no. 733.

LIN. SYST. *Monadélphia, Polyándria.* Tube of calyx turbinate (f. 125. *a.*); limb entire, or 4-6-8-lobed. Petals 4-6-8 (f. 125. *c.*), ovate, nearly equal. Stamens numerous, monadelphous at the base, and somewhat adnate to the claws of the petals. Ovarium 4-6-celled; cells many-seeded. Style short. Stigma obtuse. Capsule ovate, or nearly globose, 5-6-celled, coriaceous, valveless, umbilicate from the vestiges of the calyx. Seeds few in each cell, ovate, clothed with coriaceous membranes, suspended by long plicate funicles, fixed to the central column. Embryo fleshy. Cotyledons 2, large, nearly equal, convex on the outside, and flat inside. Radicle obtuse, hardly prominent.—Trees. Leaves alternate, large, dotless, serrated, or quite entire, glabrous. Racemes terminal, few-flowered. Flowers bibracteate, white and shewy.

1 G. AUGU'STA (Lin. amœn. acad. 8. p. 266. t. 5.) flowers of 8 petals; calyx entire, glabrous; leaves oblong-lanceolate, acuminated, much narrowed at the base, membranous, remotely and sharply toothed. ♄. S. Native of Surinam, Maranham; and of New Granada, near Turbaco, where it is called *Membrilo* and *Baco*, ex H. B. et Kunth. Pirigàra supérba, H. B. et Kunth, nov. gen. amer. 7. p. 261. Fruit unknown. Petals white. Stamens yellow. The flowers smell sweet, but the wood is extremely fetid. In Surinam it is used for hooks.

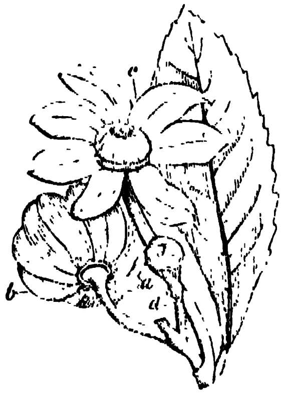
August Gustavia. Clt. 1794. Shrub 5 to 10 feet.

2 G. SPECIÒSA (D. C. prod. 3. p. 289.) flowers 6-petalled; calyx nearly entire, and are as well as the pedicels and ovaria tomentose; leaves oblong-lanceolate, acuminated, quite entire, narrowed at the base, coriaceous. ♄. S. Native of New Granada at Mariquita, where it is called *Chupa.* Pirigàra speciòsa, H. B. et Kunth, nov. gen. amer. 7. p. 200. By eating the small fruit of this tree, the body becomes yellow, and after it remains 24 or 48 hours, nothing can erase the colour, according to Humb. and Bonpl.

Showy Gustavia. Tree.

3 G. URCEOLA'TA (Poit. mem. mus. 13. p. 156. t. 5.) flowers 6-7-petalled; calyx glabrous, with an entire margin; leaves oblong-lanceolate, obtuse, or acutish, membranous, remotely subserrated on the margin. ♄. S. Native of French Guiana, where it is called *Bois puant*, because the wood becomes fetid after exposure to the air. Petals oval, obtuse, an inch long, white, rather rose-coloured on the outside. Fruit wingless. Wood fetid. (f. 125.)

FIG. 125.



Urceolate-calyxed Gustavia. Tree.

4 G. PTEROCA'RPA (Poit. l. c. p. 158. t. 6.) flowers 6-petalled; calycine lobes 6, permanent, girding the fruit; leaves oval-oblong, acuminated, rather coriaceous, quite entire, or hardly denticulated. ♄. S. Native of Guiana, at La Maza and Roura. Smaller than the first. Fruit depressed, girded by a circular wing or margin. In the specimens of Perrotett the leaves are quite entire, but in the figure of Poit, they are somewhat denticulated.

Wing-fruited Gustavia. Tree 10 to 20 feet.

5 G. FASTUÒSA (Willd. spec. 3. p. 847.) flowers 6-petalled; lobes of calyx 6, linear, thick, acute, permanent; leaves obovate, acuminated, rather repandly serrulated. ♄. S. Native of Guiana, in woods about Sinemari, where it is called *Pirigara-mepo.* Pirigàra hexapétala, Aubl. guian. 1. p. 490. t. 193. G. hexapétala, Smith, in Rees' cycl. no. 2. Leaves obovate, acuminated. Bracteas oblong, acute. Lobes of calyx narrow, acute, fleshy. Stigma tetragonal. Capsule roundish, rather cinereous, 4-celled, crowned by the truncate lobes of the calyx. Funicles thick. Perhaps the same as the first species. Petals white. Stamens yellow.

Disdainful Gustàvia. Clt. 1823. Tree 20 feet.

6 G. BRASILIA'NA (D. C. prod. 3. p. 290.) flowers 6-petalled; lobes of calyx 6, ovate, acutish, foliaceous, flat; leaves oval-oblong, acuminated, rather repandly toothed. ♄. S. Native of Brazil, on the banks of the river Amazon, near Garupa. G. fastuòsa, Mart. herb. This plant differs from the preceding species in the leaves being oval or oval-oblong, not obovate, and in the bracteas on the peduncles being ovate-obtuse, not oblong, acute; lobes of calyx ovate. Fruit 6-ribbed, not roundish and yellow, nor cinereous.

Var. γ, minor (D. C. l. c.) flowers a little smaller; leaves a little narrower. ♄. S. Native of Para, in Brazil.

Brazilian Gustavia. Tree 20 feet.

7 G. TETRAPE'TALA (Ræusch. ex D. C. prod. 3. p. 290.) flowers 4-petalled; lobes of calyx 4, roundish, at length deciduous; leaves oblong-lanceolate, acuminated, serrated, attenuated at the base. ♄. G. Native of Cayenne, on Mount Courou. Pirigàra tetrapétala, Aubl. guian. 1. p. 489. t. 192. This is perhaps the same as *G. augústa.*

Tetrapetalous Gustavia. Tree 20 feet.

8 G. VA'LIDA (D. C. l. c.) flowers 4?-petalled; lobes of calyx 4, roundish; leaves cuneate-oblong, acutish, denticulated. ♄. S. Native of Java, in woods, and in the island of Nusa-Kambanga. Pirigàra válida, Blum. bijdr. p. 1096. Cotyledons foliaceous, according to Blume. Radicle very long, clavate, ascending.

Strong Gustavia. Tree 30 to 40 feet.

Cult. A showy genus, with large leaves and flowers. A mixture of loam, peat, and sand answers the species best; and ripened cuttings root freely, if planted in sand, with a hand-glass over them, in a moist heat.

† *Genera belonging to Myrtàceæ, but are not sufficiently known. Most of them probably belong to the Tribe Mýrteæ.*

XXXVIII. CATI'NGA (*Iva Catinga* is the Guiana name of the first species). Aubl. guian. 1. p. 511. t. 203. Juss. gen. 325. D. C. prod. 3. p. 294.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx ovate; limb 4-toothed, acute, small. Petals? Stamens numerous. Drupe or berry globose or ovate, crowned by the calycine limb, 1-celled, 1-seeded, having the bark or rind fleshy and filled with aromatic oily vesicles.—Trees, natives of Guiana, with opposite, or nearly alternate, oval, entire leaves, which are acuminated at both ends, and full of pellucid dots. This genus is not sufficiently known.

1 C. MOSCHA'TA (Aubl. l. c. t. 205. f. 1.) fruit globose. ♄. S. Native of Guiana, where it is called *Iva Catinga.* Fruit exhaling a scent like musk.

Musk Catinga. Tree 50 feet.

2 C. AROMA'TICA (Aubl. l. c. t. 203. f. 2.) fruit ovate, attenuated at both ends. ♄. S. Native of Guiana, where it is called *Goyavarana.*

Aromatic Catinga. Tree 40 feet.

Cult. For culture and propagation see *Gustàvia*, p. 870.

XXXIX. PETALOTO'MA (from πεταλον, *petalon*, a petal, and τομη, *tome*, a section; in reference to the cut petals). D. C. prod. 3. p. 294. Diatòma, Lour. coch. p. 296. but not of D. C.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx campanulate, baccate; limb 8-cleft; segments acute. Petals 6-8, with filiform claws, and roundish cut limbs. Disk fleshy, crenated. Stamens 16, inserted in the disk. Anthers roundish. Style filiform; stigma 4-5-cleft, with the lobes ovate, furrowed and spreading. Berry round, crowned, 1-seeded.—A tree, with brachiate branches. Leaves opposite, ovate, glabrous, quite entire. Racemes short, nearly terminal. Flowers copper-coloured. The affinity of this genus is doubtful, unless it agrees with *Alángium*, but differs from it in the leaves being opposite, in the stigma being 4-5-cleft; stigmas and anthers roundish.

1 P. brachia'ta (D. C. l. c.) ♄. G. Native of Cochinchina, in woods. Diatòma brachiàta, Lour. l. c.

Armed Petalotoma. Tree 10 feet.

Cult. For culture and propagation, see *Gustàvia*, p. 870.

XL. FŒTI'DIA (from *fœteo*, to stink; smell of wood). Comm. in Juss. gen. p. 325. Lam. ill. t. 419. dict. 2. p. 157. D. C. prod. 3. p. 295.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx tetragonal and hemispherical; limb 4-parted; lobes valvate in æstivation, permanent, at length reflexed. Petals wanting. Stamens numerous, disposed in many series; filaments capillary, free. Style filiform; stigma 4-cleft. Berry dry, hard, nucumentaceous, indehiscent, flat above, and bluntly tetragonal beneath, 4-celled; cells 1-2-seeded.—Tree. Leaves alternate, crowded on the branches, sessile, oval, attenuated at both ends, quite entire, obtuse, glabrous, nerved, dotless. Peduncles 1-flowered, in the axils of the upper leaves.

1 F. Mauritia'na (Lam. l. c.) ♄. G. Native of the Mauritius, where it is called *Bois puant.* F. Borbonica, Ræusch. The wood is a good substitute for walnut wood.

Mauritian Fœtidia. Clt. 1827. Tree 15 to 20 feet.

Cult. For culture and propagation see *Gustàvia*, p. 870.

XLI. COUPOU'I (*Coupoui-rana* is the name given to the tree by the Indians of Guiana). Aubl. guian. suppl. p. 16. t. 377.

Lin. syst. *Icosándria, Monogýnia.*? Tube of calyx ovate; limb permanent, 5-lobed. Petals and stamens unknown. Berry ovate, crowned by the calyx, 1-celled, 1-seeded. Seed large.—A tall tree. Leaves alternate, on long petioles, obovate, acute, cordate at the base, glabrous. Flowers unknown.

1 C. aqua'tica (Aubl. l. c.). ♄. S. Native of Guiana. Leaves 20-22 inches long, and 9 inches broad. Fruit about the form and size of an orange.

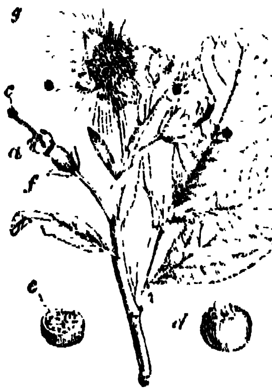
Aquatic Coupoui. Tree 60 feet.

Cult. For culture and propagation see *Gustàvia*, p. 870.

XLII. CARE'YA (in honour of the Rev. William Carey, of Serampore, a distinguished botanist). Roxb. corom. 3. p. 13. D. C. prod. 3. p. 295.

Lin. syst. *Monadélphia, Polyándria.* Tube of calyx ovate; limb 4-parted (f. 126. *b*). Petals 4, ovate, concave, spreading. Stamens numerous; filaments filiform, free, but cohering at the base with the petals into a ring; outer ones sterile (f. 126. *g.*); anthers of the fertile ones ovate and bilocular. Style filiform; stigma capitate (f. 126. *a.*), obscurely 4-toothed. Berry globose (f. 126. *d.*), covered by the fleshy calyx, and crowned by its lobes, pulpy, many-seeded, 4-celled (f. 126. *e.*) when young. Seeds oval, compressed.—East Indian herbs or trees, with alternate, feather-nerved, dotless, glabrous leaves; and large flowers with white petals, and red or yellow stamens.

FIG. 126.



1 C. herba'cea (Roxb. l. c. t. 217.) herbaceous; leaves on short petioles, obovate-cuneated, serrulated; racemes short; flowers pedunculate; outer filaments sterile, exceeding the fertile ones. ♃. S. Native of Bengal. Berry an inch in diameter. Leaves 4-8 inches long. Petals white. Stamens red. (f. 126.)

Herbaceous Careya. Fl. July, Aug. Clt. 1808. Pl. ½ to 1 ft.

2 C. arbòrea (Roxb. l. c. p. 14. t. 218.) arboreous; leaves on short petioles, obovate-cuneated, hardly serrated; spikes terminal, few-flowered; flowers sessile; outer filaments sterile, but not equal in length to the fertile ones. ♄. S. Native of the East Indies, in mountain valleys. Berries 4 inches in diameter, yellowish inside. Leaves 6-12 inches long. Petals yellowish. Stamens reddish.

Tree Careya. Clt. 1823. Shrub 6 to 10 feet.

3 C. macrosta'chya (Jack, in mal. misc. 1. no. 2. p. 47.) arboreous; leaves petiolate, obovate, rather serrated; racemes lateral, nodding, densely many-flowered; flowers sessile, in many series. ♄. S. Native of Pulo-Pinang. The inflorescence is different from those of the other species. Ovarium 4-celled: cells 4-ovulate.

Long-spiked Careya. Tree 20 feet.

4 C. sphæ'rica (Roxb. hort. beng. p. 52.). ♄. S. Native of the East Indies. This species is not described.

Spherical-fruited Careya. Shrub 3 to 4 feet.

Cult. *Careya* is a genus of fine shrubs and trees, with showy flowers. Their culture and propagation are the same as that for *Gustàvia*, p. 870.

XLIII. GLAYPHY'RIA (from γλαφυρος, *glaphyros*, elegant; in reference to the neatness and elegance of the shrubs). Jack, in Lin. trans. 14. p. 128. D. C. prod. 3. p. 295.

Lin. syst. Unknown. Limb of calyx 5-lobed. Petals 5. Berry 5-celled, many-seeded. Seeds fixed to the axis, 2 rows in each cell.—Small Indian trees, with alternate, minutely stipitate leaves, and few-flowered, axillary peduncles. Fabric of seeds unknown.

1 C. nítida (Jack, l. c.) leaves obovate. ♄. S. Native of the higher mountains of India, particularly on the Sugar-loaf Mountain, in the interior of Bencoolen, where the leaves are used by the natives in place of tea.

Shining-leaved Glaphyria. Tree 10 to 20 feet.

2 C. serícea (Jack, l. c.) leaves lanceolate, acuminated. ♄. S. Native of Pulo-Pinang, and on the west coast of Sumatra. Calyxes, peduncles, bracteas, and young leaves silky. Petals and cells of ovarium 5-6 in number.

Silky Glaphyria. Tree.

Cult. For culture and propagation see *Gustàvia*, p. 870.

XLIV. CROSSO'STYLIS (κροσσος, *krossos*, a fringe, and στυλος, *stylos*, a style; in reference to the lobes of the stigma, which are fringed). Forst. gen. t. 44. Juss. gen. p. 432.

Lin. syst. *Icosándria, Monogýnia.* Calyx quadrangular, adnate to the ovarium at the base, 4-cleft beyond the middle, permanent. Petals 4, unguiculate, alternating with the calycine lobes. Stamens about 20; filaments connate at the base into a ring, interspersed with many sterile, small hairs. Style 1, filiform. Stigma cruciately 4-lobed; lobes fimbriately trifid at the apex. Berry half superior, hemispherical, with many stripes, 1-celled, many-seeded. Seeds numerous, small, fixed to the central placenta.

1 C. BIFLÒRA (Forst. l. c.). ♄. S. Native of the Society Islands. The rest unknown.

Two-flowered Crossostylis. Tree.

Cult. For culture and propagation see *Gustàvia*, p. 870.

XLV. GRI'AS (from γραω, *grao*, to eat; fruit eatable). Lin. gen. no. 659. Swartz, obs. p. 215. Smith, in Rees' cycl. vol. 15.

LIN. SYST. *Icosándria, Monogynia.* Tube of calyx adhering to the ovarium; limb small, 4-cleft, obtuse. Petals 4, coriaceous. Stamens numerous, inserted in a square disk; filaments joined into 5 series at the base; inner ones very short: anthers kidney-shaped, small. Style wanting. Stigma cruciate, hidden by the incurved stamens. Drupe ovate, 8-furrowed, crowned by the calyx; nucleus oblong.—A tall, hardly branched tree. Leaves very long, oblong, entire, cuneated at the base, on short petioles. Flowers large, white. Peduncles short, many-flowered. This genus is said to belong to *Myrtàceæ* by Sir J. E. Smith, but it appears to be much more nearly allied to *Guttíferæ*.

1 G. CAULIFLÒRA (Lin. spec. p. 732.). ♄. S. Native of Jamaica, in subalpine, boggy places, where it is called *Anchovy pear*. Sloan. hist. 2. p. 123. t. 217. f. 1-2. leaf. Brown, jam. p. 245. Lunan. hort. jam. 1. p. 19. The leaves are 2-3 feet long. The berry is ovate and crowned by the calyx, about the size and shape of an alligator's egg, of a brownish russet colour: it is pickled and eaten like the mango, which it greatly resembles in taste. It is readily propagated by seeds, and the plants must be kept in a moist heat. To grow it for fruit, plant in a border, and train horizontally near the light.

Stem-flowered Grias or Anchovy-pear. Clt. 1768. Tree 20 to 50 feet.

Cult. This tree grows best in loamy soil; and large cuttings succeed best under a hand-glass, in heat.

ORDER CII. LECYTHII'DEÆ (plants agreeing with *Lécythis* in important characters). Rich. mss. Poit. mem. mus. 13. p. 141. (1825.) Lindl. introd. nat. syst. p. 44. Myrtàceæ, sect. Lecythídeæ, D. C. prod. 3. p. 290. Rich. in ann. des sc. 1. p. 321. (1824.)

Calyx superior, 2 or 6-leaved, or urceolate, with a divided limb (f. 127. *a.* f. 128. *a.*); valvate, or imbricate in æstivation. Corolla of 6 unequal petals, cohering at the base, with an imbricated æstivation. Stamens indefinite, epigynous, connected into a single petaloid, cucullate, unilateral body (f. 127. *l.* f. 128. *c.*). Ovarium inferior, 2-6-celled; ovula indefinite, or definite, attached to the axis; stigma simple. Fruit a woody capsule (f. 127. *i.* f. 128. *f.*), either opening with a lid or remaining inclosed. Seeds several, covered by a thick integument. Embryo without albumen, either undivided, or with 2 large, petaloid, fleshy, or leafy cotyledons, sometimes folded upon the radicle, which is next the hylum.—Large trees, with alternate, entire, or toothed leaves, with minute, deciduous stipula, and without pellucid dots. Flowers large, terminal, or lateral, solitary, or racemose. This order has been combined, by De Candolle and others, with *Myrtàceæ*, from which it differs most essentially in their alternate, often serrated leaves, without pellucid dots.

The fruit of *Couroupìta Guianénsis*, called in Guiana *Abricot sauvage*, in Cayenne is vinous and pleasant. The most gigantic tree in the ancient forests of Brazil is that called the *Jaca-pucaya*; it is the *Lécythis ollària*, the seeds of which are large and edible. Pr. trav. p. 83. The fleshy seeds of most of the species of *Lécythis* are edible, but some of them leave a bitter unpleasant after-taste in the mouth. The bark of *Lécythis ollària* is easily separable by beating the liber into a number of fine distinct layers, which divide so neatly from each other, that when separated they have the appearance of thin satiny paper. Poiteau says that he has counted as many as 110 of these coatings. The Indians cut them in pieces as wrappers for their cigars. The well-known Brazil nuts of the shops of London are the seeds of the *Bertholletia excélsa*. The lacerated parts of the flowers of *Couroupita Guianénsis* become blue upon exposure to the air.

Synopsis of the genera.

1 LE'CYTHIS. Limb of calyx 6-lobed. Staminiferous ligula bearing the anthers at the base, and the sterile filaments at the apex on the inside. Ovarium 2-6-celled, many-ovulate. Capsule opening by a lid.

2 ESCHWEILE'RA. Limb of calyx bent back and applied to the tube, and more or less adnate to it. The rest as in *Lécythis*.

3 BERTHOLLE'TIA. Limb of calyx 2-parted, deciduous. Corolla and stamens as in *Lécythis*. Ovarium 4-5-celled; cells 4 ovulate. Capsule large, opening by a lid. Seeds triangular.

4 COUROUPI'TA. Calyx and corolla as in *Lécythis*. Ovarium 6-celled. Capsule with the lid not separable.

5 COURA'TARI. Limb of calyx 6-parted. Petals 6, joined at the base. Stamineous ligula unilateral, and antheriferous inside. Fruit 3-celled, but at length 1-celled, with a convex lid, which is formed from the dilatation of the top of the central column.

I. LE'CYTHIS (λεκυθος, *lecythos*, an oil-jar; form of seed vessels). Lœfl. itin. p. 189. Lin. gen. no. 664. Lam. ill. t. 476. Poit. l. c. D. C. prod. 3. p. 290.

LIN. SYST. *Monadélphia, Polyándria.* Tube of calyx turbinate; limb 6-lobed, permanent (f. 127. *a.*). Petals 6, unequal. Staminiferous ligula (f. 127. *l.*) bearing the anthers at the base, and the sterile filaments at the apex on the inside. Ovarium 2-6-celled; cells many-ovulate. Style short. Capsule coriaceous or woody, circumcised at the apex, and therefore opening by a lid at the top (f. 127. *b.*). Seeds few or solitary in each cell ovate-oblong, fixed to the central column at the base, covered by a fleshy membrane. Embryo undivided. Cotyledons thick, closely conferruminated.—Trees nearly all glabrous. Fruit large, turbinate, or globose. Seeds edible. Numbers of the species are not well known.

* *Leaves serrated.*

1 L. OLLA'RIA (Lin. spec. p. 734.) leaves sessile, serrated, cordate-ovate; racemes terminal; fruit roundish. ♄. S. Native of Cumana, in fields, ex Lœfl. itin. p. 159.; and of Brazil, if the *Jaca-pucaya*, Marcgr. bras. p. 128. be the same. Pis. bras. p. 135. with a figure. The tree is called at Barcinoma *Ollata*. Fruit the size of a child's head, according to Marcgraff. Corolla white, with a yellow nectary. The seeds are like chestnuts, eatable either raw or roasted. The bark of the tree serves to make ink.

Ollata Cannon-ball-tree. Tree 40 to 60 feet.

2 L. MÌNOR (Jacq. amer. p. 168. t. 109.) leaves petiolate, serrated, lanceolate-oblong; racemes terminal; fruit globose. ♄. S. Native in the woods of Carthagena, especially about La Quinta. Flowers large, sweet scented, white, but with the strap of the stamens yellow. Fruit 2 inches in diameter. Seeds eatable, and with a very agreeable taste. Monkeys are said to be extremely fond of them.

Smaller Cannon-ball-tree. Clt. 1825. Tree 60 feet.

3 L. LANCEOLÀTA (Poir. dict. p. 27.) leaves petiolate, serrated, lanceolate, acuminated; racemes lateral; fruit ovate. ♄. S. Native of Brazil, whence it has been introduced to Madagascar and the Mauritius. Flowers smaller than those of the first species. Petals very blunt, nearly equal. Fruit large.

Lanceolate-leaved Cannon-ball-tree. Tree.

4 L. ELLÍPTICA (H. B. et Kunth, nov. gen. amer. 7. p. 259.) leaves petiolate, elliptic, short-acuminated, rounded at the base, dentately crenated; racemes straight; petals obtuse. ♄. S. Native of South America, on the banks of the river Magdalena, near Morales. Fruit unknown.

Elliptic-leaved Cannon-ball-tree. Tree.

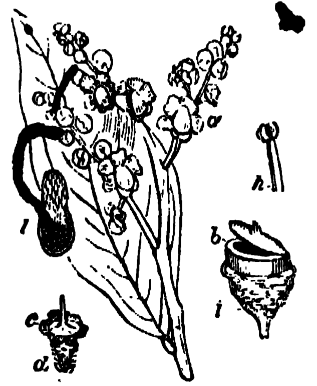
5 L. DU'BIA (H. B. et Kunth, l. c.) leaves oblong, acuminated, narrowed at the base, obsoletely toothed. ♄. S. Native on the banks of the river Magdalena. Flowers and fruit unknown.

Doubtful Cannon-ball-tree. Tr.

6 L. LONGIFÒLIA (H. B. et Kunth, l. c.) leaves petiolate, lanceolate, acuminated, acute at the base, obsoletely and remotely toothed, conduplicate. ♄. S. Native of South America, where it is called *Cocos de mono*. Flowers and fruit unknown.

Long-leaved Cannon-ball-tree. Tree.

FIG. 127.



* * *Leaves quite entire.*

7 L. GRANDIFLÒRA (Aubl. guian. 2. p. 712. tt. 283, 284, and 285.) leaves petiolate, oval, acute, quite entire, stiff; racemes axillary and terminal; pedicels thick, shorter than the largest petal; fruit ovate, nearly globose; operculum acute. ♄. S. Native of Cayenne, in woods, where it is called, as well as several other species, *Canari Macaque* and *Marmite de singe*. L. ollària, Lin. amœn. but not of his spec. pl. according to the Linnæan herbarium, ex Smith, in Rees' cycl. 20. no. 1. Leaves glabrous on both surfaces, rather velvety beneath when young. Pedicels thick. Flowers 2 inches in diameter. Petals deep red, very hard. Fruit 4-5 inches in diameter. Seeds eatable and very palatable.

Great-flowered Cannon-ball-tree. Clt. 1824. Tr. 60 to 80 ft.

8 L. CORIA'CEA (D. C. prod. 3. p. 291.) leaves on short petioles, oval, acutish, quite entire, stiff, glabrous on both surfaces; panicles axillary and terminal; pedicels slender, about the length of the flowers. ♄. S. Native of Brazil, in the province of Rio Negro. Consistence and nervation of leaves nearly as in *L. grandiflòra*, but the flowers are 3-times smaller. Fruit unknown.

Coriaceous-leaved Cannon-ball-tree. Tree.

9 L. IDATÌMON (Aubl. guian. 2. p. 721. t. 28[illegible].) leaves on short petioles, ovate-lanceolate, acuminated, quite entire; racemes axillary and terminal; pedicels slender, longer than the flowers; petals obtuse; fruit nearly ovate, depressed, 4-celled. ♄. S. Native of Guiana, in woods, at the river Sinemari, and of Brazil, in Maranham, and the province of Para. Flowers rose-coloured. Fruit an inch in diameter. The leaves in the Brazilian specimen are less intensely reticulated than in the Guiana plant. Perhaps *L. lùtea* is a variety of this species, only differing in the colour of the flowers.

Idatimon Cannon-ball-tree. Clt. 1825. Tree 60 feet.

10 L. LÓNGIPES (Poit. mem. mus. 13. p. 144. t. 2.) leaves petiolate, oblong, quite entire, abruptly acuminated; racemes terminal, loose, pendulous; fruit ovate, depressed, 2-celled. ♄. S. Native of Cayenne, at Mount Mahari. Flowers violaceous. Fruit violaceous, with a white lid, 18-24 lines in diameter.

Var. β, platycárpa (Poit. l. c.) fruit large, depressed; flowers smaller, pendulous. ♄. S. Native of Cayenne, at Savanna Baduel. Perhaps a proper species.

Long-petioled Cannon-ball-tree. Tree 20 to 30 feet.

11 L. PEDICILLA'RIS (D. C. l. c.) leaves on short petioles, oblong, gradually acuminated, quite entire; panicles terminal; pedicels slender, length of corolla. ♄. S. Native of Brazil. Intermediate between *L. lóngipes* and *L. corrugàta*, but the colour of the flowers and fruit is unknown; it however differs from the first species in the leaves being not abruptly but gradually acuminated, and in the flowers being smaller; and from the second in the pedicels being 6-times longer than the flowers; and from both in the lobes of the calyx being oval-oblong, not roundish.

Pedicelled-flowered Cannon-ball-tree. Tree.

12 L. ACUMINA'TA (D. C. l. c.) leaves on short petioles, quite entire, oval, abruptly acuminated, rather membranous; panicle elongated, sparingly branched at the base; pedicels slender, length of the corolla. ♄. S. Native of Brazil, in the province of Rio Negro. This species is allied to *L. lóngipes* and *L. pedicellàris* in the elongated pedicels, but differs from the first in the leaves being oval, not oblong, and in the racemes being erect, not pendulous, &c., and from the second in the leaves being abruptly, not gradually acuminated. Fruit unknown.

Acuminated-leaved Cannon-ball-tree. Tree.

13 L. SUBBIFLÒRA (Ruiz et Pav. fl. per. 4. t. 461.) leaves petiolate, oblong-lanceolate, quite entire, acuminated; pedicels 1-flowered, usually 2-together; petals obtuse. ♄. S. Native of Peru.

Somewhat-two-flowered Cannon-ball-tree. Tree.

14 L. ALBIFLÒRA (D. C. l. c.) leaves petiolate, oval, acute or acuminated, rather coriaceous, quite entire; panicle terminal, with its branches angular; pedicels longer than the corolla; petals rather unequal. ♄. S. Native of Brazil, in the province of Para, at the Rio Negro, in woods. Lécythis, Mart. herb. Flowers white, nearly like those of *L. Idatìmon*. Fruit unknown. Leaves less coriaceous, but much more reticulated than in *L. Idatìmon*.

White-flowered Cannon-ball-tree. Tree 60 feet.

15 L. CORRUGA'TA (Poit. mem. mus. 13. p. 145. f. 3.) leaves petiolate, oblong, acute, coriaceous, quite entire; panicle terminal, erect; flowers on very short pedicels; fruit turbinate, [illegible]lled, corrugated. ♄. S. Native of Guiana, along the river Mana. Flowers rose-coloured. Fruit an inch in diameter, girded by the calyx, deeply corrugated by transverse wr[illegible] (f. 127.)

C[illegible]ated-fruited Cannon-ball-tree. Shrub 6 to 10 feet.

16 L. ZABUCA'JO (Aubl. guian. [illegible]. p. 719. t. 288. and t. 284.) leaves petiolate, lanceolate-oblong, acuminated, quite entire; racemes terminal; pedicels rather shorter than the flowers; petals [illegible]; fruit ovate. ♄. S. Native of Guiana, in woods, where it is called by the natives *Quatelé* and *Zabucajo*. Petals

white, edged with rose-colour, nearly equal. Fruit 4 inches in diameter. Racemes nodding. Seeds eatable, and preferable to our almonds.

Zabucajo Cannon-ball-tree. Tree 50 to 60 feet.

17 L. amàra (Aubl. guian. 2. p. 716. t. 286. and t. 285. f. 1.) leaves petiolate, oblong, acuminated, quite entire, stiff; racemes axillary and terminal; pedicels rather shorter than the flowers; petals acutish; fruit ovoid, 4-celled. ♄. S. Native of Guiana, in woods. Fruit the size and form of an egg. Flowers small, yellow. Seeds bitter, but eaten by monkeys.

Bitter-seeded Cannon-ball-tree. Clt. 1825. Tree 10 to 12 ft.

18 L. parviflòra (Aubl. guian. 2. p. 717. t. 287.) leaves petiolate, oblong, acuminated, quite entire; racemes panicled, terminal; pedicels rather shorter than the flowers; petals acutish; fruit rather ovate, and somewhat 2-celled. ♄. S. Native of Guiana, on the banks of rivers. Flowers small, sulphur-coloured. Nucleus of seeds bitter. Fruit tender, not woody, 2-seeded.

Small-flowered Cannon-ball-tree. Clt. 1825. Shrub 4 to 6 ft.

19 L. ovalifòlia (D. C. l. c.) leaves petiolate, oval, obtuse at the base, acute at the apex, or rather acuminated, quite entire; racemes sub-panicled; pedicels shorter than the flowers; sepals and petals very blunt. ♄. S. Native of Brazil. Leaves rather membranous, lateral nerves distant. Petioles 3-4 lines long. Flowers the size of those of *L. Idatimon.* Fruit unknown.

Oval-leaved Cannon-ball-tree. Tree.

† *A species not sufficiently known.*

20 L. multiflòra (Smith in Rees' cycl. vol. 20. no. 8.) leaves unknown; racemes terminal, panicled; petals obtuse; calycine lobes tomentose. ♄. S. Native of Guiana. Flowers apparently yellow.

Many-flowered Cannon-ball-tree. Tree.

Cult. All the species of *Lécythis* require a strong heat. A mixture of loam and sand is the best soil for them. Ripened cuttings will root if planted in sand with a hand-glass over them, in a strong heat.

II. ESCHWEILE'RA

(evidently named after some person of the name of Eschweiler). Mart. mss. ex D. C. prod. 3. p. 293.

Lin. syst. *Monadélphia, Polyándria.* All as in *Lécythis,* but differs in the limb of the calyx being bent back upon the tube, and more or less adnate to it. Perhaps only a section of *Lécythis.*

1 E. parviflòra (Mart. mss. ex D. C. l. c.) leaves ovate, gradually acuminated, coriaceous, quite entire; lateral nerves hardly distinct, never elevated. ♄. S. Native of Brazil. Zabucàjo, Pison, bras. p. 66. with a figure. Panicle terminal. Pedicels very short. The fruit agrees with that of *Lécythis corrugàta,* but is much more turbinate at the base, and the limb of the calyx is 6-lobed and folded back upon the tube.

Small-flowered Eschweilera. Tree 40 feet.

2 E. grandiflòra (Mart. herb. ex D. C. l. c.) leaves oblong-lanceolate, obtuse at the base, acuminated at the apex, stiffish, with quite entire margins; lateral nerves distinct, not elevated beneath. ♄. S. Native of Brazil, in the province of Para. Leaves almost like those of *Lécythis Zabucàjo,* Aubl. t. 288. but they are less reticulated. Fruit globose, with a very blunt lid.

Great-flowered Eschweilera. Tree.

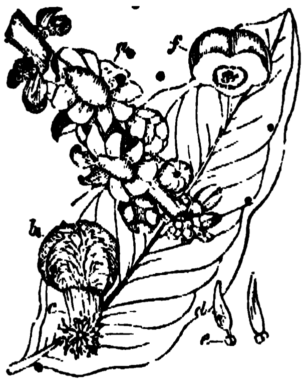
Cult. For culture and propagation see *Lécythis.*

III. BERTHOLLETIA

(in honour of Louis Claude de Berthollet, the celebrated French chemist). Humb. et Bonpl. pl. equin. 1. p. 122. t. 36. Poit. mem. mus. 13. 148. t. 4. D. C. prod. 3. p. 293.

Lin. syst. *Monadélphia, Polyándria.* Limb of calyx bipartite, deciduous. Corolla and stamens as in *Lécythis.* Style curved, bent to the side, opposite the bundle of stamens. Stigma capitate. Ovarium 4-5-celled; cells 4-seeded. Seeds placed by pairs. Capsule large, roundish, valveless, woody, fleshy inside, opening by a lid. Seeds 16-20, fixed to the base of the central column, erect, triangular, convex on the outside, bony, wrinkled. Embryo fleshy, undivided in consequence of the cotyledons being conferruminated.—A tall tree, having the young branches leafy at the apex. Leaves alternate, oblong, quite entire, rather coriaceous. Flowers cream-coloured. Stamens white.

FIG. 128.



1 B. excélsa (Humb. et Bonpl. l. c.) ♄. S. Native of South America, spontaneous in woods on the banks of the Orinoco, and now cultivated in Brazil, Guiana, &c. H. B. et Kunth, nov. gen. amer. 7. p. 260. Rich. anal. fr. p. 74. and Tonka. Rich. ibid. p. 84. The triangular seeds known by the name of Brazil-nuts in our shops are the produce of this tree. The tree is said to be originally from the province of Para in Brazil, and is said also to form forests on the borders of the Orinoco. The almonds or nuts have been known to the Portuguese for a very long time, and are now known in all parts of Europe; in France under the name of Chastaignes du Bresil; in Spain under that of Almendron; in Portugal under Castanas de Maranon; in England under the name of Para-nuts or Brazil-nuts. The natives of the country call them Juvia, the Brazilians Capucaya. The Portuguese at Para carry them to Cayenne and Maranham, and sell them under the name of Tuka. The capsule or fruit is as large as a large cannon-ball, containing many triangular nuts, laid over each other in a regular manner. An oil is prepared from them, as well as from the seeds of several species of *Lécythis,* which is in great request in Brazil.

Tall Bertholletia or Brazil-nut. Tree 100 to 150 feet.

Cult. For culture and propagation see *Lécythis.*

IV. COUROUPITA

(*Couroupitoutoumou* is the Caribbean name of the tree). Aubl. guian. 2. p. 708. Poit. mem. mus. 13. p. 152. D. C. prod. 3. p. 293.—Pontopiddàna, Scop.—Elshóltzia, Rich. but not of Willd.—Lécythis species, Willd.—Pèkea species, Juss.

Lin. syst. *Monadélphia, Polyándria.* Calyx and corolla of *Lécythis.* Stamiiniferous ligula furnished with anthers, both at the base and apex. Ovarium turbinate, 6-celled. Parietal dissepiments reflexed towards the axis, and stretched even to the column; funicles concrete among themselves, and therefore bearing many ovula. Style wanting. Stigma stellately hexagonal. Capsule crustaceous, globose, girded by the calycine circle, valveless, pulpy inside. Operculum not separable. The pulp before the fruit is ripe is fleshy, but after deliquescence it vanishes, and at length the endocarp is separable from the epicarp. Seeds imbedded in the pulp, numerous, ovate, covered by a coriaceous villous membrane. Embryo roundish, compressed, beaked. Cotyledons large, foliaceous, nerved, plicate, corrugated, curved under the club-formed radicle.—Trees. Leaves petiolate, oblong-cuneated, rather crenulated. Stipulas small, caducous. Racemes simple, rising from the trunk and branches, bracteate. Flowers large, of a dirty whitish or flesh-colour.

1 C. Guiane'nsis (Aubl. guian. 2. p. 708. t. 28[illegible].) leaves acute; edge of calyx circumcised; petals acute. ♄. S. Native of Guiana and Cayenne, in sand by the sea side, where it is called *Couroupitoutoumou*, ex Barrere; *Abricot sauvage*, ex Aublet; *Calebasse-colin*, ex Poit. Fruit larger than a head, and consequently called *boulet de canon* or *cannon-ball*. Tuss. ant. 2. p. 45. f. 20-11. Lécythis bracteàta, Willd. Pèkea Couroupita, Juss. Pulp of fruit vinous. Flowers flesh-coloured, size of those of *Lécythis grandiflòra*, sweet-scented. The pulp of the fruit is white, acid, and not disagreeable.

Guiana Cannon-ball-tree. Clt. 1820. Tree 50 to 100 ft.

2 C. Nicaraguare'nsis (D. C. prod. 3. p. 294.) leaves obtuse; margin of calyx lobed; petals obtuse. ♄. S. Native of South America, near Nicaragua. Lécythis Nicaraguarénsis, Moc. et Sesse, fl. mex. icon. ined. Differs from the first in the flowers being smaller, of a dirty whitish brown-colour, and in the pulp of the fruit being bluish.

Nicaragua Cannon-ball-tree. Tree 40 to 50 feet.

Cult. For culture and propagation see *Lécythis*, p. 874.

V. COURATA'RI (*Couratari* is the Guiana name of the first species). Aubl. guian. 2. p. 723. t. 290. Rich. ann. sc. nat. 1. p. 329. Poit. mem. mus. 14. p. 154. D. C. prod. 3. p. [illegible].—Lecythópsis, Schrank in akad. munch. phil. 7. p. 241.—Curupita, Gmel.

Lin. syst. *Monadélphia, Polyándria.* Tube of calyx turbinate; limb 6-parted. Petals 6, joined at the base. Stamens numerous; filaments concrete into an urceolately concave truncate unilateral ligula, bearing the anthers on the inside. Ovarium 3-4-celled; cells 4-ovulate; ovulas erect. Style subulate, simple. Fruit or pyxidium oblong, somewhat trigonal, 3-celled, but at length becoming 1-celled, coriaceous, valveless, closed; operculum convex, formed from the central dilated column. Seeds oblong-lanceolate, numerous, disposed in 3 bundles in the bottom of the fruit. Embryo conduplicate, with a long root. Cotyledons 2, long, foliaceous, corrugated. Radicle incumbent.—Trees. Leaves alternate, exstipulate, quite entire. Racemes axillary, spicate.

1 C. Guiane'nsis (Aubl. l. c. t. 290.) fruit somewhat tetragonal, with the orifice entire; seeds girded by a wing. ♄. S. Native of Guiana, near Aroura, at the river Sinemari, where it is called *couratari*, *maou*, and *baluta blanc*. Rich. l. c. t. 21. good. The inhabitants of Guiana form cordages of the bark of this tree.

Guiana Couratari. Tree 60 feet.

2 C. Estrelle'nsis (Raddi, mem. pl. bras. add. p. 25. f. 2.) fruit nearly cylindrical, with a lobate orifice; seeds acute upwards. ♄. S. Native of Brazil, on the mountains of Estrella. Flowers unknown.

Estrella Couratari. Shrub 6 to 10 feet.

Cult. For culture and propagation see *Lécythis*, p. 874.

END OF THE SECOND VOLUME.

GILBERT AND RIVINGTON, PRINTERS, ST. [illegible], LONDON.
